The ordinary nonstone of the Coal-measures occurs in ball or plate layers throughout the bituminous coal-region, but is almost wanting in the anthracite region. Brown hematite currents, always connected with the limestone beds in the Coal-measures, were formerly extensively mined, but the supplies of Carboniferous ore of both kinds are far from meeting the present demand, and the make of charcoal iron from them has been virtually abandoned. At the base of the Devonian series the Marcellus still yields considerable quantities of brown hematite from the outcrop of a ferruginous clay-bed, but the lower brown hematite currents, which the Clinton beds of red fossil-ore left arching at the outcrop, hard and lean lower down) at Danville and Bloomsbury, at Frankstown and Hollidaysburg, at Bloody Run and Bedford, kept furnaces going for a good many years, and are still used as mixtures at Johnstown and elsewhere. The Lower Silurian brown hematite mines, however, have been the chief dependence of the industry. They are very numerous in the isolated limestone valleys and along the whole course of the Great Valley. Some of these open quarries are of vast size, and between 100 and 200 feet deep, furnishing shot and ball and pipe ore of the finest quality, both cold-short and hot-short; and the high reputation of American or Junata iron is based upon the history first of the charcoal and then of the anthracite make of pig-metal from these special ores. Railroads now

carry them long distances to the present centres of the iron manufacture, in the heart of the bituminous coal-region, or in front of the anthracite region, on the Lehigh, Schuylkill, and Susquehanna rivers, where they can be mixed with the subcrystalline iron ores of the South Mountains or of the Highlands of New Jersey. The South Mountains of Pennsylvania, however, cannot be said to be rich in these last-mentioned deposits, a few of which are indeed mined to a considerable extent, but no thorough exploitation of the range has yet been undertaken to see if the deep-lying strata contain the Canadian and New York magnetites which are to be expected. Some of the oldest and largest mines are situated at the edge of the Trias belt, and were formerly supposed to be of Trias age, but it seems now probable that they belong to the Cambrian formation covered by the Trias, and in all cases they are touched or surrounded by trap-dikes, which cut the Trias or trap-beds that underlie the Trias. The most remarkable of these mines is the "Cornwall" near Lebanon, where great quantities of cupriferrous magnetite are obtained by stopping the walls of a vast open quarry.

The iron industry of Pennsylvania has always competed with the cotton goods of the southern States and the cotton industry of the eastern States for political power in Congress, to save itself against a foreign importation of rolled iron. The iron-masters of Pennsylvania have led in every debate upon a protective tariff. Pennsylvania has always furnished one-half of the total amount of pig-iron cast in the United States. In 1883 it made 2,638,891 tons out of a total of 5,146,973 tons made in twenty-four States and one Territory. Of these 1,416,468 tons were anthracite pig, 1,184,108 coke and raw cast, and only 35,349 were charcoal pig, and the number of furnaces at the end of 1883 was 142 in blast and 129 out of blast. In like manner Pennsylvania has always rolled more than one-half of the iron and steel rails of American manufacture,—in 1883, for instance, 857,818 tons out of a total of 1,860,694, and of these 819,544 were Bessemer. So of iron-steel ingots Pennsylvania in 1883 made 63,687 out of a total of 80,465; open-hearth steel ingots, 72,383 out of a total of 133,679, in a word, of all kinds of iron and steel, 1,031,148 tons out of a total of 8,374. The petroleum statistics for 1882, partly mixed with those of an adjoining district in New York, show a product of 50,641,740 barrels (of 42 gallons).

Vegetation.—The vegetation of the State corresponds in variety with the variety of elevation and distance from the seaboard. The mountains are clad with forests of pine, hemlock, oak, beech, maple, wild cherry, cucumber tree, dogwood, and laurel, and cultivated apple, cherry, pear, and peach are grown in the clearings. Wild grapes grow in sheltered places, wild huckleberries, strawberries, and blackberries flourish. Oaks, balsam, and timothy grass yield heavy crops. The original forest remains only here and there in secluded spots. All its white-pine timber has been cut, and none grows to replace it. The spruce-pine, hemlock, and oak woods have been girdled by settlers, or barked by tanneries and left to rot. Extensive iron-furnace tracts have been systematically cut several times, the desolated charcoal grounds in the anthracite and coke districts have become covered with a dense low growth of oak, maple, birch, dogwood, and other deciduous vegetation. Two other motives have co-operated for the destruction of the original forest,—the demand for railway sleepers and the still greater demand for timber and slabs in mines. The annual forest fires, sometimes of enormous extent, help to keep the size of the forest small, and to cover the untraversed parts of the State with brushwood. The early settlers of the low country also cut without mercy and without fear; no shadow was allowed to fall on the field. The traditional practice lasted long; but the scarcity of wood at length made itself felt. The last generation began to plant, the present cherishes and multiplies trees, in and around fields, along roads, and on rough ground. The old settled parts of the State are, however, the well wooded, the greenest, the least, and the most fertile. The outcrops of sandstone make them rocky, and the terracing of their steep slopes is not yet to be thought of. In the north-western counties the discovery of petroleum in 1859 produced a great demand for derrick lumber, and the ephemeral woodmen cities which sprang up during the succeeding twenty-five years caused a rapid bringing under cultivation of at least 8000 square miles, lying between 1000 and 2000 feet above the level of the sea.

Two hundred and eighty-four genera and 544 species of plants are enumerated as growing on the plateau of Wayne county, in the north-east corner of the State, a typical portion of the whole upland region, covered with glacial drift-sand and gravel, with innumerable lakes, ponds, and small swamps, lying at various elevations from 1100 to 2000 feet above the sea.

Fauna.—The zoology of Pennsylvania exhibits that transition stage of its history in which we live. The elk has disappeared, but the panther (puma) and the small wolf are occasionally met with. The black bear is not by any means extinct, and can always find its way anew into the State from West Virginia. The wild cat is common in the least settled counties. Hedgehogs, ground-hogs, weasels, polecats, squirrels of three species, mice of several

rest from various business hesitations. The State imposes no tax on real estate, but collects \$447,776 from taxes on money at interest, watches, and carriages. The expenditure, exclusive of payment on debt, was \$5,044,760. The debt was \$20,225,033, with \$7,992,961 of assets in the sinking fund. Thirty-eight counties report debts aggregating \$76,301,376, and there are heavy municipal debts. The value of real estate reported in 1882 was \$1,598,030,041, of which \$110,000,126 were legally exempt from taxation.

Militia—Distributed over the State and organized into regiments and brigades are 137 volunteer companies, containing 8220 men and officers, and called collectively the "national guard." They include three batteries of artillery, three companies of cavalry, and 131 of infantry, arm and armed, equipped, and supplied by the State at an annual expense of about \$245,000.

History—The grant of the extensive territory called Pennsylvania, made by Charles II in 1681 to William Penn (q.v.), carried with it full proprietorship and dominion, saving only the king's sovereignty. Penn at once created a quick market for lands by publishing in England and on the Continent his liberal scheme of government and his intention to try the "holy experiment" of "a free colony for all mankind." In 1682, when he crossed the sea to take possession, he found the western bank of the Delaware already occupied by nearly 6000 Swedes, Dutch, and English, the Swedes having begun a settlement in 1638. To these, as to settlers from all nations, he conceded equal liberties. The desire to escape from spiritual and temporal despotisms, and the chance of acquiring rich lands in a salubrious climate on easy terms, drew thousands of immigrants—English Quakers, Scotch and Irish Presbyterians, German Lutherans, French Huguenots, men of all religions, and of all colors welcome, the population increased for a few years at the rate of one thousand a year, then more rapidly, so that at the end of seventy-five years it exceeded 200,000. Penn twice visited Pennsylvania, staying each time two years. In December 1682 he summoned delegates to meet him at Upland (now Chester) to confer about government, the land was divided into counties, and in March following representatives chosen by the people of these districts agreed on a constitution, based upon popular suffrage, and guaranteeing liberty of conscience. All magistrates and officers were to be chosen by the people, Penn surrendering all claim for revenue by taxation, and retaining for himself and his deputies only the governorship. For his further connexion with Pennsylvania, see PENN. In 1682 PHILADELPHIA (q.v.) was founded. The failure to settle the boundary-line between Pennsylvania and Maryland, in dispute, between the Pennsylvania and the Maryland colonies, caused great irritation among the settlers, who were liable to double taxation; but in 1750 Lord Hardwicke's decree in Chancery confirmed the original claims of Penn, and in 1763-67 Mason and Dixon definitely fixed and marked 246 miles of the line, since made famous as the separation between free and slave States.

For over sixty years the predominance of the Quakers in the assembly had prevented any legislation for racial defence, of which, indeed, there was little need so long as Indians and whites kept their covenant. But in 1744 the Indians became allies of the French, then at war with Great Britain. French military posts established in western Pennsylvania not only violated the integrity of the province but threatened to confine the English to the east of the Alleghenies, and perhaps to crowd them off the continent. The party of non-resistance was overborne by a sense of public danger, which found strong expression in a pamphlet by Brainerd, and in 1747 the assembly permitted volunteer organization. One hundred and twenty companies were soon enrolled, ten of them, of a hundred men each, in Philadelphia. But there was no efficient management nor hearty co-operation with adjacent colonies. Braddock's defeat in 1754 intensified the alarm. Fort Duquesne (site of Pittsburgh), which he aimed to reduce, was held by the French till 1758. The peace of Paris in 1763 did not quiet the Red Men. Pontiac, a famous sachem, united the western tribes in a war of extermination, only ended when the whites had proved their mastery. The royal council, displeased with self-governing tendencies, annulled the militia law of Pennsylvania, but the pressure of common danger and the dread of tomahawk and torch not only led to the offer of a bounty of \$130 for Indian scalps, but taught the lessons of comradeship and co-operation, and nourished the self-reliant courage of the people, which was stimulated, in 1773 the old charter was formally annulled and the Penn claims silenced by payment of £130,000. During the war Pennsylvania was the scene of important events,—the deliberations of the Congress and the Declaration of Independence in 1776, the battles of Brandywine and Germantown in 1777; the British occupation of Phil-

adelphia, and the encampment of Washington at Valley Forge, in 1777-78. A brief but violent mutiny of the unpaid soldiery of Pennsylvania in 1781 led Congress to adopt a better system of finance, under the wise guidance of Robert Morris of Philadelphia. In 1812, at the outbreak of war with Great Britain, Pennsylvania promptly furnished its quota of troops. At the opening of the war with the southern States, in 1861, in response to the president's call for 14,000 men as the State's quota, Pennsylvania sent 25,977, and during the war furnished a total of 387,284. No other northern State was invaded. At Gettysburg, near the State border, a three days' battle was fought, 30th June to 3d July 1863, resulting in a decisive victory of the Federal forces. In 1864 Chambersburg was burned by the Confederates. For more than two centuries Penn's commonwealth has been advancing in population and prosperity, and the great body of the people have dwelt in peace. There have been five serious local disturbances. Between 1791 and 1794 there was organized resistance to the collection of a federal tax on distilled spirits, but a strong display of force quelled the insurrection without bloodshed. In 1844 there were riots in Kensington, a suburb of Philadelphia, between "native Americans" and Catholic Irish, resulting in the destruction of thirty dwellings, three churches, one court, and many lives. Between 1835 and 1861 anti-slavery meetings in Philadelphia were often roughly interrupted, and in 1835 Pennsylvania Hall was burned by a pro-slavery mob. A criminal combination in the anthracite mining region, known as the "Molly Maguires," was broken up in 1876 by due course of law, twenty men being hanged for murder. In 1877 the "railroad riots," an outbreak of dissatisfied railway employees, caused a vast destruction of property at Pittsburgh and vicinity, but was quelled by the military. The constitution has been four times revised,—in 1838, 1850, 1857, 1874. (J. P. L.—C. G. A.)

PENRITH, a market-town of Cumberland, England, is situated near the river Eamont, and on the Lancaster and Carlisle section of the London and North-Western Railway, 18 miles south of Carlisle, and 5 north-east of Ullswater. The town consists chiefly of one long and wide street. To the west once stood an ancient castle, erected as a protection against the Scots, on the site of an old Roman encampment. But it was dismantled by Charles I., the ruins still remain. The principal public buildings are the grammar-school, founded by Queen Elizabeth in 1566, the agricultural hall, the mechanics' institute, and the working-men's literary institute. There are breweries, tanneries, and saw-mills, but the town depends chiefly on agriculture. The population of the urban sanitary district in 1871 was 8317, and in 1881 it was 9268.

Old Penrith, the Diemotomacum of the Romans, was about 5 miles north-west of the present town. At the Conquest the honour of Penrith was a royal franchise, but it was alternately in the possession of the English and Scottish kings until given to Anthony Beek, bishop of Durham, by Edward I. The town more than once lapsed to the crown. In 1696 it was granted to William Bentinck, earl of Portland, and in 1788 it was sold by the duke of Portland to the duke of Devonshire.

PENSACOLA, a city of the United States, capital of Escambia county, Florida, on the north-west coast of Pensacola Bay. The harbour has recently been improved so as to secure a uniform depth of 24 feet. Pensacola is the terminus of three railway lines which connect it with Mobile, Montgomery, Jacksonville, and Millville, the starting-place of steamers plying to Cedar Keys, &c, and the seat of a large trade in lumber (mainly pitch pine), early vegetables, and winter fruits. About 7 miles west of Pensacola lies a United States navy-yard. The value of the exports to Great Britain and the British colonies in 1882 was \$1,481,702, to other foreign countries \$1,091,113, and to the United States \$535,225. The total imports were only \$169,082. In 1850 the population was 2164, in 1870 3347, and in 1880 6845, and it has since increased to upwards of 8000.

Pensacola Bay is said to have been discovered by Narvaez in 1528 French, and afterwards Spanish, colonists settled on the site of the town in the close of the 17th century. In 1719 it was captured by Benville, in 1728 restored to the Spaniards, in 1763 occupied by the British, in 1781 captured by General Galvez, in 1814 taken from the British by the United States general Jackson, and again in 1818 taken by the same general from the Spaniards. In 1821, according to the treaty of 1819, it became, with the rest of Florida, part of the United States territory.

PENTATEUCH AND JOSHUA. The name Pentateuch, already found in Tertullian and Origen, corresponds to the Jewish חמשה חומשי תורה (the five-fifths of the Torah, or Law), the several books were named by the Jews from their initial words, though at least Leviticus, Numbers, and Deuteronomy had also titles corresponding to those we use, *וַיַּזְכֵּר*, *וַיַּזְכֵּר*, *וַיַּזְכֵּר* (*Διαμνησκειν*), Origen, in *Eus. H. E.*, vi. 26), *כְּשֶׁנָּה חוֹרָה*. The Pentateuch, together with Joshua, Judges, and Ruth, with which it is usually united in Greek MSS., makes up the Octateuch; the Pentateuch and Joshua together have recently been named the Hexateuch. The date of the division of the Torah into five books cannot be made out; it is probably older than the Septuagint translation.

Moses is already taken for the author of the Pentateuch in 2 Chronicles xxv. 4, xxxv. 12 *sq.*, only the last eight verses of Deuteronomy are, according to the rabbins, not from his pen. From the synagogue belief in the Mosaic authorship passed to the church, and is still widely prevalent among Christians. At an early date, indeed, doubts suggested themselves as to the correctness of this view, but it was not till the 17th century that these became so strong that they could not be suppressed.¹ It was observed that Moses does not speak of himself in the first person, but that some other writer speaks of him in the third,—a writer, too, who lived long after. The expression of Gen. xii. 6, “the Canaanite was then in the land,” is spoken to readers who had long forgotten that a different nation from Israel had once occupied the Holy Land, the words of Gen. xxxv. 31, “these are the kings that reigned in Edom, before there reigned any king over the children of Israel,” have no prophetic aspect, they point to an author who wrote under the Hebrew monarchy again, the “book of the wars of Jehovah” (Num. xxi. 14) cannot possibly be cited by Moses himself, as it contains a record of his own deeds, and, when Deut. xxxiv. 10 (comp. Num. xii.) says that “there arose not a prophet since in Israel like unto Moses,” the writer is necessarily one who looked back to Moses through a long series of later prophets.

At the same time attention was drawn to a variety of contradictions, inequalities, transpositions, and repetitions of events in the Pentateuch, such as excluded the idea that the whole came from a single pen. Thus Peyræus remarked that Gen. xx and xxvi. stand in an impossible chronological context, and on the incongruity of Gen. i. and ii., which he pressed very strongly, he rested his hypothesis of the Preadamites. Such observations could not but grievously shake the persuasion that Moses was the author of the Pentateuch, while at the same time they directed criticism to a less negative task—viz., the analysis of the Pentateuch. For this, indeed, the 17th century did not effect anything considerable, but at least two conclusions came out with sufficient clearness. The first of these was the self-contained character of Deuteronomy, which in these days there was a disposition to regard as the oldest book of the Pentateuch, and that with the best claims to authenticity. And in the second place the Pentateuchal laws and the Pentateuchal history were sharply distinguished, the chief difficulties were felt to lie in the narrative, and there seemed to be less reason for questioning the Mosaic authorship of the laws.

Spinoza's bold conjecture that in their present form not only the Pentateuch but also the other historical books of the Old Testament were composed by Ezra ran far ahead of the laborious investigation of details necessary to solve

the previous question of the composition of the Pentateuch. Jean Astruc has the merit of opening the true path of Astruc this investigation. He recognized in Genesis two main sources, between which he divided the whole materials of the book, with some few exceptions, and these sources he distinguished by the mark that the one used for God the name Elohim (Gen. i. v., comp. Exod. vi. 3) and the other the name Jehovah (Gen. ii. iv.).² Astruc's hypothesis, fortified by the observation of other linguistic differences which regularly corresponded with the variation in the names of God, was introduced into Germany by Eichhorn's *Einleitung in d. A. T.*, and proved there the fruitful and just point of departure for all further inquiry. At first, indeed, it was with but uncertain steps that critics advanced from the analysis of Genesis to that of the other books, where the simple criterion of the alternation of the divine names was no longer available. In the hands of the Scotsman Geddes and the German Vater the Pentateuch resolved itself into an agglomeration of longer and shorter fragments, between which no threads of continuous connexion could be traced³ (“Fragmentary Hypothesis”). The fragmentary hypothesis was mainly supported by arguments drawn from the middle books of the Pentateuch, and as limited to these it long found wide support. Even De Wette started from it in his investigations, but this was really an inconsistency, for his fundamental idea was to show throughout all parts of the Pentateuch traces of certain common tendencies, and even of one deliberate plan, nor was he far from recognizing the close relation between the Elohist of Genesis and the legislation of the middle books.

De Wette's chief concern, however, was not with the literary but with the historical criticism of the Pentateuch, and in the latter he made an epoch. In his *Diss. Critica* of 1805 (*Opusc. Theol.*, pp. 149-168) he placed the composition of Deuteronomy in the time of King Josiah (arguing from a comparison of 2 Kings xxii., xxiii., with Deut. xii.), and pronounced it to be the most recent stratum of the Pentateuch, not, as had previously been supposed, the oldest. In his *Critical Inquiry into the Credibility of the Books of Chronicles* (Halle, 1806) he showed that the laws of Moses are unknown to the post-Mosaic history, thus he did by instituting a close comparison of Samuel and Kings with the Chronicles, from which it appeared that the variations of the latter are not to be explained by the use of other sources, but solely by the desire of the Jewish scribes to shape the history in conformity with the law, and to give the law that place in history which, to their surprise, had not been conceded to it by the older historical books. Finally, in his *Criticism of the Mosaic History* (Halle, 1807) De Wette attacked the method then prevalent in Germany of eliminating all miracles and prophecies from the Bible by explaining them away, and then rationalizing what remained into a dry prosaic pragmatism. De Wette refuses to find any history in the Pentateuch; all is legend and poetry. The Pentateuch is not an authority for the history of the time it deals with, but only for the time in which it was written; it is, he says, the conditions of this much later time which the author idealizes and throws back into the past, whether in the form of narrative or of law.

De Wette's brilliant *début*, which made his reputation for the rest of his life, exercised a powerful influence on his contemporaries. For several *decennia* all who were open to critical ideas at all stood under his influence. Gramberg, Leo, and Von Bohlen wrote under this influence; Gesenius in Halle, the greatest Hebraist then living, taught under it, nay, Vatke and George were guided by De

Wette's ideas and started from the ground that he had conceived, although they advanced beyond him to a much more definite and better established position, and were also diametrically opposed to him in one most important point, of which we shall have more to say presently.¹

Positive
literary
criticism

But meantime a reaction was rising which sought to direct criticism towards positive rather than negative results. The chief representatives of this positive criticism, which now took up a distinct attitude of opposition to the negative criticism of De Wette, were Bleek, Ewald, and Movers. By giving up certain parts of the Pentateuch, especially Deuteronomy, they thought themselves able to vindicate certain other parts as beyond doubt genuinely Mosaic, just in the same way as they threw over the Davidic authorship of certain psalms in order to strengthen the claim of others to bear his name. The procedure by which particular ancient hymns or laws were sifted out from the Psalter or the Pentateuch had some resemblance to the *decretum absolutum* of theology, but up to a certain point the reaction was in the right. The youthful De Wette and his followers had really gone too far in applying the same measure to all parts of the Pentateuch, and had been satisfied with a very inadequate insight into its composition and the relation of its parts. Historical criticism had hurried on too fast, and literary criticism had now to overtake it. De Wette himself felt the necessity for this, and from the year 1817 onwards—the year of the first edition of his *Einleitung*—he took an active and useful part in the solution of the problems of Pentateuchal analysis. The fragmentary hypothesis was now superseded; the connexion of the Elohist of Genesis with the legislation of the middle books was clearly recognized, and the book of Joshua was included as the conclusion of the Pentateuch. The closely-knit connexion and regular structure of the narrative of the Elohist impressed the critics; it seemed to supply the skeleton which had been clothed with flesh and blood by the Jehovist, in whose contributions there was no such obvious conformity to a plan. From all this it was naturally concluded that the Elohist had written the *Grundschrift* or primary narrative, which lay before the Jehovist and was supplemented by him ("Supplementary Hypothesis").²

Hupfeld. This view remained dominant till Hupfeld in 1853 published his investigations on *The Sources of Genesis and the Method of their Composition*. Hupfeld denied that the Jehovist followed the context of the Elohist narrative, merely supplementing it by additions of his own. He pointed out that such Elohist passages in Genesis as clearly have undergone a Jehovistic redaction (e.g., chaps. xx, xxi, xxi) belong to a different Elohist from the author of Gen i. Thus he distinguished three independent sources in Genesis, and he assumed further, somewhat inconsequently, that no one of them had anything to do with the others till a fourth and later writer wove them all together into a single whole. This assumption was corrected by

Noldeke. Noldeke, who showed that the second Elohist is preserved only in extracts embodied in the Jehovistic book, that the Jehovist and second Elohist form one whole and the *Grundschrift* another, and that thus, in spite of Hupfeld's discovery, the Pentateuch (Deuteronomy being excluded) was still to be regarded as made up of two great layers. Noldeke had also the honour of having been the first to

treat in detail how the Elohist *Grundschrift* runs through the whole Hexateuch, and of having described with masterly hand the peculiar and inflexible type of its ideas and language. In this task he was aided by the commentary of Knobel, whose industry furnished very valuable materials for men of judgment to work upon.³

Thus the investigation into the composition of the Pentateuch had reached a point of rest and a provisional conclusion. The results may be thus summarized. The five books of Moses with Joshua form one whole, and it is not the death of Moses but the conquest of the promised land which forms the true close of the history of the patriarchal age, the exodus, and the wanderings in the wilderness, it is therefore more correct to speak of the Hexateuch than of the Pentateuch. From this whole it is most easy to detach the book of Deuteronomy, and accordingly its independence was very early recognized. Of the other elements, that which has the most marked individuality is the work of the Elohist, which we shall in the sequel call the Priestly Code. This too, like Deuteronomy, is a law-book, but it is not a law-book in the same sense as Deuteronomy, which has an historical setting. Its main stock is Leviticus, with the cognate parts of the adjacent books, Exod. xxv-xl (except chaps xxxi-xxxiv) and Num i-x, xv-xix, xxv-xxxvi (with some inconsiderable exceptions). This law-book does not, like Deuteronomy, embrace precepts for civil life, but is confined to affairs of worship, and mainly to the esoteric aspect of public worship, that is, to such points as belonged to the function of the priests as distinguished from the worshipping people. The legal contents of the Code are supported on a scaffolding of history, which, however, belongs to the literary form rather than to the substance of the work. It is only where some point of legal interest is involved that the narrative acquires any fullness, as it does in the book of Genesis in connexion with the three preparatory stages of the Mosaic covenant attached to the names of Adam, Noah, and Abraham. Generally speaking, the historical thread is very thin, and often (Gen v, xi,) it becomes a mere genealogical line, on which is hung a continuous chronology earned on from the creation to the exodus. The Priestly Code is characterized by a marked predilection for numbers and measures, for arrangement (titles to sections) and formality of scheme, by the poverty and inflexibility of its language, by standing repetitions of certain expressions and phrases such as are not elsewhere found in old Hebrew. Thus its distinguishing marks are very pronounced, and can always be recognized without difficulty. If now Deuteronomy and the Priestly Code are successively subtracted from our present Pentateuch the Jehovistic history-book remains, distinguished from both the others by the fact that it is essentially narrative and not law, and by the pleasure it takes in bringing out details of the historical tradition, so that individual points of the story receive full justice and are not sacrificed to the interests of the general plan. The patriarchal history belongs almost entirely to this document, and forms the most characteristic part of it, here that history forms no mere epitomized introduction to more important matter, as in the Priestly Code, but is treated in all fullness as a subject of first-rate importance. Legislative elements are incorporated in the Jehovistic narrative only at one point, where they naturally fall into the historical context, viz., in connexion with the law-giving on Sinai (Exod xx-xxiii, xxxiv).

These, then, are the three main component parts of the Hexateuch—Deuteronomy, the Priestly Code, and the Jehovist. But the Jehovist has woven together in his history-book two sources, one of which uses the name

assigned by De Wette has held its ground. That the author of Deuteronomy had the Jehovistic work before him is also admitted, and it is pretty well agreed that the latter is referred, alike by the character of its language and the circle of its ideas and by express references (Gen. xii 6, xxxvi 31, xxxiv 10; Num. xxi iv, Deut. xxxiv 10), to the golden age of Hebrew literature, the same which has given us the finest parts of the books of Judges, Samuel, and Kings, and the oldest extant prophetic writings,—the age of the kings, and prophets, before the dissolution of the sister states of Israel and Judah.

Priestly
Joda.

On the other hand, the date of the Priestly Code is disputed. Till pretty recently it was commonly regarded as the oldest part of the Hexateuch. The fact that it is mainly legal seemed to give it the priority over the history of the Jehovist, for Moses was a lawgiver, not a narrator. Again, the priestly legislation has reference to worship, and regulates all points of ritual with great exactness; and by the rule that the earliest forms of religion lay most weight on ceremonies of worship and all matters of form, this fact seemed to mark the Priestly Code as older than Deuteronomy, where affairs of ritual worship are less prominent than precepts of ethical conduct. Once more, the demands made by Deuteronomy for the maintenance of the priesthood and ritual service are much less heavy than the corresponding demands of the Priestly Code, and here again it was natural enough to argue that practical difficulties had led to the abolition or modification of the heavier burdens. And these conclusions were confirmed by the prevalent impression that the final redaction of the Pentateuch, and still more of the book of Joshua, was Deuteronomic, and that the same Deuteronomic redaction could be traced also in the other historical books. But even more weight than was laid on these really plausible arguments was held to attach to another point which seemed not merely to prove the priority of the Priestly Code but to indicate that it was at least partly of Mosaic origin. Alike in the Jehovistic Book of the Covenant and in Deuteronomy the legislation is expressly constructed on the supposition of a nation no longer nomadic but settled in the land of Canaan. The Priestly Code, on the contrary, is throughout directed to Israel as it lived encamped during the wilderness wanderings, and never makes anticipatory reference to later conditions. So also in Genesis the Priestly Code strictly observes the difference between the patriarchal age and later times, and is careful not to transfer Mosaic institutions to the times of the Hebrew forefathers. This air of antiquity, combined with a corresponding severe simplicity in the style and form, and a cast of language which differs profoundly from classical Hebrew, and was conjectured to be of an older mould, was the principal feature relied on as evidence that the Priestly Code deserved the title of the *Grundchrift*, the original and fundamental part of the Hexateuch.

But, in point of fact, it was none of these arguments which really gave rise to the doctrine of the priority of the Priestly Code; that doctrine had its veritable source in the supplementary hypothesis described above. After the supplementary hypothesis was given up, the inferences originally drawn from it continued to hold their ground; though it was made out that the Jehovist did not presuppose the existence of the Priestly Code, critics still assumed without question that the latter was the older work of the two. Critical analysis made steady progress, but the work of synthesis did not hold even pace with it; thus part of the problem was treated rather slightly, and merely by the way. Indeed, the true scope of the problem was not realized, it was not seen that most important historical questions were involved as well as questions merely literary, and that to assign the true order of

the different strata of the Pentateuch was equivalent to a reconstruction of the history of Israel. As regards the narrative matter it was forgotten that, after the Jehovistic, Deuteronomic, and priestly versions of the history had been felicitously disentangled from one another, it was necessary to examine the mutual relations of the three, to consider them as marking so many stages of an historical tradition, which had passed through its successive phases under the action of living causes, and the growth of which could and must be traced and historically explained. Still greater faults of omission characterized the critical treatment of the legal parts of the Pentateuch. Bleek, the oracle in all such matters of the German school of "Vermittelungstheologen" (the theologians who tried to mediate between orthodoxy and criticism alike in doctrine and in history), never looked beyond the historical framework of the priestly laws, altogether shutting his eyes to their substance. He never thought of instituting an exact comparison between them and the Deuteronomic law, still less of examining their relation to the historical and prophetic books, with which, in truth, as appears from his *Introduction*, he had only a superficial acquaintance. Ewald, on the other hand, whose views as to the Priestly Code were cognate to those of Bleek, undoubtedly had an intimate acquaintance with Hebrew antiquity, and understood the prophets as no one else did. But he too neglected the task of a careful comparison between the different strata of the Pentateuchal legislation and the equally necessary task of determining how the several laws agreed with or differed from such definite data for the history of religion as could be collected from the historical and prophetic books. He had therefore no fixed measure to apply to the criticism of the laws, though his conception of the history suffered little, and his conception of prophecy still less, from the fact that in shaping them he left the law practically out of sight, or only called it in from time to time in an irregular and rather unnatural way.

Meanwhile, two Hegelian writers, starting from the original position of De Wette, and moving on lines apart from the beaten track of criticism, had actually effected the solution of the most important problem in the whole sphere of Old Testament study. Vatke and George have the honour of being the first by whom the question of the historical sequence of the several stages of the law was attacked on a sound method, with full mastery over the available evidence, and with a clear insight into the far-reaching scope of the problem. But their works made no permanent impression, and were neglected even by Reuss, although this scholar had fallen at the same time upon quite similar ideas, which he did not venture to publish.¹

¹ The following propositions were formulated by Reuss in 1838 (or, Reuss, as he elsewhere gives the date, in 1834), though they were not published till 1879. 1. L'édifice historique du Pentateuque peut et doit être examiné à part et ne pas être confondu avec l'édifice législatif. 2. L'un et l'autre ont pu exister sans rédaction écrite. La mention, chez d'anciens écrivains, de certaines traditions patriarcales ou mosaïques, ne prouve pas l'existence du Pentateuque, et une nation peut avoir un droit coutumier sans code écrit. Les traditions nationales des Israélites remontent plus haut que les lois du Pentateuque et la rédaction des premières est antérieure à celle des secondes. 3. L'intérêt principal de l'historien doit porter sur la date des lois, parce que sur ce terrain il a plus de chances d'arriver à des résultats certains. Il faut en conséquence procéder à l'interrogatoire des témoins. 4. L'histoire racontée dans les livres des Juges et de Samuel, et même en partie celle comprise dans les livres des Rois, est en contradiction avec des lois dites mosaïques; donc celles-ci étaient inconnues à l'époque de la rédaction de ces livres, à plus forte raison elles n'ont pas existé dans les temps qui y sont décrits. 5. Les prophètes du 8^e et du 7^e siècle ne savent rien du code mosaïque. 6. Jérémie est le premier prophète qui connaisse une loi écrite et ses citations rapportent au Deutéronome. 7. Le Deutéronome (iv 45-xviii 68) est le livre que les prêtres prétendaient avoir trouvé dans le temple, au temps du roi Josias. Ce code est la partie la plus ancienne de la législation (rédigée) comprise dans le Pentateuque. 9. L'histoire des Israélites,

K. H. Graf.

The new ideas lay dormant for thirty years, when they were revived through a pupil of Reuss, K. H. Graf. He too was deemed at first to offer an easy victory to the weapons of "critical analysis," which found many vulnerable points in the original statement of his views. For, while Graf placed the legislation of the middle books very late, holding it to have been framed after the great captivity, he at first still held fast to the doctrine of the great antiquity of the so-called Elohist of Genesis (in the sense which that term bore before Hupfeld's discovery), thus violently rending the Priestly Code in twain, and separating its members by an interval of half a millennium. Thus he was compelled to do, because, for Genesis at least, he still adhered to the supplementary hypothesis, according to which the Jehovist worked on the basis laid by the (presly) Elohist. Here, however, he was tying himself by bonds which had been already loosed by Hupfeld, and, as literary criticism actually stood, it could show no reason for holding that the Jehovist was necessarily later than the Elohist. In the end, therefore, literary criticism offered itself as Graf's auxiliary. Following a hint of Kuenen's, he embraced the proffered alliance, gave up the violent attempt to divide the Priestly Code, and proceeded without further obstacle to extend to the historical part of that code as found in Genesis those conclusions which he had already established for its main or legislative part. Graf himself did not live to see the victory of his cause. His *Goel*, to speak with the ancient Hebrews, was Professor A. Kuenen of Leyden, who has had the chief share in the task of developing and enforcing the hypothesis of Graf.¹

The characteristic feature in the hypothesis of Graf is that the Priestly Code is placed later than Deuteronomy, so that the order is no longer Priestly Code, Jehovist, Deuteronomy, but Jehovist, Deuteronomy, Priestly Code. The method of inquiry has been already indicated; the three strata of the Pentateuch are compared with one another, and at the same time the investigator seeks to place them in their proper relation to the successive phases of Hebrew history as these are known to us from other and undisputed evidence. The process may be shortened if it be taken as agreed that the date of Deuteronomy is known from 2 Kings xxii., for this gives us at starting a fixed point, to which the less certain points can be referred. The method can be applied alike to the historical and legal parts of the three strata of the Hexateuch. For the Jehovist has legislative matter in Exod. xx.-xxiii., xxiv., and Deuteronomy and the Priestly Code embraces historical matters; moreover, we always find that the legal standpoint of each author influences his presentation of the history, and *vice versa*. The most important point, however, is the comparison of the laws, especially of the laws about worship, with corresponding statements in the historical and prophetic books.

The turning-point in the history of worship in Israel is the centralization of the cultus in Jerusalem by Josiah (2 Kings xxi., xxiii.). Till then there were in Judah, as there had been before in Samaria, a multitude of local

sanctuaries, the legitimacy of which no one dreamt of disputing. If Hezekiah made an attempt to abolish these local shrines, as we are told in 2 Kings xviii. 4, 22, it is yet plain that this attempt was not very serious, as it had been quite forgotten less than a hundred years later. Josiah's reforms were the first that went deep enough to leave a mark on history. Not, indeed, that the high places fell at one blow; they rose again after the king's death, and the attachment to them finally disappeared only when the Babylonian exile tore the nation from its ancestral soil and forcibly interrupted its traditional customs. The returning exiles were thoroughly imbued with the ideas of Josiah's reform, and had no thought of worshipping except in Jerusalem; it cost them no sacrifice of their feelings to leave the ruined high places unbuilt. From this date all Jews understood as a matter of course that the one God had only one sanctuary. Thus we have three distinct historical periods,—(1) the period before Josiah, (2) the transition period introduced by Josiah's reforms, and (3) the period after the exile. Can we trace a correspondence between these three historical phases and the laws as to worship?

1. The principal law-book embodied by the Jehovist, the first so-called Book of the Covenant, takes its form in Exod. period xx. 24-26 that altars are many, not one. Here there is no idea of attaching value to the retention of a single place for the altar, earth and rough stones are to be found everywhere, and an altar of these materials falls into ruins as easily as it is built. Again, a choice of materials is given, presumably for the construction of different altars, and Jehovah proposes to come to His worshippers and bless them, not in the place where he causes His name to be celebrated, but at every such place. The Jehovistic law therefore agrees with the customary usage of the earlier period of Hebrew history, and so too does the Jehovistic story, according to which the patriarchs wherever they reside erect altars, set up *crppi* (*maggeloth*), plant trees, and dig wells. The places of which these acts of the patriarchs are related are not fortuitous; they are the same places as were afterwards famous shrines. This is why the narrator speaks of them, his interest in the sites is not antiquarian, but corresponds to the practical importance they held in the worship of his own day. The altar which Abraham built at Shechem is the same on which sacrifices still continued to be offered; Jacob's anointed stone at Bethel was still anointed, and tithes were still offered at it in fulfilment of vows, in the writer's own generation. The things which a later generation deemed offensive and heathenish—high places, *maggeloth*, sacred trees, and wells—all appear here as consecrated by patriarchal precedent, and the narrative can only be understood as a picture of what daily took place in the first century or thereabout after the division of the kingdoms, thrown back into the past and clothed with ancient authority.

2. The Deuteronomic legislation begins (Deut. xii.), second just like the Book of the Covenant, with a law for the period. place of worship. But now there is a complete change; Jehovah is to be worshipped only in Jerusalem and nowhere else. The new law-book is never weary of repeating this command and developing its consequences in every direction. All this is directed against current usage, against "what we are accustomed to do at this day"; the law is polemical and aims at reformation. This law therefore belongs to the second period of the history, the time when the party of reform in Jerusalem was attacking the high places. When we read, then, that King Josiah was moved to destroy the local sanctuaries by the discovery of a law-book, this book, assuming it to be preserved in the Pentateuch, can be none other than the legislative part of Deuteronomy, which must once have had a separate exist-

Historical periods and laws of worship.

en tant qu'il s'agit du développement personnel déterminé par des lois éternelles, se divisent en deux périodes, avant et après Josiah. Josiah est antérieur à la rédaction du code rituel et des lois qui ont distinctement organisé la hiérarchie. 11. Le livre de Josiah n'est pas, tant s'en faut, la partie la plus récente de l'ouvrage entier. 12. Le rédacteur du Pentateuque se distingue clairement de l'ancien prophète Moïse. (*L'histoire sainte et la loi*, Paris, 1879, pp. 28, 24.)

ence in a shorter form than the present book of Deuteronomy; thus, too, is the inference to which we are led by the citations and references in Kings and Jeremiah.

Thurs.
period

3 In the Priestly Code all worship depends on the tabernacle, and would fall to nothing apart from it. The tabernacle is simply a means of putting the law of unity of worship in an historical form, it is the only legitimate sanctuary; there is no other spot where God dwells and shows Himself, no other where man can approach God and seek His face with sacrifice and gifts. But, while Deuteronomy demands, the Priestly Code presupposes, the limitation of worship to one sanctuary. This principle is tacitly assumed as the basis of everything else, but is never asserted in so many words; the principle, it appears, is now no novelty, but can be taken for granted. Hence we conclude that the Priestly Code builds on the realization of the object aimed at in Deuteronomy, and therefore belongs to the time after the exile, when this object had been fully secured. An institution which in its origin must necessarily have had a negative significance as an instrument in the hands of polemical reformers is here taken to have been from the first the only intelligible and legitimate form of worship. It is so taken because established customs always appear to be natural and to need no reason for their existence.

Priest-
hood

The abolition of the local shrines in favour of Jerusalem necessarily involved the deposition of the provincial priesthood in favour of the sons of Zadok in the temple of Solomon. The law of Deuteronomy tries to avoid this consequence by conceding the privilege of offering sacrifices at Jerusalem to the Levites from other places; Levites in Deuteronomy is the general name for priests whose right to officiate is hereditary. But this privilege was never realized, no doubt because the sons of Zadok opposed it. The latter, therefore, were now the only real priests, and the priests of the high places lost their office with the destruction of their altars; for the loss of their sacrificial dues they received a sort of eleemosynary compensation from their aristocratic brethren (2 Kings xxiii 9). The displacing of the provincial priests, though practically almost inevitable, went against the law of Deuteronomy; but an argument to justify it was supplied by Ezekiel (Ezek. xlv.). The other Levites, he says, forfeited their priesthood by abusing it in the service of the high places; and for this they shall be degraded to be mere servants of the Levites of Jerusalem, who have not been guilty of the offence of doing sacrifice in provincial shrines, and thus alone deserve to remain priests. If we start from Deuteronomy, where all Levites have equal priestly rights, this argument and ordinance are plain enough, but it is utterly impossible to understand them if the Priestly Code is taken as already existing. Ezekiel views the priesthood as originally the right of all Levites, while by the Priestly Code a Levite who claims this right is guilty of baseless and wicked presumption, such as once cost the lives of all the company of Korah. And the position of the Levites which Ezekiel qualifies as a punishment and a degradation appears to the Code as the natural position, which their ancestors from father to son had held from the first. The distinction between priest and Levite, which Ezekiel introduces expressly as an innovation, and which elsewhere in the Old Testament is known only to the author of Chronicles, is, according to the Code, a Mosaic institution fixed and settled from the beginning. Ezekiel's ideas and aims are entirely in the same direction as the Priestly Code, and yet he plainly does not know the Code itself. This can only mean that in his day it did not exist, and that his ordinances formed one of the steps that prepared the way for it.

The Priestly Code gives us an hierarchy fully developed, such as existed after the exile. Aaron stands above

his sons as the sons of Aaron stand above the Levites. He has not only the highest place, but a place quite unique. Position like that of the Roman pontiff, his sons minister under of high his superintendence (Num. iii 4); he himself is the only priest priest with full rights; as such he wears the Urim and Thummim, and the golden ephod; and none but he can enter the holy of holies and offer incense there. Before the exile there were, of course, differences of rank among the priests, but the chief priest was only *primus inter pares*, even Ezekiel knows no high priest in the sense of the Priestly Code. The Urim and Thummim were the insignia of the Levites in general (Deut. xxxiii 8), and the linen ephod was worn by them all, while the golden ephod was not a garment but a gold-plated image such as the greater sanctuaries used to possess (Judges viii 27, Isa. lxx 22). Moreover, up to the exile the temple at Jerusalem was the king's chapel, and the priests were his servants, even Ezekiel, who in most points aims at securing the independence of the priests, gives the prince a weighty part in matters of worship, for it is he who receives the dues of the people, and in return defrays the sacrificial service. In the Priestly Code, on the other hand, the dues are paid direct to the sanctuary, the ritual service has full autonomy, and it has its own head, who holds his place by divine right. Nay, the high priest represents more than the church's independence of the state, he exercises sovereignty over Israel. Though sceptre and sword are lacking to him, his spiritual dignity as high priest makes him the head of the theocracy. He alone is the responsible representative of the commonwealth, the names of the twelve tribes are written on his shoulders and his breast. Offence of his incupates the whole people and demands the same expiation as a national sin, while the sin-offerings prescribed for the princes mark them out as mere private persons compared with him. His death makes an epoch, the fugitive manslayer is annested, not on the death of the king, but on the death of the high priest. On his investiture he receives a kingly uncton (whence his name, "the anointed priest"), he wears the diadem and tiara of a monarch, and is clad in royal purple, the most unpriestly dress possible. When now we find that the head of the national worship is as such, and merely as such—for no political powers accompany the high priesthood—also the head of the nation, this can only mean that the nation is one which has been deprived of its civil autonomy, that it no longer enjoys political existence, but survives merely as a church. In truth the Priestly Code never contemplates Israel as a nation, but only as a religious community, the whole life of which is summed up in the service of the sanctuary. The community is that of the second temple, the Jewish hierarchy under that foreign dominion which alone made such an hierarchy possible. The pattern of the so-called Mosaic theocracy, which does not suit the conditions of any earlier age, and of which Hebrew prophecy knows nothing, even in its ideal descriptions of the commonwealth of Israel as it ought to be, fits post-exilic Judaism to a nicety, and was never an actual thing till then. After the exile the Jews were deprived by their foreign rulers of all the functions of public political life; they were thus able, and thus indeed compelled, to devote their whole energies to sacred things, in which full freedom was left them. So the temple became the one centre of national life, and the prince of the temple head of the spiritual commonwealth, while, at the same time, the administration of the few political affairs which were still left to the Jews themselves fell into his hands as a matter of course, because the nation had no other chief.

The material basis of the hierarchy was supplied by the Sacred sacred dues. In the Priestly Code the priests receive all dues

sin-offerings and guilt-offerings, the greater part of the cereal accompaniments of sacrifices, the skin of the burnt-offering, the breast and shoulder of thank-offerings. Further, they receive the male firstlings and the tithe of cattle, as also the firstfruits and tithes of the fruits of the land. Yet with all this they are not even obliged to support at their own cost the stated services and offerings of the temple, which are provided for by a poll-tax. The poll-tax is not ordained in the main body of the Code, but such a tax, of the amount of one-third of a shekel, began to be paid in the time of Nehemiah (Neh. x. 32), and in a novel of the law (Exod. xxx. 15) it is demanded at the higher rate of half a shekel per head. That these exorbitant taxes were paid to or claimed by the priests in the wilderness, or during the anarchy of the period of the judges, is inconceivable. Nor in the period of the kingship is it conceivable that the priests laid claim to contributions much in excess of what the king himself received from his subjects; certainly no such claim would have been supported by the royal authority. In 1 Sam. viii. 15 the tithes appear as paid to the king, and are viewed as an oppressive exaction, yet they form but a single element in the multiplicity of dues which the priests claim under the Priestly Code. But, above all, the fundamental principles of the system of priestly dues in the Code are absolutely irreconcilable with the fact that as long as Solomon's temple stood the king had the power to dispose of its revenues as he pleased. The sacred taxes are the financial expression of the hierocratic system, they accord with the condition of the Jews after the exile, and under the second temple they were actually paid according to the Code, or with only minor departures from its provisions.

Before the exile the sacred gifts were not paid to the priests at all but to Jehovah; they had no resemblance to taxes, and their religious meaning, which in the later system is hardly recognizable, was quite plainly marked. They were in fact identical with the great public festival offerings which the offerers consumed in solemn sacrificial meals before Jehovah, that is, at the sanctuary. The change of these offerings into a kind of tax was connected with an entire transformation of the old character of Israel's worship, which resulted from its centralization at Jerusalem. In the old days the public worship of the nation consisted essentially in the celebration of the yearly religious feasts, that this was so can be plainly seen from the prophets,—from Amos, but especially from Hosea. And accordingly the laws of worship are confined to this one point in the Jehovahist, and even in Deuteronomy. After the exile the festival observances became much less important than the *tamid*, the regular daily and weekly offerings and services, and so we find it in the Priestly Code. But, apart from this, the feasts underwent a qualitative change, a sort of degeneration, which claims our special attention. Originally they were thanksgiving feasts in acknowledgment of Jehovah's goodness in the seasons of the year. The expression of thanks lay in the presentation of the firstlings and firstfruits, and these constituted the festival offerings. The chief feast, at the close of the old Hebrew year, was the autumn feast of ingathering (Feast of Tabernacles),—a thanksgiving for the whole produce of the winepress and the corn-flour, but especially for the vintage and the olive harvest. Then, at the beginning of the summer half-year, came the feast of unleavened bread (*Maḥḥōth*, Easter), which in turn was followed by the harvest feast (Pentecost). Between the two last there was a definite interval of seven weeks; hence the name "Feast of Weeks" (Exod. xxxiv.). In Deut. xvi. 9 the seven weeks are explained as "seven weeks from such time as thou beginnest to put the sickle to the corn." The Easter feast, therefore, is the commencement of the corn harvest, and thus throws light

on its fixed relation to Pentecost. The one is the end of the harvest, the other its commencement in Abib (the month of "corn-ears"); between them lie the "determined weeks of harvest" (Jer. v. 24). The whole of this *tempus clavum* is one great time of gladness (Isa. ix. 3), bounded by the two feasts. According to Lev. xxiii. 9-22 the distinguishing ceremony at Easter is the presentation of a sheaf of barley, before which no one is allowed to taste the new corn, the corresponding rule at Pentecost is the presentation of leavened wheaten bread. The barley of course is the first and the wheat the last grain ripe; at the beginning of harvest the firstfruits are presented in the sheaf, and men also partake of the new growth in the shape of parched ears of corn (Lev. xxiii. 14, Josh. v. 11); at the end of harvest the firstfruits take the form of ordinary bread. We now see the meaning of the "unleavened bread." Unleavened cakes are quickly prepared, and were used when bread had to be furnished suddenly (1 Sam. xxviii. 24), here it is the new meal of the year which is hastily baked into a sort of bannock without waiting for the tedious process of leavening. The unleavened bread contrasts with the Pentecostal cake in the same way as the barley sheaf and the parched ears do, and so, as we see from Josh. v. 11, parched corn may be eaten instead of unleavened bread,—a point worthy of notice.

Thus the three feasts are all originally thanksgivings. The for the fruits of the ground, and in all of them the offering of firstfruits is the characteristic feature. Quite similarly the Passover, which was celebrated at the same season as the Easter feast of unleavened bread, is also a thanksgiving feast, but here the offerings are not taken from the fruits of the ground but from the male firstlings of the cattle (sheep and oxen). The Jehovahist tradition in Exodus still exhibits this original character of the Passover with perfect clearness. Jehovah demands that His people shall go forth and celebrate His feast in the wilderness with sacrifices of sheep and oxen, and, because Pharaoh refuses to allow the Hebrews to serve their God by offering the firstlings of cattle that are His due, He takes from the king the firstborn of his subjects. The feast, therefore, is older than the exodus, and the former is the occasion of the latter, not *vice versa*. In the Priestly Code the true significance of the feasts appears only dimly in particular details of ritual, their general character is entirely changed. They no longer rest on the seasons and the fruits of the season, and indeed have no basis in the nature of things. They are simply statutory ordinances resting on a positive divine command, which at most was issued in commemoration of some historical event. Their relation to the firstfruits and firstlings is quite gone; indeed these offerings have no longer any place in acts of worship, being transformed into a mere tax, which is holy only in name. This degeneration of the old feasts is carried furthest in the case of the Passover. An historical reason is assigned to the Passover as early as Deuteronomy and the Deuteronomic redaction of the Jehovahist, but in these writings the real character of the feast remains so far unchanged that it is still celebrated by the sacrifice of the firstlings of oxen and of sheep. But in the Priestly Code the paschal sacrifice has quite lost its old character, and consists of a yearling sheep or goat, while the firstlings have no more connexion with the Passover, but are a mere due to the priests without any properly religious character. The other feasts have also lost their individuality by being divorced from the firstfruits and celebrated instead, by stated sacrifices, which are merely the *tamid* on a larger scale, and have no individuality of meaning. All this is a consequence of the centralizing process which took these observances of worship away from their religious and spiritualized them, and gave them a stereotyped reference to

Jehovah's relation with Israel as a whole, and to the sacred history. This centralization, indeed, was not the work of the Priestly Code but of the prophets, but in the Code we find all its consequences fully developed, while even in Deuteronomy the process is still quite in an early stage. Jewish practice after the exile is guided by the Priestly Code, not in every detail, but quite unquestionably in its main features. In the time of Christ no one thought of any other kind of Passover than that prescribed in the Code; the paschal lamb had obliterated all recollection of the sacrifice of the firstlings.

The conclusions which we have reached by comparing the successive strata of the laws are confirmed by a comparison of the several stages of the historical tradition embodied in the Pentateuch. The several threads of narrative which run side by side in the Pentateuch are so distinct in point of form that critics were long disposed to assume that in point of substance also they are independent narratives, without mutual relation. This, however, is highly improbable on general considerations, and is seen to be quite impossible when regard is paid to the close correspondence of the several sources in regard to the arrangement of the historical matter they contain. It is because the arrangement is so similar in all the narratives that it was possible to weave them together into one book; and besides this we find a close agreement in many notable points of detail. Here too analysis does not exhaust the task of the critic; a subsequent synthesis is required. When he has separated out the individual documents the critic has still to examine their mutual relations, to comprehend them as phases in a living process, and in this way to trace the gradual development of the Hebrew historical tradition. In the present article, however, we cannot say anything of the way in which the Deuteronomist views the Hebrew history, nor shall we attempt to characterize the differences between the two sources of the Jehovist, but limit ourselves to a general comparison between the Jehovistic narrative and that of the Priestly Code.

Narratives of Jehovah and of Priestly Code contrasted.

Bleek and his school viewed it as a great merit of the latter narrative that it strictly observes the difference between various ages, mixes nothing Mosaic with the patriarchal period, and in the Mosaic history never forgets that the scene lies in the wilderness of wandering. They also took it as a mark of fidelity to authentic sources that the Code contains so many dry lists, such a mass of unimportant numbers and names, such exact technical descriptions of details which could have no interest for posterity. Against this view Colenso, in the first part of his *Pentateuch and Book of Joshua critically examined* (Lond., 1863), proved that just those parts of the Hexateuch which contain the most precise details, and so have the air of authentic documents, are least consistent with the laws of possibility. Colenso, when he wrote, had no thought of the several sources of the Hexateuch, but this only makes it the more remarkable that his criticisms mainly affect the Priestly Code. Noldeke followed Colenso with clearer insight, and determined the character and value of the priestly narrative by tracing all through it an artificial construction and a fictitious character. In fact the supposed marks of historical accuracy and dependence on authentic records are quite out of place in such a narrative as that of the Pentateuch, the substance of which is not historical but legendary. This legendary character is always manifest both in the form and in the substance of the narrative of the Jehovist; his stories of the patriarchs and of Moses are just such as might have been gathered from popular tradition. With him the general plan of the history is still quite loose; the individual stories are the important thing, and they have a truly living

individuality. They have always a local connexion, and we can still often see what motives lie at the root of them, but even when we do not understand these legends they lose none of their charm, for they breathe a sweet poetic fragrance, and in them heaven and earth are magically blended into one. The Priestly Code, on the other hand, dwells as little as possible on the details of the several stories, the pearls are stripped off in order that the thread on which they were strung may be properly seen. Love and hate and all the passions, angels, miracles, and theophanies, local and historical allusions, disappear; the old narrative shrivels into a sort of genealogical scheme,—a bare scaffolding to support a pragmatic construction of the connexion and progress of the sacred history. But in legendary narrative connexion is a very secondary matter; indeed it is only brought in when the several legends are collected and written down. When, therefore, the Priestly Code makes the connexion the chief thing, it is clear that it has lost all touch of the original sources and starting-points of the legends. It does not, therefore, draw from oral tradition but from books, its dry excerpts can have no other source than a tradition already fixed in writing. In point of fact it simply draws on the Jehovistic narrative. The order in which that narrative disposed the popular legends is here made the essential thing, the arrangement, which in the Jehovist was still quite subordinate to the details, is here brought into the foreground, the old order of events is strictly adhered to, but is so emphasized as to become the one important thing in the history. It obviously was the intention of the priestly narrator to give by this treatment the historical quintessence of his materials, freed of all superfluous additions. At the same time he has used all means to dress up the old naive traditions into a learned history. Sorely against its real character, he forces it into a chronological system, which he carries through without a break from Adam to Joshua. Whenever he can he patches the story with things that have the air of authoritative documents, great lists of subjects without predicates, of numbers and names which could never have been handed down orally without being put in writing, and introduces a spurious air of learned research in the most unsuitable places. Finally, he rationalizes the history after the standard of his own religious ideas and general culture, above all, he shapes it so that it forms a framework, and at the same time a gradual preparation for the Mosaic law. With the spirit of the legend, in which the Jehovist still lives, he has nothing in common, and so he forces it into conformity with a point of view entirely different from its own.

The greater part of the narratives of the Pentateuch cannot be measured by an historical standard, but within certain limits that standard can be applied to the epical ages of Moses and Joshua. Thus we can apply historical criticism to the several versions of the way in which the tribes of Israel got possession of the land of Canaan. The priestly narrator represents all Canaan as reduced to a *tabula rasa*, and then makes the masterless and unpeopled land be divided by lot. The first lot falls to Judah, then come Manasseh and Ephraim, then Benjamin and Simeon, and lastly the five northerly tribes, Zebulun, Issachar, Asher, Naphtali, Dan. "These are the inheritances which Eleazar the priest and Joshua the son of Nun and the heads of the tribes of Israel apportioned by lot at Shiloh before Jehovah at the door of the tabernacle." According to the Jehovist (Josh. xiv 6) Judah and Joseph seem to have had their portions assigned to them while the Israelite headquarters were still at Gilgal—but not by lot—and to have gone forth from Gilgal to take possession of them. A good deal later the rest of the land was divided by lot to the remaining tribes at Shiloh, or perhaps, in the original form of the narrative, at Shechem (Josh. xviii 2-10), Joshua casts the lots and makes the assignments alone, Eleazar is not associated with him. The absolute uniformity in the method of the division of the land to all the tribes is in some degree given up in this account; it is still more strongly contradicted by the important chapter, Judges 1. Fragments of this chapter are found also in the book of Joshua, and there is no doubt that it belongs to the Jehovistic group of narra-

tives, in common with which it speaks of the Angel of Jehovah. It is in truth not a continuation of but a parallel to the book of Joshua, presupposing the conquest of the lands east of the Jordan, but not of western Canaan. The latter conquest is what it relates, and in a way quite different from the book of Joshua. From Gilgal, where the Angel of Jehovah first set up his camp, the tribes go forth singly each to conquer a land for itself, Judah going first and Joseph following. It is only of the movements of these two tribes that we have a regular narrative, and for Joseph this is limited to the first beginnings of his conquests. There is no mention of Joshua, a commander-in-chief of all Israel would indeed be out of place in this record of the conquest, but Joshua might have appeared in it as commander of his own tribe. The completeness of the conquest is frankly admitted; the Canaanites continued to hold undisturbed the cities of the plain, and it was only in the time of the kingship, when Israel was waxen strong, that they became subject and tributary. From all that we know of the subsequent history there can be no doubt that this account of the conquest is vastly nearer to the facts than that which prevails in the book of Joshua, where everything is done with systematic completeness, and the whole land dispeopled and then divided by lot. This latter and less historical view is most consistently carried through in the priestly narrative, which accordingly must be the narrative most remote from the origin of the Hebrew tradition. The same conclusion may be drawn from the fact that the priestly writer never names the tribe of Joseph, but always the two tribes of Ephraim and Manasseh, which, however, do not receive nearly so much notice as Judah, although Joshua, the leader of Ephraim, is retained in the character of leader of all Israel from an old and originally Ephraïm tradition.

Deuteronomie narrative. The middle position which the legal part of Deuteronomy holds between the Jehovah and the Priestly Code is also characteristic of the Deuteronomie narrative, which is founded throughout on the narrative of the Jehovah, but from time to time shows a certain leaning to the points of view characteristic of the priestly narrator. The order of the several parts of the Hexateuch to which we have been led by all these arguments is confirmed by an examination of the other historical books and the books of Chronicles. The original sources of the books of Judges, Samuel, and Kings stand on the same platform with the Jehovah, the editing they received in the exile presupposes Deuteronomy, and the latest construction of the history as contained in Chronicles rests on the Priestly Code. This is admitted and need not be proved in detail, the conclusion to be drawn is obvious.

We have now indicated the chief lines on which criticism must proceed in determining the order of the sources of the Hexateuch, and the age of the Priestly Code in particular,—though, of course, it has not been possible at all to exhaust the argument. The objections that have been taken to Graf's hypothesis partly rest on misunderstanding. It is asked, for example, what is left for Moses if he was not the author of the Torah. But Moses may have been the founder of the Torah though the Pentateuchal legislation was codified almost a thousand years later; for the Torah was originally not a written law but the oral decisions of the priests at the sanctuary—case-law, in short, by which they decided all manner of questions and controversies that were brought before their tribunal; their Torah was the instruction to others that came from their lips, not at all a written document in their hands guaranteeing their own status, and instructing themselves how to proceed in the sacrificial ritual. Questions of clean and unclean belonged to the Torah, because these were matters on which the laity required to be directed; but, speaking generally, the ritual, so far as it consisted in ceremonies performed by the priests themselves, was no part of the Torah. But, while it was only at a late date that the ritual appeared as Torah as it does in the Priestly Code, its usages and traditions are exceedingly ancient, going back, in fact, to pre-Mosaic and heathenish times. It is absurd to speak as if Graf's hypothesis meant that the whole ritual is the invention of the Priestly Code, first put into practice after the exile, all that is affirmed by

the advocates of that hypothesis is that in earlier times the ritual was not the substructure of an hierarchy, that there was in fact no hierarchy before the exile, but that Jehovah's sovereignty was an ideal thing and not visibly embodied in an organization of the commonwealth under the forms of a specifically spiritual power. Theocracy was the state, the old Israelites regarded their civil constitution as a divine miracle. The later Jews assumed the existence of the state as a natural thing that required no explanation, and built the theocracy over it as a special divine institution.

There are, however, some more serious objections taken to the Grafian hypothesis. It is, indeed, simply a mis-statement of facts to say that the language of the Priestly Code forbids us to date it so late as post-exilic times. On the other hand, a real difficulty lies in the fact that, while the priestly redaction extends to Deuteronomy (Deut. i. 3), it is also true that the Deuteronomie redaction extends to the Priestly Code (Josh. xx). The way out of this dilemma is to be found by recognizing that the so-called Deuteronomie redaction was not a single and final act, that the characteristic phrases of Deuteronomy became household words to subsequent generations, and were still current and found application centuries after the time of Josiah. Thus, for example, the traces of Deuteronomie redaction in Josh. xx. are still lacking in the Septuagint; the canonical text, we see, was retouched at a very late date indeed. Of the other objections taken to the Grafian hypothesis only one need be mentioned here, viz., that the Persians are not named in the list of nations in Gen. x. This is certainly hard to understand if the passage was written in the Persian period. But the difficulty is not insuperable; the Persians, for example, may have been held to be included in the mention of the Medians, and this also would give the list the archaic air which the priestly writer affects. At any rate, a residue of minute difficulties not yet thoroughly explained cannot outweigh the decisive arguments that support the view that the Priestly Code originated in and after the exile. Kuenen observes with justice that "it is absolutely necessary to start with the plain and unambiguous facts, and to allow them to guide our judgment on questionable points. The study of details is not superfluous in laying down the main lines of the critical construction, but, as soon as our studies have supplied us with some really fixed points, further progress must proceed from them, and we must first gain a general view of the whole field instead of always working away at details, and then coming out with a rounded theory which lacks nothing but a foundation."

Finally, it is a pure *petitio principii*, and nothing more, to say that the post-exilic age was not equal to the task of producing a work like the Priestly Code. The position of the Jews after the exile made it imperative on them to reorganize themselves in conformity with the entire change in their situation, and the Priestly Code corresponds to all that we should expect to find in a constitution for the Jews after the exile as completely as it fails to correspond with the conditions which a law-book older than the exile would have had to satisfy. After the final destruction of the kingdom by Nebuchadnezzar, they found in the ritual and *personal* of the temple at Jerusalem the elements out of which a new commonwealth could be built, in conformity with the circumstances and needs of the time. The community of Judaea raised itself from the dust by holding on to its ruined sanctuary. The old usages and ordinances were reshaped in detail, but as a whole they were not replaced by new creations; the *novus* lay in their being worked into a system and applied as a means to organize the "remnant" of Israel. This was the origin of the sacred constitution of Judaism. Religion.

in old Israel had been a faith which gave its support to the natural ordinances of human society, it was now set forth in external and visible form as a special institution, within an artificial sphere peculiar to itself, which rose far above the level of common life. The necessary presupposition of this kind of theocracy is service to a foreign empire, and so the theocracy is essentially the same thing as hierocracy. Its finished picture is drawn in the Priestly Code, the product of the labours of learned priests during the exile. When the temple was destroyed and the ritual interrupted, the old practices were written down that they might not be lost. Thus in the exile the ritual became matter of teaching, of Torah; the first who took this step, a step prescribed by the circumstances of the time, was the priest and prophet Ezekiel. In the last part of his book Ezekiel began the literary record of the customary ritual of the temple, other priests followed in his footsteps (Lev. xvii.-xxvi.); and so there arose during the captivity a school of men who wrote down and systematized what they had formerly practised. When the temple was restored this theoretic zeal still went on and produced further ritual developments, in action and reaction with the actual practice of the new temple; the final result of the long-continued process was the Priestly Code.

This Code, incorporated in the Pentateuch and forming the normative part of its legislation, became the definitive Mosaic law. As such it was published and put in action in 444 B.C. by the Babylonian priest and scribe Ezra. Ezra had come to Jerusalem as early as 458, at the head of a considerable body of zealous Jews, with full authority from Artaxerxes Longimanus to reform the community of the second temple in accordance with the law of God in his hand. But Ezra did not introduce this law immediately on his arrival; it took him fourteen years to effect his purpose. The external circumstances of the young community, which were exceedingly unfavourable, made it at first undesirable to introduce legislative innovations, perhaps, also, Ezra needed time to correct the product of Babylonian learning by the light of Judean practice, and wished, moreover, to train assistants for his task. The chief reason of the delay seems, however, to have been that, in spite of the royal favour, he could not get any energetic support from the local representatives of the Persian Government, and without this he could not have given authority to his new law. But in 445 a kindred spirit, Nehemiah b. Hakkeleiah, came to Jerusalem as Persian governor of Judaea. Ezra's opportunity had now arrived, and he was able to introduce the Pentateuch in agreement with the governor. The record of this step is contained in Neh. vii.-x., it is closely analogous to the narrative of the introduction of the Deuteronomic law under Josiah in 2 Kings xxii. Just as we are told there that Deuteronomy became known in 621 B.C., having been unknown previously, so we are told here that the Torah in the rest of the Pentateuch became known in 444, and was unknown till that date. This shows us, in the first place, that Deuteronomy contains an earlier stage of the law than the priestly Torah. And further, as the date of Deuteronomy can be inferred from the date of its publication and introduction under Josiah, so in like manner the date of the composition of the Priestly Code can be inferred from its publication and enforcement by Ezra and Nehemiah.

The establishment of the right date for the written law is of the highest importance for our understanding of the prophets, and for our whole conception of the history of Israel. See the articles ISRAEL and PROPHET. (J. W.)

PENTECOST, a feast of the Jews, was in its original meaning, as has been explained in PENTATEUCH (*supra*, p. 511), the closing feast of the harvest gladness, at which,

according to Lev. xxiii. 17, leavened bread was presented at the sanctuary as the firstfruits of the new cereal store. Hence the names "Feast of Harvest" (Exod. xxiii. 16), "Day of Firstfruits" (Num. xxviii. 26), but the commoner Old Testament name (Exod. xxxiv. 22, Deut. xvi. 10, 16, 2 Chron. viii. 13) is "Feast of Weeks," because it fell exactly seven weeks (Deut. xvi. 9), or, on the Jewish way of reckoning an interval by counting in both terms, just fifty days (Lev. xxiii. 16) after the offering of the first sheaf of the harvest at the Feast of Unleavened Bread. Pentecost or "Fiftieth" day is only a Greek equivalent of the last name (πεντηκοστή) in the Apocrypha and New Testament). The orthodox later Jews reckoned the fifty days from the sixteenth of Nisan, cutting the ritual sheaf on the night of (that is, on our division of days, the night preceding) that day (see PASSOVER). In Deuteronomy Pentecost, like the other two great annual feasts, is a pilgrimage feast (Deut. xvi. 16), and so it was observed in later times, but, unlike the others, it lasts but one day, agreeably to its character (expressed in the name ΠΝΥ, Ἀραβὴ, given to it by Josephus and the later Jews) as merely the solemn closing day of harvest-time. Like the other great feasts, it came to be celebrated by fixed special sacrifices. The amount of these is differently expressed in the earlier and later priestly law (Lev. xxiii. 18 *sq.*, Num. xxviii. 26 *sq.*); the discrepancy was met by adding the two lists. The later Jews also extended the one day of the feast to two. Further, in accordance with the tendency to substitute historical for economic explanations of the great feasts, Pentecost came to be regarded as the feast commemorative of the Sinaitic legislation.

To the Christian church Pentecost acquired a new significance through the outpouring of the Spirit (Acts i.). See WHITSUNDAY.

PENZÄ, a government of eastern Russia, bounded on the N by Nijni Novgorod, on the E by Simbirsk, and on the S. and W. by Saratoff and Tamboff, and having an area of 15,000 square miles. The surface is undulating, with deep valleys and ravines, but even in its highest parts it does not reach more than 600 to 900 feet above sea-level. It is chiefly made up of Cretaceous sandstones, sands, marls, and chalk, covered in the east by Eocene deposits. Chalk, potter's clay, peat, and iron are the chief mineral products, in the north. The soil is a black earth, more or less mixed with clay and sand, the only marshes of any extent occur in the Krasnolobodsk district, and considerable sand-areas appear in the broad valleys of the larger rivers. There are extensive forests in the north, but the south shows the characteristic features of a steppe-land. The government is watered by the Moksha, the Sura (both navigable), and the Khopor, belonging respectively to the Oka, Volga, and Don systems. Timber is floated down several smaller streams, while the Moksha and Sura are important means of conveyance for grain, spirits, timber, metals, and oils. The climate is harsh and continental, the average temperature at Penza being only 39°·8 (12°·2 in January and 68°·5 in July).

The population—1,856,600 in 1881, and in 1884 estimated at about 1,486,000—consists principally of Russians, mixed to some extent with Manchurians, there are also about 150,000 Moldavians who are to a large extent Russified, some 40,000 Mescheryaks, who have undergone the same process still more fully, and 60,000 Tatars, who still keep their own religion, language, and customs. The Russians profess the Greek faith, and very many, especially in the north, are Rascolniks. Somewhat less than 10 per cent. of the population (133,250 in 1881) live in towns; the chief occupation of the inhabitants is agriculture, 61 per cent. of the soil being arable. Wheat and millet are raised only to a limited extent, the chief crops being rye, oats, buckwheat, hemp, potatoes, and beetroot. The averages for 1870-77 were 8,900,000 quarters of corn and 1,779,200 bushels of potatoes. The chief centres of corn export are Penza, Narovtshat, and Golovinshtchina. Market-gardening is successfully

carried on in several districts, and improved varieties of fruit-trees are being introduced through the imperial botanical garden at Penza and a private school of gardening in the Gorodishche district. Fourteen per cent of the area is under meadows or grazing land; and in 1881 there were within the government 244,000 head of cattle, 385,000 horses, and 285,000 pigs. Sheep-breeding is especially developed in Tchebarkul and Insar (670,000 sheep, including 73,000 of finer breeds, in 1881). The Mordvians are very partial to bee-keeping. The forests (620,000 acres) are a considerable source of wealth, especially in Krasnoslobodsk and Gorodishche, whence timber, a variety of wooden wares, and also pitch and tar are exported to the south. As many as 30 per cent of the adult male population leave the government in search of employment, either on the Volga or in southern Russia.

The manufactures are few, employing only 13,800 hands. The yearly returns in 1879 did not exceed 18,825,000 roubles (£1,593,500). The distilleries come first (2973,200), followed by the woollen cloth industry (2287,000), the paper industry (287,200), tanneries, soap-works, glass-works, machine-works, iron-works, and beetroot-sugar factories. Trade, which has been favoured by the completion of the railway from Tula to Samara, still limited to the export of corn, spirits, timber, hemp-seed oil, tallow, hides, honey, wax, some woollen cloth, potash, and cattle, the chief centres for trade being Penza, Nym Lomoff, Mokshan, Saransk, Krasnoslobodsk, and Golovinshtchina.

The government is divided into ten districts, the chief towns of which are:—Penza (41,650), Gorodishche (3200), Insar (5280), Keneak (13,450), Krasnoslobodsk (7000), Mokshan (18,050), Narvichat (5150), Nym Lomoff (10,500), Saransk (18,450), and Tchembar (6820). Nym Lomoff (5700), Yakhim Lomoff (7800), and Sheshkoff (3500) also have municipal institutions.

The present government of Penza was formerly inhabited by Mordvians, who had the Mescheryaks in the west, the Bulgars in the north, and the Burtases in the south. In the 13th century these populations fell under the dominion of the Tatars, with whom they fought against Moscow. As early as the 14th century they possessed the town of Narvichat. The Russians penetrated into the country in the 16th century, founding the town of Mokshan in 1535, and several others in the course of that and the following centuries. Penza was founded in the beginning of the 17th century, the permanent Russian settlement dating as far back as 1636. Its wooden fort, on the site of the present cathedral of the Saviour, protected the neighbourhood against marauds of the Mordvians and Mescheryaks. In 1776 it was taken by Fugatsch. The town was almost totally destroyed by the great conflagrations of 1836, 1838, and 1858.

PENZA, capital of the above province, is situated 440 miles by rail south-east from Moscow. It is mostly built of wood, on the slopes of a plateau 730 feet above the sea, at the confluence of the little Penza with the navigable Sura. The Spasoprobrazhensky cathedral was built in the end of the 17th century, the monastery of the same name, which formerly adjoined it, being now in the suburbs. A few educational and philanthropic institutions, a theatre which has played some part in the history of the Russian stage, and a municipal bank are the chief buildings of Penza, which derives its importance chiefly from its being the seat of the provincial authorities and the see of a bishop. The great bulk of the inhabitants are peasants, who support themselves by agriculture or fishing in the Sura, some artisans, and a few merchants. An imperial botanical garden is situated within 2 miles of the town. Apart from a paper-mill and two steam flour-mills, the manufacturing establishments (producing soap, candles, wax-candles, cosmetics, machinery), distilleries, breweries, and saw-mills are small. Trade in corn, oil, tallow, and spirits is on the increase. There are two fairs where cattle and horses are sold for export, grocery and manufactured wares being the corresponding imports. The population in 1881 had reached 41,650.

PENZANCE, a seaport and municipal borough of Cornwall, and the westernmost borough of England, is finely situated on gently rising ground on the north-western shore of Mount Bay, at the terminus of the Great Western Railway, 10 miles east-north-east of Land's End and 20 west-south-west of Truro. It is the nearest port to the Scilly Isles, which are about 40 miles distant to the west-south-west. The market-place is in the centre of the town, and near it the four principal streets intersect each other at

right angles. The southern arm of the pier was built in 1773, the Albert or new pier on the east in 1845. The piers are connected by a wharf, viaduct, and swing-bridge (1882), and a dock is being at present constructed at a cost of £60,000, which will extend to about 3 acres. The limits of the port have lately (1884) been extended. The churches are St Mary's, constructed of cut granite, in the Perpendicular style, with lofty pinnacled tower and peal of eight bells, St Paul's, of cut and rubble granite, in the style of the 13th century (1843), and St John's, of stone, Early English (1881). The public buildings, erected of granite in the Italian style in 1867, include the town-hall and council-chambers, St John's Hall for public meetings, the lecture-hall, the public library (upwards of 16,000 volumes), the news-rooms, the masonic hall, the museum of the Penzance Natural History and Antiquarian Society, and the museum and other rooms of the Geological Society of Cornwall. The market-house (1837), in the Grecian style, with a central dome, includes a meat-market on the ground-floor with a corn-market above, and in the east end of the building is the grammar-school, founded in 1789. In front of the east end is a marble statue of Davy. Somewhat east of the market-house are the post and telegraph offices, completed in 1883. Among the benevolent institutions is the West Cornwall Infirmary (1874), which includes the dispensary (1809). The town has a considerable shipping trade, the total number of vessels which entered the port in 1882 being 1829 of 197,933 tons burden, the number which cleared 1774 of 187,569 tons. The exports include tin, copper, granite, serpentine, and fish, and the imports coal, timber, and provisions. Large quantities of pilchard are annually exported to Italy. Fruits, flowers, and vegetables are grown in the neighbourhood for the London market. On account of its sheltered situation and its remarkably mild and equable climate, the town has a high reputation as a winter residence for persons suffering from pulmonary complaints; and on account of its fine scenery it is also becoming a favourite watering-place. The population of the municipal borough in 1871 was 10,414, and in 1881 it was 12,409.

Penzance is said to mean "holy head," the name being derived from a chapel dedicated to St Anthony, formerly situated on a headland now forming the base of the old pier, around which a few fishermen built their huts and thus originated the town. A castle built by the Tyes, possessors of the manor of Alwinton or Alverton, is supposed to have occupied the present site of St Mary's Church. Alice de Lule, sister and heiress of the last Baron Tyes, obtained for the town the grant of a weekly market from Edward III. In the 15th century Penzance was known as a "place of ships and merchandise;" and on the 16th March 1512 it received from Henry VIII a charter granting to the inhabitants all profits arising from ships visiting the harbour upon condition that the quays and bulwarks of the town were kept in repair. In 1595 the town was burned and pillaged by the Spaniards, and in 1615 sacked by Fairfax. In 1614 it was incorporated by James I. and in 1693 it obtained a borough charter, a privilege it retained till 1888. On account of the usurpation of its chief magistracy its municipal charter was forfeited in the beginning of the reign of Queen Anne, but was restored in 1706. By the Municipal Act of 1885 the government was made to consist of a mayor, six aldermen, and eighteen councillors.

Leach-Sayns, *History of Penzance*, 1878. Millett, *Penzance Past and Present*, 1876-1880.

PEONY. See PÆONY.

PEORIA, a city of the United States, capital of Peoria county, Illinois, lies on the edge of a rolling prairie at the lower end of the so-called Lake Peoria, an expansion of the Illinois river, and is connected by the Michigan Canal with Chicago. It is a flourishing place, the meeting-point of nine railway lines, the trading centre for an extensive district, and the seat of a large grain traffic and of various manufactures; 117,168,670 proof gallons of high wines were made in 1883. From 5039 in 1850 its population increased to 14,045 in 1860, 23,245 in 1870, and 29,259 in 1880. Though its permanent settlement dates

only from 1811 and its city charter from 1844, Penia was one of the trading ports established by La Salle (1680), and was long known as a point of some importance on the route between Canada and Louisiana.

PEPPER, a name applied to several pungent spices known respectively as Black, White, Long, Red or Cayenne, Ashante, Jamaica, and Melegueta Pepper, but derived from at least three different natural orders of plants.

Black pepper is the dried fruit of *Piper nigrum*, L., a perennial climbing shrub indigenous to the forests of Travancore and Malabar, from whence it has been introduced into Java, Sumatra, Borneo, the Malay Peninsula, Siam, the Philippines, and the West Indies. It is one of the earliest spices known to mankind, and for many ages formed a staple article of commerce between India and Europe,—Venice, Genoa, and the commercial cities of central Europe being indebted to it for a large portion of their wealth. Tribute has been levied in pepper; one of the articles demanded in 408 by Alaric as part of the ransom of Rome was 3000 lb of pepper. Pepper-corn rents prevailed during the Middle Ages, and consisted of an obligation to supply a certain quantity of pepper, usually 1 lb, at stated times; and the term still lingers in use at the present day. The price of the spice during the Middle Ages was exorbitantly high, and its excessive cost was one of the inducements which led the Portuguese to seek a sea-route to India. The discovery of the passage round the Cape of Good Hope led (1498) to a considerable fall in the price, and about the same time the cultivation of the plant was extended to the western islands of the Malay Archipelago. Pepper, however, remained a monopoly of the Portuguese crown as late as the 18th century. In Great Britain it was formerly taxed very heavily, the impost in 1823 amounting to 5s., and as late as 1823 to 2s. 6d. per lb.

The largest quantities of pepper are produced in Penang, the island of Rhio, and Johore near Singapore,—Penang affording on an average about half of the entire crop. Singapore is the great emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. In 1880 the imports into England from Singapore amounted to 21,179,059 lb, valued at £385,108, and from other countries 559,909 lb, valued at £12,979, the re-exports being 12,925,886 lb, chiefly to Germany, Italy, Russia, Holland, and Spain. The varieties of black pepper met with in commerce are known as Malabar, Aleppy or Tellicherry, Cochin, Penang, Singapore, and Siam. The average market value in the London market is—Malabar, 3½d to 5½d per lb; Penang, 2½d to 4½d, Singapore, 3½d to 4½d.

Pepper owes its pungency to a resin, and its flavour to a volatile oil, of which it yields from 1.6 to 2.2 per cent. The oil agrees with oil of turpentine in composition as well as

in specific gravity and boiling point. In polarized light it deviates the ray, in a column 50 mm long, $1^{\circ} 2'$ to $3^{\circ} 4'$ to the left. Pepper also contains a neutral crystalline substance, called piperin, to the extent of 2 to 8 per cent. This substance has the same empirical formula as morphia, $C_{12}H_{11}NO_3$, but differs in constitution and properties. It is insoluble in water when pure, is devoid of colour, flavour, and odour, and may be resolved into piperic acid, $C_{12}H_{13}O_4$, and piperidin, C_5H_9N . The latter is a liquid colourless alkaloid, boiling at $106^{\circ} C$, has an odour of pepper and ammonia, and yields crystallizable salts. A fatty oil is found in the pericarp of pepper, and the berries yield on maceration from 4.1 to 5.7 of ash. The only use of pepper is as a condiment. Notwithstanding its low price and the penalty of £100 to which the manufacturer, possessor, or seller of the adulterated article is liable, powdered pepper is frequently diluted with starch, sago, meal, and other substances, which can be readily detected under the microscope.¹

In the south-west of India, where the pepper-plant grows wild, it is found in rich, moist, leafy soil, in narrow valleys, propagating itself by running along the ground and giving off roots into the soil. The only method of cultivation adopted by the natives is to tie up the end of the vines to the neighbouring trees at distances of at least 6 feet, especially to those having a rough bark, in order that the roots may easily attach themselves to the surface. The underwood is then cleared away, leaving only sufficient trees to provide shade and permit free ventilation. The roots are manured with a heap of leaves, and the shoots are trained twice a year. In localities where the pepper does not grow wild, ground is selected which permits of free drainage, but which is not too dry or liable to inundation, and cuttings are planted at about a foot from the trees either in the rainy season in June or in the dry season in February. Sometimes several cuttings about 18 inches long are placed in a basket and buried at the root of the tree, the cuttings being made to slope towards the trunk. In October or November the young plants are manured with a mixture of leaves and cow-dung. On dry soils the young plants require watering every other day during the dry season for the first three years. The plants bear in the fourth or fifth year, and if raised from cuttings are fruitful for seven years, if from seed for fourteen years. The pepper from plants raised from cuttings is said to be superior in quantity and quality, and this method is in consequence most frequently adopted. Where there are no trees the ground is made into fascines and enclosed by a mud-wall, and branches of *Erythrina indica* are run into the ground in the rainy season and in the course of a year are capable of supporting the young pepper plants. In the meantime mango trees are planted, these being preferred as supports, since their fruit is not injured by the pepper plant, while the *Erythrina* is killed by it in fourteen or fifteen years.

In Sumatra the ground is cleared, ploughed, and sown with rice, and cuttings of the vine are planted in September 5 feet apart each way, together with a sapling of quick growth and rough bark. The plants are now left for two or eighteen months and are entirely buried except a small piece of bent stem, whence new shoots arise, three or four of which are allowed to climb the tree near which they are planted. These shoots generally yield flowers and fruits the next year. Two crops are collected every year, the principal one being in December and January and the other in July and August, the latter yielding pepper of inferior quality and in less quantity, two or three varieties of which are lost in the spikiness, one which the bent kunds has broadly ovate leaves, five to seven in number, nerved and stalked. The flower-spikes are opposite the leaves, stalked and from 3 to 6 inches long, the fruits are sessile and fleshy. A single stem will bear from twenty to thirty of these spikes. The harvest commences as soon as one or two berries at the base of the spikes begin to turn red, and before the fruit is mature, but when full-grown and still hard, if allowed to ripen, the berries lose pungency, and ultimately fall off and are lost. The spikes are collected in bags or baskets and dried in the sun, on mats or hard ground, for two or three days. When dry the pepper is put into bags containing from 64 to 128 lb, and is then ready for the market. The yield varies in different localities. In Sumatra it is estimated at about 1½ lb per plant per annum. In Malabar each vine gives 2 lb a year up to the fifteenth or twentieth year, or about 24 lb from each tree, a single tree sometimes supporting eight or twelve vines; an acre is calculated to bear 2500 plants, to cost about £4 in outlay to bring it into bearing, and to yield a produce of £80 when in its best condition.

¹ Hassall, *Food and its Adulterations* (1855), p. 42, and Evans, *Pharm. Journ.* [2] p. 605.

White pepper is obtained from the same plant as the black, and differs only in being prepared from the ripe fruits. These, after collection, are kept in the house three days and then bruised and washed in a basket with the hand until the stalks and pulpy matter are removed, after which the seeds are dried. It is, however, sometimes prepared from the dried black pepper by removing the dark outer layer. It is less pungent than the black but possesses a finer flavour. It is chiefly prepared at the island of Rhio, but the finest comes from Tellicherry. The Chinese are the largest consumers. In 1877 Singapore exported 48,461 piculs (a picul = 133½ lb) to that country. The London market value is about 4½d to 7d per lb. White pepper affords on an average not more than 1·9 per cent of essential oil; but, according to Cazeneuve, as much as 9 per cent of piperin, and of ash not more than 1·1 per cent.

Long pepper is the fruit-spike of *Piper officinarum*, C. DC., and *P. longum*, L., gathered shortly before it reaches maturity and dried. The former is a native of the Indian Archipelago, occurring in Java, Sumatra, Celebes, and Timor. It has oblong, ovate, acuminate leaves, attenuated to the base, which are pinnate and veined. The latter is indigenous to Ceylon, Malabar, eastern Bengal, Timor, and the Philippines; it is distinguished from *P. officinarum* by the leaves being cordate at the base and five-veined. Long pepper appears to have been known to the ancient Greeks and Romans under the name of *πέρει μακρόν*, and in the 10th century mention is made of long pepper, or macropiper, in conjunction with black and white peppers. The spice consists of a dense spike of minute baccate fruits closely packed around the central axis, the spike being about 1½ inch long and ¼ inch thick; as met with in commerce they have the appearance of having been lmed. In Bengal the plants are cultivated by suckers, which are planted about 5 feet apart on dry rich soil on high ground. An English acre will yield about 3 maunds (80 lb) the first year, 12 the second, and 18 the third year, after this time the yield decreases, and the roots are therefore grubbed up and sold as *pipis mul*, under which name they are much used as a medicine in India. After the fruit is collected, which is usually in January, the stem and leaves die down to the ground. Long pepper contains piperin, resin, and volatile oil, and yields about 8 per cent of ash. Penang and Singapore are the principal centres in the East for its sale. In 1871 Singapore shipped 3366 cwt, of which 447 were sent to Great Britain. Penang exports annually about 2000 to 3000 piculs. The value in the London market is from 37s to 45s. a cwt.

Ashantees or West African pepper is the dried fruit of *Piper Clusii*, C. DC., a plant widely distributed in tropical Africa, occurring most abundantly in the country of the Niam-niam. It differs from black pepper in being rather smaller, less wrinkled, and in being attenuated into a stalk, like cubels, to which it bears considerable resemblance externally. The taste, however, is pungent, exactly like that of pepper, and the fruit contains piperin. It was imported from the Grain Coast by the merchants of Rouen and Dieppe as early as 1364, and was exported from Benin by the Portuguese in 1485; but, according to Clusius, its importation was forbidden by the king of Portugal for fear it should depreciate the value of the pepper from India. In tropical Africa it is extensively used as a condiment, and it could easily be collected in large quantities if a demand for it should arise.

Jamaica pepper is the fruit of *Pimenta officinalis*, Lindl., an evergreen tree of the Myrtle family. It is more correctly termed "pimento," or "allspice," as it is not a true pepper.

Melegueta pepper, known also as "Guinea grains," "grains of paradise," or "alligator pepper," is the seed of

Amomum Melegueta, Roscoe, a plant of the Ginger family; the seeds are exceedingly pungent, and are used as a spice throughout central and northern Africa. See vol vi p. 36.

For *Cayenne pepper*, see vol. v. p. 280. (E. M. H.)

PEPPERMINT, an indigenous perennial herb of the natural order *Labiata*, and genus *Mentha*, the specific name being *Mentha Piperita*, Huds., is distinguished from other species of the genus by its stalked leaves and oblong-obtusate spike-like heads of flowers. It is met with, near streams and in wet places, in several parts of England and on the Continent, and is also extensively cultivated for the sake of its essential oil in England,¹ in several parts of continental Europe, and in the United States. Yet it was only recognized as a distinct species late in the 17th century, when Dr Eales discovered it in Hertfordshire and pointed it out to Ray, who published it in the second edition of his *Synopsis Stirpium Britannicarum* (1696). The medicinal properties of the plant were speedily recognized, and it was admitted into the *London Pharmacopoeia* in 1721, under the name of *Mentha piperitis* sapor.

Two varieties are recognized by growers, the one being known as white and the other as black mint. The former

has purplish and the latter green stems; the leaves are more coarsely serrated in the white. The black is the variety more generally cultivated, probably because it is found to yield more oil, but that of the green variety is considered to have a more delicate odour, and obtains a higher price. The green is the kind chiefly dried for herbalists; it is said to be of less vigorous growth than the black. The annual yield of peppermint oil from all parts of the world has been estimated at 90,000 lb, but this is probably much below the mark, without taking into consideration the Chinese and Japanese oils of peppermint, which, however, are obtained from a different species of mint.

Peppermint oil varies considerably in commercial value, that of Mitcham commanding nearly three times the price of the finest American. The flavour varies to a slight extent even with particular plots of land, badly drained ground being known to give unfavourable results both as to the quantity and quality of the oil. That of the Japanese and Chinese oil also differs slightly from the English, and is thus distinguishable by experts. In America the oil is liable to be injured in flavour by aromatic weeds which grow freely among the crop, the most troublesome of these being *Eragrost canadense*, L., and *Erechtites hieracifolia*, Raf. When pure the oil is nearly colourless and has an agreeable odour and powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. It has a specific gravity of 0·84 to 0·92, and boils at 365° Fahr. Mitcham oil, when examined by polarized light in a column 50 mm. long, deviates from 14° 2 to 10° 7.

¹ Near Mitcham in Surrey (219 acres in 1864), Wisbeach in Cambridgeshire, Market Deeping in Lincolnshire (150 acres in 1881), and Hitchin in Hertfordshire.

FIG 1.—*Mentha Piperita* a, Flowering branch; b, flower showing form of calyx teeth.

to the left, the American 4°-3. When oil of peppermint is cooled to 4° C it sometimes deposits colourless hexagonal prisms of menthol, $C_{10}H_{20}O$, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92° Fahr. The liquid portion of the oil appears to consist chiefly of the compound $C_{15}H_{26}O$, but it has not been thoroughly investigated. Oil of peppermint is often adulterated with a third part of rectified spirit, which may be detected by the milkiness produced when the oil is agitated with water. Oil of rosemary and rectified oil of turpentine are sometimes used for the same purpose. If the oil contains turpentine it will explode with iodine. If quite pure it dissolves in its own weight of rectified spirits of wine. Peppermint oil is largely distilled at Canton, a considerable quantity (about 300 cattie annually) being sent to Bombay, also about 600 cattie of menthol. The exports from Canton in 1883 amounted to about 1200 lb. The species cultivated in the neighbourhood of Canton, and probably at Shanghai also, is *Mentha arvensis*, var. *glabrata*. Peppermint is chiefly cultivated in the province of Keang-se; and according to native statements as much as 40 piculs of oil of peppermint are sent annually to ports on the coast. In Japan also the distillation of oil of peppermint forms a considerable industry, the plant cultivated being *M. arvensis*, var. *piperascens* (see *Ph. Journ* [8] vol. ii. p. 324), of which both a purplish and a white form appear to be grown. The oil, under the name of *hakka no abura*, is exported from Hiogo and Osaka, but is said to be frequently adulterated. Since 1872 the peppermint camphor or menthol has been largely exported in the separate state from Japan to Germany and Great Britain. The menthol is obtained by subjecting the oil to a low temperature, when it crystallizes out and is separated. The two varieties of *M. arvensis* just named yield much more menthol than *M. Piperita*. It is remarkable, however, that the *M. arvensis*, var. *javanica*, Blume, growing in Ceylon, has not the flavour of peppermint but that of garden mint, while the typical form of *M. arvensis* grown in Great Britain has an odour so different from peppermint that it has to be carefully removed from the field lest it should spoil the flavour of the peppermint oil when the herb is distilled. *M. incana*, Willd., cultivated near Bombay as a herb, also possesses the flavour of peppermint. In the form in which menthol is imported it bears some resemblance to Epsom salts, with which it is said to be sometimes adulterated. It is usually not entirely free from the essential oil, and consequently undergoes purification and recrystallization in England and on the Continent. The amount of menthol imported by a large firm at Leipzig between September 1883 and April 1884 is stated by them to have been 6380 lb, while it is certain that at least an equal quantity is imported into England from Yokohama. Although the Japanese peppermint plant has been imported by a London merchant, no attempt has as yet been made to cultivate the plant in order to manufacture menthol in England. Menthol is now (1884), however, manufactured from *M. Piperita* in the United States, where also *M. arvensis*, var. *piperascens*, is cultivated.

FIG. 2.—*Mentha arvensis*, var. *piperascens*. a, Flowering branch; b, calyx showing form of teeth.

For 2.—*Mentha arvensis*, var. *piperascens*. a, Flowering branch; b, calyx showing form of teeth.

Oil of peppermint is used in medicine as an antispasmodic for the relief of griping pains in the alimentary canal, to expel flatulence, to relieve nausea, to hide the taste of other medicines, and to act as an adjunct to purgatives. The dose is usually from one to three minims. It forms a most valuable remedy in diarrhoea, acting as an antiseptic, and as a stimulant to the circulation, and as an anodyne. The oil rubbed over the head is used in China to cure sunstroke. Menthol has lately come largely into use as a remedy for neuralgia, being moulded by heat into the form of small cones, which are rubbed over the part affected. A small portion placed on the tongue frequently relieves headache, and catarrh and coryza if placed in the nostril. The largest consumption of the oil is in the manufacture of peppermint lozenges.

The following mode of cultivation is adopted by Mr Holland, at Market Deeping. A rich friable soil, retentive of moisture, is selected, and the ground is well tilled 8 to 10 inches deep. The plants are propagated in the spring, usually in April and May. When the young shoots from the crop of the previous year have attained a height of about 4 inches they are pulled up and transplanted into new soil. They grow vigorously the first year, and throw out numerous stolons on the surface of the ground. After the crop has been removed these are allowed to harden or become woody, and then fumyand manure is scattered over the field and ploughed in. In this way the stolons are divided into numerous pieces, and covered with soil before the first sets in. If the autumn is wet they are liable to become sodden, and rot, and the next crop fails. In the spring the fields are dressed with Peruvian guano. In new ground the peppermint requires hand-weeding two or three times, as the hoe cannot be used without injury to the plants. Most heavy weather in August is apt to cause the foliage to drop off and leave the stems almost bare. Under these circumstances rust (*Puccinia Menthae*) is also liable to attack the plants. This is prevented to a certain extent by a rope being drawn across the plants, by two men walking in the furrows, so as to remove excessive moisture. The average yield of peppermint is about 165 cwt. per acre. The first year's crop is always cut with the sickle to prevent injury to the stolons. The herb of the second and third year is cut with a scythe, and then cut up by hand, and is ready for carting. The field is then gleaned by boys, who add what they collect to the heaps. The plants rarely yield a fourth crop on the same land. The harvest usually commences in the beginning or middle of August, or as soon as the plants begin to flower, and lasts for six weeks, the stills being kept going night and day. The herb is carted direct from the field to the stills, which are made of copper, and contain about 5 cwt. of the herb. Before putting the peppermint into the still water is poured in to a depth of about 2 feet, at which height a false bottom is placed, and on this the herb is thrown and trodden down by men. The lid, which fits into a water-joint, is then let down by pulleys and fastened by two bars, any excess of pressure or temperature being indicated by the water that is ejected at the joint. The distillation is conducted by the application of direct heat at the lowest possible temperature, and is continued for about four or five hours. When this operation is completed, the lid is removed and a rope is attached to a hook on the false bottom, which, as well as the herb resting on it, is raised bodily by a windlass and the peppermint carried away in the empty carts on their return journey to the fields, where it is placed in heaps and allowed to rot, being subsequently mixed with the manure applied in the autumn as above stated.

At Mitcham extra payment is given to the reapers to induce them to keep the mint free from corn mites (*Metacoelus*) and other herbs, which would injure or spoil the flavour of the oil if not removed before distillation. The usual yield of oil, if the season be warm and dry, is said to be 1 oz. from 5 lb of the fresh flowering herb, but, if wet and unfavorable, the product is barely half that quantity. Mr Holland estimates the yield of a charge of the still at from 1 lb 12 oz. to 5 lb. The oil improves in mellowness even if kept as long as ten or fourteen years. The green colour sometimes present in the oil is stated to be due to a quantity of water larger than necessary having been used in the distillation; on the other hand, if the herb be left in the still from Saturday to Monday, the oil assumes a brown tint.

In France peppermint is cultivated on damp rich ground at Sens, in the department of the Yonne. In Germany it is grown in the neighbourhood of Leipzig, where the little town of Colléda produces annually as much as 40,000 cwt. of the herb. In the United States peppermint is cultivated on a most extensive scale, chiefly in southern Michigan, the west districts of New York State, and Ohio. The amount of peppermint oil now produced in the United States has been estimated at 70,000 lb annually, of which 80,000 lb are exported, about two-thirds of this quantity being produced in

New York State and the remaining one-third in Michigan. The yield averages from 10 to 80 lb per acre. The cultivation of peppermint has recently been extended to the southern States. In Michigan the plant was introduced in 1855, and in 1858 there were about 2100 acres under cultivation, and 100 distilleries yielding 15,000 lb of oil. In 1870 one of the best-known growers of New York State is said to have sent out as much as 57,565 lb. In 1874 the United States exported to Hamburg 25,840 lb of peppermint oil against 14,890 lb sent by Great Britain to the same port. (E. M. H.)

PEPPER TREE The tree usually so called has no real consanguinity with the true pepper (*Piper*), but is a member of the Anacard family known botanically as *Schinus Mollo* or *Mulla*, the latter epithet representing, it is said, the Peruvian name of the plant. It is a small tree with unequally pinnate leaves, the segments linear, entire or finely saw-toothed, the terminal one longer than the rest, and all filled with volatile oil stored in large cells or cysts, which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as violently to agitate them. The flowers are small, whitish, arranged in terminal clusters, and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushion-like disk surrounding the base of the three-celled ovary). The style is simple or three-cleft, and the fruit a small, globose, pea-like drupe with a bony kernel enclosing a single seed. The fleshy portion of the fruit has a hot aromatic flavour from the abundance of the resin it contains, and to this circumstance the tree probably owes its popular name. The resin is used for medicinal purposes by the Peruvians, and has similar properties to mastic. The Japan pepper tree is *Xanthoxylum piperitum*, the fruits of which have also a hot taste. Along the Riviera the tree known as *Melia Asedarach*, or the "Fride of India," a very ornamental tree with elegant foliage and dense clusters of fragrant lilac flowers, is also incorrectly called the pepper tree by visitors.

PEPSIN See NUTRITION, vol. xiv. p. 675 sq.

PEPPYS, SAMUEL (1633-1703), was the fifth child of John Pepys and Margaret (Perkins) *Diary*, 17th September 1633, and was born on 23d February 1632/3. His family was of the middle class, and at this time was in humble circumstances, his father being a tailor in London, while an uncle and an aunt, named Perkins, lived in poverty in the Fens near Wisbeach. His father's elder brother Robert had a small property at Brampton in Huntingdonshire, and Samuel was at school at Huntingdon about 1644. Thence he went to St Paul's, London, and on 21st June 1650 was entered as a sizar at Trinity College, Cambridge, but was transferred on 1st October in the same year to Magdalene, where he became pensioner on 4th March following. On 3d April 1651 he was elected scholar on the Spendulfe foundation, and on 4th October 1653 on that of Dr John Smith. Exactly a fortnight afterwards he was admonished by the registrar before all the fellows in residence for being "scandalously overserved with drink the night before." His love of drink, so constantly illustrated in the early pages of his *Diary*, would have been a serious drawback to his advancement, had not his love of work and order been a still stronger impulse. The crisis was reached on Sunday, 29th September 1661, when he was too drunk to trust himself to read prayers to the household. After that he makes resolute vows against wine, which he often breaks, and with regard to which he displays curious powers of self-deception.

Nothing more is known of Pepys's college career, though he tells us that he was addicted to writing romances. He became a moderate classical scholar; it is, however, a curious commentary upon the university training of those

days that, after his appointment to the navy board, he is found busy with the multiplication table, which he speaks of as entirely new to him, and of his daily progress in which he is not a little proud. After this he becomes enamoured of arithmetic and teaches his wife the science also.

In October 1655 Pepys married Elizabeth St Michel, a girl of fifteen, of great beauty, whose father, a Huguenot refugee in England, was at this time in very poor circumstances. She was a good cook and a good house-keeper, and was both clever and warm-tempered; Pepys, vain, quarrelsome, fussy, and pedantic, was unfitted, save by a general goodness of heart, to manage a high-spirited girl, and the pages of the *Diary* are full of bickerings and downright quarrels arising out of trifles, the entries of which, though often amusing, are as often extremely pathetic. Pepys and his wife, who were destitute of funds, were received by Sir Edward Montagu, afterwards earl of Sandwich, whose mother had married Pepys's grandfather. Pepys probably acted as Montagu's secretary. He was successfully cut for the stone on 26th March 1657/8, an anniversary which he always notes with gratitude. In March 1658/9 he accompanied Montagu and Algernon Sidney to the Sound on board the "Naseby" (afterwards the "Charles"). To this he more than once refers as the beginning of his fortunes. On his return he was employed as a clerk in the army pay-office of the exchequer under Downing, afterwards Sir George Downing.

In January 1659/60 Pepys began to keep his *Diary*. He was at this time living in Axe Yard, Westminster, in a small house with one servant, on straitened means. On 29th January he can count but £40; his great object is to get on and to "put money in his purse"; and by 24th May 1661 he is worth £500. Political principles he had none, though his personal attachment to James (II.) makes him call himself a Tory; but it is noticeable that even before the Restoration he regularly attended the Church of England service carried on by Peter Gunning, afterwards successively bishop of Chester and of Ely. Of active religious convictions Pepys leaves no trace, but he was ever a steady church-goer; and the epiphets he applies to the sermons are very happy in their causticity. In February he went to Cambridge to settle his brother in his old college. One side of what was distinctly a coarse-grained nature is exhibited in an entry during this week, where he describes himself (as on many other occasions) as "playing the fool with the lass of the house." His views of women, indeed, are almost always vulgar; he was given to clumsy gallantry, and he was certainly unfaithful to his wife. In March Montagu gave Pepys the post of secretary to the generals at sea. While the fleet lay off the Dutch coast he made a short journey into Holland. At this time he secured the favour of the duke of York, and he retained it through life. On 28th June he became clerk of the acts of the navy, an office which Montagu had procured for him against powerful competition. A salary of a little over £100 a year, afterwards increased to £350, was attached to the post, but Pepys had to pay an annuity of £100 to his predecessor in office. On 23d July he became clerk of the privy seal, the fees from which, at any rate for a time, brought him in an additional £3 a day (*Diary*, 10th August 1660). In this month he took his M.A. degree. On 24th September he was sworn in as J.P. for Middlesex, Essex, Kent, and Southampton. He now lived in Seething Lane, in front of the navy office, Crutched Friars. In July 1661, on the death of his uncle, the Brampton estate, worth £80 a year, came to his father, and on the latter's

¹ Pepys himself gives 10th October as the date; the registers of St Margaret's church (Westminster) say that the banns were published on 19th, 23d, and 26th October, and that he was married on 1st December. See *Notes and Queries*, 30th August 1884.

death in 1680 to Pepys himself. In July 1662 he was made a younger brother of the Trinity House.

Pepys's untiring industry in office, his prudence, his unflinching usefulness, his knowledge of business, which he was ever diligent to increase, and his general integrity secured him the greatest confidence at headquarters. As early as August 1662, when placed on the Tangier commission, he had found himself "a very rising man." In March 1664/5 he was made treasurer to the commission, and received also the contract for victualling the garrison, both lucrative appointments, and in October, through the influence of Sir W. Coventry, he was further made surveyor-general of the victualling office, a post which he resigned at the conclusion of the peace. His conduct during the Great Plague, when, alone of all the navy board, he stayed in the city of the dead and carried on the whole administration of the navy, was admirable. During the Fire also his readiness and presence of mind were of the greatest service in staying the conflagration.

In the spring of 1667/8, in the blind rage at the national disgrace generally termed the miscarriage of Chatham, the whole navy board were summoned before the House of Commons to give an account of their conduct. Pepys was deputed by his colleagues to conduct the defence, and he did so with complete success on 5th March in a speech of three hours' duration, which gained him great reputation.

In 1669 the increasing weakness of his eyesight compelled him to discontinue the *Diary*, his last entry being on 31st May. What was to us an irremediable misfortune was to Pepys "almost as much as to see myself go into the grave." He now took leave of absence and spent some months in travelling through France and in revisiting Holland. On the day of his return his wife fell ill, and died in the early spring, before 3d March 1669/70. In July 1669 Pepys stood as the duke of York's nominee, backed by the Howard influence, for the borough of Aldborough in Suffolk, but was defeated. In November 1670 we find him engaged in a quarrel with the Swedish resident, which was likely to have been followed by a duel, as Pepys, doubtless to his exceeding comfort (for he was a great coward), received an order from the king neither to send nor accept a challenge. In 1672 he was promoted to the secretaryship of the admiralty, and, when James resigned his office of lord high admiral, Pepys did all the work until the commission was appointed. He was placed also upon the new commission for Tangier.

In June 1673 he was chosen at a by-election, again as James's nominee, for Castle Rising, a Howard borough, but a vote of the committee of privileges declared the election void. Pepys, on the authority of Sir J. Banks and the earl of Shaftesbury, was denounced before the House of Commons as being a Papist; but, when these persons were called upon, they denied any definite knowledge of the altar and crucifix which he was charged with having in his house. The parliament being prorogued, he retained his seat, and is recorded as speaking on 17th May and 26th October 1673, on the latter occasion against the proposal made, in distrust of the crown, to lodge the money for the ships in the chamber of London instead of in the exchequer; and again on 11th May 1678, in the debate on the king's message to quicken supply for the navy, when he was sharply reproved by Sir R. Howard for speaking "rather like an admiral than a secretary, 'I' and 'we,'" an amusing instance of how completely Pepys had obtained control of the business of the navy and had identified himself with the work. He was afterwards, in 1678/9, returned for Harwich (see a note on p. 122 of vol. vi. of Bright's edition of the *Diary*). In the list, however, of members of the parliament which met on 6th

March in that year, which is given by the *Parliamentary History* (vol. iv. p. 1089), the members for Harwich are recorded as being Sir Anthony Deane and Sir Thomas Pepys. An investigation of the records of Harwich leaves no doubt that the *Parliamentary History* is wrong upon this point, and that Pepys did sit for the borough during this parliament.

On 7th August 1677 Pepys was elected master of the Clothworkers' Company, who still possess the silver cup he gave them on the occasion. He continued to hold the secretaryship until 1679, when fresh complaints of miscarriages in the navy were made before the House. The country was then in the throes of the popish terror. Pepys was accused, on the evidence of one Colonel Scott, an infamous character, "a very great vindicator of the Salamanca doctor" (*Intelligencer*, 20th May 1681), of sending secret information regarding the English navy to France (*Intelligencer*, 23d May 1681), and was again charged with being a Papist. On 22d May he was sent, nominally on the first charge, though really on the second, to the Tower, with his colleague Sir Anthony Deane. As he himself wrote to James on 6th May, "a papist I must be, whether I will or no, because favoured by your royal highness." On 2d June he appeared before the King's Bench, and was remanded three times, bail being refused by Jones, the attorney-general. At length Pepys was allowed out on bail for £30,000. The trial was four times postponed, in the hope that evidence would be obtained, and at last on 12th February 1680 he was released only because Scott refused to swear to his depositions, and no prosecutor appeared, and because his old servant, who had given evidence against him, being now on his deathbed, confessed that it was utterly false. This illustrates admirably the wild injustice that prevailed during that feverish time.

In April 1680 Pepys attended the king by command to Newmarket, and there took down in shorthand from his own mouth the narrative of his escape from Worcester. His post had meantime been abolished, or at any rate the constitution of the navy board changed. We find him writing to James on 6th May 1679, asking leave to lay down "this odious secretaryship," and to be placed on the commission of the navy. James urged his claims upon Charles, but the imprisonment in the Tower probably put an end to the affair. In May 1682 Pepys accompanied James when he took the government of Scotland, and while there made with Colonel Legge a tour of the chief towns. In the autumn of 1683 he sailed with the same Colonel Legge, then Lord Dartmouth, on the expedition to destroy the fortifications of Tangier, though not aware when he started of the object of the expedition. The ships reached Tangier on Friday, 14th September. Here he stayed, with the exception of a short visit to Spain, until 5th March, and arrived in London on 6th April.

On his return Pepys was again made secretary to the admiralty. In this same year (1684) he was elected president of the Royal Society. At the coronation of James II he figured as one of the barons of the Cinque Ports; and he sat in James's parliament for his old seat of Harwich along with his former colleague Sir Anthony Deane, — a fact which illustrates how completely the crown had regained possession of political power in the boroughs. He lost both his seat and his secretaryship at the Revolution, though he was consulted on navy matters to the time of his death. Having been rejected at Harwich in the new elections, he tried in vain to find another seat. His well-known intimacy with and regard for James made him a special object of suspicion to the Government, and in 1690, in common with others suspected for similar reasons, though without cause, he was suddenly arrested and sent to the Gate House, but was almost immediately released,

15th October, on bail (see his letter, Bright, vol. vi. p. 169). He was, however, afraid of fresh attacks as late as Easter 1692 (Letter to Evelyn, Bright, v. p. 173). It was about this time that he published his long-intended *Memoirs of the Navy*. He gave, as in former years, great attention to the government of Christ's Hospital, and especially to the mathematical foundation; and he was concerned with the establishment of Sir William Boreman's mathematical school at Greenwich. He was, too, a benefactor of his old school of St Paul's, and of Magdalene College.

In the spring of 1700, being very ill with the breaking out of the wound caused by the operation of 1658, he removed to the house of his old clerk William Hewer, at Clapham, and, against the urgent advice of his doctors (Bright, Preface), gave himself up to indefatigable study, feeling that his health was restored by the change. He himself, however, on 7th August 1700, wrote in a charming letter¹ that he was doing "nothing that will bear naming, and yet I am not, I think, idle; for who can, that has so much of past and to come to think on as I have? And thinking, I take it, is working." And he speaks of himself in September as making several country excursions. He was, immediately after this, confined entirely to the house with his old disease of stone, and gradually failed. He bore his long and acute sufferings with extreme fortitude, and died, in reduced circumstances (though he claimed a balance of £28,007 2s 1½d against the crown), on 26th May 1703. He was buried by the side of his wife in St Olave's, Crutched Friars, London, on 5th June. His library of 3000 volumes, which he had collected with much labour and sacrifice, and which he would not allow to be divided, was bequeathed to Magdalene College.

The last fact to be recorded of Pepys is that on 18th March 1884, two centuries after his official employment, a monument was unveiled in the church where he was buried to the "Clerk of the Acts and Secretary to the Admiralty" (*Times*, 19th March 1884).

The importance of Pepys's *Diary*, historically speaking, may be summed up by saying that without it the history of the court of Charles II could not have been written. We do not, it is true, gain from it any information as to what was going on in the country. Utterly destitute of imagination or political knowledge, Pepys could only record the sights and the gossip that were evident to all. It is because he did record these, without hesitation or concealment, that from his *Diary* we can understand the brilliancy and wickedness of the court, as well as the social state and daily life of the bourgeois class. Viewed in another light, it is unique as the record of a mind formed of inconsistencies. To him especially would his own motto apply, "Mens enquesque, est quisque." Profrity in word and integrity in office, along with self-confessed mendacity and fraud; modesty, with inordinate self-conceit; independence of mind, with the vulgarst striving after and exultation at the marks of respect which he receives as he rises in the world, and at little advantages gained over others; high understandings, with sordid spite, dignity, with buffoonery, strict common sense, with great superstition, kindness, with brutality; the eager pursuit of money, with liberality in spending it,—such are a few of the more obvious contrasts. He gained his reputation by fair means, and yet was willing enough to lie in order to increase it; he practised extreme respectability of deportment before the world, while he worshipped the most abandoned of Charles's mistresses, and now and again gave loose rein to his own very indignant morals; and he combined with courage amid difficulties and devotion to duty in the face of almost certain death, a personal piltozoonery to which few men would care to confess. The best tribute to him as a man is that in his later years Evelyn became his firm and intimate friend, and that he died amid universal respect.

Authorities.—*Diary* (Bright's edition, compared with which other editions are of slight value). Rev. J. Smith, *JAC. Journals and Correspondence of Pepys* (1841). *Parliamentary History*, vol. iv. *Journals of the House of Commons*; Evelyn, *Diary*; Wrenley, *Simonds, Pepys and his World* (see 1880), and others in various magazines and reviews. ¹ He carried on an active correspondence with literary friends, among them being Dryden, Sloane, and Evelyn.

PERCEVAL, AMAND-PIERRE CAUSSIN DE (1795-1871), Orientalist, was born at Paris, where his father was professor of Arabic in the Collège de France, on 13th January 1795. In 1814 he went to Constantinople as a student interpreter, and afterwards travelled in Asiatic Turkey, spending a year with the Maronites in the Lebanon, and finally becoming dragoman at Aleppo. Returning to Paris, he became professor of vulgar Arabic in the school of living Oriental languages in 1821, and also professor of Arabic in the Collège de France in 1833. In 1849 he was elected to the Academy of Inscriptions. He died at Paris during the siege, 15th January 1871, regretted not only for his ripe scholarship but for the gentleness and modesty of a character which represented the best features of the old school of French savants.

Caussin de Perceval published a useful *Catologue Arabe vulgaire*, which passed through several editions (4th ed. 1858), and edited and enlarged Bochoth's *Dictionnaire Francais-Arabe* (3d ed. 1864), but his great reputation rests almost entirely on one book, the *Essai sur l'histoire des Arabes* (3 vols., Paris, 1847-48), in which the native traditions as to the early history of the Arabs, down to the death of Mohammed and the complete subjugation of all the tribes to Islam, are brought together with wonderful industry and set forth with much learning and lucidity. One of the principal MS. sources used is the great *Kutab al-Aghany*, which has since been published in Egypt, but no publication of texts can deprive the *Essai*, which is now unhappily very scarce, of its value as a trustworthy guide through a tangled mass of tradition.

PERCEVAL, SPENCER (1762-1812), prime minister of England from 1809 to 1812, was the second son of John, second earl of Egmont, and was born in Audley Square, London, in November 1762. He was educated at Harrow and at Trinity College, Cambridge, where he graduated M.A. in 1781. He was called to the bar at Lincoln's Inn in 1786. A very able speech in connexion with a famous forgery case having drawn attention to his talents, his success was from that time rapid, and he was soon regarded as the leading counsel on the Midland circuit. Entering parliament for Northampton in April 1796, he distinguished himself by his speeches in support of the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic emancipation, he delivered in 1807 a speech on the subject which helped to give the deathblow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of the first rank, he succeeded in retaining office till he was shot by an assassin, perhaps a madman, named Bellingham, in the lobby of the House of Commons, 11th May 1812. Perceval will be chiefly remembered for his strenuous opposition to Catholic emancipation, an opposition due to a conscientious dread of the political evils that might result from it. He was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage.

PERCH (*Perca fluviatilis*), a freshwater fish generally distributed over Europe, northern Asia, and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the *Percida*, which is represented in European freshwaters by several other fishes such as the pike (*Esox lucerna*) and the pike-perch (*Lucioperca*). It inhabits rivers as well as lakes, and thrives best in waters with a depth of not less than 3 feet; in large deep lakes it frequently descends to depths of 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 feet.

The shape of its body is well proportioned, but many

variations occur, some specimens being singularly high-backed, others low and long-bodied, sometimes such variations are local, and Agassiz and other naturalists at one time thought it possible to distinguish two species of the common perch of Europe; there are not even sufficient grounds, however, for separating specifically the North-American form, which in the majority of ichthyological works is described as *Perca flavescens*. The brilliant and

The Perch, *Perca fluviatilis*.

striking colours of the perch render it easily recognizable even at a distance. A rich greenish-brown with golden reflexions covers the back and sides, which are ornamented with five or seven dark cross-bands. A large black spot occupies the membrane between the last spines of the dorsal fin, and the ventral, anal, and lower part of the caudal are bright vermilion. In the large peaty lakes of north Germany a beautiful variety is not uncommon, in which the golden tinge prevails, as in a gold-fish.

The perch is strictly carnivorous and most voracious; it wanders about in small shoals within a certain district, playing sad havoc among small fishes, and is therefore not to be tolerated in waters where valuable fry is cultivated. Perch of three pounds in weight are not unfrequently caught in suitable localities; one of five would now be regarded as an extraordinarily large specimen, although in older works we read of individuals exceeding even that weight.

Perch are good wholesome food, and highly esteemed in inland countries where marine fish can be obtained only with difficulty. The nearly allied pike-perch is one of the best European food-fishes. The perch is exceedingly prolific; it begins to spawn when three years old, in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands, on water plants.

PERCIVAL, JAMES GATES (1795-1856), an American writer of many-sided activity, but chiefly remembered by his verses, was born at Berlin, Connecticut, on 15th September 1795, and studied at Yale, graduating in 1815, and taking a medical degree in 1820. His life was straitened by poverty and divided among a variety of occupations. He was by turns an army surgeon, professor of chemistry at West Point, a recruiting surgeon at Boston, geological surveyor of Connecticut (writing a *Report* published in 1842), and State geologist of Wisconsin, where he died at Hazel Green, 2d May 1856. The intervals of these employments were filled up with literary work of a miscellaneous kind. An edition of his collected poems appeared at Boston in 1859 (2 vols. 8vo). Some of his miscellaneous and patriotic verses hold a high place in American poetry.

PERCY. This family, whose deeds are so prominent in English history, claimed descent from one Manfred de Perel, who was said to have come out of Denmark into Normandy before the adventure of the famous Rollo. But it is more certain that two brothers, William and Serlo de Percy, came into England with William the Conqueror, who endowed his namesake the elder with vast possessions in Hampshire, Lincolnshire, and Yorkshire, among which were Topcliffe in the North Riding and Spofforth in the

West Riding, the principal seats of the family for many ages afterwards. This William deserves special notice besides, since he refounded the noble abbey of Whithby, which had been destroyed by the Danes,—obtaining a grant of the lordship from Hugh, earl of Chester. Yet his piety would seem to have been of a rather unsteady character, for, having endowed the abbey with certain lands, he resumed them in order to reward a faithful dependant, till his brother Serlo, the abbot, complained to King William, and caused him to make restitution.

The family, however, did not really descend in a direct male line from this William; for in the reign of Henry II. his male descendants became extinct, and the inheritance was divided for a time between two sisters, though by failure of issue of one of them it was reunited in the next generation. Agnes, the sister from whom all the subsequent Percies were descended, accepted as her husband Josceline, a son of Geoffrey, duke of Louvain, on the express condition that he and his posterity should bear the surname of Percy, and assume the arms of her family, relinquishing their own. This Josceline was a brother of Adelaide or Alice of Louvain, the second queen of Henry I., and by an arrangement with his sister, confirmed by Henry II. when duke of Normandy, he became possessed of the honour of Petworth in Sussex. He was also castellan at Arundel, and held several other important posts in the south of England. His son Richard and Richard's son William were among the barons who rose in arms against John and Henry III. respectively; but the grandson made his peace with his sovereign, and had his lands restored to him. It should be remarked, however, as a feature of the times, that Richard de Percy was not the eldest but the youngest son of Josceline, and that, according to modern notions, he was really a usurper, who occupied the inheritance of a nephew; his right, however, passed undisputed. He was one of the twenty-five barons appointed to enforce the observance of Magna Charta.

The next important member of the family is Henry de Percy, whom Edward I., after the deposition of John Balliol, appointed governor of Galloway, and who was one of his most active agents in the subjugation of Scotland, till the success of Robert Bruce drove him out of Turnberry Castle, and made him withdraw into England. He was rewarded by Edward II. with the barren title of earl of Carrick, declared to be forfeited by the Scottish hero; and the same king appointed him governor of the castles of Bamborough and Scarborough. But he himself made his position strong in the north of England by purchasing lands from Anthony Beck, bishop of Durham, among which was the honour of Alnwick, the principal seat of the family ever since. His son, another Henry, took part in the league against Edward II.'s favourites the Despencers, was in favour with Edward III., and obtained from Edward Balliol as king of Scotland grants of Lochmaben, Annandale, and Moffatdale, which he surrendered to the English king for the castle and constableness of Jedburgh or Jedworth, with the forest of Jedworth and some neighbouring towns. A few years later, in fuller recompense of the unprofitable gift of Balliol, a grant of 500 marks a year was made to him out of the old customs at Berwick; and in 1346 he did splendid service to his sovereign by defeating and taking prisoner David, king of Scotland, at the battle of Neville's Cross.

To him succeeded another Henry Percy, a feudal baron like his predecessors, who fought at Crécy during his father's lifetime; and to him another Henry, who was made earl of Northumberland at the coronation of Richard II. It may be remarked incidentally that the succession of the name of Henry in this family is altogether extraordinary. For three generations before this first earl of

Northumberland, and for five different descents after him (making altogether a period of 538 years), the head of the house invariably was a Henry. Such a remarkable continuance of a single Christian name would have been less surprising in later and more peaceful times, when we might reasonably have expected the eldest born to succeed his father quietly through many generations. But the first four earls of this family were all slain in battle or in civil tumult, and the heir-apparent of the first, a Henry like the rest, was cut off in the same way during his father's lifetime. Was it that the incessant activity due to Border raids and moonlight expeditions created in these men a physical vigour of constitution which protected them to a large extent against disease and infirmity?

The first earl of Northumberland, certainly, had led a busy life enough, not only on the Borders but elsewhere. He had been in the French wars of Edward III., he had been at times a warden of the marches against Scotland, or a commissioner to treat for peace with that country. He had ravaged the lands of the earl of Dunbar and had won Berwick. Powerful in the south as well as in the north, he was the Lord Henry Percy who protected Wickliffe when cited before the archbishop at St Paul's. As earl of Northumberland he exhibited his independence of Richard II. in a way characteristic of a northern baron. Sent for to court, he neglected to come, was disgraced and banished, and thereupon fled to Scotland. He repaired to Henry of Lancaster soon after his landing at Ravenspur, and helped treacherously to decoy Richard II. into his hands at Conway. Naturally he received great honour from Henry after he had become king. He was made constable of England for life, and received a gift of the Isle of Man and a number of important offices in Cheshire, Wales, and the borders of Scotland. He was even appointed one of the commissioners for the marriage of the king's daughter Blanche with Louis, duke of Bavaria; and for the first three years of the reign both he and his family seemed faithful to the new dynasty which they had greatly helped to establish. In 1403 he and his brave son Henry, the celebrated Hotspur, won the battle of Homildon Hill and took the earl of Douglas prisoner. But immediately afterwards Harry Hotspur, whose character is so well known through Shakespeare's play of *Henry the Fourth*, resenting the king's injustice to his brother-in-law, Sir Edmund Mortimer, who had been taken prisoner by the Welsh, and whom Henry, for reasons of policy, declined to ransom, entered into a league with Owen Glendower, in whose custody Mortimer was, for a combined war against the king.

The whole family of the Percies seem to have felt that their services to Henry of Lancaster were ill requited. The earl himself joined the conspiracy. His brother Thomas Percy, earl of Worcester (so created by Richard II.), stood also to all appearance in high favour with the king, who had entrusted him with the care of his son Henry, prince of Wales. But he suddenly left the court and joined his nephew in the north, both sending forth proclamations and raising the country. The rebellion was crushed in the battle of Shrewsbury (1403), in which Hotspur was slain, and the earl of Worcester was beheaded just after the fight, while Northumberland was marching southwards to join with them. Having taken no active part in the movement, the earl pretended that he had really been going to assist the king, and had wished to avert hostilities. He afterwards went peaceably to the king at York, and was placed in custody; but such was his power and influence that next year he was acquitted of treason in full parliament, and had all his honours and possessions restored to him. All confidence, however, between him and the king was at an end, and in 1405 he joined the insurrection of Arch-

bishop Scrope, who, after being beheaded as a rebel, was venerated as a martyr over the whole north of England. Then he fled to Scotland, afterwards to Wales, and in the end, returning to his own country, perished in a new rebellion at Bramham Moor.

The title and estates were thus forfeited. But, by an act no less gracious than politic, Henry V. restored them to this earl's grandson, then a prisoner with the Scots, whose liberation he had no difficulty in procuring from the duke of Albany during the time of James I.'s captivity. From that day the loyalty of the family to the house of Lancaster was steadfast and undeviating. The second earl died fighting for Henry VI. at the first battle of St Albans in 1455, the third was slain in the bloody field of Towton (1461); the fourth was killed in quelling an insurrection in the time of Henry VII. So strong was the Lancastrian feeling of the family that even Sir Ralph Percy, a brother of the earl who fell at Towton, though he had actually submitted once to Edward IV., turned again, and when he fell at Hedgeley Moor consoled himself with the thought that he had, as he phrased it, "saved the bird in his bosom."

No wonder, then, that in Edward IV.'s days the title and estates of the family were for a time taken away and given to Lord Montagu, brother of Warwick the king-maker. But the north was so accustomed to the rule of the Percies that in a few years Edward saw the necessity of restoring them, and did so even at the cost of alienating still further the powerful family of the Nevilles, who were then already on the point of rebellion.

A crisis occurred in the fortunes of the family in the reign of Henry VIII. on the death of the sixth earl, whose two brothers, much against his will, had taken part in the great insurrection called the "Pilgrimage of Grace." A thriftless man, of whom it is recorded that in his youth he was smitten with the charms of Anne Boleyn, but was forced to give her up and marry a woman he did not love, he died childless, after selling many of the family estates and granting the others to the king. The title was forfeited, and was granted by Edward VI. to the ambitious Dudley, earl of Warwick, who was attainted in the succeeding reign. It was restored in the days of Queen Elizabeth to Thomas Percy, who, being a staunch Catholic, was one of the three earls who took the lead in the celebrated "Rising in the North," and was beheaded at York. His brother Henry, who succeeded him, was no less unhappy. Involved in Throgmorton's conspiracy, he was committed to the Tower, and was supposed to have shot himself in bed with a pistol found beside him, but there were grave suspicions that it had been suffered by another hand. His son, the next earl, discharged his two predecessors for his attachment to the religion of his forefathers. The crown lawyers sought in vain to implicate him in the Gunpowder Plot; but he was imprisoned for fifteen years in the Tower and compelled to pay a fine of £30,000. The son who next succeeded was a Parliamentary general in the Civil War. At length, in 1670, the male line of this illustrious family became extinct, just five hundred years after the marriage of Agnes de Percy with Josceline of Louvain.

Not one of the English noble houses is so distinguished as the Percies throughout the whole range of English history. It is remarkable alike for its long unbroken line, its high achievements, its general culture of arts and of letters. Pre-eminent also, as remarked by Sir Harris Nicolas, for its alliances among the peerage, it continues to this day, though represented once more by a female branch. The present dukedom of Northumberland was created in 1766 in the family of Smithson, who assumed the name of Percy and have borne it ever since. Sir Hugh Smithson, who became the first duke, married a granddaughter of a daughter of the last earl. (J. G.)

PERCY, THOMAS (1739-1811), bishop of Dromore, the editor of the *Percy Reliques*, was born at Bridgnorth 13th April 1739 and baptized at St. Leonard's Church 29th April. His father, Arthur Lowe Percy, a grocer by trade, lived in a large house at the bottom of the street called "The Cartway," and acquired sufficient means to send his son, who had received the rudiments of his education at Bridgnorth grammar-school, to Christ Church, Oxford, in 1746. He graduated in 1750 and proceeded M.A. in 1753. In the latter year he was appointed to the vicarage of Easton Maudit, Northamptonshire, and three years later instituted to the rectory of Wilby in the same county, benefices which he retained until 1782. On the 24th of April 1759 Percy was married at Desborough, Northamptonshire, to Anne, daughter of Batton Guttenidge. During his residence in the delightful but secluded neighbourhood of Easton Maudit most of the literary work for which he is now remembered—including the *Reliques*—was completed. When his name became famous through his publications he complied with the request of the duke and duchess of Northumberland that he would reside with them as their domestic chaplain, and was tempted into the belief that he belonged to the illustrious house of Percy. Through this connexion he became dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1783, from which date he was a constant resident in his adopted country. His wife predeceased him at Dromore Palace, 30th December 1806; the good bishop, blind but otherwise in sound health, lived until 30th September 1811; both of them were buried in the transept which he added to Dromore Cathedral.

For many years Dr Percy enthusiastically laboured in the fields of literature. He translated the Song of Solomon and published a key to the New Testament, a work often imitated. He edited poetry from the Icelandic language and translated Mallet's *Northern Antiquities*. His reprint of *The Household Book of the Earl of Northumberland* in 1512 is of the greatest value for the illustrations of domestic life in England at that period. But all of these works are of little estimation when compared with the *Reliques of Ancient English Poetry*, a publication which has entranced successive generations of schoolboys and students since its first appearance in February 1765. It was based on an old manuscript collection of poetry, but, unfortunately for the editor's peace of mind, it was modernized in style, a circumstance which exposed him to the sneers and suspicions of Raison. The work as originally issued by Percy has been re-edited by many British antiquaries, whilst selections have been issued for boys and girls, and the manuscript on which he worked has been edited in its complete form by J. W. Hales and P. J. Farnvill. The bishop was possessed of great poetic feeling. His ballad of "The Hermit of Warkworth" was too simple for the austere taste of Dr Johnson, but it has always and deservedly been popular; and his song now generally known as "O Nanny, wilt thou gang wi' me?" is a universal favourite, from its own merits as well as from the musical setting of an Irishman called Thomas Carter. The greater part of the seventh volume of *Mallet's Northern Antiquities*, the *Library of Poetry of the 18th Century* is filled with Bishop Percy's correspondence.

PERDIOCAS, son of Orontes, a distinguished Macedonian general under Philip and Alexander the Great, and regent of the empire from the death of the latter till he perished in a mutiny in 321 B.C. See MACEDONIAN EMPIRE, vol. xv. p. 142, and *PERIA*, *infra*, p. 585.

The same name was borne by three kings of Macedonia: PERDIOCAS I, whom Herodotus calls the founder of the monarchy of Macedon; PERDIOCAS II, the enemy of Athens in the Peloponnesian War (died c. 414 B.C.); and PERDIOCAS III (died 359 B.C.).

PEREKOP, a town of European Russia, in the Crimea, 60 miles south-east of Kherson on the isthmus which connects the peninsula with the continent, and, as its name (*perekop*, a cutting) indicates, commanding the once defensive ditch and dyke which cross from the Black Sea to the Sivash lagoon. It was formerly an important place, with a great transit trade in salt (obtained from the great salt lakes of the immediate neighbourhood), which occupied

so large a place in popular estimation that the Tatars of the Crimea were usually styled the "Perekop horde" and their khans the "Perekop khans." Since the opening of the railway route to the Crimea it has greatly declined. In 1865 the population of Perekop and its mercantile suburb (Armyansk Bazar, 3 miles to the south) was only 4927, and the number has slightly decreased since.

In ancient times the isthmus was crossed (about 14 miles south of the present town) by a ditch which gave the name of Taurikos to a Greek settlement. "Thus line of defence having fallen into decay, a fort was erected and a new ditch and dyke constructed in the 15th century by Mengli Ghaï and his son and successor Sahib Ghaï. The fort, known as Kapu or Oï-Kapu, became the nucleus of the town. In 1736 Perekop was captured by Field-Marshal Munnich, and in 1738 by Field-Marshal Laschy, who blew up the fort and destroyed a great part of the dyke. In 1764 the fort was rebuilt by Kun Ghaï, but the Greek and Armenian inhabitants of Perekop preferred to form a new settlement at Armyansk Bazar (Armenian Market). Captured by the Russians in 1771, the town passed into Russian possession with the rest of the Crimea in 1783.

PEREYASLAF, a town of European Russia, in the Poltava government, 175 miles west-north-west of Poltava, at the junction of the Trubezh and the Alta, which reach the Dnieper 5 miles lower down at the town's port, the village of Andrush. Besides the town proper there are three considerable suburbs. Though founded in 993 (by Vladimir Svyatoslavitch in memory of his signal success over the Petchenegs), Pereyaslaw has now few remains of antiquity; while the original erection of some of the churches goes back for many hundred years (that of the Assumption, e.g., to 1010), the actual buildings are not older than the 17th century. The town has trade in grain, salt, cattle, and horses, and some manufactures—tallow, wax, tobacco, &c. The population was 10,835 in 1865 and 9800 in 1870.

From 1054 Pereyaslaw was the chief town of a principality which passed from one prince to another of the Rurikovichs, Vladimirovichs, and Olgovichs. As a southern outpost it often figures in the 11th, 12th, and 13th centuries; in later times it was one of the great centres of the Cossack movement, and in 1628 the neighbourhood of the town was the scene of the extermination of the Polish forces known as "Tara's Night." It was by the treaty of Pereyaslaw that in 1654 Bogdan Khmelnitski and the Cossacks acknowledged the supremacy of Alexis. At that time the town contained from 25,000 to 80,000 inhabitants.

PEREYASLAVI, or PERESLAVI (called Zalyesski, or "Beyond the Forest," to distinguish it from the older town in Poltava after which it was named), is one of the earliest and most interesting cities in north-west Russia, situated in Vladimir government, 87 miles east of Moscow on the road to Yaroslavl, and on both banks of the Trubezh near its entrance into Lake Pleshtchevo. Pereyaslaw was formerly remarkable for the number and importance of its ecclesiastical foundations (there were in 1764 no fewer than eleven monasteries in the town and neighbourhood, and the churches about the same period numbered thirty-seven). Among those still standing are the 12th-century cathedral of the Transfiguration (with ancient wall-paintings and the graves of Demetrius, son of Alexander Nevski, and other princes), and the church of the Birth of John the Baptist, founded by Euphrosyne, wife of Demetrius Donski, in the close of the 14th century. It is by its extensive cotton manufactures (the spinning factory alone employing 1700 hands and producing to the annual value of £195,000) that Pereyaslaw is now best known throughout Russia; and it also manufactures linen, leather, and tobacco. The fisheries on the lake (20 square miles in extent and 175 feet deep) have long been of great value. The population was 6233 in 1864, 7210 in 1870, and 8700 in 1880.

Founded in 1152 by Yurgh (George) Vladimirovitch Dolgoruki, prince of Suzdal, Pereyaslaw soon began to play a considerable part in the history of the country. From 1195 till 1802 it had princes of its own; and the princes of Moscow, to whom it was then bequeathed, kept it (apart from some temporary alienations

in the 14th century) as part of then patrimony throughout the 15th and 16th centuries. The town enjoyed a great many privileges, and in return was bound to furnish the court with fish. Its cañon walls, from 20 to 50 feet in height and 7260 feet in extent, remained till 1759. Lake Pleshtchevo was the scene of Peter the Great's first attempts at creating a fleet.

PEREZ, ANTONIO (c. 1540-1611), for some years the favourite minister of Philip II. of Spain and afterwards for many more the object of his unrelenting hostility, was by birth an Aragonese. His reputed father, Gonzalo Perez, an ecclesiastic, has some place in history as having been secretary both to Charles V. and to Philip II., and in literature as author of a Spanish translation of the *Odyssey* (*La Ulycea de Homero*, Antwerp, 1558). Antonio Perez, who was legitimated by an imperial diploma issued at Valladolid in 1543, was, however, believed by many to be in reality the son of the well-known Ruy Gomez, prince of Eboli, to whom, on the completion of a liberal education at home and abroad, he appears at least to have owed his first introduction to a diplomatic career. In 1567 he became one of the secretaries of state, receiving also about the same time the lucrative appointment of protonotary of Sicily, and in 1573 the death of Ruy Gomez himself made room for Perez's promotion to be head of the "despacho universal," or private bureau, from which Philip attempted to govern by assiduous correspondence the affairs of his vast dominions. Another of the king's secretaries at this time, though in a less confidential relation, was a friend and contemporary of Perez, named Juan de Escovedo, who, however, after the fall of Tunis in 1574, was sent off to supersede Juan de Soto as secretary and adviser of Don John of Austria, thus leaving Perez without a rival. Some time after Don John's appointment to the governorship of the Netherlands Perez accidentally became cognizant of his inconveniently ambitious "empress de Inglaterra," in which he was to rescue Mary queen of Scots, marry her, and so ascend the throne of England. This secret scheme the faithful secretary at once carried to Philip, who characteristically resolved to meet it by quietly removing his brother's aid and abettor. With the king's full cognizance, accordingly, Perez, after several unsuccessful attempts to poison Escovedo, succeeded in procuring his assassination in a street of Madrid on 31st March 1578. The immediate effect was to raise Perez higher than ever in the royal confidence and favour, but, wary though the secretary had been, he had not succeeded in obliterating all trace of his connexion with the crime, and very soon a prosecution was set on foot by the representatives of the murdered man. For a time Philip was both willing and able to protect his accomplice, but ultimately he appears to have listened to those who, whether truly or falsely, were continually suggesting that Perez had had motives of his own, arising out of his relations with the princess of Eboli, for compassing the assassination of Don John's secretary, be this as it may, from trying to screen Perez the king came to be the secret instigator of those who sought his ruin. The process, as such matters often are in Spain, was a slow one, and it was not until 1589 that Perez, after more than one arrest and imprisonment on a variety of charges, seemed on the eve of being convicted and condemned as the murderer of Escovedo. At this juncture he succeeded in making his escape from prison in Castile into Aragon, where, under the ancient "fueros" of the kingdom he could claim a public trial in open court, and so bring into requisition the documentary evidence he possessed of the king's complicity in the deed. This did not suit Philip, who, although he instituted a process in the supreme tribunal of Aragon, speedily abandoned it and caused Perez to be attacked from another side, the charge of heresy being now preferred, arising out of certain reckless and even blasphemous expressions Perez had used in connexion with

his troubles in Castile. But all attempts to remove the accused from the civil prison in Saragossa to that of the Inquisition raised popular tumults, which in the end led to Perez's escape across the Pyrenees, but unfortunately also furnished Philip with a pretext for sending an army into Aragon and suppressing the ancient "fueros" altogether (1591). From the court of Catherine de Bourbon, at Pau, where he was well received, Perez passed to that of Henry IV. of France, and both there and in England his talents and diplomatic experience, as well as his well-grounded enmity to Philip, secured him much popularity. While in England he became the "intimate coach-companion and bed-companion" of Francis Bacon, and was also much in the society of the earl of Essex. The peace of Vervins in 1598 greatly reduced his apparent importance abroad, and Perez now tried to obtain the pardon of Philip III., that he might return to his native country. His efforts, however, proved vain, and he died in comparative obscurity in Paris on 3d November 1611. Some years afterwards his wife and family were relieved from the ban of the Inquisition, under which, along with himself, they had been laid.

Perez's earliest publication was a small quarto, dedicated to the earl of Essex, written and apparently printed in England about 1594, entitled *Pedacos de Historia*, and professedly published at Leon. A Dutch translation appeared in 1594, and in 1598 he published his *Relaciones*, including the *Memorial del Hecho de su Ocaso*, drawn up in 1590, and many of his letters. The Paris edition is dedicated to Henry IV., but apparently another issue was inscribed to the pope. Both dedications are given in the fullest reprint, that of Geneva (1654), which includes a collection of "aphorisms" culled from the author's writings. The literary performances of Perez owe their importance almost exclusively to the fascination of his personal narrative, which, however, gives no great impression of simplicity and straightforwardness; the letters, though admittedly models of elegant Castilian, are somewhat tedious reading. Much has recently been done, by Mignet (*Antonio Perez et Philippe II.*, 1845, 4th ed., 1874) and by Froude ("An Unsolved Historical Riddle," *Nineteenth Cent.*, 1888) among others, towards the elucidation of various difficult points in Perez's somewhat perplexing story.

PERFUMERY is the art of manipulating odoriferous substances for the gratification of the sense of smell. Perfumes may be divided into two classes, the first of which includes all primitive or simple odoriferous bodies derived from the animal or vegetable kingdom, as well as the definite chemical compounds specially manufactured, while the second comprises the various "bouquets" or "mélanges" made by blending two or more of the foregoing in varying proportions,—toilet powders, dentifrices, sachets, and the like. To the former class belong (1) the animal products, ambergris, castor, civet, musk; (2) essential oils (more properly called attars), mostly procured by distillation; (3) the pihcheome butters or oils, which are either solid or liquid fats charged with odours by the processes of inflorescing or maceration; (4) the odoriferous gum-resins or balsams which exude naturally or from wounds in the trunks of various trees and shrubs, such as benzoin, opoponax, peru, tolu, storax, myrrh; (5) a few chemical bodies, similar in odour to or identical in odoriferous active principle with certain plants, e.g., nitrobenzol, called attar of mirbane or false almond, vanillin or methyl-propyl-catecholic aldehyde, coumarin or coumaric anhydride, and a few others. Ammonia and acetic acid are used respectively as smelling salts and in the preparation of aromatic vinegar, but can scarcely be considered as perfumes. The second class contains the endless combination of tinctures for scenting the handkerchief sold under fancy names which may or may not afford a clue to their composition, such as "soudie française," "eau de senteur," "eau de Cologne," "lavendre ambrée," "blumengeist." These are sometimes made upon a quasi-scientific basis, namely, that of the odophone or gamut of odours of the late Dr. Sébastien Piesse. Their numbers may be almost

infinite, one large firm in London is known to manufacture several hundreds

Sources and Commercial Values.—For the sources of the various animal perfumes the reader is referred to the articles AMBERGRIS¹ (vol. i. p. 660), BEAVER² (vol. iii. p. 476), CIVET³ (vol. v. p. 796), and MUSK⁴ (vol. xvii. p. 106). The sources of the attars are the different parts of the plants which yield them,—the wood (hgu alo, santal, cedar), the bark (cinnamon, cascarilla), the leaves (patchouli, bay, thyme), the flowers (rose, lavender, orange-blossom), the fruit (nutmeg, citron), or the seeds (caraway, almond). Some plants yield more than one, such as lemon and bergamot. They are mostly obtained by distilling with water that part of the plant in which they are contained; but some few, as those from the rind of bergamot (from *Citrus bergamia*), lemon (citron zeste, from *C. Limonium*), lime (*C. Limetta*), by "expression." The outer layer of the cortex is rasped off from the unripe fruits, the raspings placed in a canvas bag, and squeezed in a screw or hydraulic press. The attars so obtained are separated from the admixed water by a tap-funnel, and are then filtered (see OILS, ESSENTIAL, vol. xvii. p. 748). Certain flowers, such as jasmine, tuberose, violet, cassia, either do not yield their attars by distillation at all, or do it so sparingly as not to admit of its collection for commercial purposes; and sometimes the attar, as in the case of orange (neroli), has an odour quite different from that of the fresh blossoms. In these cases the odours are secured by the processes of inflorescence (enfleurage), or by maceration. Both depend upon the remarkable property which fats and oils possess of absorbing odours. The former process has already been described in the article JASMINE (vol. xvii. p. 595). Maceration consists in soaking the flowers in heated fat, in due time they are strained off and replaced by fresh ones, as in the enfleurage process. The whole of the necessary meltings and heatings of the perfumed greases are effected by means of water-baths, whereby the temperature is kept from rising too high. For the manufacture of perfumes for the handkerchief the greases now known as pomades, butters, or phlocoms are treated with rectified spirit of wine 60° overproof, *v. e.*, containing as much as 95 per cent. of absolute alcohol by volume, which practically completely abstracts the odour.

The gum-resins have been employed as perfumes from the earliest ages; many are referred to in the Old Testament, see INCENSE (vol. xii. p. 718) and FRANKINCENSE (vol. ix. p. 709). They are largely used in the manufacture of perfumes, both for burning as pastilles, ribbon of Bruges, incenses, &c., and in tinctures, to which they impart their characteristic odours, affording, at the same time, a certain fixity to other perfumes of a more fleeting nature when mixed with them. The chemical perfumes are relatively new. Vanillin, the odoriferous principle of vanilla (*V. planifolia*), was first artificially prepared by Helman and Hermann in Germany, who obtained it from the sap of certain kinds of fir, and established its composition. Their research was afterwards remarkably verified by Dr C. R. Alder Wright, who prepared it from crude opium. It is a pale straw-yellow crystalline substance, smelling exactly like vanilla, and said to be forty times stronger. Its value commercially is about 28s per oz. Coumarin, the odoriferous principle of Tonquin beans (*Diptera odorata*), is also artificially prepared. In appearance it resembles vanillin, and is valued at 9s per oz. Some similar bodies with fancy names, such as "hemercalle," "bromelia," "aubépine," are in the market, but have scarcely yet found

their way into the perfume manufactory. Nitro-benzol, before mentioned, is employed only for imparting an almond-like odour to inferior soaps. The various compound ethers called artificial fruit essences, from their resemblance to the odours of certain fruits (argonne pear, pine-apple, plum, &c.), find no place in perfumery, though largely used in confectionery for flavouring.

As before stated, the bouquets constituting the second class of perfumes are but alcoholic solutions, *v. e.*, tinctures of some of the foregoing blended together in various proportions, of which the following well-known recipes are examples —

"Rondelette."			"Bouquet du Roi."		
Ext. Vanilla	2 pnts		Ext. Neroli	2 pnts.	
" Musk	1 "		" Rose	2 "	
" Civet	1 "		" Musk	2 "	
Attar Rose	1 oz		" Vanilla	1 "	
" Mitcham Lavender	1 "		Attar Rose	1 diam.	

The Odophone.—The late Dr Septimus Piesse endeavoured to show that a certain scale or gamut existed amongst odours as amongst sounds, taking the sharp smells to correspond with high notes and the heavy smells with low. He illustrated the idea by classifying some fifty odours in this manner, making each to correspond with a certain note, one-half in each cliff, and extending above and below the lines. For example, treble clef note E (4th space) corresponds with Portugal (orange), note D (1st space below clef) with violet, note F (4th space above clef) with ambergris. It is readily noticed in practice that ambergris is much sharper in smell (higher) than violet, while Portugal is intermediate. He asserted that properly to constitute a bouquet the odours to be taken should correspond in the gamut like the notes of a musical chord,—one base note among the odours as among the notes, destroying the harmony. Thus on his odophone, santal, gummum, acacia, orange-flower, camphor, corresponding with C (bass 2d line below), C (bass 2d space), B (treble 1st line), G (treble 2d line), C (treble 3d space), constitute the bouquet of chord C.

Other Branches of Perfumery.—For the preparation of scented soaps two methods are in use, both start with a basis either of fine yellow soap (which owes its odour and colour to the presence of resin), or of cold soap (which is white, and colourless), and is prepared without resin. In one process the soap is melted by superheated steam, and while still hot and semi-fluid mixed by means of a T-shaped stirrer of wood with iron cross-bar, technically called a "crutch," with the attars and colouring matter. It is then removed from the melting pan to a rectangular iron mould or box, the sides of which can be removed by unscrewing the tie-rods which hold them in position, when the mass is cut into slabs and bars with a thin brass wire. In the other or cold process the soap is first cut into chips or shavings by a plane or "chipping machine," then the colouring matters are added and thoroughly incorporated by passing the soap between granite rollers driven by steam-power, the tinted soap emerges in a continuous sheet but little thicker than paper. The attars are then added, and after standing for about twelve hours the soap is again sent through the rolling machine. It is then transferred to a bar-forming machine, which consists of an alchimedean screw with tapering thread revolving in a box, the soap in sheets is roughly squeezed through a hopper over the widest threads of the screw and is forced, as this revolves, towards the distant end of the box, to an opening of the required size, through which it emerges in a continuous bar almost as hard as wood. Soap thus worked contains less than 10 per cent. of water, that prepared by melting contains 20 and even 80 per cent. The amount of attar so added depends upon the nature of the perfume, and amounts usually to about 7 or 8 per cent. The finest soaps are always manufactured by the cold process. **Violet powders** are of various sorts. They consist of rice-starch or wheat-starch, with powdered orris-root in varying proportions, and with or without the addition of oxide of zinc, oxide of bismuth, or French chalk. The constituent powders, after the addition of the attars, are thoroughly incorporated and mixed by sifting through a fine sieve. Violet powder for the nursery should contain a quantity of powdered violet root (*Iris Florentina*), from the odour of which the powder is named. It is of a yellowish tint, soft, and pleasant to the touch. The white common so-called "violet powders" consist of starch only scented with attar of bergamot, and are in every sense inferior. **Tooth powders** consist for the most part of mixtures of powdered orris-root with precipitated chalk, and some other constituent destined to particulate it as to properties or flavour, such as charcoal, finely-pulverized pumice, quassia, sugar, camphor, &c. The perfume of the contained orris-root is modified, if required, by the addition of a little of some attar. **Tooth pastes** are not much in vogue; they are formed of the same constituents as the powders, and are worked into a paste by the addition of a little honey or glucose.

¹ The present (1884) value of ambergris is about 90s per oz.

² The present value of castoreum is about 32s per lb.

³ Its price is about 8s per oz.

⁴ Average value about 25s per oz.

syrrup, which substances are usually believed ultimately to have an injurious effect on the teeth. *Perfume sachets* consist either of a powder composed of a mixture of vanilla, musk, Tonquin beans, &c.; or one of other predominating as required, contained in an ornamental silk sac, or of some of the foregoing substances spread upon card or chamois leather or flannel and being made into a paste with mulling and a little glycerol. When dry the card so prepared is daintily covered with various pretty-coloured silks for sale. Where the ingredients employed in their manufacture are of good quality these cards, known as "peau d'Espagne" sachets, retain their odour unimpaired for years.

Adulterations.—There is, as might be expected, considerable scope for the adulteration of the "initiates" perfumes, employed in perfumery, and it is to be regretted that many unscrupulous dealers avail themselves of the facilities offered for this dishonourable practice. Thus, in the case of musk, the "pods" are frequently found to be partially emptied of the grain, which has been replaced by hide or skin, while the weight has been increased by the introduction of lead, &c. In other instances the fraud consists in the admixture of refuse grain, from which the odour has been exhausted with spirit, with dried blood, and similar substances, while pungency is secured by the addition of carbonate of ammonia. A tincture of rose is diluted down with attar of *Palma rose*, a variety of geranium of only a quarter or a fifth of the value. The main adulterant of all the attars, however, is castor oil. This is a bland neutral body, practically odourless, and completely soluble in alcohol, it therefore presents all the requisites for the purpose. Its detection is difficult even by chemical analysis, which is obviously inapplicable in most instances, the safeguard of the purchaser is the knowledge resulting from experience.

Statistics.—In Europe, flower-farming for perfumery purposes is almost exclusively confined to that triangular portion of the valley of the Var (Riance) which has Grasse for its apex and the Mediterranean shore between Nice and Cannes for its base, with an area of about 115,000 English acres. It is here that the jasmine, tuberose, cassia, rose, and violet grow to such perfection, and that the processes of enfleurage and maceration are commercially worked. Subjoined is an estimate¹ of the weight of flowers annually employed.

	Tons	Harvest Time
Orange blossoms	1890	30th April to 31st May
Roses	930	May
Violets	147	15th January to 15th April
Jasmine	147	30th July to 15th October
Tuberose	74	August, September, and October
Cassia	80	October, November, and December
Ylang-ylang	15	February and March

Great praise is due to the pioneers of flower-farming in the British colonies of South Africa and Australia, and especially to Colonel Talbot in Jamaica, whose efforts in this direction had but to meet with complete commercial success.

The attars from peppermint (*Mentha Piperita*), thyme (*T. vulgaris*), and lavender (*Lavandula vera*), the finest in the world, are distilled from plants grown in the neighbourhood of Mitcham in Surrey. It is estimated that between 8000 and 10,000 ounces of musk are annually imported from all sources, while the quantity of alcohol employed in the manufacture of perfumes is calculated to exceed 60,000 gallons.

See *Fessier's Art of Perfumery*, 4th ed., 1880.

(O H P)

PERGAMUM, an important city of Teuthrania, a district in Mysia, it is usually named Πέργαμον by Greek writers, but Ptolemy has the form Πέργανος. The name, which is related to the German *berg*, is appropriate to the situation on a lofty isolated hill in the broad and fertile valley of the Caicus, about 120 stadia, less than 15 miles, from its mouth. According to the belief of its inhabitants, the town was founded by Arcadian colonists, led by Telephus, son of Heracles. Auge, the mother of Telephus, was priestess of Athena Alea at Tegea, and daughter of Aleus; fleeing from Tegea, she became the wife of Teuthrae, the eponymous king of Teuthrania, and her son Telephus succeeded him. Athena Polias was the patron-goddess of Pergamum, and the legend combines the ethnological record of the connexion claimed between Arcadia and Pergamum with the usual belief that the hero of the city was son of its guardian deity, or at least of the priestess who represented her. Nothing more is recorded of the city till the time of Xenophon, when it was a small fortified town on the summit of the hill. Its importance began under

Lysimachus, who deposited his treasures, 9000 talents, in this strong fortress under the charge of a eunuch Philetaerus of Tium. In 283 B.C. Philetaerus rebelled, Lysimachus died without being able to put down the revolt, and Pergamum became the capital of a little principality. Partly by clever diplomacy, partly through the troubles caused by the Gaulish invasion and by the dissensions among the rival kings, Philetaerus contrived to keep on good terms with his neighbours on all sides (283-263 B.C.). His nephew Eumenes (263-241) succeeded him, increased his power, and even defeated Antiochus of Syria in a pitched battle near Sardis. His successor Attalus I. (241-197) won a great battle over the Gauls, and assumed the title of king. The other Greek kings who aimed at power in Asia Minor were his natural enemies. On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus perceived the advantage of their alliance against his Greek rivals, connected himself with them from the first, and shared in their continuous success. Under the reign of Attalus Pergamum became the capital of a considerable territory and a centre of art and regal magnificence. Sculptors were attracted by the wealth of the state and the king's desire to celebrate his victories by monuments of art, and thus arose the so-called "Pergamenean school" in sculpture. The Pergamenean kings appear to have been far more truly Hellenic, and to have admitted far less of the "barbarian" Oriental character to their court, than the other Hellenistic sovereigns, whose habits and surroundings were those of Eastern sultans with a thin surface-gloss of Greek manners. We hear more of the munificence of Attalus towards Athens, than the educational centre of Greece, than to his own capital. The splendour of Pergamum was at its height under Eumenes II. (197-159). He continued true to the Romans during their wars with Antiochus and Perseus, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, great part of Phrygia and Caria. To celebrate the great achievement of his race, the defeat of the barbarian Gauls, he built in the agora a vast altar to Zeus Soter, adorned with sculptures and especially with a gigantic frieze, in which the symbolic theme of the defeat of the barbarian giants by the gods was treated on such a scale, and with such wealth of detail and perfection of technical skill, as made the monument one of the marvels of the ancient world. He devoted great care to the improvement and embellishment of the city. It is not certain when the old Doro temple of Athena Polias and Nicophorus on the Acropolis was replaced by a more magnificent marble temple, but Eumenes planted a grove in the Nicophorion, the sacred precinct of the goddess, and established libraries and other great works in the city. He left an infant son, Attalus (III.), and a brother, Attalus II. (Philadelphus), who ruled 159-138, and was succeeded by his nephew, Attalus III. (Philometor). The latter died in 133, and bequeathed his kingdom to the Romans, who erected it into a province under the name of Asia. Pergamum continued to rank, with Ephesus and Smyrna, as one of the three great cities of the province, and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the acropolis a magnificent temple to Augustus. It was the seat of a *conventus*, including the cities of the Caicus valley and some of those in the northern part of the Hermus valley. Under the Roman empire Pergamum was one of the chief seats of the worship of Asclepius; invalids came from distant parts of the country to ask advice from the god and his priests. The temple and the curative establishment of the god were situated outside the city. Pergamum was one of the early seats of Christianity, and one of the seven churches enumerated in the Revelation was situated

¹ Kindly furnished by M. Buisson Court, head of the well-known house of Notre Dame des Fleurs of Grasse.

there. Two tributaries of the Caucas, named Selinus and Cetus, flowed through or near the city. The ancient name is still preserved under the form "Pergamo."

The excavations conducted by the Prussian Government at Pergamum under the direction of Humann and Bohn have disclosed many of the buildings with which the acropolis was adorned, the temples of Athena and Augustus, the Stoa, &c., have recovered great part of the frieze on the altar of Zeus, and have given materials of every kind for the elucidation of Pergamian history and Greek antiquities generally, which it will take years to classify and place before the public (see the preliminary reports published by Conze, Bohn, and Humann).

PERGOLESI (or **PERGOLESE**), **GIOVANNI BATTISTA** (1710-1736), Italian musical composer, was born at Jesi, Ancona, 3d January 1710, and educated at Naples in the Conservatorio dei Poveri di Gesù Cristo, where he studied the violin under Domenico de Matteis, and counterpoint under Gaetano Greco, Durante, and Francesco Feo. While learning all he could from these great teachers he struck out from the very first a style of his own, and brought it prominently forward in his earliest known composition, an oratorio, called *La Conversione di S. Guglielmo*, performed in the church of S. Agnello in 1731, in which year he also produced his first opera, *Sallustia*, at the Teatro Fiorentino. After receiving further instruction from Vinci he produced another opera, *Reclamo*, which failed lamentably. This disappointment led him to devote his chief attention to church music; and his next great works—two masses, one for two and the other for four choirs, with double orchestra—established his reputation as a genius of the highest order, and proved that he was at least as great in his newly-adopted style as in his dramatic pieces. Nevertheless, the greatest success that he was ever destined to attain was reserved for his celebrated intermezzo¹—or, as we should now call it, operetta—*La Serva Padrona*. This delightful work, fairly successful on the occasion of its first production in 1731 or 1733, became after Pergolesi's death a recognized favourite at every theatre of importance in Europe. In 1746 it found its way to Paris, and had a long run at the Théâtre Italien, followed in 1752 by an equally successful one at the Académie. Two years later it was translated into French, and ran for 150 successive nights. As late as 1867 it was revived in this form at the Opéra Comique; and in 1873 it was revived in London at the Royalty Theatre. The libretto by Nelli is unusually bright and sparkling; and so fresh is the music that it still sounds as if composed but yesterday. In this characteristic, indeed, lies the secret of its extraordinary success, for the scale on which it is written is of the smallest imaginable dimensions. The dramatic persons consist of three characters only, one of them being mute, and the orchestra is limited entirely to the stringed band, unrelieved by a single wind instrument. But the fire of genius breathes in every bar, and the whole work has the character of a continuous inspiration.

In 1734 Pergolesi was appointed maestro di cappella at Loreto. Soon after this his health began to fail rapidly, but he worked on necessarily to the end. His last compositions were a cantata for a single voice, *Orfeo ed Euridice*, a lovely *Salve Regina*, also for a single voice; and his famous *Stabat Mater*, for two female voices. For this last named work—the best known of all his sacred compositions—he received in advance ten ducats (£1 15s.), and thought the price enormous. He was barely able to finish it before his death, which took place at Pozzuoli, 16th March 1736.

Pergolesi's works comprise fourteen operas and intermezzi, nineteen sacred compositions, and many charming pieces of chamber music—a long list, when one remembers that he died at the age of 26 years and 3 months. The purity of his style has not been ex-

ceeded by any composer of the Italian school, and in his orchestral effects and other points of little less importance he shows himself immensely in advance of all his predecessors.

PERLANDER was born about 665 B.C. and succeeded his father Cypselus as despot of Corinth in 625 B.C. His rule appears to have been at first mild and beneficent, but evil advice or domestic calamity converted him into a cruel tyrant. There runs a well-known story that he sent to ask the advice of Thrasylus, tyrant of Miletus, who, instead of replying, walked with the messenger through a cornfield and struck off as he walked the tallest and fairest of the ears. Perlander took the hint, and proceeded to exterminate the most eminent of his subjects.¹ Whatever the cause, there seems no reason to doubt that the latter part of the despot's life was darkened by crime. Goaded by the slanders of concubines, he murdered his beloved wife Melissa, daughter of Procles, tyrant of Epidaurus, and then, in a fit of remorse, burned the slanderers alive.² The murder of his wife alienated from the tyrant the affection of his favourite son Lycophron, whom, failing to move either by rigour or blandishments, he banished to Corcyra, then a dependency of Corinth. At last, enfeebled by age, Perlander offered to resign the tyranny to his son and to retire himself to Corcyra, but the prospect alarmed the Corcyreans, and they put Lycophron to death. The tyrant took his revenge by sending three hundred of the noblest Corcyrean youths to Alyattes, king of Lydia, to be made eunuchs of, they were rescued, however, by the Samians. Perlander did not long survive his son, he fell into a deep despondency, and died either of grief or by violence voluntarily incurred in 585 B.C., at the age of eighty.

The accounts of Perlander's character are at first sight discrepant. One writer (Hecataeus) describes him as just and moderate, an enemy of vice and luxury, which he severely repressed. But more commonly he appears as cruel and avaricious. He surrounded himself with a body-guard, and, according to Aristotle, reduced tyranny to a system by putting down eminent and aspiring citizens, impoverishing the rich, maintaining spies, and sowing distrust between classes and individuals. His costly offerings to the gods drained the resources, while his public works and constant wars taxed the energies and distracted the attention of the citizens. The privilege of settling in Corinth was placed by him upon a certain service. On the other hand, he not only patronized literature in the person of the poet Arion but was himself the author of a collection of moral maxims in 2000 verses. His reputation for wisdom stood so high that he was commonly reckoned amongst the seven wise men, though some, as Plato, denied his claim. Amongst the wars to which he owed his military fame were successful expeditions against Epidaurus and Corcyra. He built a fleet and scoured the seas on both sides of the Isthmus, through which it is said that he meditated cutting a canal. To him were due the Greek colonies of Apollonia, Anactorium, and Leucas. On the whole, Perlander would appear to have been one of those brilliant despots whose personal vices have not destroyed their literary and artistic sense, and who by their abilities have raised the states which they governed to a high pitch of outward prosperity and power. Certain it is that with the close of his dynasty, which happened a few years after his death, when his successor Pausanias perished in a popular rising, the golden age of Corinthian history came to an end.

There was another Perlander, tyrant of Ambracia, said to have been a relative of the tyrant of Corinth. He was deposed by the people, probably not long after the death of the latter.

¹ The chief authorities in the life of Perlander are Hecataeus (ii. 48-49, v. 62), Aristotle (*Pol.*, v. 11, 12), Hecataeus Ponticus (v.), Nysid Damascus (59, 60), Diog. Laert. (1, 7). The letters in Diogenes ascribed to Perlander are no doubt spurious.

² In Aristotle's version of the story the rôles of Perlander and Thrasylus are reversed.

³ The relations of Perlander to his dead wife form the subject of a curious tale. It is said that he got a necromancer to call up the spirit of Melissa (as Saul called up Samuel), in order to question him about a hidden treasure, just as people in Württemberg used to call up ghosts in churchyards for a similar purpose. But the ghost refused to answer. "For," said she, "I am cold; I cannot wear the garments laid in my grave, because they have not been burned." So Perlander called together all the women of Corinth in their best attire as for a festival, stripped them, and burned their garments on the grave of his wife, that her ghost might not go naked. Similar to this is the story in Lucian of the ghost of a dead wife appearing to her husband and begging him to find and burn one of her golden sandals which had fallen underneath the chest and so had not been burned with the other.

¹ A light buffo piece, the acts of which were interpolated, for the sake of relief, between those of a serious opera.

PERICLES, a great Athenian statesman, and one of the most remarkable men of antiquity, was the son of Xanthippus, who commanded the Greeks at the battle of Mycale in 479 B.C. By his mother Agariste, niece of Cleisthenes, who reformed the democracy at Athens after the expulsion of the Pisistratids, he was connected both with the old princely line of Sicyon and with the great but unfortunate house of the Alcmeonidae.¹ The date of his birth is unknown, but his youth must have fallen in the stirring times of the great Persian war. From his friendship with the poet Anacreon, his father would seem to have been a man of taste, and as he stood in relations of hospitality to the Spartan kings his house was no doubt a political as well as literary centre. Pericles received the best education which the age could supply. For masters he had Pythocles and the distinguished musician Damon, who infused into his music lessons a tincture of philosophy, whereby he incurred the suspicions of the vulgar, and received the honour of ostiasim.² Pericles listened also to the subtle dialectics of the Eleatic Zeno. But the man who swayed him most deeply and permanently was the philosopher Anaxagoras. The influence of the speculative genius and dignified and gentle character of the philosopher who resigned his property that he might turn his thoughts more steadily to heaven, which he called his home, and who begged as his last honour that the school-children might have a holiday on the day he died, can be traced alike in the intellectual breadth and the elevated moral tone of the pupil, in his superiority to vulgar superstitions, and in the unflinching serenity which he preserved throughout the storms of political life.³ It was probably the grand manner of Pericles even more than his eloquence that won him the surname of Olympian Zeus.⁴ In his youth he distinguished himself in the field, but eschewed politics, fearing, it is said, the suspicions which might be excited in the populace not only by his wealth, high birth, and powerful friends, but by the striking resemblance to the tyrant Pisistratus which old men traced in his personal appearance, musical voice, and flowing speech. But, when the banishment of Themistocles⁵ and the death of Aristides had somewhat cleared the political stage, Pericles came forward as the champion of the democratic or progressive party, in opposition to Cimon, the leader of the aristocratic or conservative party. The two leaders differed hardly less than their policies. Both indeed were men of aristocratic birth and temper, honourable, brave, and generous, faithful and laborious in the service of Athens. But Cimon was a true sailor, blunt, jovial, freeheaded, who sang a capital song, and was always equally ready to drink or fight, to whose artless mind (he was innocent of even a smattering of letters⁶) the barrack-room life of the barbarous Spartans seemed the type of human perfectibility, and whose simple programme was summed up in the

maxim "fight the Persians." Naturally the new ideas of political progress and intellectual development had no place in his honest head, naturally he was a sturdy supporter of the good old times of which, to the popular mind, he was the best embodiment. Pericles, grave, studious, reserved, was himself penetrated by those ideas of progress and culture which he undertook to convert into political and social realities; philosophy was his recreation, during the whole course of his political career he never accepted but once an invitation to dinner, and he was never to be seen walking except between his house and the popular assembly and senate-house. He husbanded his patrimony and regulated his domestic affairs with rigid economy that he might escape both the temptation and suspicion of enriching himself at the public expense.

The steps by which he rose to the commanding position which he occupied in later life cannot be traced with certainty. According to Plutarch, Pericles, whose fortune did not allow him to imitate the profuse hospitality by which Cimon endeared himself to the people, sought to outbid him by a lavish distribution of the public moneys among the poorer classes, this device was suggested to him by Damonides, says Plutarch on the authority of Aristotle. We may doubt the motive alleged by Plutarch, but we cannot doubt the fact that Pericles did extend, if not originate, the practice of distributing large sums among the citizens either as gratuities or as payment for services rendered,—a practice which afterwards attained most mischievous proportions. According to Plato (*Gorgias*, 515 E), it was a common saying that Pericles, by the system of payments which he introduced, had corrupted the Athenians, rendering them idle, cowardly, talkative, and avaricious. It was Pericles who introduced the payment of jurymen, and, as there were 6000 of them told off annually for duty, of whom a great part sat daily, the disbursement from the treasury was great, while the poor and idle was encouraged to live at the public expense. But the payment for attendance on the public assembly or parliament (of which all citizens of mature age were members), though probably suggested by the payment of the jurymen, was not introduced by Pericles, and indeed does not seem to have existed during his lifetime.⁷ It was he who instituted the payment of the citizens for military service,⁸—a measure but for which the Athenians would probably not have prolonged the Peloponnesian War as they did, and in particular would not have been so ready to embark on the fatal Sicilian expedition. There was more justification, perhaps, for the practice, originated by Pericles, of supplying the poorer citizens from the public treasury with the price of admission to the theatre. For in an age when the study of the poets formed a chief element of education, and when the great dramas of Æschylus, Sophocles, and Euripides were being put on the stage in all their freshness, such a measure may almost be regarded as a state provision for the education of the citizens. It was part of the policy of Pericles at once to educate and delight the people by numerous and splendid festivals, processions, and shows. But the good was mixed with seeds of evil, which took root and spread, till, in the days of Demosthenes, the money which should have been spent in fighting the enemies of Athens was squandered in spectacles and pageants. The Spectacular Fund or *Theorikon* has been called the cancer of Athens. Vast sums were further spent by Pericles in adorning the city with those buildings which even in their ruins are the wonder of the world. Amongst these were the Parthenon, or Temple of the Virgin (Athena), and the Erechtheum,

¹ Herod., vi. 121.

² Plut., *Per.*, 4; cp. Plato, *Laches*, pp. 180, 197, 200, and *Rep.*, 400, 424.

³ If the statement reported by Diogenes Laertius (i. 3, 7), that Anaxagoras spent thirty years at Athens, is correct, he probably arrived there about 462, and Pericles must have reached maturity before he met him (see Zeller, *Die Philosophie der Griechen*, i. p. 865 sq.).

⁴ It is said that once, when Pericles was transacting business in public, a low fellow raised at him all day long, and at length dogged him to his house, reviling him in the foulest language. Pericles took no notice of him till he reached his own door, when he bade one of the servants take a torch and light the man home.

⁵ Varnally placed in 476 (Kruger), 471 (Clinton), and 470 (Curtius). Considerable divergence of opinion prevails as to the dates of most events between the Second Persian War and the outbreak of the Peloponnesian War (see Pearson, in *Philologia*, 1869; Clemen's *Theophrastus*, book i. Añh.). Pericles, who died in 429, is said to have had a public life of forty years, hence he probably began to take part in politics about 469.

⁶ Plut., *Cim.*, 4. It is amusing to read of this stout old man sitting in judgment on the respective merits of Æschylus and Sophocles (ib., 8).

⁷ See Boeckh, *Sittenabstättung der Athenen*, i. p. 320; Curtius, *Griech. Gesch.*, ii. pp. 227, 242.

both on the Acropolis, the former completed in 438,¹ the latter left unfinished at Pericles's death, the magnificent Propylæa or vestibule to the Acropolis, built 437-432, and the Odeum or music-hall, on the south-eastern slope of the Acropolis, completed before 444. The musical contests instituted by Pericles, and for which he himself laid down the rules and acted as judge, took place in the Odeum. Many artists and architects were entrusted with the execution of these great works, but under the direction of the master-mind of Phidias, sculptor, architect, painter,—the Michelangelo of antiquity. But Pericles fortified as well as beautified Athens. It had been the policy of Themistocles to make her primarily a naval and commercial power, and to do so he strengthened the marine, and gave to the city as far as possible the advantages of an insular situation by means of fortifications, which rendered both it and its port (the Piræus) impregnable on the land side. By thus basing the Athenian state on commerce instead of, like Solon, on agriculture,² he at the same time transferred the political predominance to the democratic or progressive party, which is as naturally recruited from a commercial as a conservative or aristocratic party is from an agricultural population. This policy was fully accepted and carried out by Pericles. It was in his time and probably by his advice that the Long Walls were built, which, connecting Athens with Piræus, converted the capital and its seaport into one vast fortress.³ Further, in order to train the Athenians in seamanship, he kept a fleet of sixty ships at sea eight months out of every year. The expenses entailed by these great schemes were chiefly defrayed by the annual tribute, which the confederates of Athens originally furnished for the purpose of waging war against Persia, but which Athens, as head of the league, subsequently applied to her own purposes. If, as seems probable, the transference of the treasury of the league from Delos to Athens, which sealed the conversion of the Athenian headship into an empire, took place between 460 and 454, the step was probably suggested or supported by Pericles, and at all events he managed the fund after its transference.⁴ But, though the diversion of the fund from its original purpose probably did not begin with Pericles, yet, once established, he maintained it unwaveringly. The Athenians, he held, fulfilled the trust committed to them by defending their allies against all comers, and the tribute (increased during his administration from 460 to 600 talents annually) was their wages, which it was their right and privilege to expend in works which by employing labour and stimulating commerce were a present benefit, and by their beauty would be "a joy for ever." That Athens ruled by force, that her empire was in fact a

tyranny, he fully admitted, but he justified that tyranny by the high and glorious ends which it subserved.⁵

The rise of Pericles to power, though it cannot be followed step by step, has an obvious and sufficient explanation in his combined wisdom and eloquence. Plato traces his eloquence largely to the influence of Anaxagoras; intercourse with that philosopher (he says) filled the mind of Pericles with lofty speculations and a true conception of the nature of intelligence, and hence his oratory possessed the intellectual grandeur and artistic finish characteristic of the highest eloquence (*Phædrus*, 270 A). The range and compass of his rhetoric were wonderful, extending from the most winning persuasion to the most overwhelming denunciation. The comic poets of the day, in general very unfriendly to him, speak with admiration of his oratory: "greatest of Grecian tongues," says Cratinus, "persuasion sat on his lips, such was his charm," and "he alone of the orators left his sting in his hearers," says Eupolis; "he lightened, he thundered," says Aristophanes. His speeches were prepared with conscientious care; before rising to speak he used to pray that no inappropriate word might fall from his lips.⁶ He left no written speeches,⁷ but the few sayings of his which have come down to us reveal a passionate imagination such as breathes in the fragments of Sappho. Thus, in speaking of those who had died in war, he said that the youth had perished from the city like the spring from the year.⁸ He called the hostile island of Ægina "the eye-sore of the Piræus," and declared that he saw war "lowering from Peloponnesus." Three of his speeches have been reported by Thucydides, who may have heard them, but, though their substance may be correctly recorded, in passing through the medium of the historian's dispassionate mind they have been shorn of the orator's imaginative glow, and in their cold iron logic are hardly to be distinguished from the other speeches in Thucydides. An exception to this is the speech which Thucydides reports as having been delivered by Pericles over the slain in the first year of the Peloponnesian War. This speech stands quite apart from the others, and as well in particular touches (e.g., the saying that "the grave of great men is the world") as in its whole tenor we catch the ring of a great orator, such as Thucydides with all his genius was not. It is probably a fairly close report of the speech actually delivered by Pericles.

The first public appearance of Pericles of which we have record probably fell about 463. When Cimon, on his return from the expedition to Thasos, was tried on the utterly improbable charge of having been bribed by the Macedonian king to betray the interests of Athens, Pericles was appointed by the people to assist in conducting the prosecution; but, more perhaps from a conviction of the innocence of the accused than, as was said, in compliance with the entreaties of Cimon's sister Elpinice, he did not press the charge, and Cimon was acquitted. Not long afterwards Pericles struck a blow at the conservative

¹ The date of the commencement of the Parthenon is variously put at 444 (Leake), 454 (Michaelis), and 460 (Wachsmuth). From an inscription it would seem that the building was finished at least as far back as 447. See Curtius, *Gr. Gesch.*, ii. p. 852.

² Solon's classification of the citizens for political purposes rested exclusively on the possession of cultivated land.

³ There were three of these walls, of which the northern (to Piræus) and the southern (to Phalerum) were completed after the battle of Cnephya (Thucyd., i. 108) in 456. The foundation of these two walls seems to have been laid by Cimon (Plut., *Cim.*, 13) about 462. See Leake's *Topography of Athens*, i. p. 124. Some scholars, relying on an interpretation of Thucydides (i. 107, 108), suppose that these walls were begun in one year and finished in the next. But considering the length of the walls (8 miles) and their massiveness (as shown by their remains) this seems quite impossible. The middle wall, which ran parallel to the northern wall and at no great distance from it, was built later (it was not begun before 449, Andocides, *De pace cum Lacet.*, 7, and the progress was slow, Plut., *Per.*, 13), and there is no doubt that Pericles advised its construction (Plato, *Gorgias*, 455 E). The wall to Phalerum seems afterwards to have fallen into decay, and the middle wall then went by the name of the southern, and it and the northern were known as the Long Walls (Harpocration, s.v. *διὰ μέγαν ῥεύμα*, Leake, i. p. 427).

⁴ Justin, ii. 6, 4, Diod., xi. 38, Curtius, *Gr. Gesch.*, ii. 168, 387.

⁵ Cf. Thucyd., i. 143, and ii. 63, 64; Plut., *Per.*, 12.

⁶ Compare the story in Piatarch (*De educ. juv.*, 9), that on one occasion, though repeatedly called on by the people to speak, he declined to do so, saying that he was unprepared.

⁷ Plut., *Per.*, 8. In the time of Cicero there were some writings bearing his name (*Brutus*, 7, 27; *De Or.*, ii. 22, 93), but they were no doubt spurious. Cf. Quintilian, ii. 1, 12; xii. 2, 22 and 10, 49.

⁸ Cope (on Aristotle, *Rhetoric*, i. 7, 34) denies that Pericles was the author of the saying. His only plausible ground is that a similar saying is attributed to Gelson by Herodotus (vii. 162).

It is more open to question whether the simile occurred in the funeral speech delivered at the close of the Samian War, or in that during the Peloponnesian War, but the former is more probable. In Thucydides's report of the latter speech the simile does not occur.

party by attacking the Areopagus, a council composed of life-members who had worthily discharged the duties of archon. The nature of the functions of the Areopagus at this period is but little known, it seems to have had a general supervision over the magistrates, the popular assembly, and the citizens, and to have exercised this supervision in an eminently conservative spirit. It sat also as a court for the trial of certain crimes, especially murder. Pericles seems to have deprived it of nearly all its functions, except its jurisdiction in cases of murder.¹ The poet Æschylus composed his *Eumenides* in vindication of the ancient privileges of the Areopagus. Though Pericles was the real author of the attack on the Areopagus, the measure was nominally carried by Ephialtes. It was, indeed, part of Pericles's policy to keep in the background, and to act as far as possible through agents, reserving himself for great occasions. Ephialtes, a friend of Pericles, and a patriot of inflexible integrity, paid dearly for the distinction, he fell by the hand of an assassin employed by the oligarchical party,—an event the more striking from the rarity of political assassinations in Greek history. The popular party seems to have immediately followed up its victory over the Areopagus by procuring the ostracism of Cimon,² which strengthened the hands of Pericles by removing his most influential opponent (461). Pericles took part in the battle of Tanagra (457) and bore himself with desperate bravery. After the battle Cimon was recalled from banishment, and it was Pericles who proposed and carried the decree for his recall. In 454 Pericles led an Athenian squadron from the port of Pegae on the Cornithian Gulf, landed at Sicyon, and defeated the inhabitants who ventured to oppose him; then, taking with him a body of Achæans, he crossed to Acarnania, and besieged the town of Cénadiæ, but had to return home without capturing it. Not long afterwards³ Pericles conducted a successful expedition to the Thracian Chersonese, where he not only strengthened the Greek cities by the addition of 1000 Athenian colonists, but also protected them against the incursions of the barbarians by fortifying the isthmus from sea to sea. This was only one of Pericles's many measures for extending and strengthening the naval empire of Athens. Colonies were established by him at various times in Naxos, Andros, Oreus in Eubœa (in 448), Brea in Macedonia (about 443), and Ægina (in 431). They served the double purpose of establishing the Athenian power in distant parts and of relieving the pressure of population at Athens by providing the poorer citizens with lands. Somewhat different were the famous colonies established under Pericles's influence at Thurii in Italy, on the site of the ancient Sybaris (in 443), and at Amphipolis on the Strymon (in 437), for, though planted under the conduct of Athens, they were not exclusively Athenian colonies, other Greeks being allowed, and even invited, to take part in them. This was especially true of Thurii, which was in a manner a national Greek colony, and never stood in a relation of subjection to Athens. On one occasion (some time apparently between 454 and 449)⁴

Pericles sailed at the head of a splendid armament to the Black Sea, where he helped and encouraged the Greek cities and overawed the barbarians. At Sinope he left a force of ships and men under the gallant Lámachus, to co-operate with the inhabitants against the tyrant Timæus, and on the expulsion of the tyrant and his party he carried a decree for the despatch of 600 Athenian colonists to Sinope, to occupy the lands vacated by the exiles. But, with the sober wisdom which characterized him, Pericles never allowed his plans to exceed the bounds of the possible; he was no political dreamer like Alcibiades, to be dazzled with the vision of a universal Athenian empire in Greece, Italy, and Africa, such as floated before the minds of many in that and the following generations.⁵ The disastrous expedition which the Athenians sent to Egypt, to support the rebel Inarus against Persia (460-455), received no countenance from Pericles.

When Cimon died in 449 the aristocratical party sought to counterbalance the power of Pericles by putting forward Thucydides, son of Melesias, as the new head of the party. He seems to have been an honest patriot, but, as the event proved, he was no match for Pericles. The Sacred War in 448 showed once more that Pericles knew how to defend the interests of Athens. The Phocians, under the protection of Athens, had wrested the control of the Delphic oracle from their enemies the Delphians. The latter were friendly to Sparta, and accordingly the Spartans marched into Phocis and restored the oracle to the Delphians. When they had departed, Pericles, at the head of an Athenian force, placed the oracle once more in the hands of the Phocians. As the seat of the great oracle, Delphi was to ancient Greece much what Rome was to mediæval Europe, and the friendship of the god, or of his priests, was no small political advantage. When the Athenians despatched a small force under Tolmides to crush a rising in Boeotia, they did so in spite of the warnings of Pericles. These warnings were soon justified by the unfortunate battle of Coronæa (447), which deprived Athens at a blow of the continental dominion she had acquired a few years before by the battle of Ænophytia (456). The island of Eubœa now revolted from Athens, and hardly had Pericles crossed over with an army to reduce it when word came that the Megarians had massacred the Athenian garrison, and, in league with Corinth, Sicyon, and Epidaurus, were up in arms, while a Peloponnesian army under King Plistonax was on the point of invading Attica. Pericles recrossed in haste to Attica. The Peloponnesians returned home, having advanced no farther than Eleusis and Thria. It was said that Pericles had bribed Cleandridas; certain it is that both Cleandridas and Plistonax were charged at Sparta with having misconducted the expedition and were found guilty. Having saved Attica, Pericles returned to Eubœa, reduced it to subjection, expelled the Histians, and settled the Athenian colony of Oreus (446) on their lands. The thirty years' peace, concluded soon afterwards (445) with Sparta, was probably in large measure the work of Pericles. The Athenians had evacuated Boeotia immediately after the battle of Coronæa, and by the terms of the peace they now renounced their other continental possessions,—Achæa, Troezen, Nisæa, and Pegæ. The peace left Pericles at liberty to develop his schemes for promoting the internal welfare of Athens, and for making it the centre of the intellectual and artistic life of Greece. But first he had to settle accounts with his political rival Thucydides, the struggle was soon decided by the ostracism of the latter in 444. Thenceforward to the end of his life Pericles

¹ Cp. Philochorus, 141 b, in Muller's *Fragm. Hist. Græc.*, vol. 1; Plut., *Per.*, 9, and *Cim.*, 16; Aristotle, *Pol.*, 1274 a, 7; Thirlwall's *Hist. of Greece*, ii, pp. 458, 459.

² The ostracism of Cimon lasted between four and five years (Theopompus, 92, in *Fr. Hist. Gr.*; cp. Corn. Nep., *Cimon*, 3). Hence, if his recall took place shortly after the battle of Tanagra (Plut., *Cim.*, 17, and *Per.*, 10), say at the beginning of 456, he must have been ostracized about the middle or latter part of 461. Diodorus (xi 77) places the attack on the Areopagus in 460, but, if that attack preceded (as Plutarch implies) the banishment of Cimon, it would be necessary, in order to harmonize Diodorus and Theopompus, to place the recall of Cimon in 455 or 454—a *s.*, between one and two years after the battle of Tanagra—and this seems forbidden by Plutarch's narrative.

³ In 458, according to Diod., xi 38.

⁴ The expedition is only recorded by Plutarch (*Per.*, 20), and in

mentioned by him immediately after the expedition against Cénadiæ (454) and before the Sacred War (449).

⁵ Thucyd., vi, 15, 90; Diod., xi 54; Plut., *Per.*, 20, and *Alcib.*, 17, Pausan., i, 11, 7.

guided the destinies of Athens alone, in the words of the historian Thucydides, the government was in name a democracy, but in fact it was the rule of the first citizen. The unparalleled ascendancy which he wielded so long over the fickle people is one of the best proofs of his extraordinary genius. He owed it entirely to his personal character, and he used it for the wisest and purest purposes. He was neither a vulgar demagogue to buckle to the passions and caprices of the mob, nor a vulgar despot to cowl it by a hireling soldiery; he was a citizen among citizens, who obeyed him because they trusted him, because they knew that in his hands the honour and interests of Athens were safe. The period during which he ruled Athens was the happiest and greatest in her history, as it was one of the greatest ages of the world. Other ages have had their bright particular stars, the age of Pericles is the Milky Way of great men. In his lifetime there lived and worked at Athens the poets Æschylus, Sophocles, Euripides, Cratinus, Crates, the philosophers Anaxagoras, Zeno, Protagoras, Socrates, the astronomer Meton, the painter Polygnotus, and the sculptors Myron and Phidias. Contemporary with these, though not resident at Athens, were Herodotus, the father of history, Hippocrates, the father of medicine; Pindar, "the Theban eagle", the sculptor Polycritus, and the philosophers Empedocles and Democritus, the latter joint author with Leucippus of the atomic theory. When Pericles died other stars were rising or soon to rise above the horizon,—the historians Thucydides and Xenophon, the poets Eupolis and Aristophanes, the orators Lyias and Isocrates, and the gifted but unscrupulous Alcibiades. Plato was born shortly before or after the death of Pericles. Of this brilliant circle Pericles was the centre. His generous and richly-endowed nature responded to all that was beautiful and noble not only in literature and art but in life, and it is with justice that the age of Pericles has received its name from the man in whom, more than in any other, all the various lines of Greek culture met and were harmonized. In this perfect harmony and completeness of nature, and in the classic calm which was the fruit of it, Pericles is the type of the ideal spirit, not of his own age only, but of antiquity.

It seems to have been shortly after the ostracism of Thucydides that Pericles conceived the plan of summoning a general congress of all the Greek states to be held at Athens. Its objects were the restoration of the temples which the Persians had destroyed, the fulfilment of the vows made during the war, and the establishment of a general peace and the security of the sea. Invitations were sent to the Greeks of Asia, the islands from Lesbos to Rhodes, the Hellespont, Thrace, Byzantium, Boeotia, Phocia, Peloponnesus, Locria, Acarnania, Ambracia, and Thessaly. The aim of Pericles seems to have been to draw the bonds of union closer between the Greeks and to form a national federation. The beneficent project was defeated by the short-sighted opposition of the Spartans. But, if in this scheme Pericles rose above the petty jealousies of Greek politics, another of his measures proves that he shared the Greek prejudices as to birth. At an early period of his career (apparently about 460) he enacted, or perhaps only revived,¹ a law confining the rights of Athenian citizenship to persons both of whose parents were Athenian citizens. In the year 444, on the occasion of a scrutiny of the list of citizens, nearly 5000 persons claiming to be citizens were proved to be aliens under this law, and were ruthlessly sold into slavery.

The period of the thirty years' peace was not one of uninterrupted tranquillity for Athens. In 440 a war broke out between the island of Samos (a leading member

of the Athenian confederacy) and Miletus. Athens sided with Miletus; Pericles sailed to Samos with an Athenian squadron, and established a democracy in place of the previous oligarchy. After his departure, however, some of the exiled oligarchs, in league with Pisistratus, satrap of Sardis, collected troops and, crossing over to Samos, overpowered the popular party and revolted from Athens. In this revolt they were joined by Byzantium. The situation was critical, the example set by Samos and Byzantium might be followed by the other confederates. Pericles discerned the danger and met it promptly. He led a squadron of sixty ships against Samos; and, after detaching some vessels to summon reinforcements from Chios and Lesbos, and others to look out for the Phœnician fleet which the Persians were expected to send to the help of Samos, he gave battle with forty-four ships to the Samian fleet of seventy sail and defeated it. Having received reinforcements of sixty-five ships, he landed in Samos and laid siege to the capital. But, when he sailed with sixty ships to meet the Phœnician vessels which were reported to be near, the Samians sallied out with their vessels, defeated the besiegers, and remained masters of the sea for fourteen days. On his return, however, they were again blockaded, and were compelled to surrender, nine months after the outbreak of the war (spring of 439).

Though Pericles enjoyed the confidence of the people as a whole, his policy and opinions could not fail to rouse the dislike and suspicions of many, and in the last years of his life his enemies combined to assail him. Two points in particular were singled out for attack, his administration of the public moneys and his religious opinions. With regard to the former there must always be a certain number of persons who will not believe that others can resist and despise a temptation which to themselves would be irresistible, with regard to the latter, the suspicion that Pericles held heretical views on the national religion was doubtless well grounded. At first, however, his enemies did not venture to impeach himself, but struck at him in the persons of his friends. In 432² Phidias was accused of having appropriated some of the gold destined for the adornment of the statue of Athene in the Parthenon. But by the prudent advice of Pericles the golden ornaments had been so attached that they could be taken off and weighed, and when Pericles challenged the accusers to have recourse to this test the accusation fell to the ground. More dangerous, for more true, was the charge against Phidias of having introduced portraits of himself and Pericles into the battle of the Amazons, depicted on the shield of the goddess. The sculptor appeared as a bald old man lifting a stone, while Pericles was represented as fighting an Amazon, his face partly concealed by his raised spear. To the pious Athenians this seemed a desecration of the temple, and accordingly Phidias was clapped into goal. Whether he died there or at Elis is uncertain.³ Even more deeply was Pericles wounded by the accusation levelled at the woman he loved. This was the famous Aspasia, a native of Miletus, whose talents won for her general admiration at Athens. Pericles divorced his wife, a lady of good birth who had borne him two sons, Xanthippus and Paralus, but with whom he was unhappy, and attached himself to Aspasia. With her he lived on terms of devoted affection to the end of his life, though, as she was a foreigner, their union was not a legal marriage. She enjoyed a high reputation as a teacher of rhetoric, and

¹ See Schömann's *Antiquities of Greece*, p. 357, Eng. tr.; Hermann's *Staatsalterthümer*, § 118.

² A scholiast on Aristoph., *Pax*, 606, places the condemnation of Phidias seven years before the outbreak of the Peloponnesian War, or in 438 (according to Palmer's correction), see Müller *ad l.*, in *Fræg. Hist. Gr.*, v. p. 18.

³ Different views of the fate of Phidias are taken by scholars. See PHIDIAS.

seems to have been the centre of a brilliant intellectual society, which included Socrates and his friends. The comic poet, Hermippus, brought her to trial on the double charge of impiety and of corrupting Athenian women for the gratification of Pericles. A decree was further carried by a religious fanatic named Diophtes, whereby all who denied the existence of the gods or discussed the nature of the heavenly bodies were to be tried as criminals. This blow was aimed directly at the aged philosopher Anaxagoras, but indirectly at his pupil Pericles as well as at Aspasia. When this decree was passed, and apparently while the trial of Aspasia was still pending, Pericles himself was called upon by a decree of the people to render an account of the money which had passed through his hands. The result is not mentioned, but we cannot doubt that the matter either was dropped or ended in an acquittal. The perfect integrity of Pericles is proved by the unimpeachable evidence of his contemporary, the historian Thucydides. Aspasia was acquitted, but not before Pericles had exerted all his eloquence in her behalf. Anaxagoras, tried on the charge of impiety, was obliged to quit the city.¹

It was in the same year (432) that the great contest between Athens and Sparta, known as the Peloponnesian War, broke out. We may dismiss as a vulgar calumny the statement, often repeated in antiquity,² but quite unsupported by Thucydides, that the war was brought about by Pericles for the purpose of avoiding a prosecution. The war was in truth inevitable; its real cause was Sparta's jealousy of the growing power of Athens, its immediate occasion was the help lent by Athens to Corcyra in its war with Corinth. At first, with a hypocritical regard for religion, the Spartans demanded as a condition of peace that the Athenians should expel the race of the Alcmaeonidae (including, of course, Pericles), whose ancestors had been guilty of sacrilege about two centuries before. The Athenians retorted in kind, and, after a little more diplomatic fencing, the Spartans were constrained to show their hand by demanding bluntly that Athens should give back to the Greeks their independence,—in other words, renounce her empire and abandon herself to the tender mercies of Sparta. Pericles encouraged the Athenians to reject the demand. He pointed out that Athens possessed advantages over the Peloponnesians in superior wealth and greater unity of counsels. He advised the Athenians, in case of war, not to take the field against the numerically superior forces of the Peloponnesians, but to allow the enemy to ravage Attica at will, while they confined themselves to the defence of the city. Through their fleet they would maintain communication with their island empire, procure supplies, and harass the enemy by sudden descents on his coasts. By pursuing this defensive policy without attempting to extend their empire, he predicted that they would be victorious. The people hearkened to him and replied to the Spartan ultimatum by counter-demands, which they knew would not be accepted. Pericles had not neglected in time of peace to prepare for war, and Athens was now well equipped with men, money, and ships. In June of the following summer (431) a Peloponnesian army invaded Attica. By the advice of Pericles the rural population, with their movables, had taken refuge in the city, while the cattle had been sent for safety to the neighbouring islands. The sight of their country ravaged under their eyes excited in the Athenians a long ing to march out and meet the enemy, but in the teeth of popular clamour and obloquy Pericles steadily adhered to

his defensive policy, content to protect the suburbs of Athens with cavalry. Meanwhile, Athenian fleets retaliated upon the enemy's coasts. About the same time, as a punishment for the share that they were supposed to have had in binging on the war, the whole population of Ægina was expelled from their island to make room for Athenian colonists. This measure, directed by Pericles, relieved to some extent the pressure in the overcrowded capital, and secured a strong outpost on the side of the Peloponnesus. In the autumn, after the Peloponnesian army had been obliged by want of provisions to quit Attica and disband, Pericles conducted the whole available army of Athens into the territory of Megara, and laid it waste.

It was a custom with the Athenians that at the end of a campaign the bones of those who had fallen in battle should be buried with public honours in the beautiful suburb of Caramicus, the Westminster of Athens, and the vast crowd of mourners and spectators gathered about the grave was addressed by a citizen chosen for his character and abilities to pay the last tribute of a grateful country to its departed brave. On the present occasion the choice fell on Pericles. Once before, at the close of the Samian War, it had been his lot to discharge a similar duty. The speech which he now delivered, as reported to us by Thucydides, is one of the noblest monuments of antiquity. It is indeed the creed of Athens and of Greece. In its aristocratic republicanism—recognizing at once the equal legal rights and the unequal intrinsic merits of individuals—it differs alike from the monarchical spirit of mediæval and modern Europe, with its artificial class distinctions, and from that reactionary communism which preaches the natural as well as the legal equality of men. In its frank admiration of art and letters and all the social festivals which humanize and cheer life it is as far from the sullen asceticism and the wild debauchery of the East, as the grave and manly simplicity of its style is removed from the fanciful luxuriance of Oriental rhetoric. Finally, in the words of comfort—a exhortation addressed to the bereaved, the speech—“to adopt Thirlwall's description of another great effort of Athenian oratory³”—“beathes the spirit of that high philosophy which, whether learnt in the schools or from life, has consoled the noblest of our kind in prisons, and on scaffolds, and under every persecution of adverse fortune.”

The fortitude of the Athenians was put to a still severer test in the following summer (430), when to the horrors of war (the Peloponnesians had again invaded Attica) were added the horrors of the plague, which spread havoc in the crowded city. Pericles himself escaped the scourge,⁴ but many of his relations and best friends, amongst them his sister and his two sons Xanthippus and Paralus, were struck down. With the elder of his sons, Xanthippus, a worthless young man, the father had been on bad terms, but the death of his surviving son, at an interval of a few days, affected him deeply, and, when he came to lay the wreath upon the corpse, though he struggled hard to maintain his habitual calm, he broke down, and for the first time in his public life burst into a passion of weeping.⁵ But neither private grief nor public calamity shook for a moment the lofty courage and resolution with which he continued to the last to oppose a firm front alike to enemies without and to cravens within. While refusing as before to risk a battle in Attica, which he allowed the Peloponnesians

¹ The speech of Demosthenes “On the Crown.”

² Pintarch, admitting that Pericles was not attacked by the plague in its acute form, believes that it so far affected him as to throw him into a lingering decline. But we do not gather from Thucydides's description of the plague that it ever had this effect.

³ Aristophanes, *Pax*, 605 sq., with schol. ad l.; Diod., xii. 38-40; Plut., *Per.*, 31, 32; Aristodemus, xvi., Suidas, s.v. “*ῥηδίας*”

⁴ Not inconsistent with this are the accounts of the general fortitude with which he bore his bereavement (Plut., *Consol. ad Apoll.*, 33; *Ælian, Var. Hist.*, ix. 6, Val Max., v. 10).

to devastate at pleasure, he led in person a powerful fleet against Peloponnesus, ravaged the coast, and destroyed the town of Prasie in Laconia. But the Athenians were greatly disheartened; they sued for peace, and when their suit was rejected by Sparta they vented their ill-humour on Pencilas, as the author of the war, by subjecting him to a fine. However, they soon repented of this burst of petulance, and atoned for it by re-electing him general¹ and placing the government once more in his hands. Further, they allowed him to legitimate his son by Aspasia, that his house might not be without an heir. He survived this reconciliation about a year, but his name is not again mentioned in connexion with public affairs. In the autumn of 429 he died. We may well believe that the philosophy which had been the recreation of his happier days supported and consoled him in the clouded evening of his life. To his clement nature it was a peculiar consolation to reflect that he had never carried political differences to the shedding of blood. Indeed, his extraordinary, almost fatherly, tenderness for the life of every Athenian citizen is attested by various of his sayings.² On his deathbed, when the friends about him were telling his long roll of glory, rousing himself from a lethargy into which he had fallen, he reminded them of his faintest title to honour. "No Athenian," he said, "ever put on black through me."

He was buried amongst the great dead in the Ceramicus, and in after years Phormio, Thrasylbulus, and Chabrias slept beside him.³ In person he was graceful and well made, save for an unusual height of head, which the comic poets were never weary of ridiculing. In the busts of him which we possess, his regular features, with the straight Greek nose and full lips, still preserve an expression of Olympian repose.

The chief, perhaps the only trustworthy, authority for the life of Pencilas is the history of his contemporary Thucydides. The biography by Plutarch is compiled from Thucydides, Ephorus, Ion, Stesimbrotus, Demis of Samos, Aistatos, Alcmanus, Echinus, and Heraclides Ponticus, together with the comic poets Cratinus, Taldides, Ekmippus, Plato, Epullos, and . . . stophanes Ephorus, a pupil of Isocrates, must have had plenty of means of ascertaining the facts, but how little his judgment is to be trusted is shown by his account of the origin of the Peloponnesian War,—an account also followed by Diodorus Siculus, whose history adds nothing of importance to the narratives of Thucydides and Plutarch. Ion and Stesimbrotus were contemporaries of Pencilas, but, as both were admirers of Cimon and opposed to the policy of Pencilas, their accounts have to be received with caution. (J. G. FR.)

PERIDOTE, a name applied by jewellers to the green transparent varieties of olivine. When yellow, or yellowish-green, the stone is generally known as "chrysolite." The colour of the peridote is never vivid, like that of emerald, but is usually some shade of olive-, pistachio-, or leek-green. Although sometimes cut in rose-forms and *en cabochon*, the stone displays its colour most advantageously when it is worked in small steps. Unfortunately the peridote is the very softest of gem-stones, its hardness being only about 6.5, or but little above that of glass; hence the stone, when polished, rapidly loses its lustre, and readily suffers abrasion by wear. There is considerable difficulty in polishing the peridote, the final touch is given on a copper wheel moistened with sulphuric acid, yet, curiously enough, the mineral is soluble in this medium. The peridote is a silicate of magnesium and iron, having a specific gravity of about 3.4, and crystallizing in the orthorhombic system (see fig. 468, MINERALOGY, vol. xvi p. 410). Good crystals,

however, are extremely rare, the mineral being usually found as rolled fragments. The localities for peridote and chrysolite are Egypt, Ceylon, Pegu, and Brazil, while the dull varieties of olivine enjoy a world-wide distribution in various eruptive rocks and in serpentine. Olivine is found also in meteorites.

There can be little doubt that the ancient "topazion" was our peridote or chrysolite, and that the mineral now called topaz was unknown to ancient and mediæval writers. The earliest mention of the word "peridote" is said to occur in the Wardrobe Book of 27 Edward I., where, among the jewels of the bishop of Bath and Wells which had escheated to the crown, mention is made of "unus annulus auri cum *periditis*." The origin of the word has given rise to much speculation, some authorities deriving it from *περίδωρος*, "a wager," and others from *περίδωρος*, "banded," while others, again, refer it to an Arabic origin.

For the history of the stone see King's *Natural History, Ancient and Modern, of Precious Stones*, 1865.

PÉRIGORD, an old province of France which formed part of the military government of Guenne and Gascony, and was bounded N. by Angoumois, E. by Limousin and Quercy, S. by Agenais and Bazadais, and W. by Bordelais and Saintonge. It is now represented by Dordogne and part of Lot-et-Garonne. The capital was PÉRIGUEUX (*q.v.*).

PÉRIGUEUX, formerly capital of Périgord, now chief town of the department of the Dordogne, France, situated on the slope of an eminence commanding the right bank of the Isle, one of the tributaries of the Dordogne. It is 310 miles by rail south-south-west of Paris and 79 miles east-north-east of Bordeaux. Périgueux is divided into three distinct parts. In the middle, on the slope of the hill, is the town of the Middle Ages, with narrow, crooked, and dirty streets, above which rises the cathedral of St Front, higher up comes the modern town, its houses separated by gardens and public walks; and at the foot of the hill and lying along the Isle are small houses of modern construction, built on the fine ruins of the Roman town. Three bridges connect Périgueux with the left bank of the Isle, where stood Vesunna, the capital of the Petrocorii. Hardly a trace of this old Gallic oppidum remains, but not far off, on the Plateau de la Boissière, the rampart of the old Roman camp, 1970 feet long and half as wide, is still to be recognized. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the 1st or 2d century, which had a frontage of 200 feet, and were supplied by an aqueduct 4 miles long, which spanned the Isle. In several places numerous mosaics have been found, some of which have been placed in the museum. A circular building, called the "Tower of Vesunna," 68 feet in diameter and 89 feet in height, stands at what was formerly the centre of the city, where all the chief streets met. It is believed to have been originally the cella or main part of a temple, of which the peristyle has disappeared, probably dedicated to the tutelary deities of Vesunna. Of the amphitheatre there still remain huge fragments of wall built of pebbles and cement, staircases, vomitories, and partly uncovered vaults. The building, which held 40,000 spectators, had a diameter of 1312 feet, that of the arena being 876 feet; judging from its construction it must be as old as the 3d or even the 2d century. The counts of Périgueux used it for their chateau, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters took from it the stones required for the construction of their nunnery. At present it is private property. The most remarkable, however, of the ruins of old Vesunna is the Chateau Barrière. It rests on stones of great size, and dates in part from a very remote period. Two towers date from the 3d or 4th century, and formed part

¹ There were ten generals at Athens annually elected by the votes of the people. They seem to have had civil as well as military duties, and the importance of the office must have increased in proportion to the degradation of the offices which were filled by lot. After the ostracism of Pencilas Pencilas was elected to the office again and again.

² Plut., *Per*, 18, 38, 38; *Reg. et imp. Anaph.*; *Prosept. ger. Rep.*, xvi. 4.

³ Pausan., i. 29, 8; cp. Cic., *De Fin.*, v. 2.

of the fortified enceinte, the highest tower is of the 10th century, and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century. Lastly, there are still to be traced the two tiers of wall of the enceinte, built round the city in the 5th century; but these are partly hidden by restorations of a later date. Numerous courses of stone are also to be seen, shafts of columns, and marbles of various shapes and sizes. Of the mediæval town the feature most worthy of notice is the cathedral of St Front, which is indeed (or rather was) one of the most interesting of sacred buildings. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and was built from 984 to 1047, contemporaneously with the latter (977-1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 69 feet in width, and the whole is 184 feet long. These cupolas, 89 feet high from the keystone to the ground, and supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture, served as models for many other churches in Aquitania, thus St Front is entitled to a prominent place in the history of art. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. The restoration of the edifice, begun in 1865, resulted, unfortunately, in an almost complete reconstruction, in which the old features have been largely lost. The belfry of St Front is the only one in the Byzantine style now extant, it dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. The interior of the church has a fine altar-screen of carved oak. Near St Front are the ruins of the old basilica built in the 6th century. The bishop's palace, in the grounds of the ancient abbey, has a curious subterranean cloister of the 12th, 13th, and 14th centuries. Périgueux has several old and curious houses of the mediæval and Renaissance periods; a large prefecture of some architectural merit, built at great expense a few years ago in the style of the Renaissance

and of the 18th century; a museum which is singularly rich in Roman, Frank, Egyptian, and pre-Celtic antiquities, and a library of 30,000 volumes. In the squares are statues of Montaigne, Fénelon, General Damesnil, the defender of Vincennes (1814-15), and Marshal Bugeaud. The town has iron and copper foundries, serge and bombazine factories, tanneries, and dye-works. It does a large trade in flour, wine, brandy, hides, poultry, and in the celebrated patés du Périgord. It is the junction of the railway from Paris to Agen with that from Bordeaux to Lyons via Clermont. The population in 1881 was 25,036.

Vesunna, as has already been said, was the capital of the Petrocorii, allies of Vercingetorix when Cæsar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle opposite the site of the Gallic oppidum. It contained public buildings, and Roman roads led from it to Lugones, Agen, Bordeaux, and Saintes. The barbarian invasion brought this prosperity to a close. In the 6th century St Front preached Christianity here, and over his tomb there was raised in the 10th century an abbey, which became the centre of the new town, called Puy St Front. The latter soon began to rival the old city in importance, and it was not until 1269 that they were united by a solemn treaty. After the time of Charles Pègureux was governed by a line of counts. During the Hundred Years War Périgueux was twice attacked by the English, who took the fortified town in 1359; and the town was ceded to them by the treaty of Brétigny, but returned to the French crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV, and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a Calvinist stronghold, and it also suffered during the troubles of the Fronde.

PERINTHUS, a town of Thrace, on the Propontia, 22 miles to the west of Selymbria, strongly situated on a small peninsula on the Bay of Perinthus, on the site of the modern Eski Eregli. It is said to have been a Samian colony, and to have been founded about 599 B.C. According to Tzetzes, its original name was Mygdonia; later it was called Heraclea (Heraclea Thracie, Heraclea Perinthus). It figures in history chiefly by its stubborn and successful resistance to Philip of Macedon in 340, at which period it seems to have been even more important than Byzantium itself. A number of extant coins of Perinthus show that it was the seat of large and celebrated festivals.

PERIODICALS

PERIODICALS may be broadly divided into two classes, the one chiefly devoted to general literature, apart from political and social news (a subject dealt with under the heading of NEWSPAPERS), and the other more exclusively to science and art, or to particular branches of knowledge or trade. The former class, and those of general interest only, will be principally dealt with in this article, where an endeavour is made to trace briefly the history of the rise and progress of that vast and increasing body of printed matter which, under the different names of reviews, magazines, &c., forms so large a part of current literature.

BRITISH.

The first literary periodical in English was the *Mercurius Librarius*, or a Faithful Account of all Books and Pamphlets (1680), a mere catalogue, followed by *Weekly Memorials for the Ingenious* (18th January 1681/82 to 15th January 1683), which was more of the type of the *Journal des Savants*, whence it borrowed many contributions, and by the *Bibliothèque Universelle et Historique* (January 1686-88), begun by Jean Leclerc, continued with the assistance of J. de la Crosse, and carried on during the last six years of its existence by J. Bernard. Of the *History of Learning* (1691; another with the same title in 1694) only a few

numbers appeared, as the conductor; De la Crosse, started the *Works of the Learned* (August 1691 to April 1693), devoted principally to Continental scholarship. The *Complete Library* (1692 to December 1693) was a venture of John Dunton; the *Memoirs for the Ingenious* (1693) ran to six monthly numbers, and another with the same title appeared in the following year, only to enjoy an equally brief career. The first periodical of merit and influence was the *History of the Works of the Learned* (1699-1712), largely consisting of descriptions of foreign books. The *Memoirs of Literature*, the first English review consisting entirely of original matter, published in London from 1710 to 1714, had for editor Michel de la Roche, a French Protestant refugee, who also edited at Amsterdam the *Bibliothèque Angloise* (1717-19), and subsequently *Mémoires Littéraires de la Grande Bretagne* (1720-24). Returning to England in 1725, he recommenced his *New Memoirs of Literature* (1725-28), and in 1730 a *Literary Journal*. Dr Samuel Jebb started *Bibliotheca Literaria* (1732-34), which dealt with medals and antiquities as well as with literature, but only ten numbers appeared. The *Present State of the Republick of Letters* was commenced by Andrew Reid in January 1728, and completed in December 1736. It contained not only excellent reviews of English books but papers from the works of foreigners, and, as well as the *Historia Literaria*

17th and
18th cen-
turies.

(1790-34) of Archibald Bower,¹ was very successful. The *Bee* (1793-34) of the unfortunate Eustace Dugdell, and the *Literary Magazine* (1795-36), with which Ephraim Chambers had much to do, were very short-lived. In 1737 the *History of the Works of the Learned* appeared again, and was continued without intermission until 1743, when its place was taken by *A Literary Journal* (Dublin, 1744-49), the first review published in Ireland. The *Museum* (1746) of R. Dodsley united the character of a review of books with that of a literary magazine. Although England can show nothing like the *Journal des Savants*, which has flourished almost without a break for 220 years, a nearly complete series of reviews of English literature may be made up from 1681 to the present day.

After the close of the first quarter of the 18th century the literary journal began to assume more of the style of the modern review, and in 1749 the title and the chief features were united in the *Monthly Review*, established by Ralph Griffiths,² who conducted it until 1803, whence it was edited by his son down to 1825. It came to an end in 1845. From its commencement the *Review* dealt with science and literature, as well as with literary criticism. It was Whig in politics and Nonconformist in theology. The Tory party and the established church were defended in the *Critical Review* (1756-1817), founded by Archibald Hamilton and supported by Smollett, Johnson, and Robertson. Johnson took a considerable part in the *Literary Magazine* (1756-58). The reviews rapidly increased in number towards the end of the century. Among the principal were the *London Review* (1775-80), *A New Review* (1782-86), the *English Review* (1783-95), incorporated in 1797 with the *Analytical Review* (1788-99), the *Anti-Jacobin Review and Magazine* (1798-1821), and the *British Critic* (1793-1843), the organ of the High Church party, and first edited by Archdeacon Nares and Beloe.

These periodicals had now become extremely numerous, and many of the leading London publishers found it convenient to maintain their own particular organs. It is not a matter of surprise, therefore, that the authority of the reviews should have fallen somewhat in public estimation. The time was ripe for one which should be quite independent of the booksellers, and which should also aim at a higher standard of excellence. As far back as 1755 Adam Smith, Blair, and others had endeavoured to carry on such a quarterly without achieving success, and in 1773 Gilbert Stuart and William Smellie issued during three years an *Edinburgh Magazine and Review*. To the northern capital is also due the first high-class critical journal which has kept up its reputation to the present day. The *Edinburgh Review* was established in 1802 by Jeffrey, Scott, Horner, Brougham, and Sydney Smith. It created a new era in periodical criticism, and assumed from the commencement a wider range and more elevated tone than any of its predecessors. The first editor was Sydney Smith, then Jeffrey for many years, and afterwards Macvey Napier. At one time 20,000 copies are said to have been published, but the circulation declined in 1832 to less than 9000. Scott, being dissatisfied with the new review, persuaded John Murray to start its brilliant Tory competitor, the *Quarterly Review* (1809), first edited by William Gifford, then by Sir J. T. Coleridge, and subsequently by J. G. Lockhart. The *Westminster Review* (1824), established by the disciples of Jeremy Bentham, advocated radical reforms

in church, state, and legislation. In 1836 it was joined to the *London Review* (1829), founded by Sir William Molesworth, and then bore the name of the *London and Westminster Review* till 1851, when it returned to the original title. The other quarterly reviews are the *Edinburgh Review* (1805-68), edited down to 1834 by Josiah Conder and supported by the Dissenters, the *British Review* (1811-26); the *Christian Remembrancer* (1819-68); the *Retrospective Review* (1820-26, 1828, 1853-54), for old books, the *Foreign Quarterly Review* (1827-46), afterwards incorporated with the *Westminster*, the *Foreign Review* (1828-39), the *Dublin Review* (1836), still continued as the organ of the Roman Catholics; the *Foreign and Colonial Quarterly Review* (1843-47); the *Prospectus Review* (1845-55), given up to theology and literature, previously the *Christian Teacher* (1835-44), the *North British Review* (1844-71); the *British Quarterly Review* (1845), successor to the *British and Foreign Review* (1835-44), the *New Quarterly Review* (1852-61), the *Scottish Review* (1853-62), published at Glasgow, the *Wesleyan London Quarterly Review* (1853), the *National Review* (1855-64), the *Diplomatic Review* (1855-81); the *Irish Quarterly Review* (1851-59), brought out in Dublin, the *Home and Foreign Review* (1862-64), the *Fine Arts Quarterly Review* (1863-65); the *New Quarterly Magazine* (1873-80), the *Catholic Union Review* (1863-74), the *Anglo-Church Quarterly Review* (1875); *Mind* (1876), dealing with mental philosophy, the *Modern Review* (1880); and the *Scottish Review* (1882).

The monthly reviews include the *Christian Observer* Month (1802-57), conducted by members of the established church. *Lies.* upon evangelical principles, with Zachary Macaulay as the first editor; and the *Monthly Repository* (1806-37), originally purely theological, but after coming into the hands of the Rev. W. J. Fox made entirely literary and political. The *Fortnightly Review* (1865) was intended as a kind of English *Revue des Deux Mondes*. Since 1866 it has appeared monthly. The *Contemporary Review* (1866) and the *Nineteenth Century* (1877) are similar in character, consisting of signed articles by men of mark of all opinions upon questions of the day. The *National Review* (1888) was brought out to supply the demand for an exclusively Conservative review, and *Modern Thought* (1879) for the free discussion of political, religious, and social subjects.

The weekly reviews dealing generally with literature, *Week-* science, and art are the *Literary Gazette* (1817-62), first *lies.* edited by William Jerdan, which had for many years a circulation of 6000 copies, the *Athenaeum* (1828), established by Silk Buckingham, but which was not very successful until it was taken over by C. W. Dilke; and the *Academy* (1869), founded, and at first edited, by Dr Appleton. Those which also include political and social topics are the *Examiner* (1808-81), the *Spectator* (1828), the *Saturday Review* (1855), and the *Chronicle* (1867-68). The reviews in the *Academy* are signed.

Soon after the introduction of the literary journal in England, one of a more familiar tone was started by the eccentric John Dunton in the *Athenian Gazette*, or *Casualty Mercury*, resolving all the most *Nice and Curious Questions* (1689/90 to 1695/96), a kind of forerunner of *Notes and Queries*, being a penny weekly sheet, with a quarterly critical supplement. In the last part the publisher announces that it will be continued "as soon as ever the glut of news is a little over." Defoe's *Review* (1704-13) dealt chiefly with politics and commerce, but the introduction in it of what its editor fittingly termed the "scandalous club" was another step nearer the papers of Steele and the periodical essayists, the first attempts to create an organized popular opinion in matters of taste and manners. These little papers, rapidly thrown off for a temporary purpose, were destined to form a very important part of

¹ Archibald Bower (1686-1768) was educated at Douai, and became a Jesuit. He subsequently professed himself a convert to the Anglican Church, and published a number of works, but was more esteemed for his ability than for his moral character.

² The biographers of Goldsmith have made us familiar with the name of Griffiths, the prosperous publisher, with his diploma of LL.D. granted by an American university, and with the quarrels between him and the poet.

Tatler,
&c.

the literature of the 18th century, and in some respects its most marked feature. Although the frequenters of the clubs and coffee-houses were the persons for whom the essay-papers were mainly written, a proof of the increasing refinement of the age is to be found in the fact that now for the first time were women specially addressed as part of the reading public. The *Tatler* was commenced by Richard Steele in 1709, and issued thrice a week until 1711. The idea was at once extremely popular, and a dozen similar papers were started within the year, at least one half bearing colourable imitations of the title. Addison contributed to the *Tatler*, and together with Steele established and carried on the *Spectator* (1710-14), and subsequently the *Guardian* (1713). The newspaper tax enforced in 1712 was a sore blow. Before this time the daily issue of the *Spectator* had reached 3000 copies; it then fell to 1600, the price was raised from a penny to twopenny, but the paper came to an end in 1714. Dr Drake (*Essays illustr'd of the Rambler, &c.*, u. 490) drew up an imperfect list of the essayists, and reckoned that from the *Tatler* to Johnson's *Rambler*, during a period of forty-one years, 106 papers of this description were published. Dr Drake continued the list down to 1809, and described altogether 221 which had appeared within a hundred years. The following is a list of the most considerable, with their dates, founders, and chief contributions.

Tatler (12th April 1709 to 2d January 1710/11), Steele, Addison, Swift, Hughes, &c.; *Spectator* (1st March 1710/11 to 20th December 1714), Addison, Steele, Budge, Hughes, Grove, Pope, Parnell, Swift, &c.; *Guardian* (12th March 1713 to 1st October 1718), Steele, Addison, Berkeley, Pope, Tickell, Budge, &c.; *Rambler* (20th March 1760 to 14th March 1762), Johnson; *Adventurer* (7th November 1729 to 9th March 1734), Hawkesworth, Johnson, Dethmou, Warton, Chapone; *World* (4th January 1753 to 30th December 1756), E. Moore, earl of Chesterfield, R. O. Cambridge, earl of Oxford, Soame Jenyns, &c.; *Connoisseur* (31st January 1764 to 30th September 1766), Colman, Thornton, Walton, earl of Cork, &c.; *Tales* (15th April 1768 to 6th April 1769), Johnson, Sir J. Reynolds, and Bennet Langton; *See* (6th October 1769 to 34th November 1769), O. Goldsmith; *Mirror* (2nd January 1779 to 27th May 1780), Mackenzie, Craig Abercromby, Horne, Bannatyne, &c.; *Lounger* (6th February 1785 to 6th January 1787), Mackenzie, Craig, Abercromby, Tytler; *Observer* (1785 to 1790), Cumberland; *Looker-on* (10th March 1792 to 1st February 1794), W. Roberts, Beresford, Chalmers.

Modern
magazines

As from the "pamphlet of news" arose the weekly paper wholly devoted to the circulation of news, so from the general newspaper was specialized the weekly or monthly review of literature, antiquities, and science, which, when it included essay-papers, made up the magazine or miscellaneous repository of matter for information and amusement. Several monthly publications had come into existence since 1681, but perhaps the first germ of the magazine is to be found in the *Gentleman's Journal* (1691-94) of Peter Motteux, which, besides the news of the month, contained miscellaneous prose and poetry. In 1722 Dr Samuel Jebb included antiquarian notices as well as literary reviews in his *Bibliotheca Literaria* (1722-24), but the *Gentleman's Magazine*, founded in 1731, fully established, through the tact and energy of the publisher Edward Cave, the type of the magazine, from that time so marked a feature of English periodical literature. This magazine, so long a source of fortune to its successive owners, was vainly offered during four years to different publishers before Cave was able to start it himself. The first idea is due to Motteux, from whom the title, motto, and general plan were borrowed. The chief feature in the new venture at first consisted of the analysis of the journals, which Cave undertook personally. Prizes were offered for poetry. In April 1732 the leading metropolitan publishers, jealous of the interpoler Cave, started the *London Magazine*, or *Gentleman's Monthly Intelligencer* (1732-84), which

had a long and prosperous career. The new magazine closely copied Cave's title, plan, and aspect, and bitter war was long waged between the two. The rivalry was not without benefit to the literary public, as the conductors of each used every effort to improve their own review. Cave introduced the practice of giving engravings, maps, and portraits, but his greatest success was the addition of Johnson to the regular staff. This took place in 1738, when the latter wrote the preface to the volume for that year, observing that the magazine had "given rise to almost twenty imitations of it, which are either all dead or very little regarded." The plan was also imitated in Denmark, Sweden, and Germany. Cave edited his magazine down to his death in 1754, when it was continued by his brother-in-law David Henry, afterwards by John Nichols and his son. The specially antiquarian and historical features were dropped in 1868, and it was changed to a miscellany of light literature.

Many other magazines were produced in consequence of the success of these two. It will be sufficient to mention the following. The *Stots Magazine* (1739-1817) was the first published in Scotland; from 1817 to 1826 it was styled the *Edinburgh Magazine*. The *Universal Magazine* (1747) had a short, if brilliant, career; but the *European Magazine*, founded by James Perry in 1782, lasted down to 1826. Of more importance than these, or than the *Royal Magazine* (1759-71), was the *Monthly Magazine* (1796-1843), with which Priestley and Godwin were originally connected. During thirty years the *Monthly* was conducted by Sir Richard Phillips, under whom it became more statistical and scientific than literary. Class magazines were represented by the *Edinburgh Farmer's Magazine* (1800-25) and the *Philosophical Magazine* (1798), established in London by Alexander Tilloch, the latter at first consisted chiefly of translations of scientific articles from the French. The following periodicals, all of which date from the 18th century, are still published—the *Gentleman's Magazine* (1731), the *Gospel Magazine* (1768), the *Wesleyan Methodist Magazine* (1778), *Curtis's Botanical Magazine* (1786), *Evangelical Magazine* (1793), *Methodist New Connexion Magazine* (1797), *Philosophical Magazine* (1798).

The increased influence of this class of periodical upon the public opinion of our own era was first apparent in Blackwood's *Edinburgh Magazine*, founded in 1817 by the publisher of that name, and carried to a high degree of excellence by the contributions of Scott, Lockhart, Hogg, Maginn, Syme, and John Wilson, the editor. It is still issued, and has always remained Liberal in literature and Conservative in politics. The *New Monthly Magazine* is somewhat earlier in date. It was founded in 1814 by the London publisher Colburn, and was edited in turns by Campbell, Theodore Hook, Bulwer Lytton, and Ainsworth. Many of Carlyle's and Thackeray's pieces first appeared in *Fraser's Magazine* (1830), long famous for its personalities and its gallery of literary portraits. The *Metropolitan Magazine* was started in opposition to *Fraser*, and was first edited by Campbell, who had left its rival. It subsequently came into the hands of Captain Maryatt, who printed in it many of his sea-tales. The *British Magazine* (1832-49) included religious and ecclesiastical information. From Ireland came the *Dublin University Magazine* (1833). The regular price of these magazines was half a crown; the first of the cheaper ones was *Tait's Edinburgh Magazine* (1832-61) at a shilling. It was Radical in politics, and had Roebuck as one of its founders. *Bentley's Miscellany* (1837-68) was exclusively devoted to novels, light literature, and travels. Several of Ainsworth's romances, illustrated by Cruikshank, first saw the light in *Bentley*. The *Nautical Magazine* (1832) was addressed specially to

sailors, and Colburn's *United Service Journal* (1829) to both services. The *Asiatic Journal* (1816) dealt with Oriental subjects.

Cheap
publica-
tions.

From 1815 to 1820 a number of low-priced and unwholesome periodicals flourished. The *Mirror* (1823-49), a two-penny illustrated magazine, begun by John Lubbock, and the *Mechanics Magazine* (1823) were steps in a better direction. The political agitation of 1831 led to a further popular demand, and a supply of cheap and healthy serials for the reading multitude commenced with *Chambers's Edinburgh Journal* (1832), the *Penny Magazine* (1832-45) of Charles Knight, issued under the patronage of the Society for the Diffusion of Useful Knowledge, and the *Saturday Magazine* (1832-44), begun by the Society for Promoting Christian Knowledge. The first was published at 1½d. and the last two at 1d. Knight secured the best authors and artists of the day to write for and illustrate his magazine, which, though at first a commercial success, may have had the reason of its subsequent discontinuance in its literary excellence. At the end of 1832 it had reached a sale of 200,000 in weekly numbers and monthly parts. It came to an end in 1845 and was succeeded by *Knight's Penny Magazine* (1845), which was stopped after six monthly parts. These periodicals were followed by a number of penny weeklies of a lower tone, such as the *Family Herald* (1843), the *London Journal* (1845), and *Lloyd's Miscellany*; the two former are still thriving. In 1850 the sale of the first of them was placed at 175,000 copies, the second at 170,000, and *Lloyd's* at 95,000. In 1846 fourteen penny and three halfpenny magazines, twelve social journals, and thirty-seven book-serials were produced every week in London. A further and permanent improvement in cheap weeklies for home reading may be traced from the foundation of *Howitt's Journal* (1847-49), and more especially *Household Words* (1850), conducted by Charles Dickens, *All the Year Round* (1850), by the same editor, and afterwards by his son, *Once a Week* (1859), and the *Leisure Hour* (1859). The plan of *Notes and Queries* (1849), for the purpose of intercommunication among those interested in special points of literary and antiquarian character, has led to the adoption of similar departments in a great number of newspapers and periodicals, and, besides several imitators in England, there are now parallel journals in Holland, France, and Italy.

Recent shilling monthlies began with *Macmillan* (1859), the *Cornhill* (1860), and *Temple Bar* (1860). The *Cornhill*, first edited by Thackeray, was known for its specially literary tone down to 1883. *St James's Magazine* (1861), *Belgravia* (1866), *St Paul's* (1867-74), *London Society* (1862), and *Tinsley's* (1867) are devoted chiefly to novels and light reading. The sixpenny illustrated magazines commenced with *Good Words* (1860) and the *Quiver* (1861), both religious in tendency. In 1882 *Fraser* changed its name to *Longman's Magazine*, and was entirely popularized and reduced to sixpence. The *Cornhill* followed the same example in 1883, reducing its price to sixpence and devoting its pages to light reading. The *English Illustrated Magazine* (1883) was brought out in competition with the American *Harper and Century*. Of the artistic periodicals we may signalize the *Art Journal* (1849), long known for its line engravings, the *Portfolio* (1870), which has done much to popularize etching, and the *Magazine of Art* (1878).

Statistics.

The following statistics furnish an idea of the marvellous increase in the number of periodicals issued at different times during the last fifty years. In figures submitted

¹ John Lubbock, to whom even before Chambers or Knight is due the carrying out the idea of a cheap and good periodical for the people, died so recently as 31st October 1883, without having achieved the worldly prosperity of his two followers.

to the House of Commons in 1864 Sir Edward Baines estimated the circulation of the monthly magazines in 1831 at no more than 125,000 copies, when he spoke the number had increased to 3,609,350. The weeklies might be reckoned in 1831 at about equal to the monthlies in circulation, and the miscellaneous serials at 120,000, amounting altogether to 420,000 copies. In 1864 the circulation of weeklies and monthlies reached a total of 6,094,950 (*Journal of Statist. Soc.*, 1864, pp. 410-412). Concurrently with this increase in the whole number published there may be observed an equally regular decrease in the average cost of each. In 1831 there were issued in London alone 177 monthlies, costing £17, 12s 6d, or an average of 2s apiece. At the end of 1833 there were 236 of the same class, costing £23, 3s 6d, and the average price had decreased to 1s 11½d. Twenty years later, in 1853, there were 362 monthlies, costing £14, 17s 6d, the average cost of each being now only 3½d. (Knight's *Old Printer and Modern Press*, 263).

In London itself the increase of the weeklies, monthlies, and quarterlies at different periods has been as follows.—

	Weekly	Monthly	Quarterly	Total
1833	21	236	25	282
1837	69	196	84	230
1844	69	297	38	395
1853	55	362	50	467
1863	{ Included in } { monthlies }	453	75	528
1874	50	462	84	596
1884	110	669	120	905

Extending the inquiry to the whole of the United Kingdom, and including every description of periodical, with the exception of annuals and newspapers, May's *British and Irish Press Guide* for the years 1874 and 1884 supplies this comparison.—

	1874	1884		1874	1884
Metropolis	641	771	Daily	1	12
England	60	154	Three times a week		11
Wales	15	26	Weekly	58	114
Scotland	37	61	Twice a month	6	18
Ireland	11	39	Monthly	469	609
Channel Isles, &c	2	8	Bi-monthly	6	9
Total	662	1041	Quarterly	84	109
			Half-yearly	4	16
			Irregular	28	47
			Total	662	1041

The chief classes into which the same periodicals may be divided are:—

	Religious	Illustrated	Juvenile	Trade-organs
1863	126			
1874	297	175	59	64
1884	350	388	100	137

Among the different periodicals issued in 1884 there were also 73 advocating temperance, 28 devoted to agriculture, 57 family magazines, 31 financial, 15 insurance, 18 medical, 7 secularist, 9 tailoring, and 7 bicycling.

Indexes to English Periodicals.—Lists of the separate indexes to particular series are given in H. B. Wheatley's *What is an Index?* 1879, and *List of Bibliographies in the Reading Room of the British Museum*, 1881. The valuable and elaborate work of W. F. Poole, *Index to Periodical Lit.*, Boston (Massachusetts), 1882, supplies an exhaustive alphabetical index to the titles of articles in 6205 volumes of English and American serials of the present century. Monthly supplements appear in the *Laboratory Journal*.

Authorities.—"Periodicals," in the British Museum catalogue, *Learned, Bibliographic Manual*, by Hy G. Bohn, 1804; *Cat of Periodicals in the Bodl. Lib.*, part i, "English Periodicals," 1878; *Cat of the Hope Collection of Early Newspapers and Magazines in the Bodl. Lib.*, 1886; *Recherches sur les Journaux*, 1879; Andrews, *List of Brit. Journals*, 1880; Chalmers, *List of the Press in England in six and a half Years*, 1857; Madden, *List of Irish Period. Lit.*, 1857; J. Grant, *The Great Metropolitan*, p. 229-237; "Periodical Essays of the Age of Anne," in *N. American Rev.*, xlv: "Disks of the Spectator," 1854; "Puffin," do, 1810-14; Courchoud, *Adresses* ("Engl. Men of Letters"), 1854; "Forgotten Periodical Publications," in *Notes and Queries*, ser. iii, vol. ix, 8; "Account of Periodical Literary Journals from 1651 to 1740," by S. Parker, in *Quarterly Journ. of St. J. Soc.*, xii, 96-239; "Last Century Magazines," in *Proc. Soc.*

May, Sept. 1876, 925; "Periodicals during 1712-22," in *Notes and Queries*, ser. iii, vol. ix, 72, 80, x, 124, "Catholicon Period. India.

India and the British Colonies—The first Indian periodical was the *Calcutta Monthly Digest* (1790), which lasted but a short time. A *Calcutta Literary Gazette* came out in 1830. In 1844 appeared the first number of the *Calcutta Review* (1844), which is still the most important serial of the Indian empire. *The Bombay Quarterly Review* was founded in 1855. Madras had a *Journal of Literature and Science* and the *Oriental Magazine and Indian Hurkura* (1819). *The Religious and Theological Magazine* was produced at Colombo in 1833. *The Christian College Magazine* was commenced in 1833. At Singapore the *Journal of the Indian Archipelago* appeared from 1847 to 1855. *The Chinese Repository* (1832), edited at Canton by Morrison, dealt with the father East.

See "Periodical Literature in India" in *Dark Blue*, 1872-78.

British Colonies.

Hubbard (*Newspaper Director*) estimates the existing periodicals (omitting newspapers) of British North America at 655. The monthly and quarterly publications of Australia, Tasmania, and New Zealand are placed by the same authority at 570. *The Melbourne Review* (1876) deserves special mention.

FOREIGN.

France.

France—We owe the literary journal in France, where it soon attained to a degree of importance unapproached in any other country. The first idea may be traced in the *Bureau d'Adresse* of Théophraste Renaudot, giving the proceedings of his conferences upon literary and scientific matters (1633-42). About the year 1663 Mézière obtained a privilege for a regular literary periodical, which came to nothing, and it was left to Denis de Sallo, conseiller of the parliament of Paris and a man of rare merit and learning, to actually carry the project into effect. The first number of the *Journal des Savants* appeared on 5th January 1665, under the assumed name of the sieur d'Héolenville. The prospectus promised to give an account of the chief books published throughout Europe, obituary notices, a review of the progress of science, besides legal and ecclesiastical information and other matters of interest to cultivated persons. Some, however, would not admit abbots, doctors, and the clergy, and the journal was suppressed after a career of three months. Colbert, seeing the public utility of such a periodical, ordered the abbé Gallois, a contributor of De Sallo's, to re-establish it, an event which took place on 4th January 1668. It lingered nine years under the new editor, who was replaced in 1675 by the abbé de la Roque, and the latter in his turn by the president Cousin in 1686. From 1701 commenced a new era for the *Journal*, which was then acquired by the chancellor of Pontchartrain for the state and placed under the direction of a commission of learned men. Just before the Revolution it developed fresh activity, but the troubles of 1793 caused it to be discontinued until 1796, when it again failed to appear after twelve numbers had been issued. In 1816 it was definitively re-established and replaced under Government patronage, remaining subject to the chancellor or grand-secrétaire until 1827, when it was placed under the control of the minister of public instruction. The present organization much resembles that of an academy. The members of the commission are elected, approved of by the minister, and divided into assistants and authors, the latter furnishing at least three articles per annum at a fixed and modest rate of payment. All communications are discussed at fortnightly conferences.

Louis Auguste de Bourbon, sovereign prince of Dombes, having transferred his parliament to Trévoux, set up a printing press, and was persuaded by two Jesuits, Michel le Tellier and Philippe Lalleman, to establish the *Mémoires pour servir à l'Histoire des Sciences et des Arts* (1701-67), more familiarly known as the *Journal de Trévoux*, long the best-informed and best-written journal in France. One feature of its career was its constant appeal for the literary assistance of outsiders. It was continued in a more popular style as *Journal des Sciences et des Beaux-Arts* (1744-45) by the abbé Aubert and by the brothers Casimir (1749-53) and *Journal de Littérature, des Sciences, et des Arts* (1779-83) by the abbé Grosier.

The first legal periodical was the *Journal du Palais* (1679) of Blondeau and Guéret, and the first devoted to medicine the *Nouvelles Découvertes dans toutes les Parties de la Médecine* (1679) of Nicolas de Blegny, frequently spoken of as a charlatan, a term which sometimes means simply a man of many ideas. Religious periodicals date from 1680 and the first political, *Revue littéraire* of the abbé de la Roque. The prototype of the historical-literary periodical may be discovered in *La Clé du Cabinet des Princes de l'Europe* (1704-6), familiarly known as *Journal de Verdun*, and carried on under various titles down to 1794.

Literary criticism was no more free than political discussion, and

no person was allowed to trespass either upon the domain of the *Journal des Savants* or that of the *Affaires de France* without the payment of heavy subsidies. This was the origin of the clandestine press of Holland, and it was that country which for the next hundred years supplied the ablest periodical criticism from the pens of French Protestant refugees. During that period thirty-one journals of the first class proceeded from these sources. From its commencement the *Journal des Savants* was printed in Holland, and for ten years a kind of joint issue made up with the *Journal des Trévoux* appeared at Amsterdam. From 1764 to 1775 miscellaneous articles from different French and English reviews were added to this reprint. Bayle, a born journalist and the most able critic of the day, conceived the plan of the *Nouvelles de la République des Lettres* (1684-1718), which at once became a highly successful and obtained for him during the three years of his control the dictatorship of the world of letters. He was succeeded as editor by La Roque, Babin, Beinaud, and Leclerc. Bayle's method was followed in an equally meticulous periodical, the *Histoire des Ouvrages des Savants* (1687-1704) of H. Bannag de Beauval. Another continuator of Bayle was Jean Leclerc, one of the most learned and acute critics of the 18th century, who carried out three reviews, the *Bibliothèque Universelle et Historique* (1686-63), the *Bibliothèque Choise* (1703-13), and the *Bibliothèque Ancienne et Moderne* (1714-27). They form one series, and, besides valuable estimates of new books, include original dissertations, articles, and biographies like our modern learned magazines. The *Journal Littéraire* (1718-22, 1728-36) was founded by a society of young men, who made it a rule to discuss their contributions in common. It was devoted to English literature, and its title was *Journal Anglaise* (1718-23), the *Mémoires Littéraires de la Grande Bretagne* (1730-24), the *Bibliothèque Britannique* (1738-84), and the *Journal Britannique* (1750-57) of Maty, who took for his principle, "pour penser avec liberté il faut penser seul." One of these Dutch-printed reviews was *L'Europe des Savants* (1718-80), founded chiefly by Thomassin de Saint-Yves, with the intention of placing each separate department under the care of a specialist. The *Bibliothèque Germanique* (1730-40) was established by Jacques Le Gentil, the only northern European who the *Bibliothèque Britannique* did not England. It was followed by the *Nouvelle Bibliothèque Germanique* (1745-59). The *Bibliothèque Rassemblée des Ouvrages des Savants* (1728-58) was supplementary to Leclerc, and was succeeded by the *Bibliothèque des Sciences et des Beaux-Arts* (1764-80). Nearly all of the preceding was produced either at Amsterdam or Rotterdam, and, although it is not clear to a precise geographical limit, really belong to France by the close ties of language and of blood.

Taking up the exact chronological order again, we find the success of the English essay-papers led to their prompt introduction to the Continent. An incomplete translation of the *Spectator* was published at Amsterdam in 1714, and many volumes of extracts from *Le Teller*, *Spectator*, and *Guardian* were issued in France early in the 18th century. *Malvieux* brought out a *Spectateur Français* (1728), which was coldly received; it was followed by fourteen or fifteen others under the titles of *Le Spectateur* (1728-30), *Le Radeleur* (1775), *Le Bailioliard* (1778-79), &c. Of a similar character was *Le Pour et le Contre* (1728-40) of the abbé Pivérot, which contained anecdotes and criticism, with special reference to Great Britain. Throughout the 18th century, in France as in England, a favourite literary method was to write of social subjects under the assumed character of a foreigner, generally an Oriental, with the title of *Turkish Spy*, &c. These productions were usually issued in periodical form, and, besides an immense amount of worthless title-tattle, contain some valuable matter.

During the first half of the century France has little of importance to show in periodical literature. The *Nouvelles Encyclopédiques* (1728-1808) were first printed and circulated secretly by the Jansenists in opposition to the *Constitution Unigenitus*. The Jansenists allied with the supplanters of the Jesuits, and the *Encyclopédie* (1751-72) was the result. The promising title may have had something to do with the temporary success of the *Mémoires Secrets de la République des Lettres* (1744-48) of the marquis d'Argens. In the *Observations sur les Lettres Modernes* (1735-43) Desfontaines held the gates of Philistia for eight years against the Encyclopedists and even the redoubtable Voltaire himself. It was continued by the *Jugements sur quelques Ouvrages nouveaux* (1744-45). The name of Fréron, perhaps the most vigorous enemy Voltaire ever encountered, was long connected with *Lettres sur quelques Biais de ce Temps* (1749-54), followed by *L'Année Littéraire* (1764-90). Among the contributors of Fréron was another manufacturer of criticism, the abbé de la Porte, who, having quarrelled with his confrère, founded *Observations sur la Littérature Moderne* (1749-52) and *L'Observateur Littéraire* (1758-61).

A number of special organs came into existence about this period. The first treatise of agriculture and domestic economy was the *Journal Économique* (1761-72), a *Journal de Commerce* was founded

1 Matthew Maty, M.D. born in Holland, 1718, died principal librarian of the British Museum, 1776. He resided in England in 1746, published several books, and wrote the preface to Gibbon's first work, *Essai de la Littérature*.

in 1759, periodical language may be best seen in the *Néologie des Hommes Lettrés de France* (1761-82), the political economists established the *Éphémérides des Citoyens* in 1755, the first *Journal d'Éducation* was founded in 1768, and the *Courcier de la Mode* in the same year, the theatre had its first origin in the *Journal des Théâtres* (1770), in the same year were produced a *Journal de Médecine* and the *Journal de l'Industrie* (1776), the civil service was supplied with a *Journal du Médecin* in 1778. We have already noted several journals specially devoted to one or other foreign literature. It was left to Fétion, Grimm, Pétrov, and others in 1761 to extend the idea to all foreign productions, and the *Journal Étranger* (1764-66) was founded for this purpose. The *Gazette Littéraire* (1764-66), which had Voltaire, Diderot, and Saurin-Lamartini among its editors, was intended to supply the small fry of criticism, the *Journal des Dames* (1758-78) was of a light magazine class, and the *Journal de Monsieur* (1776-83) had three phases of existence, and died after extending to thirty volumes. The *Mémoires Secrets pour servir à l'Histoire de la République des Lettres* (1762-87), better known as *Mémoires de Bachaumont*, from the name of their founder, furnish a minute account of the social and literary history for a period of twenty-six years. Of a similar character was the *Correspondance Littéraire Secrète* (1774-93), to which Méhau was the chief contributor. *L'Esprit des Journaux* (1773-1818) forms an important literary and historical collection, which is rarely to be found complete.

The movement of ideas at the close of the century may best be traced in the *Annales Politiques, Civiles, et Littéraires* (1777-92) of Lauguet. The *Diatribe Philosophique* (1781, or 1790/97), founded by Ginguené, is the first periodical to mention a class which appeared after the storms of the Revolution. It was a kind of resuscitation of good taste; under the empire it formed the sole object of the opposition. By a decree of 17th January 1800 the consulate reduced the number of Parisian journals to thirteen, of which the *Décade* was one; all the others, with the exception of those dealing solely with science, art, commerce, and advertisements, were suppressed. The report submitted to Bonaparte by Férrière¹ in the year XI (1803/8) furnishes a list of fifty-one of these periodicals. In the year XIII (1804/5) only seven non-political journals were permitted to appear.

Between 1815 and 1819 there was a constant struggle between freedom of thought on the one hand and the census, the police, and the law-officers on the other. This oppression led to the device of "anti-periodical" publications, of which *Le Minerve Française* (1818-19) is the most important. It was founded by the Restoration, and was brought out four times a year at irregular intervals. Of the same class was the *Bibliothèque Historique* (1818-20), another anti-royalist organ. The census was re-established in 1820 and abolished in 1828 with the monopoly. It has always seemed impossible to carry on successfully in France a review upon the lines of those which have become so numerous and important in England. The short-lived *Revue Française* (1828-30), founded by Guizot, Rémusat, De Broglie, and the *Revue des Deux Mondes*, was an attempt in this direction. The well-known *Revue des Deux Mondes* was established in 1829 by Séguin-Dupeyron and Mauroy, but it ceased to appear at the end of the year, and its actual existence dates from its acquisition in 1831 by François Buloz,² a masterful editor, under whose energetic management it soon achieved a world-wide reputation. The most distinguished names in French literature have been among its contributors, for whom it was styled the "vestibule of the Academy." It was preceded by a few months by the *Revue de Paris* (1829-45), founded by Véron, who introduced the novel to periodical literature. In 1854 this was purchased by Buloz, and brought out concurrently with his other *Revue*. While the former was exclusively literary and artistic, the latter dealt more with philosophy. The *Revue Indépendante* (1841-48) was founded by Paul Leroux, and the *Revue Française* for the democracy. The times of the consulate and the empire, with all subjects dealt with by the *Revue de l'Empire* (1842-48). In *Le Correspondant* (1848), established by Montalembert and De Falloux, the Catholics and Legitimists had a valuable supporter. The *Revue Contemporaine* (1852), founded by the comte de Belval as a royalist organ, had joined to it in 1856 the *Athénæum Français*. The *Revue Germanique* (1858) exchanged its exclusive name and character in 1862 to the *Revue Moderne*. The *Revue Européenne* (1859) was at first subordinated like the *Revue Contemporaine*, from which it soon withdrew Government favour. The *Revue Nationale* (1860) appeared quarterly, and succeeded to the *Magasin de Librairie* (1858).

The last of current periodicals, to which should be added the

Revue des Deux Mondes and the *Correspondant*, include the following. Among those devoted to literature and criticism may be mentioned the *Revue Biographique* (1825); the *Revue Critique d'Histoire et de Littérature* (1856), one of the first of European weekly reviews; the *Revue Polémique et Littéraire*, successor to the *Revue des Deux Mondes* (1838), also weekly; the *Le Livre* (1850), confined to bibliography and literary history, monthly, and the *Nouvelle Revue* (1879), already a serious rival of the *Revue des Deux Mondes*, which it resembles in character and mode of publication, although distinctly Republican in politics. History and archaeology are represented by the *Bibliothèque de l'École des Chartes* (1839), which deals especially with the Middle Ages, and is published at three months; the *Revue Historique* (1855), a monthly, devoted to MSS and unpublished documents, the *Revue Historique* (1876), two-monthly, and the monthly *Revue Archéologique* (1860). The fine arts are cared for by the *Gazette des Beaux-Arts* (1859), monthly, and *L'Art* (1875), published weekly. We may also mention the *Revue Philosophique* (1876), monthly, and *Le Tour du Monde* (1860), an illustrated weekly, consisting entirely of voyages and travels.

In 1858, apart from political newspapers, there was published in Paris 879 periodicals of all kinds. They may be classified in the following order:—theology 96, jurisprudence 130, reviews 75, popular reading 169, history and geography 37, political economy and finance 248, science generally 28, mathematics 6, medicine 101, natural science 21, military 14, naval 12, fine arts 75, fashion 81, education 46, technology 137, agriculture 46, sport 24, miscellaneous 40. Authorities.—The subject of French periodicals has been extensively treated in the various works of Eugene Fournier, *la Presse de France* (1880), 8 vols., *les Journaux de Hollande et la Presse Française* (1881), 4 vols., 1880, and *Bibliographie de la Presse Française* (1880), 800 also *la Presse et l'Éducation de France*, 1840, 7 vols., *Journal des Journaux*, de, *publié à Paris*, 1879, Bureaux, *Manuel du Libraire*, *avec Supplément*, 1880-86, 8 vols., *Le Soulier*, *Catalogue des Journaux*, *Revue*, et *Publications Périodiques*, *parus en France depuis 1825*, 1883, P. Nègre, *Les Journaux et Revues Périodiques de la Basse Armée*, 1890.

Germany.—The earliest trace of the literary journal in Germany is

to be found in the *Erwählte Monatsunterredungen* (1668) of the poet Johann Rist and in the *Miscellanea curiosa medico-physica* (1670-1704) of the Academicus naturae curio, Leopoldin-Gallina, the first scientific annual, uniting the features of the *Journal des Savants* and of the *Philosophical Transactions*. D. G. Mohr, the author of the well-known *Polyhistor*, conceived the idea of a monthly serial to be devoted to the history of modern books and learning, which came to nothing. While professor of morals at Leipzig, Otto Mencke planned the *Acta Eruditorum*, with a view to raise the standard, by means of analysis, examination, and new works produced throughout Europe. In 1680 he travelled in England and Holland in order to obtain literary assistance, and the first number appeared in 1682, under the title of *Acta Eruditorum Lipsienensium*, and, like its successors, was written in Latin. Among the contributors to subsequent numbers were Leibnitz, Seckendorf, and Cellarius. A volume came out each year, with supplementary issues. After editing about 30 volumes Mencke died, leaving the publication to his son, and the *Acta* remained in the possession of the family down to 1745, when they extended to 117 volumes, which form an extremely valuable history of the learning of the period. A selection of the dissertations and articles was published at Venice in 7 vols. 4to, 1740. The *Acta* soon had imitators. The *Ephemerides Litterariae* (1688) came out at Hamburg in Latin and French. The *Novae Litteraturae maris Balticae et Septentrionalis* (1698-1708) was more especially devoted to north Germany, and the universities of Kiel, Rostock, and Dorpat. Supplementary to the preceding was the *Novae Litterae ab Haemania collectae Hamburgae* (1708-9), which from 1707 widened its field of view to the whole of Europe. At Leipzig was produced the *Teutsche Acta Eruditorum* (1712), an excellent periodical, edited by J. G. Rabener and O. Jocher, and continued from 1740 to 1768 as *Zweiterlesende Neuchâtelien*. It included portraits. The brilliant and enterprising Christian Thomsen brought out periodically, in dialogue form, his *Acta Eruditorum* (1768-90), written by himself in the vernacular, to defend his novel theses against the alarmed pomposity of Germany, and, together with Stahl, Buddeus, and others, *Observationes selectae ad rem litterariam spectantes* (1700), written in Latin. W. E. Tenzel also published *Monatliche Unterredungen* (1699-98), continued from 1704 as *Curiosae Bibliothekae*, and treating various subjects in dialogue form. A list of names of Tenzel the *Bibliothek* was carried on under different titles by G. Wolterbe, J. G. Kars, and others, down to 1781.

Of much greater importance than these was the *Monatlicher Auszug* (1701), supported by J. G. Ewald and Leibnitz. Another periodical on Thomsen's plan was *Neue Unterredungen* (1702), edited by N. H. Gundling. The *Gundlingiana* of the latter period, published at Halle (1718-32), and written partly in Latin and partly in German by the editor, contained a miscellaneous collection of juridical, historical, and theological observations and dissertations.

Nearly all departments of learning possessed their several special periodical organs about the close of the 17th or the beginning of the 18th century. The *Annus Francoscorum* (1680) was edited by the Jesuit Stiller, and J. S. Adami published, between 1690 and 1718, certain theological repertoires under the name of *Dehane*.

¹ The novelist and poet Joseph Férrière (1707-1839), known for his relations with Napoleon I., has been made the subject for a study by Sainte-Beuve (*Causette*, v. 172).

² François-Marie Buloz (1804-1877) began life as a shepherd. Educated through the charity of M. Neville, he came to Paris as a compositor, and by translating from the English earned sufficient to purchase the moribund *Revue des Deux Mondes*, which acquired its subsequent position in spite of the revolutionary political behaviour of the proprietor. M. Monod (*Contemporain*, 20th Jan 1877) states that latterly Buloz enjoyed an income of 365,000 francs from the *Revue*.

1890 it was joined to the *Nederlandsch Spectator* (1855). Of those founded in the present century may be mentioned the *Revenant* (1898) and *Nieuw Tijdschrift*; the *Nederlandsch Museum* (1855); the *Gids* (1837); the *Tijdschrift* (1857); the *Protestant*, a literary journal of Protestant tendency; the *Theologisch Tijdschrift* (1867), the organ of the Leyden school of theology; and the *Dietsche Warande*, a Roman Catholic review devoted to the national antiquities. Colonial interests have been cared for by the *Tijdschrift voor Nederlandsch Indië* (1848). The *Nederlandsch Magazin* and *Minerva* are still published.

See *Alphabetisch Verzeichnis* (1790-1873), Amsterdam, 1888-78.

Denmark. *Scandinavia*.—Early in the 19th century Denmark had the *Nye Tidender* (1780), continued down to 1836 under the name of *Dansk-litteraturlitidende*. The *Minerva* (1786) of Rahbek was carried on to 1819, and the *Skandinaviske Museum* (1798-1803) was revived by the *Litteratur-Selskabs Skrifter* (1806). These were followed by the *Lærde Efterretninger* (1799-1810), afterwards styled *Litteraturlitidende* (1811-36), the *Athenæ* (1818-17), and *Historkisk Tidsskrift* (1840). In more modern times appeared *Tidsskrift for Litteratur og Kritik* (1838-42, 1848); *Maanedsskrift for Litteratur* (1829-38); *Nord og Syd* (1848-49) of Goldschmidt, succeeded by *Ude og Hjemme*, still published; and the *Danske Maanedsskrift* (1858) of Steenstrup, with signed historical and literary articles. One of the most noteworthy Scandinavian periodicals has been the *Nordisk Universitets Tidsskrift* (1854-64), a bond of union between the universities of Christiania, Upsala, Lund, and Copenhagen.

See *Revue des Journaux*, 1st August 1891.

Iceland. Iceland has the *Islandsk Samgátt* (1817-26), *Skráir* (1827), still published, *Ný Þingamyrt* (1841), and *Gefn* (1870-73).

See T. Moltus, *Nat. bibl. Island.*, in *Norvegiens*, Leipzig, 1860-60.

Norway. The first trace of the serial form of publication to be found in Norway is in the *Journal des Aftandinger* (1760-61), "Weekly Short Treatises," of Bishop Fr. Mønstedt, consisting of moral and theological essays. The *Maanedlige Aftandinger* (1782), "Monthly Treatises," was supported by several writers and devoted chiefly to rural economy. These two were followed by *Politik og Historie* (1807-10); *Saga* (1816-20), a quarterly review edited by J. S. Munch; *Den Norske Tidsskrift* (1817-21), a miscellany brought out at Bergen; *Hermøden* (1821-27), a weekly aesthetic journal; *Iduna*, (1829-33), the first and best of less than five; *Vidne* (1828-34), a weekly scientific and literary review; *Nor* (1840-46), of the same type; *Norsk Tidsskrift for Videnskabelig Litteratur* (1847-55); *Illustreret Nyhedsblad* (1851-65), "Illustrated News"; *Norsk Maanedsskrift* (1856-60), "Monthly Review for Norway," devoted to history and philology; and *Norden* (1866), a literary and scientific review. Popular serials date from the *Stillingen Magazin* (1835), which first introduced wood-engraving, and is still published. The *Norsk Familienblad* was of the same class.

See P. Botten-Hansen, *La Norvège Littéraire*, Christiania, 1888; *Norsk Bog-Fortegnelse* (1814-73).

Sweden. The *Swenska Argus* (1733-34) of Olof Dalin is the first contribution of Sweden to this subject. The next were the *Tidningar om den Lärda Arbeten* (1745) and the *Lärda Tidningar*. The patriotic journalist C. C. Gjörvick established about twenty literary periodicals, of which the most important was the *Swenska Mercurius* (1755-59). Afterward some fellow-students founded about 1810 a society for the deliverance of the country from French pedantry, with this end carried on a periodical entitled *Phosphoros* (1810-13), to propagate the opinions of Schlegel and Schelling. The *Swensk Litteratur-Tidning* (1813-25) of Palmblad and the *Polygfen* (1819-18) had the same end in view. Among more recent periodicals we may mention *Scandia* (1833-37), *Illustreret Nyhedsblad* (1838-40), *Skillingar och Förhållanden* (1838) of Cruusentzsch, a monthly review of Scandinavian history; *Tidsskrift for Litteratur* (1850); *Norsk Tidsskrift* (1852), weekly, still published; *För och Nu*; and the *Revue Suédoise* (1858) of Kramer, written in French. The *Ny Illustreret Tidning* and *Hemmen* are current illustrated weeklies; the *Swenska Fackblad* is also weekly.

See *Revue des Journaux*, 1st August 1891.

Spain. *Spain and Portugal*.—Spain owes her intellectual emancipation to the monk Benito Feijoo, who in 1726 produced a volume of dissertations somewhat after the fashion of the *Spectator*, but on graver subjects, entitled *Teatro Crítico*, which was continued down to 1739. His *Cartas Eruditas* (1745-60) were also issued periodically. The earliest critical serial, the *Diario de las Literaturas* (1787-48), kept up at the expense of Philip V., did not long survive a court favour. Other periodicals which appeared in the 18th century were Mañer's *Mercurio* (1738); the *Diario Noticioso* (1759-81); *El Pensador* (1762-67) of Joseph Clavijo y Fajardo; *El Belicista Literario* (1765), satirical in character; the *Semanario Erudito* (1778-81), a clumsy collection of documents; *El Correo Literario de la Europa* (1781-82); *El Correo* (1781); the valuable *Memorial Literario* (1784-1808); *El Nuevo Literario* (1786-91), devoted to literature and science; and the agricultural *El Correo* (1792-98) and *El Semanario de Agricultura* (1797-1805). In the present century we have *Particidas de Ciencias, Literatura, y Artes* (1808-5), among whose contributors have been the distinguished names of Quintana, Moratin, and Antillon; *Miscelánea de*

Comercio (1819); and *Diario general de las Ciencias Médicas*. The Spanish refugees in London published *Ocios de Españoles Esfugiados* (1829-26) and *Miscelánea Hispano-americana* (1824-28), and at Paris *Miscelánea Española americana* (1826). The *Orientales científicos* (1817-20) was afterwards transformed into a daily newspaper. Subsequently to the extinction of *El Censor* (1820-33) there was nothing of any value until the *Cartas Españolas* (1832), since known as the *Revista Española* (1832-36) and as the *Revista de Madrid* (1838). Upon the death of Ferdinand VII. periodicals had a new opening; in 1838 there were published sixteen journals devoted to science and art. The fashion of literary criticism introduced in the *Semanario pitagorico Español* (1836-37), noticeable for its biographies and descriptions of Spanish monuments. *El Panorama* (1839-41) was another literary periodical with engravings. Of more recent date have been the *Revista Iérica* (1861-63), conducted by Sanz del Río; *La América* (1857-70), specially devoted to American subjects and edited by the brothers Asquerino; and the *Revista de Cataluña*, published at Barcelona. The chief of those published at the present time are the *Revista de España*, the *Revista Contemporánea*, the *Revista Europea*, and the *Revista de Archivos*.

Apart from newspapers, there were issued at Madrid in 1867 47 periodicals, of which 10 were religious, 32 literary, 17 official, 7 satirical, &c. In 1882 the number of periodicals issued in Spain was 377—34 legal, 24 agricultural, 35 commercial, 15 army and navy, 14 theatrical, 45 illustrated, 86 literature and science, 52 medical, 11 fashions, 61 education, 45 political, 58 miscell., &c. See G. Dickson, *History of Spanish Literature*, New York, 1873; G. Hubbard, *Histoire de la littérature contemporaine en Espagne*, Paris, 1878; E. Hartzenbusch, *Periodicos de Madrid*, 1876; Lapeyre, *Catálogo-Índice de los periódicos, revistas, y traducciones en España*, 1888.

Portugal could long boast of only one review, the *Jornal Enci-Portugal* (1779-1806), which had many interruptions; then came the *Jornal de Coimbra* (1812-20), the *Panorama* (1836-57), founded by Herculano; the *Revista Universal Lisbonense* (1841-53), established by Castilho; the *Instituto* (1853) of Coimbra; the *Arquivo Lusitano* (1857) of Lisbon; and the *Jornal da Sociedade dos Antigos dos Lettados*. In 1858 a review called *O Feminista*, and conducted by women, was established at Lisbon.

I. F. Da Silva, *Dicionario Bibl. Portuguez*, 1858.

Greece.—The periodical literature of modern Greece commences Greece with "O Aghos Ephef," brought out at Vienna in 1811 by Anthimos Gazis and continued to 1821. A philological serial with no less a title is still published. In *Agini* the Aghos appeared in 1831, edited by Muxtoridis; and at Corin, in Greek, Italian, and English, the *Archeologia* (1844). After the return of King Otto in 1833 a literary review called "Iris" was commenced. *La Spectateur de l'Orient*, in French, pleaded the national cause before Europe for three years from 1855. A military journal was published at Athens in 1855, and two years later the archaeological periodical conducted by Pittakis and Rangavi. For many years *Archeologia* (1859-73), edited by Rangavi and Papargorgopoulos, was the leading serial. Among existing periodicals *Phos* deals with natural science, the *Panorama* with agriculture, and the *Epiphorai* with theology.

See A. R. Rangavi, *Hist. littéraire de la Grèce Moderne*, Paris, 1878; R. Nicot, *Geschichte der neugriechischen Literatur*, 1878.

Russia.—The historian Müller made the first attempt to establish Russia.

periodical literature in Russia in his *Pojam' gosudarstvennaia Sotcheniya* (1756-64), or "Monthly Works." In 1759 Sumarokoff founded the *Trudolyubivaya Pchela*, or "Industrious Bee," giving translations from the *Spectator*, and, for the first time, critical essays. Karazin brought out in 1802 the *Vestnik Evropy*, an important review with Liberal tendencies, which is still appearing. The Conservative *Zvezdnyy Pustynnik* (1808) was revived at Moscow in 1856 by Katchenkov and is also published now. The romantic school was supported by Sin Oleschetska (1812), "Son of the Fatherland," united in 1826 to the *Svernoi Arkhiv* (1822), which dwindled and came to an end soon after 1839. One of the most successful Russian reviews has been the *Biblioteka dlya Tschetnika* (1834), or "Library of Reading." The Slavophile party is represented by the *Russkaya Mysl*, "Russian Thought," published in Moscow.

Finland has had *Suomi* (1841), written in Swedish.

Finland. See C. Cornilieu, *Histoire de la littérature contemporaine en Russie*, Paris, 1875, and the bibliographical works of Mécq.

Slovakia.—Bohemia has had the *Časopis Českého Bohemia*. *Museum* (1827), founded by Palacky; *Zvez* (1858), a review of natural history; and the *Somasky Archeologicki*.

Hungary. We show the *Ungarische Museum* (1781-87, 1791), Hungary. published at Pressburg, and the *Magyar Museum* (1798). The *Tudományos grófjelmű* (1817-41) and the *Művelődés* (1837-48) deserve mention. *Uj Magyar Museum* was a scientific magazine, and the *Budapesti Szemle* (1857) of a more general character.

Before the revolution of 1830 Poland had the *Pamiętnik War-Poland*. *smosci* of Lach Szyma. Among other reviews may be mentioned the *Deutsches Literaturblatt* of Lemberg, the *Literatura Warszawskie* of Warsaw, and the *Przegląd Polski* of Cracow.

Romania commenced with the *Magazinul istoriei pentru Dacia Ron-* (1845), among containing valuable historical documents, and Moldavia mania. with *Dacia Literaria* (1840) and *Arhivele Romanesca* (1841).

Servia

The best literary review Servia has had was the *Wala*, edited by Norakovic
 See A. Böttger, *Ueber die literarischen Verhältnisse in Servien*, 1876, 2 fasc.,
Bibliographisches Lexikon der Literatur, 1876.

UNITED STATES

United States

Spurred by the success of the *Centinel's Magazine* in England, Benjamin Franklin printed and published the earliest miscellany in America, under the title of the *General Magazine* (1741), at Philadelphia, which, owing to want of support, expired after six monthly numbers had appeared. Franklin's rival, John Webbe, brought out in opposition the *American Magazine* (1741), which ran only to two numbers. Futile attempts at Philadelphia in 1757 and 1769 to revive periodicals with the same name were both fruitless. The other pre-revolutionary magazines were the *Boston Area Magazine* (1747-48), in imitation of the *London Magazine*; the *Boston Weekly Magazine* (1743); the *Christian History* (1743-44); the *New York Independent Reflector* (1752-53); the *New England Magazine* (1758-60), a collection of fugitive pieces; the *Boston Royal American Magazine* (1774-75), and the *Pennsylvania Magazine* (1775-76), which, founded by R. Aitken, with the help of Thomas Paine, came to an untimely end upon the commencement of the war. The *Columbian Magazine* (1786-90) was compiled as the *Universal Asylum* (1790-92). Matthew Carey brought out the *American Museum* in 1787, and it lasted until 1792. Five or six more magazines ran out a brief existence before the end of the century. One of the most successful of them was the *Fame's Museum* (1793-99), supported by perhaps the most brilliant staff of writers American periodical literature had yet been able to show, and edited by Dennis, who in 1801 commenced the publication of the *Portfolio*, continued on to 1827. Philadelphia. For five years it was a weekly miscellany in quarto, and afterwards an octavo monthly; it was the first American serial which could boast of so long an existence. The *Literary Magazine* (1803-5) was established at Philadelphia by C. B. Brown, who, with Dennis, may be considered as having been the first American professional man of letters. The Anthology Club was founded at Boston in 1803 by Phineas Adams for the cultivation of literature and the discussion of philosophy. Elbridge, Everett, and Bishop, among the members, and were contributors to the origin of the club, the *Monthly Anthology* (1803-11), the forerunner of the *North American Review*. In the year 1810 Thomas (P. using in *American*, n. 292) informs us that 27 periodicals were issued in the United States. The first serious rival of the *Portfolio* was the *Athenae Magazine* (1813-20), founded at Philadelphia by Moses Thomas, with the literary assistance of W. Irving (for some time the editor), and ending, as an anthologist, in spite of a large subscription list it came to an end on account of the costly style of its production. The first southern serial was the *Monthly Register* (1805) of Charleston. New York possessed no periodical worthy of the title until 1824, when the *Atlantic Magazine* appeared, which changed its name shortly afterwards to the *New York Monthly Review*, and was supported by R. C. Sands and W. C. Bryant. For many years *Graham's Magazine* was the leading popular miscellany in the country, reaching at one time a circulation of about 35,000 copies. The first western periodical was the *Illinois Monthly Magazine* (1830-32), published, owned, edited, and almost entirely written by James Hall, who followed with his *Western Monthly Magazine* (1833-38), produced in a similar manner. In 1838 the novelist C. F. Hoffman founded at New York *The Knickerbocker* (1838-60), which soon passed under the control of Timothy Flint and then, after a somewhat successful, most of the leading native writers of the next twenty years having been contributors. Equally popular was Putnam's *Monthly Magazine* (1853-67), 1867-69. The *Dial* (1811-44), Boston, the organ of the transcendentalists, was first edited by Margaret Fuller, and subsequently by R. W. Emerson and G. Ripley. Among other extinct magazines may be mentioned the *American Monthly Magazine* (1833-38), the *Southern Literary Messenger* (1834), Richmond, the *Centinel's Magazine* (1837-40), and the *Westchester Review* (1850-52). Edited by R. W. Griswold, the *Yale Literary Magazine* dates from 1838. The *McClure's Magazine* was issued in 1871 with the *Cosmopolitan* and *Funeral Chronicle*. Foremost among existing magazines came *Haver's Monthly Magazine* (1850) and *Servia's Monthly* (1870), now *The Century*, both famous for their unrivalled wood-engraving and literary excellence. Within the last few years the circulation of these two periodicals has increased to a remarkable degree both at home and abroad. Not less admirable in their way are the *Atlantic Monthly* (1867), *Lippincott's Magazine*, and the *Manhattan*.

The first attempt to carry on an American review was made by Robert Walsh in 1811 at Philadelphia with the *American Review of History and Politics*, which lasted only a couple of years. Still more brief was the existence of the *General Repository and Review* (1812), brought out at Cambridge by Andrews Norton, with the help of the professors of the university, but of which only four numbers appeared. Niles's *Weekly Register* (1811-48) was political, historical, and literary. *The North American Review*, the oldest and most prosperous of all the American reviews, dates from 1815,

and was founded by William Tudor, a member of the previously-mentioned Anthology Club. After two years' control Tudor handed over the review to the club, then styled the North American Club, whose most active members were R. T. Claquett, B. H. Dana, and Jacob Spack. On his return from Europe in 1819 E. Everett, and his elder brother Alexander acquired the property in 1829. The roll of the contributors to this review numbers almost every American writer of note. Since January 1879 it has been published monthly. The *American Quarterly Review* (1827-37), established at Philadelphia by Robert Walsh, came to an end on his departure for Europe. The *Southern Review* (1828-52), conducted by H. Legaré, S. Elliott, and G. W. Sumner in defence of the politics and honour of the South, enjoyed a shorter career. It was reconstituted in 1842, and lived another ten years. These two were followed by the *Democratic Review* (1838-52), the *American Review*, afterwards the *American Whig Review* (1845-52), the *Massachusetts Quarterly Review* (1847-50), and a few more. *The New Englander* (1843), the *Biblical Repository* and *Princeton Review* (1826), and the *National Quarterly Review* (1860) are still published. The critical weeklies of the past include the *New York Literary Gazette* (1824-25, 1830), *The Bowdoin Review* (1846), the *Literary World* (1847-53), the *Criterion* (1855-56), the *Round Table* (1863-64), the *Citizen* (1864-73), and *Appleton's Journal* (1869). The leading weeklies of the day include the *Nation* (1865), the *Literary World* (1870), and the *Critic* (1881).

Religious periodicals have been extremely numerous in the United States during the last hundred years. The earliest was the *Theological Magazine* (1796-98), the *Christian Examiner* dates from 1824 and lasted down to 1870. *The Pencil* (1805), changed to the *Missionary Herald*, still represents the American Board of Missions. The *Methodist Magazine* dates from 1818 and the *Christian Disciple* from 1813. The *American Biblical Repository* (1831-50), a quarterly, was united with the *Andover Bibliotheca Sacra* (1849) and with the *Theological Science* (1865). *Brownson's Quarterly Review* began as the *Boston Quarterly Review* in 1838, and did much to introduce to American readers the works of the modern French philosophical school. Among more recent titles of this class we may notice the *Protestant Episcopal Quarterly Review* (1854), the *Presbyterian Magazine* (1851-60), the *Orthodox World* (1865), the *Southern Review* (1867), the *New Jerusalem Magazine* (1827), *American Baptist Magazine* (1817), the *Church Review* (1818), the *Christian Review* (1836), the *Universalist Quarterly* (1844). Among historical periodicals may be numbered the *American Register* (1808-11), the *American Quarterly Review* (1848-51), the *American Quarterly Review* (1829-48), the *New England Historical and Genealogical Register* (1847), *Polsom's Historical Magazine* (1857), the *New York Genealogical Record* (1869), and the *Magazine of American History* (1877).

For many years the leading English periodicals have been regularly imported in the United States, and many serial publications have been almost entirely made up of extracts from English sources. Perhaps the earliest example is to be found in *Robert Paves of Literature* (1811-12). The *Religious Magazine* (1844) and *Littell's Living Age* (1844) are still published.

In 1817 America possessed only one scientific periodical, the *Journal of Mineralogy*. Professor Silliman established the journal known by his name in 1818. Since that time the *American Journal of Science* has enjoyed increasing favour. Among other special periodicals of the day may be mentioned the *American Naturalist*, 1847, R. Stevens, *Journal of the Boston Society for the Study of the History of Speculative Philosophy*, the *American Journal of Philology*, the *American Railroad Journal*, the *Banker's Magazine*, the *Index Medicus*, and the *Journal of the Franklin Institute*.

The number of periodicals devoted to light literature and to female readers has been, and still remains, extremely large. The earliest in the latter class was the *Lady's Magazine* (1792) of Philadelphia. The name of the *Ladies Offering* (1841), written chiefly by lady writers, is well known in England. *Good and Beautiful* is still issued. Children's magazines originated with the *Young Misses' Magazine* (1806) of Brooklyn, *St Nicholas* is a modern high-class representative of this kind, another current example is the *Child's Paper* (1859).

The following estimate of the number of periodicals now appearing in the United States is taken from G. P. Rowell and Co's *American Newspaper Record* (1888). It reckons, and probably includes more frequently than once a week, are omitted on account of the difficulty of distinguishing them from newspapers. The numbers given are—bi-weeklies 47, semi-monthlies 176, monthlies 1084, bi-monthlies 12, quarterlies 69, and total 1872.

PERIPATETICS was the name given in antiquity to the followers of Aristotle, from their master's habit of walking up and down as he lectured conversationally to his pupils. Others derive the name from the *peripatros*, or covered walk of the Lyceum. An account of the Aristotelian philosophy will be found in the articles ARISTOTLE, ETHICS, LOGIC, and METAPHYSIC. Here it must suffice to recall those features of the system which mainly conditioned the development of the school. Aristotle's central conception is the correlative opposition of form and matter. This may be called the supreme category under which he views the world, it is the point where, as Zeller puts it, Aristotle's system at once refutes and completes the Platonic doctrine of the "idea" in its relation to phenomena. But Aristotle did not succeed in expelling the dualism which he blamed in Plato. His deity is pure form, and dwells in abstract self-contemplation withdrawn from the actual life of the world. The development of the world remains, therefore, unrelated to the divine subject. In Aristotle's doctrine of man, precisely the same difficulty is experienced in connecting the active or passionless reason with the individual life, the latter being a process of development bound up with sense, imagination, and desire. The soul is originally defined as the entelechy of the body, and, moreover, not of body in general but of its particular body. It is impossible, therefore, from this point of view to speak of soul and body as separate entities. Yet Aristotle holds that besides the individual mind, which is all things potentially—which *becomes* all things—there is superinduced upon the process of development the active or creative reason, the pure actuality (*ἐνέργεια*) which the development presupposes as its necessary *praxis*, just as the world-process presupposes God. This reason is "separable," and is said to enter "from without" when it unites itself to the process of individual life. It must therefore exist before the individual, and it alone outlasts the death of the body, to it alone properly belong the titles of "immortal" and "divine." But its relation to the universal divine reason was not handled by Aristotle at all. The question was destined to become the *crux* of his commentators. In general it is evident that, if reason in man be identified with the process of natural development (and there is Aristotelian warrant for declaring these to be simply two aspects of the same thing), we drift into a purely naturalistic or materialistic doctrine. On the other hand, the doctrine of the "active reason" may be maintained, but what Aristotle left vague may be further defined. The rational soul of each individual may be explicitly identified with the divine reason. This leads to the denial of individual immortality and the doctrine of one immortal impersonal reason, such as we find, for example, in the rationalistic pantheism of Averroes. A third position is possible, if the statements of Aristotle be left in their original vagueness. Aristotle may then be interpreted as supporting monotheism and the immortality of separate rational souls. This was the reading adopted by the orthodox scholastic Aristotelians, as well as by those early Peripatetics who contented themselves with paraphrasing their master's doctrine.

Aristotle's immediate successors, Theophrastus, who presided over the Lyceum from 322 to 288 B.C., and Eudemus of Rhodes, were distinguished by a learned diligence rather than by original speculative power. They made no innovations upon the main doctrines of their master, and their industry is chiefly directed to supplementing his works in minor particulars. Thus they amplified the Aristotelian logic by the theory of the hypothetical and disjunctive syllogism, and added to the first figure of the categorical syllogism the five moods out of which the fourth figure was afterwards constructed. The impulse towards natural science and the systematizing of empirical details which

distinguished Aristotle from Plato was shared by Theophrastus. His two works on the *History of Plants* and *Causes of Plants* prove him to have been a careful and acute observer. The same turn for detail is observable in his ethics, where, to judge from the unimpaired evidence of the *Characteres*, he elaborated still further Aristotle's portraitures of the virtues and their relative vices. In his doctrine of virtue the distinctive Peripatetic position regarding the importance of external goods was defended by him with emphasis against the assaults of the Stoics. He appears to have laid even more stress on this point than Aristotle himself, being doubtless led to do so, partly by the heat of controversy and partly by the importance which leisure and freedom from harassing cares naturally assumed to a man of his studious temperament. The metaphysical *ὑποτάξις* of Theophrastus which have come down to us show that he was fully alive to the difficulties that start up round many of the Aristotelian definitions. But we are ignorant how he proposed to meet his own criticisms, and they do not appear to have suggested to him an actual departure from his master's doctrine, much less any radical transformation of it. In the difficulties which he raises with reference to the relation of the active and the passive reason, as well as in his ascription of the physical predicate of motion to the activity of the soul, we may perhaps detect a leaning towards a naturalistic interpretation. The tendency of Eudemus, on the other hand, is more towards the theological or Platonic side of Aristotle's philosophy. The *Eudemian Ethics* (which, with the possible exception of the three books common to this treatise and the *Nicomachean Ethics*, there need be no hesitation in ascribing to Eudemus) expressly identify Aristotle's ultimate ethical ideal of *εὐτυχία* with the knowledge and contemplation of God. And this supplies Eudemus with a standard for the determination of the mean by reason, which Aristotle demanded, but himself left vague. Whatever furthers us in our progress towards a knowledge of God is good, every hindrance is evil. The same spirit may be traced in the author of the chapters which appear as an appendix to book i. of Aristotle's *Metaphysics*. They have been attributed to Pasicles, the nephew of Eudemus. For the rest, Eudemus shows even less philosophical independence than Theophrastus. Among the Peripatetics of the first generation who had been personal disciples of Aristotle, the other chief names are those of Aristoxenus of Tarentum and Dicaearchus of Messene. Aristoxenus, "the musician," who had formerly belonged to the Pythagorean school, maintained the position, already combated by Plato in the *Phaedo*, that the soul is to be regarded as nothing more than the harmony of the body. Dicaearchus agreed with his friend in this naturalistic rendering of the Aristotelian entelechy, and is recorded to have argued formally against the immortality of the soul.

The naturalistic tendency of the school reached its full expression in Strato of Lampascus, who succeeded Theophrastus as head of the Lyceum, and occupied that position for eighteen years (287-269 B.C.). His predilection for natural science earned for him in antiquity the title of "the physicist." He is the most independent, and was probably the ablest, of the earlier Peripatetics. His system is based upon the formal denial of a transcendent deity. Cicero attributes to him the saying that he did not require the aid of the gods in the construction of the universe; in other words, he reduced the formation of the world to the operation of natural forces. We have evidence that he did not substitute an immanent world-soul for Aristotle's extra-mundane deity; he recognized nothing beyond natural necessity. He was at issue, however, with the atomistic materialism of Democritus in regard to its twin assumption

taut of absolute atoms and infinite space. His own speculations led him rather to lay stress on the qualitative aspect of the world. The true explanation of things was to be found, according to Strato, in the forces which produced their attributes, and he followed Aristotle in deducing all phenomena from the fundamental attributes of elements of heat and cold. His psychological doctrine explained all the functions of the soul as modes of motion, and denied any separation of the reason from the faculties of sense-perception. He appealed in this connexion to the statement of Aristotle that we are unable to think without a sense-image.

The successors of Strato in the headship of the Lyceum were Lyco, Aristo of Ceos, Critolaus (who, with Carneades the Academic and Diogenes the Stoic, undertook in 155 B.C. the famous embassy to Rome, more important in its philo-sophical than in its political bearings), Diodorus of Tyre, and Erymnus, who brings the philosophic succession down to about the year 100 B.C. Other Peripatetics belonging to this period are Hieronymus of Rhodes, Pyrtanis, and Phormio, the *delirus senex* who attempted to instruct Hannibal in the art of war. Sotion, Hippius, and Satyrus were historians rather than philosophers. Hecatachides Lombus, Agatharchides, and Antisthenes of Rhodes, are names to us and nothing more. The philosophic unfruitfulness of the school during this whole period is expressly charged against it by Stabio, who explains it by his well-known story of the disappearance of Aristotle's writings after the death of Theophrastus. But it is impossible that this story should be true in the shape in which it is told by Stabio, and a sufficient explanation of the barrenness of the school may be found in the general circumstances of the time. From the outset the characteristic of the Aristotelian philosophy had been its disinterested scientific character, but the age was one for which speculation as such had lost its attractiveness. At such a time it was natural, therefore, that the Peripatetic school should suffer more than the others. It had also in practical matters taken up a mediating position, so that it lacked the attractions which, in the case of extreme views, enlist supporters and inspire them with propagandist zeal. The fact, at all events, is not to be denied that, after Strato, the Peripatetic school has no thinker of any note to show for about 200 years. With Strato, moreover, the scientific activity of the school has an end, when it received a new infusion of life its activity took another direction. Strato accuses the Peripatetics of this period of devoting themselves to the ticking out of commonplaces. This seems in great measure true of those who still occupied themselves with philosophy; they cultivated ethics and rhetoric, and were noted for the elegance of their style. But the majority followed the current of the time, and gave themselves up to the historical, philological, and grammatical studies which mark the Alexandrian age.

Early in the 1st century B.C. all the philosophic schools began to be invaded by a spirit of eclecticism. This was partly the natural result of the decay of speculative interest and partly due to the unconscious influence of Rome upon the philosophers. The Roman mind measured philosophy, like other things, by the standard of practical utility. As an instrument of education, and especially as the inculcator of moral principles, the Roman welcomed and appreciated philosophy; but his general point of view was naively put by the proconsul Gallus (about 70 A.D.), who proposed to the representatives of the schools in Athens that they should settle their differences amicably, at the same time offering his personal services as mediator. Though the well-meant proposal was not accepted, this atmosphere of indifference unperceptibly influenced the attitude of the

contending schools to one another. Thus Boethius the Stoic deserted the pantheism of his school and assigned the deity, as Aristotle had done, to the highest sphere. He likewise embraced the Peripatetic doctrine of the eternity of the world. A similar approximation to Peripateticism is seen in Panætius. About the same time, Antiochus of Ascalon, founder of the so-called fifth Academy, tried to combine Plato, Aristotle, and Zeno, asserting that they differed only in words. Meanwhile the Peripatetic school may be said to have taken a new departure and a new lease of life. The impulse was due to Andronicus of Rhodes, the well-known editor of Aristotle's works, who presided over the Lyceum towards the middle of the 1st century B.C. His critical edition indicated to the later Peripatetics the direction in which they could profitably work, and the school devoted itself henceforth almost exclusively to the writing of commentaries on Aristotle. Boethius of Sidon and Aristo of Alexandria carried on the work of interpretation begun by Andronicus. Boethius appears, like many of his predecessors, to have taken the naturalistic view of Aristotle's doctrines, and even in some respects to have approximated to the Stoic materialism. Staseas, Cratippus, and Nicolaus of Damascus need only be named as belonging to this century. The most interesting Peripatetic work of the period is the treatise *De Mundo*, which has come down to us under Aristotle's name, but which internal evidence obliges us to assign to a date later than the writings of the Stoic Posidonius. The interest of the treatise lies in the evidence it affords within the Peripatetic school of the eclectic tendency which was then in the air. The admixture of Stoic elements is so great that some critics have attributed the work to a Stoic author, but the writer's Peripateticism seems to be the more fundamental constituent of his doctrine.

Our knowledge of the Peripatetic school during the first two centuries of the Christian era is very fragmentary; but those of its representatives of whom anything is known confined themselves entirely to commenting upon the different treatises of Aristotle. Thus Alexander of Aegæ, the teacher of Neio, commented on the *Categories* and the *De Culo*. In the 2d century Aspasius and Adrastus wrote numerous commentaries. The latter also treated of the order of the Aristotelian writings in a separate work. Somewhat later, Herminius, Achaicus, and Sosigenes commented on the logical treatises. Aristoteles of Messene, the teacher of Alexander of Aphrodisias, was the author of a complete critical history of Greek philosophy. This second phase of the activity of the school closes with the comprehensive labours of Alexander of Aphrodisias, the exægete *par excellence*, called sometimes the second Aristotle. He became head of the Lyceum during the reign of Septimius Severus, some time between 198 and 211 A.D. Alexander's interpretation proceeds throughout upon the naturalistic lines which have already become familiar to us. Aristotle had maintained that the individual alone is real, and had nevertheless asserted that the universal is the proper object of knowledge. Alexander seeks consistency by holding to the first position alone. The individual is prior to the universal, he says, not only "for us," but also in itself, and universals are abstractions which have merely a subjective existence in the intelligence which abstracts them. Even the deity must be brought under the conception of individual substance. Such an interpretation enables us to understand how it was possible, at a later date, for Aristotle to be regarded as the father of Nominalism. Form, Alexander proceeds, is everywhere indivisible from matter. Hence the soul is inseparable from the body whose soul or form it is. Reason or intellect is bound up with the other faculties. It exists primarily in man only as a disposition or capacity—*νοῦς ἑλκός καὶ φυσικός*—and

is afterwards developed into actual intelligence—*νοῦς ἐντελὴς*—the intellect acquired by the Scholastics. The active reason—*νοῦς ποιητικὸς*—which effects this development is, according to Alexander, no part of the soul, but simply the divine reason acting upon it. The influence of God upon nature is elsewhere reduced by Alexander, as far as possible, to a mechanical process. Aristotle's ethico-mystical conception of God as the ultimate and transcendent object of desire is set aside; and the influence of the deity is represented simply as a diffusion of force, first into the heavens and thence downwards, each lower element receiving less according to its greater distance from the source. The commentaries of the Aphrodisian formed the foundation of the Arabian and Scholastic study of Aristotle. Soon after Alexander's death the Peripatetic school was merged, like all others, in the Neoplatonic. Neoplatonists like Porphyry, Iamblichus, Themistius, Dexippus, Syrianus, Ammonius, Simplicius, and Philoponus carried on the work of countenancing on Aristotle till the final disappearance of Greek philosophy. For the further history of Aristotelianism, see ARABIAN PHILOSOPHY and SCHOLASTICISM.

The authorities on whom we depend for our knowledge of the Peripatetics are collected and sifted with exhaustive care by Zeller in the relative sections of his *Philosophie der Griechen* (ii. 2 and iii. 1). (A SE)

PERIPATUS. See MYRIAPODA, vol. xvii. p. 116.

PERITONITIS, inflammation of the peritoneum or membrane investing the abdominal and pelvic cavities and their contained viscera. It may exist in an acute or a chronic form, and may be either localized in one part or generally diffused.

Acute peritonitis may attack persons of both sexes and of any age. It is sometimes brought on, like other inflammations, by exposure to cold, but it would appear to arise quite as frequently in connexion with some antecedent injury or disease in some of the abdominal organs, or with depraved conditions of the general health. It is an occasional result of hernia and obstructions of the bowels, of wounds penetrating into the abdomen, of the perforation of viscera by disease (e.g., in ulcer of the stomach and in typhoid fever), of the bursting of abscesses or cysts into the abdominal cavity, and also of the extension of inflammatory action from some of the abdominal or pelvic organs. Not unfrequently it is at first localized, and then, spreading onwards, becomes general.

The changes which take place in the peritoneum are similar to those undergone by other serous membranes when inflamed, viz., (1) congestion, (2) exudation of lymph in greater or less abundance, at first greyish in colour and soft, thereafter yellow and becoming tough in consistence, causing the folds of intestine to adhere together, (3) effusion of fluid, either clear, turbid, bloody, or purulent, (4) absorption more or less complete of the fluid and lymph. Occasionally shreds or bands of unabsorbed lymph remain, constituting a subsequent danger of strangulation of the bowel. The symptoms usually begin by a rigor, together with vomiting and pain in the abdomen of a peculiarly severe and sickening character, accompanied with extreme tenderness, so that the slightest pressure causes a great aggravation of suffering. The patient lies on the back with the knees drawn up, and it will be noticed that the breathing is rapid and shallow and performed by movements of the chest only, the abdominal muscles remaining quiescent, unlike what takes place in healthy respiration. The abdomen becomes swollen by flatulent distension of the intestines, which increases the patient's distress. There is usually constipation. The skin is hot, although there may be perspiration; the pulse is small, hard, and wiry; the urine is scanty and high-coloured, and passed with pain. The patient's aspect is

one of anxiety and suffering. These symptoms may subside in a day or two, but if they do not the case is apt to go on rapidly to a fatal termination. In such an event the pain and tenderness subside, the abdomen becomes more distended, hicough and vomiting of brown or blood-coloured matter occur, the temperature falls, the face becomes pinched, cold, and clammy, the pulse exceedingly rapid and feeble, and death takes place from collapse, the patient's mental faculties generally remaining clear till the close. When the peritonitis is due to perforation, as may happen in the case of the gastric ulcer, or the ulcers of typhoid fever, the above-mentioned symptoms and the fatal collapse may all take place in from twelve to twenty-four hours. Further, the puerperal form of this disease, which comes on within a day or two after parturition, is always very serious and is often rapidly fatal. The symptoms are similar to those already described, but in addition there are generally superadded those of septæmæmia (blood-poisoning).

Chronic peritonitis occurs in two forms—(1) as a result of the acute attack, (2) as a tubercular disease. In the former case, the acute symptoms having subsided, abdominal pain to some extent continues, and along with this there is considerable swelling of the abdomen, corresponding to a thickening of the peritoneum, and it may be also to find in the peritoneal cavity. Occasionally a condition of this kind appears to develop slowly without there having been any preceding acute attack. In this form of peritonitis there is considerable constitutional disturbance, together with loss of strength and flesh, nevertheless, although the disease is essentially a chronic one, it is often recovered from. The tubercular form of peritonitis occurs either alone or associated with tuberculous disease of the lungs or other organs. The chief symptoms are abdominal pain and distension, along with disturbance of the functions of the bowels, there being either constipation or diarrhoea, or each alternately. Along with these local manifestations there exist the usual phenomena of tuberculous disease, viz., high fever, with rapid emaciation and loss of strength. Cases of this kind are of grave import, and their tendency is to a fatal termination.

In the treatment of acute peritonitis the remedy upon which most reliance is to be placed is opium, which affords relief to the pain, and appears to exercise a certain controlling influence upon the inflammatory process. It requires to be given in considerable quantity, yet with due care, so as to avoid its narcotization. The old plan of covering the abdomen with leeches is now seldom resorted to, nevertheless a moderate abstraction of blood by this means in a previously healthy person may contribute to the relief of the pain. Hot fomentations with turpentine or opium applied over the abdomen are of value. The strength must be maintained by milk, soups, and other light forms of nourishment. It is not in general desirable that the bowels should act, and this is one of the benefits obtained by the internal administration of opium. In the simple chronic form the use of iodine externally and of tonics with cod-liver oil internally will be found of service; while in the tubercular form remedies as at a rule of little value, but such symptoms as pain, fever, diarrhoea, &c., must be dealt with by palliative measures appropriate to these conditions.

PERIZONIUS, JACOB (1651-1715), classical scholar the most distinguished member of a learned Dutch family of that name (Voorbroek in the vernacular), was the eldest son of Anton Perizonius, author of a once well-known treatise, *De ratione studii theologicæ*, and was born at Dam in Groningen on 26th October 1651. He received his school education at Dam and Deventer, and afterwards studied in the university of Utrecht, where he came under the influence of Grævius and abandoned theology for pure literature. The death of his father and other untoward circumstances involved him in a struggle with various outward difficulties, but the influence of Heinsius and Grævius, who already appreciated him highly, and expected great things from him, ultimately procured for

him in 1682 the appointment to the chair of eloquence and history at Franeker, where his expositions of Cicero, Terence, Florus, and Suetonius, as well as his lectures on general history, attracted a large and increasing number of hearers. In 1693 he was promoted to the corresponding chair at Leyden, where he succeeded F. Spanheim in 1701. His death took place in that city on 6th April 1715.

The works of Perizonius both as an author and as an editor were very numerous, and by universal consent entitle him to a place of the highest rank among the scholars of his age. Special interest attaches to his edition of the *Minerva* of Scaevola or Scaevola (1st ed. 1687, 4th ed. 1714), which may be said to be one of the last developments of the study of Latin grammar while in its pre-scientific stage, when the phenomena of language had not yet ceased to be regarded as for the most part disconnected, conventional, or fortuitous. Mention must also be made of his *Animadversiones historice, in quibus quædam plurima in processu Romanarum rerum hæc utriusque linguæ auctoribus notantur, nullæ etiam utuntur aliquæ considerantur, veris de quibus antiquorum rituum cruetur et ubi usque explicavit* (1683), a work which Bayle has characterized as deserving to be entitled "The *Errata* of scholars and critics," and of his *Dissertationes duæ de Republica Romana*, alluded to with honour by Niebuhr in the preface to his *Roman History* (4th ed., 1833) as marking the beginning of that new era of classical study with which his own name is so closely associated.

PERJURY is an assertion upon an oath duly administered in a judicial proceeding, before a competent court, of the truth of some matter of fact, material to the question depending in that proceeding, which assertion the assertor does not believe to be true when he makes it, or on which he knows himself to be ignorant (Stephen, *Digest of the Criminal Law*, Art. 135). In the early stages of legal history perjury seems to have been regarded rather as a sin than as a crime, and so subject only to supernatural penalties. The injury caused by a false oath was supposed to be done not so much to society as to the Divine Being in whose name the oath was taken (see OATH). One of the practical effects of this view was to make perjury so common in the Middle Ages that the probable reason for preserving trial by combat was the difficulty of securing a just case against the perjury of witnesses (Hallam, *Middle Ages*, ch. ix. pt. 1). The almost universal existence of compurgation was no doubt another explanation of the frequency of perjury. In cases of compurgation, or in cases where wager of law was allowed, it is difficult to imagine that the defence could as a rule have been an honest one. In Roman law, even in the time of the empire, the perjurer fell simply under divine reprobation, and was not dealt with as a criminal, except where he had been bribed to withhold true or give false evidence, or where the oath was by the genius of the emperor. In the latter case punishment was no doubt inflicted more for the insult to the emperor than for the perjury. False testimony leading to the conviction of a person for a crime punishable with death constituted the offence of homicide rather than of perjury. In England, perjury, as being a sin, was originally a matter of ecclesiastical cognizance. At a later period, when it had become a crime, the jurisdiction of the spiritual courts became gradually confined to such perjury as was committed in ecclesiastical proceedings, and did not extend to perjury committed in a temporal court. The only perjury which was for a long time noticed at common law was the perjury of jurors. Attain of jurors (who were originally rather in the position of witnesses than of judges of fact) incidentally subjected them to punishment for perjury. Criminal jurisdiction over perjury by persons other than jurors seems to have been first assumed by the Star Chamber, acting under the powers supposed to have been conferred by 3 Hen. VII. ch. 1. After the abolition of the Star Chamber by the Long Parliament in 1641 and the gradual diminution of the authority of the spiritual courts, perjury (whether in the strict sense of the word or the taking of a false oath in non-judicial

proceedings) practically fell entirely within the jurisdiction of the ordinary criminal tribunals. The jurisdiction of the spiritual courts over perjury may now be considered obsolete. An unsuccessful attempt was made as lately as 1876 to induce the Court of Arches to entertain a criminal suit against a layman for a false oath taken before a surrogate (Phillimore v. Machon, *Law Rep.*, 1 Prob. Div. 481). See further, for the history of the law of perjury, Stephen, *History of the Criminal Law*, vol. ii. p. 408, vol. iii. p. 240. At common law only a false oath in judicial proceedings is perjury. But by statute the penalties of perjury have been extended to extra-judicial matters, e.g., false declarations made for the purpose of procuring marriage (19 and 20 Vict. c. 119, s. 18), and false affidavits under the Bills of Sale Act, 1878 (41 and 42 Vict. c. 31, s. 17). False affirmation by a person permitted by law to affirm is perjury (32 and 33 Vict. c. 68, s. 4; 33 and 34 Vict. c. 49). In order to support an indictment for perjury the prosecution must prove the authority to administer the oath, the occasion of administering it, the taking of the oath, the substance of the oath, the materiality of the matter sworn, the falsity of the matter sworn, and the corrupt intention of the defendant. The indictment must allege that the perjury was wilful and corrupt, and must set out the false statement or statements on which perjury is assigned, subject to the provisions of 23 Geo. II. c. 11 (which also applies to subornation of perjury). By that Act it is sufficient to set out the substance of the offence, without setting forth the bill, answer, &c., or any part of the record, and without setting forth the commission or authority of the court before whom the perjury was committed. The matter sworn to must be one of fact and not of mere belief or opinion. It is not homicide, as in Roman law, to procure the death of another by false evidence, but the Criminal Code, s. 118, 164, proposes to make such an offence a substantive crime of greater gravity than ordinary perjury, and punishable by penal servitude for life. It is a rule of evidence, founded upon obvious reasons, that the testimony of a single witness is insufficient to convict on a charge of perjury. There must be corroboration of his evidence in some material particular. Perjury is a common law misdemeanour, not triable at quarter-sessions. Proceedings may also be taken under 5 Eliz. c. 9, but this Act is of little practical importance, as the common law is more extensive than the statute. Most persons in a judicial position have the right of directing the prosecution of any witness, if it appears to them that he has been guilty of perjury (14 and 15 Vict. c. 100, s. 19). The provisions of the Vexatious Indictments Act (22 and 23 Vict. c. 17) extend to perjury and subornation of perjury. By that Act no indictment for either of such offences can be preferred unless the prosecutor or accused is bound by recognition, or the accused is in custody, or the consent of a judge is obtained, or (in the case of perjury) a prosecution is directed under 14 and 15 Vict. c. 100.

Subornation of perjury is procuring a person to commit a perjury which he actually commits in consequence of such procurement. If the person attempted to be suborned do not take the oath, the person inciting him, though not guilty of subornation, is liable to fine and corporal punishment. Perjury and subornation of perjury are punishable at common law with fine and imprisonment. By the combined operation of 2 Geo. II. c. 25 and later statutes, the punishment at present appears to be penal servitude for any term, or imprisonment with or without hard labour for a term not exceeding seven years (see Stephen, *Digest*, Art. 187). Perjury or prevarication committed before a committee of either House of Parliament may be dealt with as a contempt or breach of privilege as well as by prosecution. As to false oaths not perjury, it is a

misdeemeanour at common law, punishable by fine and imprisonment, to swear falsely before any person authorized to administer an oath upon a matter of common concern, under such circumstances that the false swearing, if committed in judicial proceedings, would have amounted to perjury. There are some cases of making false declarations which are punishable on summary conviction, *e.g.*, certain declarations under the Registration of Births and Deaths Act, 1874, and the Customs Consolidation Act, 1876. A conviction for perjury subjects the person convicted to certain disqualifications. He cannot hold a parish office (4 and 5 Will IV c 76, s 48). If a solicitor, and he attempt to practise after conviction, he is liable on summary conviction by a judge to seven years' penal servitude (13 Geo I c 29, s 4). If the prosecution be under the statute of Elizabeth, the person convicted is disabled from giving evidence for the future (5 Eliz c 9, s 2). The provisions of the last two Acts may, however, be regarded as virtually obsolete. The perjury of a witness may be a ground for pardon where the perjury has taken place in a criminal trial in which accused was convicted, or for a new trial in a civil action. In order to procure a pardon or a new trial it is generally necessary to show that the witness was a material one, and also that the perjurer has been prosecuted to conviction.

In Scotland the law, as a general rule, agrees with that of England. Perjury may be committed by a party on reference to oath as well as by a witness. A witness making a false affirmation is guilty of perjury (28 Vict c 9). The Acts 14 and 15 Vict c 100 and 22 and 23 Vict c 17 do not extend to Scotland. The trial, though usually by the Court of Justiciary, may be by the Court of Session if the perjury is committed in the course of an action before that court. The punishment is penal servitude or imprisonment at the discretion of the court. Formerly a person convicted of perjury was disabled from giving evidence in future, this disability was abolished by 16 Vict c 27, s 1.

In the United States the common law has been extended by most States to embrace false affirmations and false evidence in proceedings not judicial. Perjury in the United States courts is dealt with by an Act of Congress of 3d March 1836, by which the maximum punishment for perjury or subornation of perjury is a fine of \$2000 or imprisonment for five years. The jurisdiction of the States to punish perjury committed in the State courts is specially preserved by the same Act. Statutory provisions founded upon 23 Geo II c 11 have been adopted in some States, but not in others. In the States which have not adopted such provisions, the indictment must set out the offence with the particularity necessary at common law. (J. W. T.)

PERKINS, ЯАОВ (1766-1849), inventor and physicist, was born at Newburyport, Massachusetts, in 1766, and apprenticed to a goldsmith. He soon made himself known by a variety of useful mechanical inventions, and in 1818 came over to England with a plan for engraving bank-notes on steel, which, though it did not find acceptance at once, ultimately proved a signal success, and was carried out by Perkins in partnership with the English engraver Heath during the rest of his long business life. Perkins continued to be fertile of inventions, and his steam-gun, exhibited in 1824, attracted much attention, though the danger attending the use of highly-compressed steam prevented its practical adoption. His chief contribution to physics lay in the experiments by which he proved the compressibility of water and measured it by a piezometer of his own invention, see vol. vii p. 801, and *Phil. Trans.*, 1820, 1826. He retired in 1834, and died in London, 30th July 1849.

PERM, a government of Russia, on both slopes of the Ural Mountains, with an area of 128,250 square miles. Though Perm administratively belongs entirely to Russia in Europe, its eastern part (about 57,000 square miles) is situated in Siberia, in the basin of the Obi. It is traversed from north to south by the Ural range, a low ridge, from 30 to 45 miles in width, thickly covered with forests, and deeply excavated by rivers. The highest summits do not

rise above 3600 feet in the northern section of the range (the Vogulian Ural), in the central portion, between 59° and 60° 30' N. lat., they once or twice exceed 5000 feet (Denezhkin, 5027 feet, and Konzhakovskii Kamen, 5135 feet), but the chain soon sinks towards the south, where it barely attains an elevation of 3000 feet. Where the great Siberian road crosses the ridge the highest point is 1400 feet. Westward the plain of the river Kama is still 500 feet above sea-level at a distance of 120 miles from the main watershed, but to the east the secondary ridges and spurs of the central chain fall away somewhat more rapidly,—Kamyshloff, 100 miles distant, being situated amidst the lowlands of the Obi at an altitude of less than 200 feet.

The geology of Perm has been the subject of very many investigations since the journeys of Humboldt and Murchison, but several parts of the government still remain unexplored. Granites, diorites, porphyries, serpentines, and Laurentian gneisses and limestones, containing iron, copper, and zinc ores, constitute the main axis of the Ural chain, their western slope is covered by a narrow strip of Huronian crystalline slates, which disappear in the east under the Post-Tertiary deposits of the Siberian lowlands, while on the west narrow strips of Silurian limestones, quartzites, and slates, and separate islands of Devonian deposits appear on the surface. These in their turn are covered with Carboniferous clays and sandstones, containing Coal-measures in several isolated basins. The Permian deposits extend as a regular strip, parallel to the main ridge, over these last, and are covered with the so-called "variegated marls," which are now considered as Triassic, and which appear only in the western corner of the territory. Perm is the chief mining region of Russia, owing to its wealth in iron, silver, platinum, copper, nickel, lead, chrome ore, and auriferous alluvial deposits. Many rare metals, besides, such as iridium, osmium, rhodium, and ruthenium, are found along with the above, as also a great variety of precious stones, such as sapphires, jacinths, beryls, phenacites, chrysoberyls, emeralds, aquamarines, topazes, amethysts, jades, malachite. Salt-springs appear in the west; and the mineral waters, though still little known, are also worthy of mention.

The government is very well watered by rivers belonging to the Petchora, Tobol (affluent of the Obi), and Kama systems. The Petchora itself rises in the northern corner of the government, and its tributary the Volosmita is separated by a distance of only 4900 yards from the navigable Vogulka, a tributary of the Kama,—a circumstance of some commercial importance. The tributaries of the Tobol (Sosva, Tura, Isset, and U) are far more important. Their sources, which approach those of the tributaries of the Kama very closely, early become a link between Russia and Siberia, and the first section of the Siberian railway (completed for 312 miles from Perm to Ekaterinburg) has been planned to connect the Kama at Perm with the Tura at Tumen, whence there is a navigable route by the Siberian rivers to the very heart of western Siberia at Tomsk. The chief river of Perm is, however, the Kama, whose great navigable tributaries the Tuhosvaya, Sylva, and Kolva are important channels for the export of the heavy iron goods to Russia,—5,000,000 cwts. valued at upwards of £2,000,000, being annually shipped on these rivers to the Volga. Timber also is floated down many of the smaller streams. Altogether, the rivers supply to some extent the want of roads or the defects of those which exist, the great Siberian highway even (*via* Kazan, Okhansk, Perm, Ekaterinburg, and Tumen) being usually in a bad state.

The government is dotted with a great number of lakes of comparatively trifling size, and marshes also are extensive

in the hilly tracts of the north. No less than 45,750,000 acres are forest, of this large area only 2,175,600 acres are under proper forest administration. The forests are distributed very unequally, covering 95 per cent of the area in the north, and only 25 per cent in the south-east. Fir (*Abies sibirica*, *Picea abies*), pine (*Pinus sylvestris*), cedar (*Pinus cembra*), larch (*L. sibirica*), birch, alder (*Alnus*), and lme are the most common woods; the oak appears only in the south-west. The flora of Perm (956 Phanerogams) presents a mixture of Siberian and Russian species, several of which have their north-eastern or south-western limits within the government. The climate is severe, the average temperature at different places being as follows —

	Lat N	Altitude	Yearly average	January average	July average
		Feet	Fahr	Fahr	Fahr
Bogoslorski	59° 45'	430	29° 3'	3° 0'	62° 6'
Usohe (Kama)	59° 25'	300	34° 0'	4° 5'	63° 8'
Nine-Taghlisk	57° 53'	590	38° 1'	2° 0'	64° 9'
Ektatnburg	56° 48'	800	32° 9'	2° 5'	63° 5'

The population in 1881 amounted to 2,620,100, of which upwards 100,500 lived in towns. It consisted chiefly of Great Russians, Bashkirs (about 100,000), including Mordvins, Chuvashes, about 65,000 Finnyaks, Permians, 25,000 Tatars, 8000 Tchecos, and some 2500 Voguls. More than a million of the Great Russians are Nonconformists, their number having rapidly increased within the last twenty years. Except in the northern districts, which are covered with marshes and tundras, and in a zone 70 miles wide, which includes the higher and stony parts of the Ural Mountains to the north of the 58th parallel, agriculture is the general occupation of the population, who are favoured with very fertile soil in the southern districts. Nevertheless, only 8,000,000 acres are under crops, the proportion of arable land ranging from 2 to 34 per cent of the area in different districts. Rye, oats, barley, and hemp are raised in all parts, and wheat, millet, buckwheat, and flax in the south. The average crops in recent years have been 4,185,000 quarters of grain and 1,865,400 bushels of potatoes.

Cattle-breeding is especially important, especially among the Bashkirs, who have large numbers of horses, but it is at present decreasing. In 1881 there were 837,000 horses, 820,000 horned cattle, 1,055,000 sheep, and 287,000 pigs. These figures vary, however, from year to year, in consequence of the murrains that periodically destroy great numbers of horses and cattle. Agriculture is widely spread among the Bashkirs, Tatars, and Tcherekmess, and this class is still a considerable element of the population, the Voguls. Shipbuilding is developed on the Kama, Vishna (a tributary of the Kama), Sylva, and Tchu-ovaya, and large amounts of timber, pitch, and tar, as also wooden implements, are exported to the Volga. Some 100,000 hands find occupation in connection with the mining industry, and a number are engaged in the transport trade to and from Siberia, or in shipping. Mining increases every year, especially since private enterprise has been allowed to develop freely. In 1879 the total production of metals on the mining works of the crown and of private individuals was (in cwts.) — gold, 102 7, copper, 12,913, pig-iron, 4,457,000, iron, 2,704,000; steel, 599,600, salt, 8,750,000. The working of coal, although recent, promises to be most valuable. In 1885 the aggregate of all manufactures connected with mining had exceeded 15,000,000 roubles (14,500,000 in value). In 1879 it was — copper, 673,800 roubles, pig-iron, 14,070,000, iron, 2,777,600, and steel, 2,531,000. The aggregate of other manufactures employing 7400 hands, in the same year reached 20,962,000 roubles, against 5,802,000 in 1865. The first place is taken by flour-mills (2973,500), followed by distilleries (2568,500) and tanneries (2112,300); next in order come the manufactures of spirits, saddlery, woollen cloth, ropes, oils, cakes, paper, chemicals, candles, tallow, soap, matches, wax-candles, glass, pottery, &c. The working of precious stones is extensively carried on throughout the villages on the eastern slope of the Ural Mountains, the chief market for them being at Ektatnburg. Besides, a variety of petty trades are carried on, the manufacture of carpets in the south-east (Tumen carpets), as also that of boots at Kungur, being especially worthy of mention.

An active trade, greatly favoured by the easy communication of the chief centres of the mining industry with the great market of Nijn Novgorod on the one side and with the great network of Siberian rivers on the other, is carried on in metals and metal wares, minerals, timber and wooden wares, tallow, skins, cattle, furs, corn, and linseed. Large caravans descend the affluents of the Kama every spring, and reach the great fairs of Laisheff and Nijn Novgorod, or descend the Volga to Samara and Astrakhan, while Ektatnburg is an important centre for the trade with

Siberia. The fair at Irbit, second in importance only to that of Nijn Novgorod, is a great centre for supplying Siberia with grocery and manufactured wares, as also for the purchase of tea, of furs for Russia, and of corn and cattle for the mining districts. About 180 other fairs are held every year within the government. The chief commercial centres are Ektatnburg, Irbit, Perm, Kamyshloft, Shadrinsk, Tcherydyn, and several non-works (*zavodny*).

Perm is more largely provided with educational institutions and primary schools than most of the governments of central Russia. Besides the usual lyceum and ecclesiastical seminary at Perm, there are a mining school at Ektatnburg and lower mining schools at Bogoslorski and Kashiya, and two lycées for women at Perm and Ektatnburg. The number of primary schools in 1881 was 621 (39,778 scholars, including about 8000 girls). The Nonconformists are very diligent in teaching reading (in Old Slavonian) to their girls. The Ural Society of Naturalists, at Ektatnburg, issues valuable scientific serials, and these are within the government two first-rate meteorological and magnetic observatories, at Ektatnburg and Bogoslorski.

Perm is divided into twelve districts having for their chief towns (with populations in 1879) — Perm (32,850), Kungur (14,000), Krasnoufimsk (3700), Okhansk (1650), Osa (2850), Solikamsk (16,900), and Tcherydyn (3280) in Europe, Ektatnburg (25,150), Irbit (4250), Kamyshloft (2160), Shadrinsk (11,550), and Verkhotrie (8800) in Asia. Alapaevsk (5450), Dalmatof (4350), and Dedyukhn (3900, with important salt works) have also municipal institutions. The non-works form the following important towns.

Nyne-Taghlisk (30,000 in 1881), Nevansk (14,000), Kungur (9750), Krasnoufimsk (3700), Uspel (1000), Ust-Ikhtinsk (1000), Nyazepetrovsk (8000), Verkh-Isetsk (7000), Nijn-Isetsk, Sysetsk (8900), Bogoslorski (4500), Verkhine-Taghlisk (3850), and Sukhsansk (3150). The salt works of Usole (7700) and Lenza (3250) may also be mentioned.

History — Remains of Paleolithic man, everywhere very scarce in Russia, have not yet been discovered in the upper basin of the Kama and Ol, with the exception of a fragment of a single human skull found in a cavern on the Tchuva (basin of Kama), together with a skull of *Ursus spelaeus*. Neolithic remains, on the other hand, are met with in immense quantities on both Ural slopes throughout the territory of Perm. Still larger quantities of implements belonging to an early Finnish, or rather Ugrian, civilization are found everywhere in the basin of the Kama, even in its northern parts, the present district of Tcherydyn. Even Herodotus speaks of the richness of the colonies of the Scythians, the Perm, who kept up a brisk traffic with the Greek colony of Olbia, and with the Boeotians by way of the Sea of Azoff and the Volga. The precise period at which the Ugrians left the district for the southern steppes of Russia (the "Lebedia" of Constantine Porphyrogenitus) is not known. In the 9th century the Scandinavians were acquainted with the country as Balama, and Byzantine analysts in finding the names Nestor describes it as a territory of the Perm, a Finnish people, some 50,000 of whom still remain, and whose name seems to have been derived from *perma*, a Finnish word denoting hilly tracts thickly covered with forests.

The Russians penetrated into this region at an early date. In the 11th century Novgorod levied tribute from the Finnish inhabitants, and undertook the colonization of the country, which in the twenties of the 13th century is dealt with as a separate territory of Novgorod. The first step was taken by the Perm, who was annexed to Moscow, which in the following year elected a fof to protect Russian settlers and tradesmen from the Voguls, Ostyaks, and Samoyeds. Tcherydyn, the oldest town of Perm, was already in existence in the 15th century. The mineral wealth of the country soon attracted the attention of the Moscow princes, and Ivan III sent two Germans to search for ores; these they succeeded in finding south of the upper Tetchora. A great impulse to colonization and mining was given by the Shuiskoff when, in the 16th century they received immense tracts of land on the Kama and Tchu-ovaya. They founded the first salt and iron works, built forts, and colonized the Ural region Solikamsk, Osa, Okhansk, and Verkhotrie were founded during this century. By the latter part of the century the Russian colonies had spread beyond the Ural Mountains, and in this direction the Strogonoffs continued to extend their mining operations. The rapidly-growing trade with Siberia gave a new impulse to the development of the country. This trade had its centres at Perm and Solikamsk, where merchandise brought up the Kama was unloaded and transported by land to Verkhotrie, at that time the first Siberian town and custom-house on the great highway. Kungur, too, attained some commercial importance. The fair of Irbit in the 17th century became the chief seat of the trade in merchandises, brought both from Russia to Siberia and from Siberia and Baidina to Russia. Communication with Siberia having taken a northern route, the southern parts of the territory were not colonized until the next century, when Ektatnburg, Krasnoufimsk, and Alapaevsk were founded. In 1780 the provinces of Perm and Ektatnburg were instituted, but were soon united into one. (P. A. K.)

PERM, capital of the above government, stands on the left bank of the Kama, on the great highway to Siberia, 930 miles north-east from Moscow. During summer it has regular steam communication with Kazan, 685 miles distant, and it is connected by rail with Ekaterinburg. The town is mostly built of wood, with broad streets and wide squares, and has a somewhat poor aspect, especially when compared with Ekaterinburg. It is the see of a bishop, and has an ecclesiastical seminary and a military school. The manufactures are few, the Government manufactory of steel guns and munitions of war, in the immediate neighbourhood of the town, turns out about 1600 tons of guns annually. The aggregate production of the private manufactories of all kinds did not exceed £165,000 in 1879; they included tanneries (£78,600), distilleries (£61,000), rope-works (£9500), brick-works, breweries, soap and candle works, iron-wire and copper-ware works. Numerous flour-mills and several oil-works occur within the district. The town derives its commercial importance as being the chief place of storage for merchandise to and from Siberia (tea, metals and metal-ware, skins, leather, butter, wool, bristles, tallow, cedar nuts, linseed, &c.), which is unshipped here from the steamers coming up the Kama, and despatched by rail or on cars and sledges to Siberia, or *vice versa*. The trade is chiefly in the hands of Nymy Novgorod, Kazan, Ekaterinburg, and Siberian merchants. The population of Perm in 1879 was 32,350.

The present site of Perm was occupied, as early as the year 1568, by a settlement named Brukhanovo, founded by one of the Stroganoffs, this settlement seems to have received the name of Perm in the 17th century. The Yagodzikhinsky copper-works was founded in the immediate neighbourhood in 1723, and in 1781 it received officially the name of Perm, and became an administrative centre both for the country and for the mining region. The mining authorities left Perm for Ekaterinburg in 1880.

PERMUTATIONS. See ALGEBRA, vol. i p 560

PERNAMBUCO, or RECIFE, a city and seaport of Brazil and the chief town of the extensive province of Pernambuco. As it is situated on the coast in 8° 3' 27" S. lat. and 34° 50' 14" W. long. (Fort Picoa), not far from the point where the continent begins to trend towards the south-west, it is naturally the first port visited by steamers from Lisbon to Brazil. The reef, which can be traced more or less distinctly along the Brazilian seaboard for several hundred miles, rises at Pernambuco into a perfectly straight artificial-looking wall, 3½ miles long, with even

duced by the successive growth and death of the small shells of *Scaphite* with some few barnacles and molluscs, proves so effectual a protection of the outer surface that though it is exposed to the full force of the waves of the open Atlantic the oldest pilots know of no tradition of change in its appearance.¹ The belt of water within the reef is about a mile in width and forms a safe but rather shallow harbour, vessels drawing 18½ feet can enter, and there is abundant room for mooring along the shore and reef, but mail-steamers usually anchor in the roads and discharge by means of lighters. Sir John Hawkshaw's scheme for the improvement of the harbour (1874) was rejected by the Government as too costly, but extensive dredging operations are being prosecuted. The city of Pernambuco lies low, and is surrounded by a swampy stretch of country, with no high ground nearer than the hill on which Olinda is built, 8 miles to the north. It used to be considered the most pestilential of Brazilian seaports, but its sanitary condition has greatly improved, partly owing to drainage-works executed by an English company. There are three natural divisions in the city—Recife ("the Reef"), situated not on the reef proper but on an island forming the southern end of a sandbank that stretches north towards Olinda; Sant' Antonio, on a peninsula separated from the island by the united waters of the Capibaribe and the Biberibe; and Boa Vista, the fashionable residential district on the mainland opposite Sant' Antonio. In Recife the streets are narrow and crooked and many of the houses are of great age and present Dutch characteristics, but Sant' Antonio has broad straight streets, with well-paved side-walks, tramways (worked by mules), and modern-looking houses. Among the public buildings in Pernambuco it is enough to mention the governor's palace, the episcopal palace, the hospital of Pedro II (5000 patients per annum, with French sisters of mercy as nurses), the foundling hospital, the poorhouse, the new lunatic asylum (1881), the university (18 professors and 530 students in 1879), the normal school, and the provincial library (13,000 vols., 11,581 readers, in 1880). The great commercial staple is sugar, and the brown sticky mud of the streets owes its peculiar character to the juice of the cane, 825,711 bags of sugar were brought to the market in 1875-76 and 1,715,637 bags in 1879-80. Cotton, which was first exported in 1778 and continued a small item till 1781, now holds the second place,—130,925 bales in 1875-76 and 60,117 in 1879-80. Coal began to be imported in 1834,—25,314 tons in 1879-80. The total value of the exports and imports has greatly increased.

Plan of Pernambuco.

sides and a smooth and almost level top from 30 to 60 yards in width. It is of a hard pale-coloured sandstone, breaking with a very smooth fracture; and a tough layer of calcareous matter, generally several inches thick, pro-

	1810	1855	1866	1870	1880
Imports	£101,923	£252,130	£1,517,408	£1,591,104	£2,478,893
Exports	£126,794	£247,003	£1,507,010	£1,508,068	£2,021,518

The port was opened to British vessels in 1808, and goods, which formerly had to pass through Portugal, began to be brought to England direct. A cemetery for British subjects was opened in 1814, a British hospital in 1821, and a British chapel in 1836. In 1880, out of a total of 1047 vessels (674,227 tons) calling at Pernambuco 451 (249,912 tons) were British. Pernambuco is connected with Olinda by a steam-tramway line and with Caxanga (8½ miles) by a mule-tramway, the Recife and San Francisco Railway (1856-62) runs 78 miles to Una, and is continued by a narrow-gauge line to Garanhuns, and another narrow line strikes up the Capibaribe 52 miles to Limoeiro. In 1878 the population of the town and immediate suburbs was 94,493.

The name of Pernambuco (*pera*, "a stone," *nambuco*, "porcel") appears to have been originally applied to Itamaracá (a town in

¹ See Darwin's account in *London, Edinburgh, and Dublin Phil. Mag.* vol. xiv., 1841, p 287; and *Naturalist's Voyage*, p 498.

7° 44' S lat., now decayed, but formerly the capital of an independent captivity, where also there is an opening in the reef. In 1532 Duarte Coelho founded the city of Olinda, which continued to be the capital of the captaincy of Pernambuco till 1710. When in 1580 the country passed into the hands of Spain it had 700 stone houses, 4000 to 5000 negro slaves were employed in its sugar plantations, and from 10 to 50 vessels came annually to load with sugar and Brazil wood, often called simply Pernambuco or Pernambuco Real, which was a most collection of slaves, but when captured by the French under Villegaignon in 1565, shortly afterwards began to attract attention as a port. It was captured and held for thirty-four days in 1595 by Sir James Low (q.v.), who did not, however, succeed in his attack on Olinda. In the 17th century this part of Brazil was the scene of a great struggle between the Spaniards and the Dutch. Olinda and Recife were captured by the Dutch under Admiral Loncy in 1630, and in the following year, when they were obliged to retreat to the reef, they left Olinda in flames. Fort Buon was built in 1631. In 1639 (Recife already containing 2000 houses) Count Maurits laid out a new town (Mauritsstad) on the island of Antonio Vaz, and built himself a palace (Vrijburg or Sanj Sowa) of materials obtained by the demolition of Olinda. A bridge was thrown across from Recife to Mauritsstad, and another from Mauritsstad to the mainland, where the count had his summer residence at Boa Vista. An observatory was erected under Matagosa and De Laet. In 1654 the Dutch garrison, neglected by the authorities at home, who were at war with Cromwell, was obliged to capitulate to the Portuguese (26th January).

Sou J. B. Fernandes Gama, Mem. hist. do Trou de Pernambuco (Pernambuco, 1849); Baileys, in an in 2 vols. (London, 1840); and others. "Les Hollandais au Brésil," in Le Monde des Indes Orientales (1848-49).

PERNAU, in Russian **PERNOFF**, a seaport town and watering-place of European Russia, in the government of Livonia, is situated in 58° 23' N lat. and 24° 30' E long., 155 miles north of Riga, on the left bank of the Pernau or Pernova, which about half a mile farther down enters the Bay of Pernau, the northern arm of the Gulf of Riga. The town proper is well and regularly built, and contains two public gardens and two public parks (Salon Park and Bado Park), a town-house, a hospital, and a public library. On the right side of the river lies the suburb of Bremerseite. The harbour is small, and the depth of water on the bar under 10 feet. The exports, which consist mainly of flax (to Great Britain, France, and Portugal), linseed (to Germany), mats, and cereals, had a value of 8,220,421 silver roubles in 1880, and of 5,427,465 in 1881 (a bad year). The population was 6690 in 1863, 9525 in 1867, and 19,918 in 1881.

Founded on the right side of the river in 1255 by one of the bishops of Oesel, Pernau, with its walls and castle, soon became a flourishing place. In the 16th century it was occupied in succession by the Swedes, the Poles, and the knights of the Teutonic order. After 1599 the Poles transferred the town to the left side of the river, and in 1642 the Swedes, who had been in possession since 1617, strengthened it with regular fortifications. In 1710 it was besieged and taken by the Russians, and the fortress is now demolished.

PERNE, **ANDREW** (1519-1589), a notable character in 16th-century history, was born at East Bilney in Norfolk in 1519. He received his education at St John's College, Cambridge, was afterwards a fellow of Queens' College, and finally master of Peterhouse in the same university. He is best known as a remarkable example of the tergiversation in reference to religious profession which, owing to the sudden changes in the prescribed theological belief of the state, was only too common in his age. In the reign of Henry VIII. he defended the adoration of saints, but subsequently abandoned this doctrine in the reign of Edward VI., and became distinguished as an active promulgator of Reformation tenets. In the reign of Mary he subscribed the Roman Catholic articles, and when the remains of Martin Bucer and Paulus Fagnus, — two Protestant professors in the university — were exhumed and burnt, he preached on the occasion. He was rewarded for his subservience by being promoted to the deanery of Ely. Notwithstanding this discreditable compliance, he succeeded in gaining Elizabeth's favour on her accession; he signed the grace for restoring the names of Bucer and Fagnus in the lists of honours and dignities

from which they had been expunged; and he was elected by the university to the office of vice-chancellor. He thus, like Symond Symonds, the vicar of Bray, was twice a Papist and twice a Protestant. During the remainder of his career he was known as a moderate supporter of Church of England doctrine against the Puritan party ("What bishop or politician in England," asks Gabriel Harvey, "was so great a temporizer as he?") The wags of the university invented a verb, *perne*, which, they declared, meant, "I réit," "I change often." Yet the satirist, notwithstanding, admires his many excellent qualities and eulogizes him for his urbanity and singular tact in his intercourse with men of every class and shade of opinion. To this latter characteristic we must attribute the fact that, while, throughout his life, Perne possessed the friendship of austere churchmen like Whitgift, he was popular with critics of a very different stamp, such as the dissolute Thomas Nash, who declares that "few men lived better." It is not a little to Perne's credit that the social influence which he thus acquired was uniformly exerted to bring about the ends which he had in view as a philanthropist and a true lover of learning. He was a distinguished benefactor of the university in which his life was mainly passed, and its library was restored chiefly through his efforts. His own library at Petehouse was said to be the best at that time in England. Dr Perne died in 1589 while on a visit to Archbishop Whitgift, on whose gratitude he had established a lasting claim by the protection he accorded him during the persecution under Mary. He belongs to the class of men whose influence during their lives is felt rather than seen, and the services he rendered to his generation become increasingly apparent in proportion as this period of English history is more closely studied.

PÉRONNE, chief town of an arrondissement of the department of the Somme, France, and a fortified place on the right bank of that river at its confluence with the stream called the Dornet or Cologne, lies 94 miles north-north-east of Paris on the railway from Paris to Cambrai. Wet moats surround the ramparts, which are built of brick. The church of St Jean (1509-1535) was greatly damaged during the bombardment of 1870-71, but has since been restored. The castle of Péronne, in one of the bastions of the enceinte, was partially destroyed by fire in 1877; it still retains four large conical-roofed towers dating from the Middle Ages, one of which is said to have been the prison of Louis XI., when he had his famous encounter with Charles the Bold (1468). The town-hall, which was built in the 16th century, has an elegant campanile of modern construction. The population of Péronne in 1881 was 4696.

The Frankish kings had a villa at Péronne, which Clovis II. gave to Erchenbold, mayor of the palace. The latter founded a monastery here, and raised in honour of St Fuscay a collegiate church, which was a wealthy establishment until the Revolution; it is the burial-place of Charles the Simple, who died of starvation in a dungeon in Péronne, into which he had been thrown by the count of Vermandois (929). After the death of Philip of Alsace Péronne, which he had inherited through his wife, escheated to the French crown (1199), and in 1209 received a charter with municipal privileges from Philip Augustus. By the treaty of Arras (1485) it was given to the Burgundians, bought back by Louis XI., it passed again into the hands of Charles the Bold in 1465. On the death of Charles, however, in 1477, Louis XI. resumed possession. In 1588 the emperor Charles V. besieged Péronne, but without success, in its defence a woman called Marie Fourré greatly distinguished herself, and the anniversary of the raising of the siege was celebrated at Péronne for many years. It was the first town after Paris at which the League was proclaimed in 1577. Péronne's greatest misfortune occurred during the late Franco-German war. It was invested on 27th December 1870, and bombarded from the 28th to the 9th of the following January, upon which date, on account of the sufferings of the civil population, among whom smallpox had broken out, it was compelled to capitulate. Out of 700 houses 600 were

more or less injured and eighty-two buildings set on fire, the tower of the church of St Jean was also burnt, its roofing and timber-work destroyed, and the bells melted by the flames. This damage has since been repaired.

PEROUSE See LA PÉROUSE, vol. xiv. p. 298.

PERPETUAL MOTION, or PERPETUUM MOBILE, in its usual significance does not mean simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed. Briefly, a perpetual motion usually means a machine which will create energy.

The earlier seekers after the "perpetuum mobile" did not always appreciate the exact nature of their quest, for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat. Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding coin, and so on. Like the exact quadrature of the circle, the transmutation of metals, and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest. Just as some of the most interesting branches of modern pure mathematics sprang from the problem of squaring the circle, as the researches of the alchemists developed into the science of modern chemistry, so, as the result of the vain search after the perpetual motion, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreatable and indestructible in the ordinary course of nature, even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master's work, and it was just as reasonable to suppose that a structure of wood, brass, and iron could be found to work under like conditions. The disproof is in both cases alike. No such spirit has ever existed, save in the imagination of his describer, and no such machine has ever been known to act, save in the fancy of its inventor.

The principle of the conservation of energy, which in one sense is simply a denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment is not half a century old, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been proved to accord with experience, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to

trace its power to some hidden source of a kind already known, or in the last resort he would seek for a source of energy of a new kind and give it a new name. Any assertion of creation of energy by means of a mere machine would have to be authenticated in many instances, and established by long investigation, before it could be received in modern science. The case is precisely as with the law of gravitation, if any apparent exception to this were observed in the case of some heavenly body, astronomers, instead of denying the law, would immediately seek to explain the occurrence by a wider application of it, say by including in their calculations the effect of some disturbing body hitherto neglected. If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, and, provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays. The interest of such cases is that attaching to the morbid anatomy of the human mind. Perhaps the most striking feature about them is the woful sameness of the symptoms of their madness. As a body perpetual-motion seekers are ambitious, lovers of the short path to wealth and fame, but wholly superficial. Their inventions are very rarely characterized even by mechanical ingenuity. Sometimes indeed the inventor has simply bewildered himself by the complexity of his device, but in most cases the machines of the perpetual motionist are of child-like simplicity, remarkable only for the extraordinary assertions of the inventor concerning them. Wealth of ideas there is none; simply assertions that such and such a machine solves the problem, although an identical contrivance has been shown to do no such thing by the brutal test of standing still in the hands of many previous inventors. Hosts of the seekers for the perpetual motion have attacked their insoluble problem with less than a schoolboy's share of the requisite knowledge, and their confidence as a rule is in proportion to their ignorance. Very often they get no farther than a mere prospectus, on the strength of which they claim some imaginary reward, or offer their precious discovery for sale; sometimes they get the length of a model which wants only the last perfection (already in the inventor's brain) to solve the great problem, sometimes fraud is made to supply the motive-power which their real or pretended efforts have failed to discover.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the "perpetuum mobile" was an impossibility. We find the Parisian Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they class with solutions of the duplication of the cube, the trisection of an angle, and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his *Principia* states, so far as ordinary mechanics are concerned, a principle which virtually amounts to the same thing (see *MECHANICS*, vol. xv. p. 715).

The famous proof of De la Hire simply refers to some of the more common gravitational perpetual motions, to which we shall refer shortly. The truth is, as we have said already, that, if proof is to be given, or considered

necessary, it must proceed by induction from all physical phenomena.

It would serve no useful purpose here to give an exhaustive historical account of the vagaries of mankind in pursuit of the "perpetuum mobile." The reader may consult on this subject the two volumes by Henry Dicks, C.E., published by E and F N. Spon, London, 1861 and 1870, from which, for the most part, we select the following facts to give the reader some idea of this department of the history of human fallibility.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids. We have not read of any actual proposal of the kind, but the most obvious thing to imagine in this way would be to procure some substance which intercepts gravitational attraction. If this could be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work, then, removing the plate, we could allow the body to fall and do work, eccentrics or other imposing device being added to move the gravitational interceptor, behold a perpetual motion complete! The great difficulty is that no one has found the proper material for an interceptor.

Fig. 1 represents one of the most ancient and oftentimes repeated of gravitational perpetual motions. The idea is that the balls rolling in the compartments between the talloes and the rim of the wheel will, on the whole, so comport themselves that the moment about the centre of those on the descending side exceeds the moment of those on the ascending side. Endless devices, such as curved spokes, levers with elbow-joints, eccentrics, &c., have been proposed for effecting this impossibility. The modern student of dynamics at once convinces himself that no machinery can effect any such result; because, if we give the wheel a complete turn, so that each ball returns to its original position, the whole work done by the ball will, at the most, equal that done on it. If we were to start the wheel and balls in the most general way possible, we should doubtless have a very pretty problem to solve; but we know that, if the laws of motion be true, in each step the kinetic energy given to the whole system of wheel and balls is equal to that taken from the potential energy of the balls less what is dissipated in the form of heat by frictional forces, or *vice versa*, if the wheel and balls be losing kinetic energy,—save that the friction in both cases leads to dissipation. So that, whatever the system may lose, it can, after it is left to itself, never gain energy during its motion.

The two most famous perpetual motions of history, viz, the wheels of the marquis of Worcester and of Councillor Orffyreus were probably of this type. The marquis of Worcester gives the following account of his machine in his *Century of Inventions* (art. 56)

"To provide and make that all the Weights of the descending side of a Wheel shall be perpetually further from the Centre than those of the mounting side, and yet equal in number and left to the one side as the other. A most incredible thing, if not seen, but tried before the late king (of blessed memory) in the Tower, by my directions, two Extraordinary Embassadors accompanying His Majesty, and the Duke of Richmond, and Duke of Hamilton, with most of the Court, attending Him. The Wheel was 14 Foot over, and 40. Weights of 50 pounds apiece. Sir William Balgore, then Lieutenant of the Tower, can justify it, with several others. They all saw, that no sooner these great Weights passed the Diameter-

line of the lower side, but they hung a foot further from the Centre, nor no sooner passed the Diameter-line of the upper side but they hung a foot nearer. Be pleased to judge the consequence."

Orffyreus (whose real name was Bessler) also obtained distinguished patronage for his invention. His last wheel, for he appears to have constructed more than one, was 13 feet in diameter and 1 foot 2 inches broad, it consisted of a light framework of wood covered in with oil-cloth so that the interior was concealed, and was mounted on an axle which had no visible connexion with any external mover. It was examined and approved of by the landgrave of Hesse-Cassel, in whose castle at Weissenstein it is said to have gone for eight weeks in a sealed room. The most remarkable thing about this machine is that it evidently imposed upon the mathematician's Gravesande, who wrote a letter to Newton giving an account of his examination of Orffyreus's wheel undertaken at the request of the landgrave, wherein he professes himself dissatisfied with the proofs theretofore given of the impossibility of perpetual motion, and indicates his opinion that the invention of Orffyreus is worthy of investigation. He himself, however, was not allowed to examine the interior of the wheel. The inventor seems to have destroyed it himself. One story is that he did so on account of difficulties with the landgrave's Government as to a licence for it; another that he was annoyed at the examination by Gravesande, and wrote on the wall of the room containing the fragments of his model that he had destroyed it because of the impetinent curiosity of Professor's Gravesande.

The history of this case is noteworthy, because it contains all the characters that usually appear in such comedies even now,—the fraudulent paradoxer, the illustrious and intelligent patron, the simple-minded, unbiassed, scientific witness.

It is worthy of remark that the overbalancing-wheel perpetual motion seems to be as old as the 13th century. In his second series Dicks quotes an account of an invention by Wilas de Honecourt, an architect whose sketch-book is still preserved in the Écoles des Chartes at Paris. De Honecourt says, "Many a time have skilful workmen tried to contrive a wheel that shall turn of itself, here is a way to do it by means of an uneven number of mallets, or by quicksilver." He thereupon gives a rude sketch of a wheel with mallets joined to its circumference. It would appear from some of the manuscripts of Leonardo da Vinci that he had worked with similar notions.

Another scheme of the perpetual motionist is a water-wheel which shall feed its own mill-stream. This notion is probably as old as the first miller who experienced the difficulty of a dry season. One form is figured in the *Mathematical Magic* of Bishop Wilkins (1614-1679); the essential part of it is the water-screw of Archimedes, which appears in many of the earlier machines of this class. Some of the later ones dispense with even the subtlety of the water-screw, and boldly represent a water-wheel pumping the water upon its own buckets.

Perpetual motions founded on the hydrostatical paradox are not uncommon; Papin, the well-known inventor of the digester, exposes one of these in the *Philosophical Transactions* for 1685. The most naive of these devices is that illustrated in fig. 2, the idea of which is that the larger quantity of water in the wider part of the vessel weighing more will overbalance the smaller quantity in the narrower part, so that the water will run over at C, and so on continually.

Capillary attraction has also been a favourite field for

Fig. 1

Fig. 2

Chat Botté, Les Fées, Cendrillon, Ruyet à la Loupette, which, after being published in a miscellany during 1696 and 1697, appeared in a volume with the last-named year on the title-page, and with the general title of *Histoires du Temps Passé*. No criticism of these famous productions is necessary, and it is scarcely less superfluous to observe that Perrault has no claim to the invention of the subjects. His merit is that he has treated them with a literary skill in adapting style to matter which cannot possibly be exceeded. Of his other work some *Mémoires* and academic *Éloges* need alone be mentioned. He died on 16th May 1703.

Except the tales, Perrault's works have not recently been reprinted. Of the tales the best recent editions are those of Grand (Lyons, 1865) and Lefèvre (Paris, 1875).

PERRONE, GIOVANNI (1794-1876), Roman Catholic theologian, was born at Chieri (Piedmont) in 1794, studied theology at Turin, and in his twenty-first year went to Rome, where he joined the Society of Jesus, and, after his ordination to the priesthood, became a teacher in the Collegium Romanum. From Feraia, where he was rector of the Jesuit college after 1830, he returned to his teaching work in Rome, being made head of his old college in 1850. He died on 26th August 1876. He was the author of numerous dogmatic works, which, as clearly and faithfully reflecting the prevailing tendencies of Roman theology, obtained wide currency and were extensively translated. They may still be regarded as representing most nearly the modern orthodoxy of his church. The *Prælectiones Theologicæ* may be specially named (1st ed 1835, 31st ed 1866).

PERRY, an alcoholic beverage, obtained by the fermentation of the juice of pears. The manufacture is in all essentials identical with that of *CIDER* (*q.v.*), though there are some variations in detail arising from the more abundant mucilage of the pear. The clearest and most concise account of making cider and perry is contained in the fourth part of the *Herfordshire Pomona* for 1881 (p. 138 *sq.*). The fruits are either taken at once to the crushing mill or allowed, like apples, to remain in heaps so as to ripen uniformly, they are then crushed between rollers of granite or millstone grit, and the must or juice poured into casks. In making the better kinds of perry only the best sorts of pears are used without admixture, but for ordinary purposes pears of various kinds are mixed indiscriminately, although, as in the case of the apple, the fruits used for the manufacture of perry are not those which are the most suitable for dessert. It is considered better not to crush the pips, as the flavour of the perry is thereby deteriorated. The most scrupulous cleanliness is absolutely requisite, and all the metal-work of the machinery should be sedulously kept bright, otherwise the acids of the juice dissolve the oxides, and, in the case of lead, produce poisonous salts. Pear-juice contains grape-sugar, tannic, malic, and tartaric acids, albumen, lime, pectin, mucilage, and other ingredients. The quantity of potash and phosphoric acid in the juice is relatively large. At a temperature ranging from 50° to 80° the juice undergoes natural fermentation without the addition of yeast. This fermentation, however, is brought about by the agency of a "ferment" (saccharomyces), which feeds on the grape-sugar of the juice, decomposing it, and causing the rearrangement of its constituents in the form of alcohol, carbonic-acid gas, glycerin, &c. The saccharomyces ferments in the first instance absorb oxygen and liberate carbonic acid, as in the process of respiration, but the air of the fluid in which they live speedily becomes exhausted of its oxygen, and then the ferments obtain further supplies from the glucose, in effecting the decomposition of which they set free more oxygen than they require, and thus,

uniting with the hydrogen and the carbon, forms the products of fermentation.

In practice the pulp is removed from the mill and placed in open vats for forty-eight hours or longer. Gentle fermentation sets in, as shown by the formation of froth and bubbles of carbonic-acid gas. The pulp is then placed in layers separated by hair-cloths, which act as sieves or filters when the mass is placed in a press like a cheese-press. The pressure is gradual at first and afterwards increased. The juice or must is poured into hogsheds, leaving an unfilled space as "ullage." The hogsheds are placed in a cool cellar, when fermentation begins as above explained, and a thick scum forms on the surface called the "upper lees." At the same time mucilage and ferment-cells with the more solid particles sink to the bottom and form the "lower lees" at the bottom of the barrel. When the fermentation has subsided the liquor between the upper and lower lees should be bright, but in the case of perry, owing to the large quantity of mucilage, the juice has to be filtered through fillets of Forfar linen,—a tedious process. The clear liquor is now racked off into clean casks, not quite filled, but leaving space for "ullage," and kept uncorked at a low temperature. A better practice is to close the cask with a bung, through which a curved siphon-like tube is passed, one end of it being in the "ullage" and the portion of it outside the cask being bent downwards and then upwards, then either the bend of the tube may be filled with one or two tablespoons of water, or the outer end of the bent tube may be plunged in a cup of water,—the object in all cases being to provide for the escape of gas from the cask and to prevent the passage of air into it. In a week or so the fermentation ceases or nearly so, the liquor becomes clear and quiet, when if glass is added in the proportion of one ounce to a hogsherd of 100 to 115 gallons. (In Devonshire, the hogsherd contains uniformly fifty gallons.) In January or February the bungs are driven in firmly. While fermentation is going on, a temperature of 50° to 70° is most propitious, but after the liquor has been racked off it should be kept in a uniformly cool cellar as near to 40° Fahr as can be done. When it is desirable to restrain over-violent or hasty fermentation, sulphur or salicylic acid is employed. The latter, being the simpler and cleaner, is the better agent to be adopted. An ounce or an ounce and a half to a hundred gallons should be poured into the fermenting liquor immediately after it has been racked. It is very effectual, and leaves no sensible effects on the liquor if carefully used, being tasteless and free from smell. Great care should be taken, however, not to allow the acid to come into contact with any metal such as iron, or a black colour will result. Perry contains about 7 per cent. of alcohol, and will keep in casks if well made for three or four years, or longer if in bottle. It does not, however, travel well.

PERSEPHONE. See PROSERPINE.

PERSEPOLIS. In the interior of Persia proper, some 40 miles north-east of Shiráz, and not far from where the small river Pulwār flows into the Kur (Kyrus), there is a large terrace with its east side leaning on Kūhi Rahmet ("the Mount of Grace"). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 14 to 41 feet; and on the west side a magnificent double stair, of very easy steps, leads to the top. On this terrace, which is not perfectly level, stand and lie the ruins of a number of colossal buildings, all constructed of exquisite dark-grey marble from the adjacent mountain. The stones were laid without mortar, and many of them are still *in situ*, although the iron clamps by which they were fastened together have been stolen or destroyed by rust. The mason-work is excellent, and the

style of the lofty palaces, colonnades, and vestibules most imposing. Especially striking are the huge pillars, of which a number still stand erect. No traveller can escape the spell of these majestic ruins.¹ It is impossible to give a minute account of them here; the reader must refer to the numerous descriptions and illustrations in the works of ancient and modern travellers.² It is to be observed that several of the buildings were never finished. Stölze has shown that in some cases even the mason's rubbish has not been removed, and remarks accordingly that in those early times, just as at the present day, an Oriental prince would rather commence a new building of his own than complete the unfinished work of his predecessor.

These ruins, for which the name *Chihil minare* or "the forty minarets"³ can be traced back to the 13th century,⁴ are now known as *Takht Jamshid*, "the throne of Jamshid" (a mythical king). That they represent the Persepolis captured and partly destroyed by Alexander the Great has been beyond dispute, at least since the time of Pietro della Valle.⁵ Amongst the earlier scholars the fanciful notions of the Persians, who are utterly ignorant of the real history of their country before Alexander, often received too much attention, hence many of them were of opinion that the buildings were of much higher antiquity than the time of Cyrus, and even those who rightly regarded them as the works of the Achemenians were unable to support their theory by conclusive evidence.⁶ The decipherment of the cuneiform Persian inscriptions found on the ruins and in the neighbourhood has put an end to all doubt on this point. We now read with absolute certainty that some of the edifices are the work of Darius I, Xerxes, and Artaxerxes III. (Ochus), and with equal certainty we may conclude that all the others were built under the Achemenian dynasty.

Behind Takht Jamshid are three sepulchres hewn out of the rock in the hillside, the façades, one of which is incomplete, being richly ornamented with reliefs. About 8 miles to the north-north-east, on the opposite side of the Pulwâr, rises a perpendicular wall of rock, in which four similar tombs are cut, at a considerable height from the bottom of the valley. The modern Persians call this place *Nakshi Rüstam* ("the picture of Rüstam") from the Sassanian reliefs beneath the opening, which they take to be a representation of the mythical hero Rüstam. That the occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at Nakshi Rüstam is expressly declared in its inscription to be the tomb of the great Darius, concerning whom Ctesias relates

that his grave was in the face of a rock, and could be reached only by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persian kings, either that their remains were brought to Persia, "to the Persians," or that they died there.⁷ Now we know that Cyrus was buried at Pasargadae, the modern Murgâb, two days' journey north-east from Persepolis,⁸ and it there is any truth in the statement that the body of Cambyzes was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at Nakshi Rüstam are probably, besides Darius, Xerxes I., Artaxerxes I., and Darius II. Xerxes II., who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sogdianus. The two completed graves behind Takht Jamshid would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Aises, who reigned at the longest two years, or, if not his, then that of Darius III. (Codomannus), who is one of those whose bodies are said to have been brought "to the Persians."⁹

Another small group of ruins in the same style is found at the village of Hâji âbâd, on the Pulwâr, a good hour's walk above Takht Jamshid. These formed a single building, which was still intact 900 years ago, and was used as the mosque of the then existing city of Istakhr. For there is no other place that can have answered to the description of the eminent geographer Makdisi, who was himself in this neighbourhood, when he says: "The chief mosque (*gânâ*) of Istakhr is situated beside the bazaars. It is built after the fashion of the principal mosques in Syria,¹⁰ with round pillars. On the top of each pillar is a cow.¹¹ Formerly it is said to have been a fire-temple. The bazaars surround it on three sides" (p. 436).

In the time of its greatest prosperity the Persian metropolis must undoubtedly have covered a great part of the extremely fertile valley of the Pulwâr. It is not at all necessary to suppose that its limits are determined by the two heaps of ruins. The great bulk of the houses would, of course, be built in the wretched manner which is all but universal in the East.

Since Cyrus was buried in Pasargadae, which moreover is mentioned in Ctesias as his own city,¹² and since, to judge from the inscriptions, the buildings at Persepolis commenced with Darius I., it was probably under this king, with whom the sceptre passed to a new branch of the royal house, that Persepolis became the capital.¹³ At least it is probable that the great city, in the original home of the dynasty, with its lordly palaces and royal sepulchres, was theoretically considered the metropolis of the whole empire. But certainly, as a residence for the rulers of such extensive territories, a remote place in a

¹ See the description of Mas'ûdî (ed. Babui de Meynard, iv 76 sq.), written 944 A.D., and that of Makdisi (Mokaddasi, ed. De Goeje, p. 444), written forty years later.

² See especially Charlin, Kaempfer, Niebuhr, and Ouseley. Niebuhr's drawings, though good, are, for the purposes of the architectural student, inferior to the great work of Texier, and still far more to that of Fleusin and Coste. Good sketches, chiefly after Fleusin, are given by Kossovich, *Inscriptions paléo-persees*, St. Petersburg, 1872. In addition to these we have now the photographic plates in Stölze's *Persepolis* (2 vols., Berlin, 1882). Stölze's "photogrammetric" plan surpasses all previous attempts in accuracy. The numerous reliefs found in this group of ruins (especially on the great double stair), executed in a very remarkable style of art, were first brought within the scope of accurate examination by these works, since, with some individual exceptions (as in Ouseley), the drawings of the figures in the older works were quite inadequate.

³ Neither "the forty towers" nor "the forty pillars" is a correct rendering of the expression. The round pillars with their heavy capitals have a much closer resemblance to the turrets of the Mohammedan mosques than to our church towers. An older name for all the splendid ruins through the Pulwâr valley is *hadr astân*, "the thousand pillars" (Hafiz Jap., ed. Gotwaldski, p. 88). A thousand is, of course, like forty, a round number.

⁴ Sir W. Ouseley, *Travels*, ii 369.

⁵ Lettæa xv (ed. Brighton, 1649, ii 246 sq.).

⁶ See the discussion of this question in Ouseley

⁷ This statement is not made in Ctesias (or rather in the extract of Photius) about Darius II., which is probably accidental; in the case of Sogdianus (Sikydnianus), who as a usurper was not deemed worthy of honourable burial, there is good reason for the omission.

⁸ See at PERSEA (p. 567 below). The complete proof will be found in Stölze's work already mentioned, and in his paper cited below.

⁹ *Artax.* ii. 22, 1.

¹⁰ This refers only to its solidity and magnificentness, and perhaps also to some of its minor features, but not to its general style. These Moslems had no great discernment in matters of style. For instance, Makdisi and others compare the ruins of Takht Jamshid to those of Palmyra and Baalbek.

¹¹ Capitals formed of recumbent animal figures are peculiar to the buildings of the Achemenians.

¹² Cf. also in particular, Plutarch, *Artax.* ii., where Pasargadae is distinctly looked on as the sacred cradle of the dynasty.

¹³ The story of Aëtan (*H. A.* i. 59), who makes Cyrus build his royal palace in Persepolis, deserves no attention.

difficult alpine region was far from convenient. The practical capitals were Susa, Babylon, and Ecbatana.

Thus, at the same time, accounts for the fact that the Greeks were not really acquainted with the city until it was taken by Alexander.¹ Ctesias must certainly have known of it, and it is possible that he may have named it simply Πέρσας,² after the people, as is undoubtedly done by certain writers of a somewhat later date.³ But whether the city really bore the name of the people and the country is another question. And it is extremely hazardous to assume, with Sir H. Rawlinson and Oppert, that the words *anā Pārsā*, "in this Persia," which occur in an inscription on the gateway built by Xerxes (D. lin. 14), signify "in this city of Pārsā," and consequently prove that the name of the city is identical with the name of the country.

The name Persepolis appears to have been first used by Clitarchus, one of the earliest, but unfortunately one of the most imaginative annalists of the exploits of Alexander. The word was no doubt meant to allude to the "Persians," but apparently he preferred this extraordinary form⁴ to the regular "Persepolis"⁵ for the sake of a play on the destruction (τέρεος) which he relates. Later writers have followed him in the use of the name Persepolis.⁶ For information about the capture and treatment of the city by Alexander we are almost entirely dependent on narratives which are based on Clitarchus, since Arrian unfortunately disposes of this episode in a very summary fashion. The course of events may be traced somewhat as follows.

Alexander, having crushed the resistance of the Persian army under Artobazanes at the "Persian Gates,"⁷ marched rapidly on the capital. Artobazanes had made his way thither with a few followers, but was refused admission by Tiridates, the commandant of the citadel, who had already commenced negotiations with Alexander, and at last surrendered the place with its immense treasures to the conqueror. In a subsequent battle Artobazanes was killed.⁸ Alexander then ordered a general massacre, and gave up the city to be plundered. In the citadel he placed a garrison of 3000 men under Nearchides,⁹ and then caused

¹ Eschylus, whose knowledge of the world is certainly not very extensive, takes the "city of the Persians" to be Susa. Cf. especially *Pers.*, v. 15 with v. 761 (*πί' δ' ἄρ' ὅσον*). Herodotus does not mention the capital of Persia at all.

² The only expression that could be interpreted in this sense is *ἐς Πέρσας*, "to the Persians." But perhaps *ἐς Πέρσας*, with him, means only "to the land of Persia." No doubt, when he says that the body of Cyrus was conveyed *ἐς Πέρσας*, this might be explained on the supposition that he wrongly imagined that Cyrus was buried in Persepolis. Xenophon, who knew of Pasargada from Ctesias, calls it *Πέρσας* (*Cyr.*, vi. 5, 21); but, as he was not acquainted with the country, this goes for nothing. Of more importance is the fact that Plutarch (*Artax.*, vi. (probably after Diod.), places Pasargada *ἐν Πέρσας*, where the expression applies to the country and not to the city.

³ So undoubtedly Arrian (ii. 18, 1, 10), or rather his best authority, King Ptolemy. So, again, the Babylonian Berossus, Alexandria. See Clemens Alex., *Admon. ad gentes*, c. 6, where, with Georg Hoffmann (*Per. Med. aegypt.*, 187), and so to be inserted before *Πέρσας*, and this to be understood as the name of the metropolis.

⁴ *Περσπολις* means strictly "city-destroying." *Περσπολις*, a well-authenticated reading in Strabo and Athanasius (*l. c.*), is no improvement.

⁵ This form is actually restored by later scholars, and seems to have been used by the geographer Ptolemy (vi. 4).

⁶ Besides the historians who draw upon Clitarchus (Diodorus, Curtius, Justin, Plutarch in *Alexander*), Strabo (79 *sq.*, 721 *sq.*), Ptolemy (vi. 115, 218), and several others, it is also introduced in the name Persepolis in an account which is based on Ctesias, just as Arrian (vi. 1, 1) once employs it, although he can scarcely have got it from his excellent sources.

⁷ On this locality, see the paper of Fr. Stolze in the *Verhandlungen der Gesellschaft für Erdkunde in Berlin*, 1883, Nos. 3 and 6.

⁸ This is mentioned by Curtius only, but it has great intrinsic probability. The massacre at the taking of the city appears to be confirmed by Plutarch (*Artax.*, 37) from the letters of the king.

⁹ This again is only found in Curtius. Alexander was in the heat of a country which he had laid waste, but by no means thoroughly subdued, which hated him bitterly, and which was the native land of the dynasty; he was amongst a people who still felt themselves to be

the royal palaces to be set on fire,—certainly not in a drunken freak, but apparently with deliberate calculation on the effect it would produce on the minds of the Asiatics.¹⁰

Now it has hitherto been universally admitted that "the palaces" or "the palace" (τὰ βασιλῆα) burned down by Alexander are those now in ruins at Takhti Jamshid, as already described. From Stolze's investigations it appears that at least one of these, the castle built by Xerxes, bears evident traces of having been destroyed by fire.¹¹ The locality described by Diodorus after Clitarchus corresponds in important particulars with Takhti Jamshid, for example, in being supported by the mountain on the east.¹² And, if there are other details, such as the triple wall, which it is difficult to reconcile with the existing state of things, we must bear in mind on the one hand the great destruction that must have been wrought in the course of thousands of years, and on the other that small inaccuracies are not to be wondered at in a writer like Clitarchus, who is constantly straining after effect. There is, however, one formidable difficulty. Diodorus says that the rock at the back of the palace containing the royal sepulchres rises so steep that the bodies could be raised to their last resting-place only by mechanical appliances. This is not true of the graves behind Takhti Jamshid, to which, as Stolze expressly observes, one can easily ride up, on the other hand, it is strictly true of the graves at Nakshi Rostam. Stolze has accordingly started the theory that the royal castle of Persepolis stood close by Nakshi Rostam, and has sunk in course of time to shapeless heaps of earth, under which the remains may be concealed. He and Andreas, our highest authorities on the topography of this district,¹³ consider this spot peculiarly adapted for the site of a citadel, while the water-supply would suffice for a numerous court-tetinue and garrison, and for a royal residence with its palaces and gardens. Nevertheless we are unable to adopt this suggestion. The vast ruins of Takhti Jamshid, and the terrace constructed with so much labour, appear to us of more importance than any number of doubts and conjectures. These remains can hardly be anything else than the ruins of palaces and the other belongings of a kingly residence, as for temples, the Persians had no such thing, at least in the time of Darius and Xerxes. And it can hardly be supposed that such solid structures were much more numerous in former times, and that these alone have survived owing to their peculiar situation on the terrace. For, in the first place, it is evident at a glance that the situation itself is of an exceptional kind. Moreover, Persian tradition at a very remote period knew of only three architectural wonders in that region, which it attributed to the fabulous queen Humai (Khumai)—the grave of Cyrus at Murgah, the building at Hájí ábád, and those on the great terrace.¹⁴ It is safest therefore to identify these last with the royal palaces destroyed by Alexander. Clitarchus, who can scarcely have visited the place himself, has simply, with his usual

the dominant race, and knew that their king was still alive. That in these circumstances he should have a strong garrison under a trustworthy Macedonian was simply a matter of course. Nearchides afterwards commanded a tremen in the fleet that sailed from the Indus to the Tigris (Arrian, *Indica*, xix. 6, after Nearchus).

¹⁰ See art. *Persia*, p. 532 below.

¹¹ Dr. Stolze has kindly explained to the writer of this article that the layer of charcoal in the "hall of a hundred pillars" is apparently the result not of a conflagration but of gradual decomposition.

¹² The name of this mountain too, *βασιλικὸν ὄρος*, is identical with *Shāh-kāh*, which is at least tolerably well established by Ouseley (ii. 417) as a synonym of *Kāh* *rahmet*.

¹³ We are here again indebted to private communications from Stolze, as well as to his published papers.

¹⁴ See especially Hamza Isf., 88; Tabari, i. 690, 616 (cf. Nuldeke, *Geschichte der Perser . . . aus . . . Tabari*, p. 8). The ruins at Takhti Jamshid are alluded to as the work of Humai, in connexion with an event which occurred shortly after 200 A.D.

recklessness of statement, confounded the tombs behind the palaces with those of Nakshi Rustam, indeed he appears to imagine that all the royal sepulchres were at the same place. It is possible, however, that the discrepancy originated with Diodorus, who often makes his extracts in a very perfunctory manner.¹

It is should prove that, after all, the terrace is not large enough to have contained the treasure-houses and the barracks of the garrison, in addition to the palaces, or that Alexander could not have set fire to the latter without endangering the former and the safety of the whole fortress, then we should have to assume that a separate citadel (*ἄκρα*) stood somewhere outside of the terrace with the palaces. There are many positions naturally adapted for defence in the vicinity. But, as far as yet appears, such an assumption is scarcely required. Of course we need not suppose that the number 3000 represents the actual strength of Alexander's garrison; and we must consider that, when Darius, in the height of his power, laid out this place in the heart of his empire, he was thinking more of regal magnificence than of security. A high wall and a guard of 200 men would suffice for the protection of the treasures at a time when battering engines were unknown.

In 316 n. c. Persepolis is still the capital of Persia as a province of the great Macedonian empire (see Diol., 19, 21 *et*, 46, probably after Hieronymus of Cardia, who was living about 316). The city must have gradually declined in the course of time, but the ruins of the Achaemenian remained as the witnesses to its past glory. It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About 200 A. D. we find there the city Istakhr,² as the seat of the local governors. There the foundations of the second great Persian empire were laid, and once more there arose round the tombs of the Achaemenians what was for centuries the theoretical metropolis of a great monarchy whose administrative capital lay to the west. Istakhr acquired an importance in the centre of purely Asiatic and other history. In its most flourishing days it was probably as large as Persepolis had been, whose ruins undoubtedly furnished much of the material for its houses. The peaceable resident, intent on building his house or hut, has too often moved more destructive to ancient buildings than a foreign invader or even the devastating forces of nature. The Sassanian kings have covered the face of the rocks in this most famous of cities by inscriptions in their own language, with their sculptures and inscriptions, and must themselves have built largely here, although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis, and this in spite of the fact that for four hundred years they maintained relations, friendly or hostile, with the empire, while their own sway extended far into the heart of Asia. So remote as Persia!

At the time of the Arabian conquest Istakhr offered a desperate resistance, which was renewed again and again before the place was finally subdued. Blood flowed like water in these struggles for religion and liberty. Nevertheless the city was still a place of considerable importance in the first century of Islam, although its greatness was speedily eclipsed by the new metropolis Shiraz. In the 10th century Istakhr had become an entirely insignificant place, as may be seen from the descriptions of Istakhr, a native (c. 950), and of Makrizi (c. 985). At this time the little town occupied approximately the site assigned to it on Flamin's map, near the present village of Hajji Abad, surrounding the ruined structure of the Achaemenians, and principally on the left side of the stream. During the following centuries Istakhr gradually declined, until, as a city, it ceased to exist. This fruitful region, however, was covered with villages till the fearful devastations of last century, and even now it is, comparatively speaking, well cultivated.

The "castle of Istakhr" played a conspicuous part several times during the Mohammedan period as a strong fortress. It was the middlemost and the highest of the three steep eags which rise from the valley of the Kni, at some distance to the west or north-west of Nakshi Rustam.³ We learn from Oriental writers that one

of the Bawaland sultans in the 10th century of the Flight constructed the great citadel, which may yet be seen, and have been visited, amongst others, by James Morier and Flamin.⁴ Orseley, who has extracted a vast amount of information from Persian authors about the ruins of Persepolis and about Istakhr,⁵ points out that this castle was still used in the 16th century, at least as a state prison. But when Della Valle was there in 1621 it was already in ruins. (TH N)

PERSEUS, a hero of Grecian fable, son of DANAE (*q v*) and Zeus. When Perseus was grown to manhood Polydeutes, the wicked king of Seriphus, cast his eye on Danae; and, that he might rid himself of the son, he exacted of him a promise that he would bring him the head of the Gorgon Medusa. Now the dreadful GORGONS (*q v*) dwelt with their sisters the GRÆÆ (the Gray Women) by the great ocean, far away in the west. Guided by Hermes and Athene, Perseus came to the GRÆÆ. They were three hags, with but one eye and one tooth between them, which they handed one to the other. Perseus stole the eye and tooth, and would not restore them till the GRÆÆ had guided him to the Nymphs, from whom he received the winged sandals, the wallet (*κιβιστος*), and the cap of invisibility. These he put on, and, being armed by Hermes with a scimitar (*ἀσπίς*), came upon the Gorgons as they slept and cut off Medusa's head, while with averted eyes he looked at her image on his brazen shield lest he should be turned to stone. Perseus put the Gorgon's head in his wallet and fled. Coming to Æthiopia he delivered and married ANDROMEDA (*q v*). With her he returned to Seriphus in time to rescue his mother and Diety from Polydeutes, whom he turned to stone along with all his court by showing them the Gorgon's head. The island itself was turned to stone, and was still and lonely ever after, the very frogs of Seriphus (so ran the proverb) were dumb. Perseus then gave the head of Medusa to Athene, who put it on her shield, and, with Danae and Andromeda, he hastened to Argos to see his grandfather, Acrisius, once more. But he, fearing the oracle, had gone to Larissa in Thessaly. Thither his grandson followed him, but at some games given by Teutamias, king of Larissa, he threw a quoit which lighted on his grandfather's foot and caused his death. Ashamed to return to Argos, Perseus gave his kingdom to Megapenthes, and received from him Thyrs in return. There he reigned and founded Midea and the famed Mycenae, and became the ancestor of the Persidae, amongst whom were Eurystheus and Hercules.

The legend of Perseus was a favourite theme of Greek poetry and art. Sophocles and Euripides had each several dramas on the subject, and sculptors and painters vied with each other in depicting the rescue of Andromeda from the sea-monster. The story was localized in various places. Italy claimed that the ark with Danae and Perseus had drifted to the Latin coast (Servius on Virg., *Æn.*, vi, 372, and viii, 345). The Persian kings were said to have sprung from a son of Perseus (Apollon., i, 4, 6; Herod., vii, 61), and, according to Pausanias, Democritus, Perseus taught the Persians to worship fire, and founded the Magian priesthood. The tale of the rescue of Andromeda by Perseus from the sea-beast is akin to that of Hercules and Hesione. Both have been interpreted of the sun slaying the darkness, Andromeda or Hesione being the moon, when the darkness is about to devour. According to one version Hercules rescued Hesione from the sea-beast by slaying him in the month, from which he came forth after three days spent in the belly of the beast. This points to a connexion with the Semitic story of Jonah and the fish. Greek sculptures of Andromeda's monster were the models for Jonah's fish in early Christian art, and on a rock at Joppa they showed the chains which had bound Andromeda, and the bones of the sea-beast (Pliny, *II N*, v, 13, Mela, i, 11). Tausus in Cilicia was said to have been founded by Perseus, who appears on coins of the city, as well as on coins of Pontus and Cappadocia.

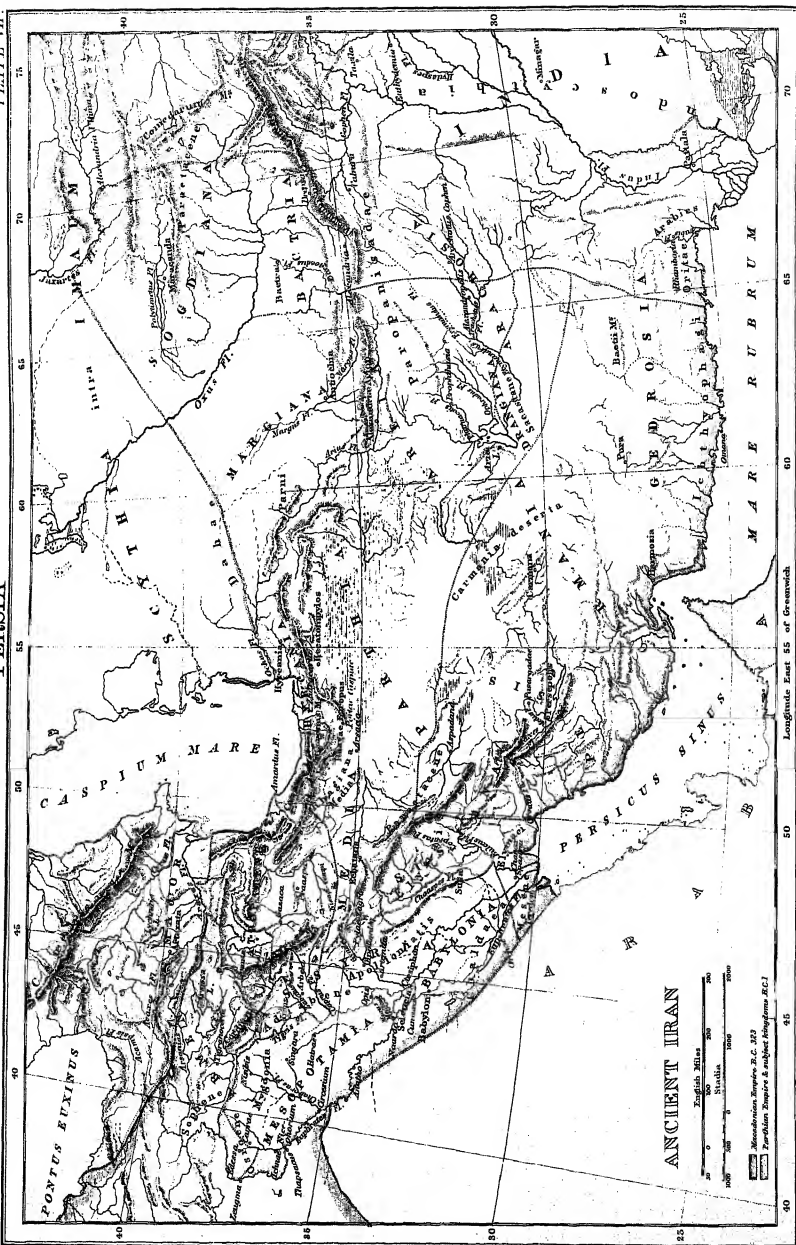

⁴ See the plans and sketches in Flamin, to whom it was stated that the castle-rock was called *Ἰστακρ*, "castle of the cypress," from a solitary cypress growing there. It is unfortunate that for this particular locality the newest map of Hantschke (Berlin, 1882) is quite unreliable.

⁵ These references are still very useful, although we have now the advantage of knowing the extremely valuable Arabian sources of many of his Persian narratives from printed texts.

¹ Curtius repeatedly confounds the palace with the metropolis (both being *ῥὰ βασιλεύς*), and so speaks of the city being set on fire.

² Properly *Stakhr*, as written in Pahlavi, on the coins of the Sassanians "str" stands as an abbreviation for the name. The Armenians write *Stakhs*. The form with the prosthetic vowel *Ἰστακρ* is New Persian; the Syrians used it at still earlier times for the form *Ἰστακρ* or *Ἰστακρ*.

³ This height is now called, from its situation, *Alfaykale* (middle fortress). Older writers and travellers give other names, the nomenclature of all this part of Persia having greatly altered, but the name "castle" or "hill of Istakhr" appears not to have entirely disappeared.

PERSIA

PERSIA, or IRÁN In modern political geography these two terms are synonymous, the kingdom which we call Persia the Persians themselves call Irán. But each of the words has a somewhat complicated history, a brief sketch of which will best explain the connexion between the several subjects which, in an encyclopaedic treatment, naturally demand notice under one or other of the names which head this article.

Persia, or rather Persis (Greek exclusively Περσίς), is the Latinized form of a name which originally and strictly designated only the country bounded on the N by Media and on the N W by Susiana, which of old had its capital at Persepolis or Istakhr, and for almost twelve centuries since has had it at Shiráz. This country and its people were anciently called Pársa (now Párs or Fárs). The oldest certain use of the name is in Ezekiel (xxvii. 10, xxxviii. 5). The Greek form Πέρσας, with *θ* for *δ*, which all European languages follow, seems to have come from the Ionians, who disliked to pronounce *δ* even in foreign words. Thus Πέρσας would stand for Πέρσας, which in turn stands to Pársa as Μηδοί to Μάδα.

The name of Persian was naturally extended to the great monarchy of the Achemenians who came forth from Persis; and so again, when a second great empire, that of the Sásánians, arose from the same land, all its subjects began to be called Persians, and Persis or Persia was sometimes used of the whole Sásánian lands (Ammianus, xxiii. 6, 1). The prevalent language of this empire (see PAHLAVI) had a still better right to be called Persian, for it seems to have had its basis in the language of the old Persus. The same thing is true of the so-called New Persian, which has been a literary language for the last thousand years.

Historically, then, the term Persian is fitly applied to the two great empires which rose in Párs or Persis—the form Persia will be used in this restricted sense throughout the present article—and not unfitly to the modern state which embraces Persus and its sister lands, and in which a descendant of the ancient tongue of Persis is still the official and literary language.

The name Irán, on the other hand, was originally of much wider signification than Persia, and the whole upland country from Kurdistán to Afghánistán may, in accordance with the native use of its ancient inhabitants, be called the Iranian upland. The inhabitants of this upland, together with certain tribes of the same race in adjacent lands, shared with their near kinsmen in India the name of Aryans (Arya, Arya of the *Avesta*; Sk. Arya). King Darius calls himself "Persian son of a Persian, Aryan son of an Aryan," and Herodotus (vii. 62) knows 'Αριος as an old name of the Medes. The ancient nobles affected names compounded with Arya,—Ariyádmna (*Ἀριγδάμνης*), Ariobazanes, and the like. The lands of the Aryans, as a whole, were called Ariyána (Ariyana of the *Avesta*); Eriosthenes and after him Strabo and others are certainly wrong in limiting 'Αριανή, 'Αριανός, to eastern Irán (Afghanistán, Baluchistán, &c.)¹

Ardashír, the first Sásánian, is called on coins and inscriptions "king of the kings of Érán," his son Shápur or Sapor is "king of the kings of Érán and not-Érán." Now Ardashír, as well as his son, had non-Aryan subjects, the main population of Babylonia and other provinces being of Semitic race; Érán and not-Érán therefore must here be used not ethnographically but in a definite politico-geographical sense. The official name of the empire, however, was always Érán, and the great officers of state had such titles as Érán-Spáhpat, "general of Érán," Érán-Anbákrpat, "store-master of Érán."²

For the last 500 years most Persians have pronounced Irán instead of Érán (more recently also Irán, Irún), and this is the official title of the kingdom which once had Isphahan, and now has Teherán, as capital. Modern Irán, or Persia, does not embrace nearly the whole Iranian upland, still less all men of Iranian nationality, that is, all who speak an Iranian dialect akin to Persian. On the other hand, the modern kingdom of Irán has many subjects who are not Iranians ethnographically, but come originally from Central Asia or Arabia, and speak Turkish or Arabic.

PART I.—ANCIENT IRAN

SECTION I.—MEDO-PERSIAN EMPIRE.

Plate VII The Babylonian Berosus, writing soon after Alexander the Great, states that at a very early time, which we must place somewhat over two thousand years before Christ, the Medes conquered Babylonia, and that eight Median kings reigned thereafter in Babylonia for a space of 224 years.³ This is an early instance of the occupation of the rich lowlands by warlike tribes of the neighbouring highlands; and indeed the contrast between the plain of the Euphrates and Tigris, peopled mainly by Semites, and the tableland of the Iranians, surrounded by lofty mountains, is a very important factor in the whole history of wide regions of Asia. But it is, to say the least, not certain whether Berosus means the Iranian people afterwards called Medes. The expression might have a merely geographical signification, and it is at all events possible that at that distant period tribes of different descent dwelt in the land. In any case, we have here no Iranian empire, but only a Babylonian dynasty founded by foreigners.

Be this as it may, it is certain that at an early period there were regular monarchies of some size even in the distant Iranian lands. Unmistakable traces lead us to

assume an old empire in Bactria—the Iranian land far to the east, in the region of the Oxus, beyond the great tableland—which must have developed a tolerably high civilization. But we have no exact information about it.

The series of the great Iranian monarchies begins for Medes us with the Median empire of Ecbatana. Unfortunately we possess but little trustworthy information about its history, being almost wholly dependent on what two Greeks, Herodotus and Ctesias, who wrote long after the fall of the kingdom, report from the mouths of Orientals. These two authorities differ so widely that their statements are to a great extent mutually exclusive. Nevertheless careful investigation has shown that many of the statements of Ctesias (which are only preserved through the medium of later writers, like Diodorus) rest on the same basis as those of Herodotus. This common basis included an artificially arranged chronology.⁴ According to Herod-

³ Sásánian inscriptions in Chaldean Pahlavi still show the ancient form Arián (𐭠𐭣𐭥), and Greek inscriptions of the older kings have the genitive pl. 'Αριανῶν. But the corresponding common Pahlavi inscriptions and the coins already show the form Irán (𐭠𐭣𐭥), following an established law of phonetic decay.

⁴ The information is preserved by Eusebius, who took it from Alexander Polyhistor; see Eusebius, *Chronicon*, ed. Schoene, 25.

⁵ See Hupfeld, *Zeretzitismus Herodotes Spec. II. de re vetere Medorum regno*, Rostali, 1843.

¹ Less careful writers, like Piny, confuse Ariana with Aria, properly Haria, the land of Harava, the later Harv, Haré, Haré, Ambo Haré.

a.715-634, out of the Medes freed themselves from the Assyrians, and lived for a time without a master till Deioces obtained the kingly power by stratagem. There reigned then

Deioces 53 years	} 75 years	} 160 years.
Phraortes 23 "		
Cyaxares 40 "		
Astages 35 "		

The totals show how the figures are arranged on an artificial system. The duration of the kingdom is exactly a century and a half, divided into two exactly equal portions, each of which is occupied by the reigns of two kings. But further, according to Herodotus, the rule of the Medes over Upper Asia, i.e., the land east of the Halys, lasted 128 years, save only (*ᾠραὶ*) the twenty-eight years during which the Scythians ruled. It is easy to see that "save only" means "minus," and that thus the foreign supremacy of the Medes is reckoned at exactly 100 years, or two-thirds of the total duration of the kingdom. Obviously such figures can at most be only approximately correct. Now the number 128 is got by adding the reigns of the first king and the last two. This number is certainly due to an error on the part of Herodotus, who has committed similar mistakes in arithmetic elsewhere; in adding up he took the reign of Deioces for that of Phraortes. We may conjecture that the original statement received by Herodotus was that the supremacy, represented by the last three reigns, lasted a century, a round number being put for 97 (93 + 40 + 35). With regard to the individual items, it is somewhat suspicious that the second half (75 years) is divided into its two most convenient fractions, 40 and 35. Consequently we cannot place much reliance on the figures representing the reigns of the first two rulers either, especially as it can be made probable that they also rest on an artificial basis.

Now it can be proved that Ctesias's list of nine or properly ten kings was based on that of Herodotus, but with all the numbers doubled. Probably this list of Ctesias assigned 350 years as the total duration of the empire, which is the number given in Justin, i 6, 17. The Mede from whom Ctesias derived his information, or the Median source on which his informant drew (there is no mistaking the Median colouring which pervades Ctesias's narrative), wished to glorify the empire of his people by the length of its duration, hence the doubling. The source from which the names of the Median kings in Ctesias are derived is still a mystery; they are quite different from those of Herodotus. Even Oppert's hypothesis, that the names of the last four kings in Ctesias are the Iranian translation of the non-Iranian names in Herodotus and belong to the language of the second kind of cuneiform writing, though perhaps plausible at first sight, is on close examination untenable. In general there is no warrant for the assumption that as late as the time of the Median and Persian empires there was a large non-Iranian population in Media,—an assumption which conflicts with all tradition and originates solely in the difficulty of finding a home for the second kind of cuneiform writing. But the names of the kings in Herodotus are now all authenticated, directly or indirectly, by the inscriptions lately discovered. Probably too the reckoning of the total duration of the empire at a century and a half is about right. Indeed such chronological systems sometimes correspond better, on the whole, with the facts than their artificiality would lead us to expect.

Ctesias's narrative opens with a highly-coloured description of a real event, namely, the destruction of Nineveh by the leader of the Medes, called by him Arbaces, with the help of the Babylonian Belsyses (the historical Nabopolassar). But the fact that by this event the position of Media as a great power was for the first time assured is mixed up by

Ctesias with the beginning of the monarchy itself. In addition, he grossly exaggerates the duration of the empire; so that we arrive at the monstrous result that between 606 or 607, the real date of the destruction of Nineveh, and 550, the year of the fall of the Median supremacy, more than 300 years are supposed to have elapsed.

Down to the destruction of Nineveh we must ignore Ctesias almost completely and follow Herodotus alone.

We will not repeat Herodotus's naive story of the foundation of the Median kingdom by Deioces, son of Phraortes, a story in which Greek and Oriental colours are charmingly blended. We may assume as certain that Deioces possessed a principality, the central point of which was Ecbatana (or Agbatana; Old Persian *Hagmatāna*, now Hamadān), a place which for thousands of years has held the rank of a capital. This principality probably never embraced the whole of Media (i.e., nearly the present provinces of Irāk Adjemi and Azerbāijān with a portion of Turkish Kurdistan), but by his successors it was enlarged into the great Median empire. Of course there was no smooth and formal constitution, no fixed frontier, no exact determination of the prerogatives of different chiefs in the particular districts. From of old the Assyrians had made frequent attempts to subjugate the country of the Medes, but perhaps never quite possessed the whole land with its numerous inaccessible mountains and warlike robber tribes. Nevertheless they made successful expeditions into the interior of Media even down to the time at which Herodotus regards Media as independent.¹ Neither the liberation of Media nor the foundation of the monarchy is an event which can be limited to a particular year, the thing took place gradually. In the period not long before Deioces, according to Herodotus's reckoning, very many tributary Median chieftains are mentioned in the Assyrian inscriptions, this confirms, in some measure at least, the statement that "anarchy" then prevailed.² In 715 b.c. there was carried off as prisoner one Dajaukkū; this is certainly the same name, perhaps the same person (for his captivity may have been brief), as Daiokēs, which appears in Herodotus in the Ionic form Deiokeas. We can certainly identify Herodotus's first king with the prince whose land, called Bit Dajaukkū, i.e., land of Dajaukkū, King Sargon of Assyria conquered in 713 b.c. The man who thus gave his name to the land must have occupied a high station. The date is not very remote from that assigned by Herodotus to Deioces, for we get from Herodotus as the date of Deioces 709-656, or, if we correct his error in dating the end of the empire, 700-647. Deioces was not a king of kings; he was forced to bow to the Assyrians repeatedly, but he was the founder of the empire. Three kings followed him. It is possible that there were really more, and that in the summary list the shorter reigns are passed over. Nor can we place much reliance on Herodotus's assertion that each successive ruler was the son of his predecessor.

In perfect harmony with the conditions of development Phraortes of a small state into a great power is the statement of Herodotus that the second king of the Medes, Phraortes (*Φραορτης*), according to Herodotus's reckoning 656-634 (647-626), extended his sway beyond the limits of Media and first of all subjugated Persia, or Persia proper, the secluded mountain-land south-east of Media. During all this time indeed, as we learn from Darius's great inscription, Persia had kings of its own, but these were simply vassals of the sultan

¹ For this and what follows compare, besides the works of the Assyriologists, A. v. Gutshmid, *Neue Beiträge zur Geschichte des alten Orients*, 87, 88.

² That parts at least of Media were subject to Assyria at that period is further shown by 2 Kings xvi 6, xviii 11—mere evidence than that of the inscriptions, which may not always be rightly interpreted, and contain, besides, many exaggerations.

who had his seat in Ecbatana. After conquering the Persian, Phraortes, says Herodotus, subjugated piece after piece of Asia, until he was discomfited and slain in the attempt to conquer the Assyrians in Nineveh, whose empire was by that time completely lost. Allowing for some exaggerations with respect to the extent of the empire, there is nothing in these statements that need excite suspicion. Independent evidence seems to show that towards the middle of the 7th century the Assyrian empire had fallen very low,¹ and that the inhabitants of the cluster of vast cities to which Nineveh belonged were able to repel the first attack of an enemy who could hardly have been their match in the art of siege-warfare is perfectly natural. Besides, the stability of the Median military, political, and court institutions, which were afterwards taken over unaltered by the Persians, must surely have required for its development a longer time than some modern inquirers, following exclusively the cuneiform inscriptions, have assumed for the actual duration of the Median empire.

Cyaxares Phraortes's successor, Cyaxares (*Huvakhshatar*); according to Herodotus's reckoning 634-594 (625-585)² brought the empire to the highest pitch of power. He is said to have introduced fixed tactical arrangements into the army. It was to him that the pretenders whom Darius had to overcome traced their descent, as he tells us himself. Cyaxares, according to Herodotus, took the field successfully against Nineveh, but as he was besieging the city the inroad of the "Scythians" compelled him to forego for a time all the fruits of victory. Who these Scythians were is unknown. Herodotus took them for the people tolerably familiar to the Greeks, whose true name was *Scythæ*,³ but his evidence does not go far much, since he often falls into the popular misuse of the term "Scythian" as a name for all the peoples of the steppes, and brings the inroad of these Scythians into a most unlikely connexion with the desolating raids of Thracian tribes (the Treres or Terres, commonly called Cimmerians) in Asia Minor. We must content ourselves with assuming that we have here one of those irruptions of northern barbarians into Iran of which we hear so often in later times. Probably these nomads came, as Herodotus indicates, through the natural gate between the Caucasus and the Caspian Sea, the pass of Derbent, though it is quite possible that they came from the east of the Caspian, from the steppes of Turkestan. Whether these Scythians are really the same people who made their way as far as Palestine and Egypt⁴ is, indeed, far from being as certain as is commonly supposed, nor can the date of the irruption into these countries be determined. At any rate, the barbarians overthrew the Medes and flooded the whole empire. From what we know of the doings of Huns, Khazars, Turks, and Mongols in later times we can infer how these Scythians behaved in Iran. Cyaxares must have come to some sort of terms with them; and at last he laid himself of them in a truly Eastern fashion, by inviting most of them—*i.e.*, of their chiefs—to a feast, where he made them drunk and slew them at their wine.⁵ It is not in the least surprising that Cyaxares afterwards had Scythians in his service; savages like these have no steady national feeling, and serve any potentate for pay.

With the Scythian disorders we might combine the contests which, according to Ctesias, the Parthians and Saces (*i.e.*, the inhabitants of the Turkoman desert, who are also called "Scythians" by the Greeks) waged with

Cyaxares or Astibaras, as Ctesias calls him.⁶ But it is 634-585, not safe to do so, as the whole narrative is only the framework for a pretty romance.

Cyaxares marched a second time against Nineveh and Nínurá destroyed it about 607. Not only Ctesias but also Berosus⁷ taken asserts that the king of the Medes achieved this great success in league with the king of Babylon. That the Median tradition represented the Mede and the Babylonian tradition the Babylonian as suzerain, and the other king as a vassal, is not surprising. The more powerful of the two was doubtless the Median, the richer the Babylonian. Unfortunately Herodotus's work does not include the "Assyrian memoirs," in which he intended to give a fuller account of the fall of Nineveh,—probably because he died before completing the task. In order to protect himself against his ally, who by the fall of the Assyrian empire had grown too powerful, the Chaldean king had recourse to a double precaution: he married his son, afterwards the potent Nebuchadnezzar, to Amytis or Amyitis, daughter of the Median king, but he also erected extensive fortifications. After the fall of Nineveh, Nebuchadnezzar made himself master of Syria and Palestine, and Cyaxares acquired most of the rest of the Assyrian territory. Probably Assyria proper belonged to him also, and we can thus explain Xenophon's error that the Assyrian cities before their destruction belonged to the Medes (*Anab.*, III. 4, 7-10). When Cyaxares afterwards began the war with the Lydians he was already master of Armenia and Cappadocia, though he probably did not acquire them until after he had got rid of the Scythians and destroyed Nineveh. The pretext for the war was afforded by the flight of some Scythians in Cyaxares's service to Alyattes, king of Lydia; but the real cause was doubtless thirst of conquest. The war lasted for five years with varying fortune, and was ended by the battle during which the eclipse of the sun, said to have been predicted by Thales, took place. The terrified combatants saw in this a divine warning and hastily concluded peace. An impression so profound could be produced by nothing short of a total eclipse. Now, according to Airy's calculation, of all the eclipses of that period the only one which was total in the east of Asia Minor (where we must necessarily look for the seat of war) was that of 28th May 585. Ancient writers⁸ also place the eclipse in this year. But this only proves that learned Greeks of a much later age calculated the year of an eclipse which they took to be that of Thales; yet in this case they have hit the truth. More exact calculations have shown that the eclipse of 30th September 610, formerly regarded as that mentioned by Herodotus, was total only to the north of the Black Sea. Besides, it is inconceivable that this war and the new grouping of states which it involved should have taken place before the destruction of Nineveh. The 28th of May 585 is perhaps the oldest date of a great event which can be fixed with perfect certainty down to the day of the month. The conclusion of peace which followed affords us a remarkable instance of diplomatic mediation in

¹ See Diod., II. 34, Nicol. Dam., 6, Anonymus de muleribus.

² See Euseb., *Chronicon*, pp. 30, 35, 37, and Syncellus, 210 B. The first passage refers to Abydenus, who made use of Berosus. He names the Median king *Arakshat*, which Gutschmidt regards as a corruption of *Arakshat* = *Arakshat*. This is acute, but it seems better to suppose that Abydenus or an exceptor confused Cyaxares with the last king of the Medes.

³ He reigned, according to Herodotus's reckoning, from 618 to 561. As this is narrated by Herodotus in his history of Lydia, he probably has it from Lydian sources, and we may regard this as a welcome confirmation of what we are told on Median authority about the destruction of the Scythians.

⁴ Pliny, *H. N.*, II. 53, and other passages; compare Götze, in *Rhean. Museum für Philologie*, N. F., xii. 284 sq. An astronomer, a friend of the writer of this article, has by independent calculations confirmed the dates assigned in the text for both eclipses.

¹ The Assyrian inscriptions break off abruptly with the year 644; Gutschmidt, *op. cit.* § 9.

² Herod., I. 105; compare Ptolemy, in Justin, II. 8, and Jordanes, *De orig. Get.*, 6, whose account perhaps goes back to Diodorus.

³ Between the years 1090 and 1040 A. D. we know three cases where pieces of Iranian lands despatched inconvenient Turkomans in exactly similar fashion; see Im Athin, ix. 266 sq., 272.

c 585-550 very ancient times. The peace was brought about by Sennesius, prince of Cilicia, and Nebuchadnezzar, king of Babylon.¹ Astyages, son of Cyaxares, married Aiyen, daughter of Alyattes. But according to Herodotus's calculation the above date does not fall within the time of Cyaxares, and even with the necessary correction (of nine years, see below) Astyages ascended the throne in this same year. We might suppose that the battle fell in the father's, the peace in the son's time. But, as we saw above, the dates of these reigns are not of a sort in which we can place much confidence, and it is more likely that the reign of Astyages did not last so long as tradition asserts. Thus Cyaxares probably died after 585.

Astyages Of the reign of his son Astyages (in Ctesias Astyrgas, in a Babylonian inscription *Istungu*) we have no particulars. It is not even certain that he was cruel, for Herodotus's account of him and of the revolt of Cyrus is not impartial, based as it is on the narratives of the descendants of Harpagus, who had an interest in portraying in unfavourable colours the prince whom their ancestor had betrayed. On the other hand, Ctesias's Median authority (Nicolaus Dam., 64 *sq.*), which sets Astyages in a very favourable light, has no better claim to credence on this point.

State of Median empire The Median empire must at this time have reached a tolerably high degree of civilization. As remarked above, the political and military institutions of the Persians are substantially those of the Medes, even the dress (of the Persian troops) was borrowed from the Medes.² Of buildings erected by the Median kings there are, so far as we know, no remains. The colossal hour, still to be seen, though in a sadly mutilated state, at Hamadân, and about which Arabian writers have all sorts of wonderful tales, is perhaps a monument of the Median age. The fortifications of Ecbatana must certainly have been magnificent, according to Herodotus's description; they showed strong traces of the influence of the star-worship practised by the neighbouring Babylonians, whose civilization was of a much earlier date.³ It may be that careful explorations in the neighbourhood of Hamadân or excavations will one day bring to light traces of that distant age, perhaps even some distinct inscriptions of Median kings. Such inscriptions would be of the highest value; and we might almost conjecture that the language and writing would be identical with those of the Persian kings. Since the Magi are expressly described by Herodotus as a Median tribe, and since in the age of the Achæmenians the Persian priests were drawn as exclusively from the Magi as in later times, it is highly probable that the Median kings established the Zoroastrian religion as the state religion, and appointed this Median tribe to be the priests. The religion itself arose in the far east, probably in Bactria. It is often assumed nowadays to have originated in Media, but the fact that its sacred books know nothing of the Magi tells particularly against this view. How firmly the Median Magi were in possession of the priesthood in Persia proper (Persis) about the year 512 we learn from the circumstance that they maintained their position in spite of the catastrophe of the false Smeadus. They must therefore have already held it for some time, and this carries us back almost necessarily to the influence of the Median empire. If this is correct, the Median empire has an extraordinary importance in the history of religions. The consideration enjoyed by the Median monarchy is proved by the fact that in Western lands which never came in contact with it at all its name

was so familiar that more than a hundred years after its fall the Persians were still mostly called Medes by the Greeks; in particular the wars of independence with the Persians still went at a much later date simply by the name *τὰ Μηδικά*.⁴

Nor was the Median empire properly destroyed by Cyrus, it was only transformed. Another race of the Iranian people and another dynasty stood at the head of the Iranian empire and carried out, as far as it was at all possible, Cyaxares's scheme for the conquest of Asia and the border-lands. That the Persian empire was the direct heir of the Median was known both to the Greeks—for only on this supposition were the above-mentioned expressions possible—and to the Hebrews (Isa. xlii 17, Ezra i. 3, &c.).

We possess three accounts of the mode in which the Fall of transition was effected, that of Herodotus, that of Ctesias, (of which that of Dinon, preserved only in some fragments and vestiges, is merely a variation), and that of Xenophon in the *Cyropædia*. Though Xenophon had before him the works of both Herodotus and Ctesias, we must, with Niebuhr,⁵ regard his book as nothing more than an extremely silly romance, the attempts to employ it as an independent historical source have always failed. Herodotus probably got his charming narrative directly or indirectly from the descendants of Harpagus, a man who undoubtedly played a chief part in transferring the supremacy from the Medes to the Persians. Ctesias's narrative, which we are obliged to piece together from Nicolaus Damascenus, Photius, Justin, Polyanius, and Diodorus, is highly coloured, but in parts very pretty, and has, in contradistinction to Xenophon's romance, a genuinely Oriental stamp. It appears to be based on the account of a Mede, who gave a marked preference to his own people, and represented the founder of the Persian empire in as unfavourable a light as it was possible for a Persian subject (and probably an official) to do. There was no denying the fact of Cyrus's final victory, but in Ctesias's narrative he achieves his greatest successes by cunning and deceit. He is a genuine herdman's son, takes early to robbery, and discharges menial services, in the course of which, significantly enough, he gets plenty of hard knocks. His accomplice Cbares is a cowardly rascal. Astyages defeats Cyrus in Persis itself and pursues him to his home, Pasargade, he is only saved by the intervention of the women. On the other hand, Astyages magnanimously spares Cyrus's father, who had fallen into his power. It is particularly significant that over the corpse of Astyages, who had been left by stratagem to pine in the wilderness, a royal guard of lions kept watch and ward. Of course all this does not exclude the supposition that this partisan narrative is founded on a genuine Persian legend. For the rest, the narrative of Ctesias agrees in some particulars, and even in some names, with that of Herodotus.

That Cyrus (*Kuru*, nominative *Kurush*, or rather *Kéru*, Cyrus. *Kürük**) was not of lowly descent but of a princely house was long ago seen to be a necessary supposition. Popular legend loves the elevation of sons of the people to the throne, but as a matter of fact national kingdoms are not easily founded anywhere, and least of all amongst primitive peoples, except by persons of distinguished birth. A knowledge of the Persian inscriptions has put it beyond a doubt

¹ For the latter Herodotus wrongly substitutes his successor Labrynates (Nabund, Persian *Nabunaid*).

² Herod., vii 82.

³ See Sir H. Rawlinson, in G. Rawlinson's *Herodotus*, i. 98, and Joh. Branda, in *Mon. et. m.* 284.

⁴ It is noteworthy, however, that Æschylus in the *Persæ* says "Persians" almost exclusively, but "Medes" only exceptionally (ver. 286, 791, and so in his epitaph); perhaps the poet chose "Persians" as the less usual expression.

⁵ *Lectures on Ancient History*, i. 96, Eng. tr.

⁶ The *u* is long, as is shown by the agreement of Kûper, Æschyl., Pers., 768, and 9712 of the Old Testament. The long *u* makes it impossible to identify the name with the Indian Kûrû, as Spiegel proposes.

Full of
Median
empire.

547-539. when he offered battle, and captured his capital Sardis after a short siege. Not only Herodotus but also apparently his contemporary Xanthus the Lydian, quite independently of Herodotus, told how Cyrus would have burned Croesus alive.¹ The statements of Ctesias and Xenophon to the same effect are borrowed from Herodotus. But there is also a vase of the time of Pericles representing Croesus seated on a pyre and majestically pouring out a libation.² We may not of course infer from this that Croesus offered himself as a willing sacrifice,³ but it certainly shows that a hundred years later there was a general belief that Croesus had stood upon the pyre. And it is by no means inconceivable that Cyrus, whom we must picture to ourselves, not as the chivalrous and sentimental hero of Xenophon, but as a savage conqueror, should have destined such a punishment for a vanquished foe, against whom he may personally have been especially embittered. No doubt to pollute the fire with a corpse was even in those days an impiety in the eyes of the Persians, but who knows whether Cyrus in his wrath paid much more heed to such religious maxims than did his son Cambyses? However, Croesus was pardoned, after all, perhaps because some external circumstance interposed (because a sudden shower prevented the fire from burning?), or because the conqueror changed his mind before it was too late. The pious and believing saw in the event a direct intervention of Apollo on behalf of the man who had honoured the Delphic shrine so highly.⁴

The date of Croesus's fall is not quite certain. It may have been 547 or 546. When Cyrus had marched away, the Lydian Pactyas, whom Cyrus had appointed guardian of the treasures, raised a revolt, but it was speedily put down by the king's generals. From that time forwards the Lydians never made the slightest attempt to shake off the Persian rule.

War with
Assyria
Greeks

But now began that struggle of the Persians with the Greeks which has so much importance for the history of the world. The Lydian kings had subdued a number of Greek cities in Asia Minor, but even these latter shrank from submitting to the still barbarous Persians, whose rule was far more oppressive, inasmuch as they ruthlessly required military service. But Harpagus and other Persian leaders quickly took one Greek town after the other; some, like Priene, were razed to the ground. Some of the Ionians, such as the Teians, and most of the Phocaeans, avoided slavery by emigrating. Miletus alone, the most flourishing of all these cities, had early come to an understanding with Cyrus, and the latter pledged himself to lay no heavier burden on it than Croesus had before him. In most of the cities the Persians seem to have set up tyrants, who gave them a better guarantee of obedience than democratic or autocratic governments. In other respects they left the Greeks alone, just as they left their other subjects alone, not meddling with their internal affairs so long as they paid the necessary contributions, and supplied men and ships for their wars. Most of the other peoples in the west of Asia Minor submitted without much resistance, except the freedom-loving Lycians. Driven into Xanthus, the capital, they perished in a body rather than surrender.⁵ Some Carian cities also defended themselves stoutly. Thus

may have given a Persian here and there an inkling even then that the little peoples on the western sea were, after all, harder to manage than the nations of slaves in the interior of Asia. Sardis became and remained the mainstay of the Persian rule in western Asia Minor. The governorship was one of the most influential posts in the empire, and the governor seems to have exercised a certain supremacy over some neighbouring governorships.

Though Cyrus had made, and continued to make, con-Babylon quests in the interior of Asia, he was still without the true⁶ capital of Asia, Babylon, the seat of primeval civilization, together with the rich country in which it lay, and the wide districts of Mesopotamia,⁷ Syria, and the borderlands over which it ruled. Now that we know the two Babylonian memorials mentioned above we can dispense with most of the various, often very fabulous, accounts which Greek writers give of the conquest of Babylon, but when these documents are rightly understood the divergence between them and the account of Berossus⁸ is, on the main points, not very great. Before the capture of the city, in the summer of 539, a great battle took place, in consequence of which Cyrus occupied the capital without any further serious fighting, since the Babylonian troops had mutined against their king. Late in the autumn of 539⁹ Cyrus marched into Babylon, Nabunaid, the king, having previously surrendered himself. According to Berossus, Cyrus appointed Nabunaid governor of Carmania, east of Persia¹⁰, but in the annals inscribed on the tablet it is said to be recorded that Nabunaid died when the city was taken. If both memorials represent Cyrus as a pious worshipper of the Babylonian gods, if, according to the cylinder, the Babylonian god Merodach, wrath with the king of Babylon because he had not served him aright, actually himself led and guided Cyrus, such a piece of priestly diplomacy ought not to impose on any student of history. The priests turned to the rising sun, whether they had been on good or bad terms with Nabunaid. Cyrus certainly did not put down the Babylonian worship, as the Hebrew prophets expected; he must even have been impressed by the magnificence of the service in the richest city of the world, and by the vast antiquity of the rites. But he was no more an adherent of the Babylonian religion, because the priests said he was, than Cambyses and the Roman emperors were worshippers of the Egyptian gods, because Egyptian monuments represent them as doing reverence to the gods exactly in the style of Egyptian kings. Sayce doubts whether Cyrus could read their documents; we doubt whether Cyrus understood their language at all, and regard it as inconceivable that he learned their complicated writing, indeed, on the strength of all analogies, we may regard it as scarcely probable that he could read and write at all.¹¹ The countries subject to

⁶ We always use "Mesopotamia" in the sense in which alone this geographical conception ought to be used, viz. as equivalent to the Arabic *Jazira*, i.e., to denote the cultivated land between the middle Euphrates and the Tigris, which is separated by the Mesopotamian desert from the totally different *Irak* (Babylonia).

⁷ In Josephus, *c. Ap.*, i. 20. On many particular points in these memorials the Assyriologists themselves hold different opinions; but the part which concerns us most seems to be free from doubt.

⁸ On 3d Mithraevia, which month corresponds nearly to our November. The year which begins with 5th January 538 B.C. is the astronomical epoch, the first year of Cyrus as king of Babylon. If as the strict rule requires, we make the small remainder of the year after the taking of the city to be the first year of Cyrus's reign, then the events in the text fall in 538. But probably the remainder of the year was not reckoned in, and for this there are analogies. (See below.)

⁹ This statement is further supported by that of Abydenus, doubtless taken from Berossus, that Darius drove Nabunaid out of Carmania (*Staub, Chron.*, p. 41). This is certainly not an invention. At the most, the former king of Babylon might have been confounded with another Babylonian prince.

¹⁰ Even the comparatively simple Pesian cuneiform writing was certainly always the secret of a few; otherwise it could not have

¹ See Nicolaus Dam., 67 (apparently put together from Herodotus and Xanthus).

² *Mém. de l'Inst. Arch.*, i. 54.

³ Croesus's good repute amongst the Greeks of the mainland (see *Prin. d'Art.*, i. 134 [94]) was due to his liberality to the Delphians. Even 400 years afterwards the Delphians appealed to their old friendship with the people of Sardis (i.e., with Croesus). *Bulletin de corresp. hellénique*, v. 333, 339 sq. That Croesus could also be inhuman enough is shown by Herod., i. 82.

⁴ About 500 years later the inhabitants of Xanthus followed their example in the struggle with that champion of freedom, Brutus

Babylon seem to have submitted without resistance to the Persians. The fortress of Gaza alone, in the land of the Philistines, perhaps defended itself for a time¹. On the other hand, the Phœnician cities, some of which offered a sturdy resistance to other conquerors, submitted immediately, and remained steadily obedient to the Persians down almost to the end of the empire. It seems, however, that, as the real prop of the naval power of Persia, they were almost always treated with special consideration by the latter. In the very first year of his reign in Babylon² (538) Cyrus gave the Jewish exiles in Babylon leave to return home (3 Chron. xxxvi. 22 sq. = Ezra: 1 sq.). Comparatively few availed themselves of this permission, but these few formed the starting-point of a development which has been of infinite importance for the history of the world.

Cyrus's
away. How far to the east Cyrus extended his dominion we do not know, but it is probable that all the countries to the east which are mentioned in the older inscriptions of Darius as in subjection or rebellion were already subject in the time of Cyrus. In this case Chorasma (Khârezm, the modern Khiva) and Sogdiana (Samarkand and Bokhâta) belonged to him. Agreeably with this, Alexander found a city of Cyrus (Cyropolis)³ on the Jaxartes, in the neighbourhood of the modern Khôkand. He doubtless ruled also over large portions of the modern Afghanistan, though it is hardly likely that he ever made his way into the land of the Indus. The story of his unsuccessful march on India⁴ seems to have been invented by way of contrast to Alexander's fortunate expedition.

Death of
Cyrus Different accounts of Cyrus's death were early current. Herodotus gives the well-known diadematic story of the battle with Tomyris, queen of the Massagete, as the most probable of many which were told. If we accept Herodotus's statements, we must look for the Massagete beyond the Jaxartes. In Ctesias Cyrus is mortally wounded in battle with the Derbices, who probably dwelt near the middle or upper Oxus. A fragment of Berossus⁵ says that Cyrus fell in the land of the Dai (Dahs), i.e., in the modern Tukuman desert, perhaps in the southern or south-western portion of it; this account may very well be derived from contemporary Babylonian records. Be that as it may, Cyrus met his death in battle with a savage tribe of the north-east. The battle was probably lost, but the Persians rescued his body, which was buried at Pasargadae in the ancient land of his race. To this day there is to be seen at Murghâb, north of Persepolis (on the telegraph line from Abûshehr to Teherân), the empty tomb and other remains of the great mausoleum, which Aristobolus, a companion of Alexander, described from his own observation⁶, and on some pillars there the inscription is to be read: "I am Cyrus, the king, the Achememen." Till lately the same inscription was also to be found high on the pillar which bears in bas-relief a winged figure of a king. This figure is furnished with a "pschent," i.e., such an ornamented crown as is worn by kings and gods on Egyptian monuments.⁷ This was no

happened that, e.g., the Behistûn inscriptions of Darius should have been described to Ctesias as those of Semiramis (Diod., i. 18).

¹ According to the conjecture of Valerius in Polyb., xvi. 40, *ῥῆς Ἡεράρας*, which, though not absolutely certain, is still the best emendation of the passage.

² This statement goes to show that the small remainder of the year after the taking of Babylon was not reckoned in Cyrus's first year. For he had at that time something more to do than to trouble himself straightway about the Israelites.

³ Arrian, iv. 2 sq.; Curtius, vii. 6, 16, vi. 6, 20; Strabo, 617, Ptol., vi. 12; Steph. Byz., Phil., vi. 49; Solinus, xlix. 4.

⁴ Nearchus, in Arrian, vi. 24, 2, Strabo, 636, 742.

⁵ Bœsch, Chron., p. 23.

⁶ See Strabo, 730, Arrian, vi. 29, 4 sq.

⁷ See the copies in the great works of Texier and of Flandin and Coste. The most exact representations are those from photographs in Stolze, *Persepolis* (Berlin, 1832), tab. 128 sq., 132 sq. The proof that this is really the grave of Cyrus is given in Stolze's Introduction, as

doubt meant by Cambyzes as a special mark of honour to his father, whose monument must have required years to finish. It is quite natural that the ancient art of Egypt should have made a deep impression even upon those of its conquerors who in other respects had little liking for Egyptian ways.

If one could accept without question the judgment of the Hs. Persians as recorded by Herodotus (ii. 89, 160), expanded character. by Xenophon, and repeated by later writers (from Plato downwards), Cyrus must have been the most perfect model of a ruler. But we must view with great suspicion a tribute of praise like this paid to the founder of an empire by those who reaped the fruits of his labours. The founder of the Sâsânian empire is also described as a paragon of wisdom and virtue, though his deeds strikingly belie such an estimate. We must be content to know that we are no better informed about the character of many other great men of the past than about that of Cyrus. That he was a very remarkable man and a great king is a matter of course. Whether he deserves the reputation of a great statesman, which even in modern times has been accorded to him, we cannot say. Certain it is he left the empire still in a very unformed condition. To expend the immense treasures of Ecbatana, Sardis, and Babylon for the benefit of the empire was to be sure an idea which certainly would never have entered into the head of any Eastern conqueror. The treasures simply became the property of the king, though of course a large part went to the leading Persians and Medes who filled the most important offices.

Cyrus died in the beginning of the year 529. He left behind him two sons, Smerdis (Persian *Bardiya*) and Cambyzes (*Kambuyiya*), their common mother was according to Herodotus an Achememen, according to Ctesias the daughter of the Median king. The great inscription of Darius states that Cambyzes caused Smerdis to be put to death without the people being aware of it. From this it follows that the partition of the kingdom between the two brothers, of which Ctesias speaks, can hardly have taken place, for the murder of a king or consort could not have remained concealed. Besides, in both the Babylonian inscriptions, of which mention has been frequently made, Cambyzes is spoken of in a way which distinctly shows him to have been heir-apparent. This fratricide, the true motives of which we do not know, was the forerunner of many similar horrors in the dynasty. The inscription proves, as against Herodotus, that the deed was done before the expedition to Egypt. Nothing else is told us about the earlier part of the reign of Cambyzes. It is only when we come to his conquest of Egypt that we have more exact information. The pretex-^{of Egypt.}ts for the Egyptian war need not detain us. The riches of Egypt had from of old attracted the lords of the neighbouring lands, and Herodotus takes it for a matter of course that Cyrus had occupied himself with plans against Egypt. According to the statements of Manetho⁸ and of the Egyptian monuments, the conquest of Egypt took place in the spring of 525. vast warlike preparations preceded the expedition. The Greeks of Asia Minor, the Cyprians, who had just submitted, and the Phœnicians had to furnish the fleet. A countryman of Herodotus, the mercenary captain Phanes of Halicarnassus, deserted from the Egyptians to the

well as in his paper in the *Verhandl. der Gesellschaft für Erdkunde zu Berlin*, 1838, Nos. 5 and 6 (p. 19 sq. of the separate edition).

⁸ So Herodotus (the name being assimilated to a genuine Greek name Smerdis, Smerdes). Aeschyl., *Pers.* 774, has Mardos, Justin, i. 9, 9 sq., Mergas, the scholium on Aesch., l. c., Merdas.

⁹ See Wiedemann, *Geschichte Ägyptens von Psammethich I. bis auf Alexander den Grossen*, v. 218 sq.; comp. too Diod., i. 68. For what follows, and for all that concerns the relations between Egypt and Persia, the work of Wiedemann is to be consulted. At the same time the assumption of the year 525 as the date of the conquest is open to some objections; there are many arguments in favour of 527.

525-521. Persians and made himself very useful in the conquest. It seems that only one great battle was fought, at Pelusium, the gateway of Egypt. The Egyptians, utterly beaten, fled to Memphis, which soon fell into the enemy's hands. Thus Egypt became a province of Persia, and a pretext was soon found for executing the captured king Psammetichus. This was followed by the submission of the neighbouring Libyans and the princes of the Greek cities of Cyrene and Barca. The peculiar religious feelings of the Egyptians were almost as easily wounded as those of the Jews were in later times. The Persians, flushed with victory, recked little of Egyptian wisdom or folly, least of all recked the brutal king. It is true that even Egyptian inscriptions represent him as a pious worshipper of the Egyptian gods, but this is only the courtly ecclesiastical style, which the Egyptians, partly from servility, partly from long habit, can never drop. And, even if Cambyses did once in a way gratify a pious Egyptian, *et*, by ordering his troops to quit a temple which they had occupied as a barrack, no great importance is to be attached to the fact. No doubt the Egyptian priests grossly exaggerated the king's wickednesses, but enough remains after all deductions. The dreadful hate which again and again goaded the naturally patient and slavish nation into revolt against the Persians dates from this time, Darius could not atone for the guilt of Cambyses. The brutality of the latter began with maltreating and burning the mummy of the former king Amasis, who had personally insulted him or his father, to the Persians, as Herodotus expressly says, the burning of the body was no less an impiety than to the Egyptians. From Egypt he sent an expedition to the shrine of Ammon in the Libyan Desert, but, caught presumably in a snare, it was never heard of again. He led in person a great expedition to Nubia ("Æthiopia"). It does not seem to have been such an utter failure as one might at first infer from Herodotus's narrative, for some districts to the south of Egypt were conquered, but the results purchased by hecatombs of men who perished by fatigue or were buried in the sands were far from contenting the king. Returning to Memphis, he found the people exulting over the discovery of a new Apis. Their joy did not fall in with his mood. In a fury, or perhaps out of a tyrant's caprice, he inflicted with his own hand a mortal wound on the sacred steer and instituted a massacre among its worshippers. We may well believe Herodotus that from that time his barbarity to the Egyptians showed itself in ever darker colours. He spared not even the Persians. Ctesias too calls him bloodthirsty. Added to this was his drunkenness. But his marriage with one or two sisters, at which Herodotus takes offence, was really, according to Persian notions, an act of piety.¹ Similarly, when he put to death a corrupt judge of the highest family and caused his skin to be made into a covering for the seat on which his son was to sit and administer justice, the act was one which all Orientals recognized as truly kingly (Herod., v. 25).

The empire was extended in another direction, when Polydates, the powerful tyrant of Samos and the neighbouring islands, sought safety in submission to the great king.

The false Smerdis

Suddenly, however, the empire rang with the news that the king's brother Smerdis had seized the crown in Persia. We are now in possession of Darius's own account of these events, and can fairly dispense with the Greek narratives, but we may note that here again, in spite of his poetical colouring, Herodotus stands the test much better than Ctesias.² Gaumátas (in Ionic form *Gōmātes*, Justin, i. 9), a

Magian, gave himself out as Smerdis (spring of 522) and formally assumed the government. Even Darius's account lets us see that Cambyses was very unpopular, and the same thing appears from the fact that everybody sided with the new king. Cambyses seems to have marched against him as far as Syria, but there he put an end to himself,—an end plainly affirmed by the great inscription, and quite in keeping with the wildly passionate nature of the man. Gaumátas reigned, universally acknowledged, and, as it seems, beloved, because he granted extensive remissions of taxes. He appeared in the character of Smerdis, son of Cyrus, and therefore as Persian king. This is enough to show that there can be here no question of a political opposition of the Medes to the Persians, such as Herodotus imagines, nor yet of a religious opposition to the Persians by the Magians. The changes for the worse now introduced, and abolished again by Darius when he ascended the throne,³ seem to imply no more than a very intelligible disregard of the leading Persian families, whom Gaumátas could not but fear, since they knew much better than the people that he was an impostor. He fell, not through the patriotic indignation of the Persian people, but through the enmity of these families. Seven persons conspired against him, their names, each with that of his father, are given by Darius in full agreement with Herodotus, while the list of Ctesias presents somewhat more divergence.⁴ No doubt they were members of the seven most illustrious houses, but certainly not the actual heads of these houses; for such a life-and-death enterprise, where all depended upon energy and silence, could not be entrusted to persons who happened to be heads of families and some of them perhaps old men. Moreover, Darius himself, who was undoubtedly from the outset the real leader, was certainly not the head of his house, for his father Hystaspes (Vishtāspa) was still alive and in full vigour, since he afterwards governed a province and fought the rebels. But the ring-leaders would choose one out of each of the seven families in order to commit the families themselves. The conspiracy was completely successful; and the seven killed Gaumátas in the fortress Sikathahuvasti near Ecbatana, in the land of Nisa in Media. This happened in the beginning of 521. Darius was then made king. He was probably the only one of the seven who was qualified to be so, for he alone belonged to the royal family, of which, it is true, there may have been many members more nearly related to Cambyses. At any rate there was hardly another candidate for the crown as able as he.

Darius (*Dārayavahus*, in the nominative *Dārayavahush*) Darius I. was then, according to Herodotus (i. 209), about thirty years of age. Amongst other measures for securing himself and adding to his dignity he took to wife Atossa, daughter of Cyrus, who had already been married to her brother Cambyses and to the false Smerdis. He soon showed that his six comrades were not his peers by executing Intaphernes, who had forgotten the respect due to the king, together with his whole family. That at first his seat on the throne was far from firm is intimated by Herodotus (iii. 127), who also mentions cursorily an insurrection of the Medes against him (i. 130), but it is only from the king's great inscription that we learn the gigantic nature of the task he undertook when he ascended the throne.

He had first to unite the empire again, one province after another was in insurrection; the west alone remained quiet, but it was partly in the hands of governors of pro-

vinces.

¹ Unfortunately in this interesting passage of the great Behistūn inscription the particulars are a very obscure.

² In Ctesias the name of a son is twice given for that of the father. It is obvious that we are here dealing with the ancestors of the seven great families, and one generation could very easily be named by mistake for another.

³ Herodotus's Persian informants told him much of the real or pretended virtues of their people, but concealed things which would have offended him.

⁴ Small remains of another ancient and trustworthy account are to be found in Justin.

doubtful loyalty. Darius gives the day of the month for the most important events, but unfortunately not the year. Moreover, in consequence of the mutilation of the Babylonian text it is only of some of the Persian months that we can say with certainty to what parts of the year they roughly correspond.¹ Thus the particular chronology of these insurrections remains in many points quite uncertain, especially as it can be seen that many events narrated as successive were contemporaneous. In any case Darius acted very energetically and promptly; and the chief provinces were undoubtedly again reduced to subjection in the first three years of his reign. The insurrection of Aithra in Susiana was promptly suppressed by a Persian army. More dangerous was the revolt in Babylon of Nidintubel (*Nadintabara*), a real or pretended member of the Babylonian royal house who assumed the august name of Nabukadrezzar (Nebuchadnezzar). Darius hastened thither and defeated him in several battles. But the long siege after which, according to Herodotus, the rebel city fell into the hands of Darius, cannot have taken place then.² While Darius was in Babylon a whole series of revolts broke out. That of Martiya in Susiana, who called himself Imani, and appeared in the character of king of that country, was indeed soon put down with the help of the people of Susiana themselves, but in Media, the heart of the monarchy, the situation was much more grave. Phraortes (*Fravarte*), who gave himself out to be a scion of the old royal house of Media, was made king of Media, and the Pathians and Hyrcanians to the eastward, whose satrap was Hystaspes, father of Darius, sided with him. The king's generals could effect nothing decisive against Phraortes, at last he was overthrown by the king in person. Like all rebels who deduced their descent rightly or wrongly from the old dynasties, he was put to death with circumstances of especial cruelty. In the meantime one of Darius's generals had put down a second false Nebuchadnezzar in Babylon; others had to suppress insurrections in two regions of Armenia, which were, perhaps, connected with the revolt of Phraortes, and a rising in the distant Margiana (the district of Merv). Even Persis had risen. Another false Smerdis, Vahyazdāta, appeared in the east while Darius was in Babylon, and crowds flocked to him. His power increased so much that he was even able to send an army to Arachosia (a part of western Afghanistan). While Darius in person took the field against Phraortes, he despatched against Vahyazdāta a general who at last overthrew the rebel. Arachosia, too, was reduced to subjection. So, too, was the nomad tribe of the Sagartii (perhaps on the northern or north-eastern frontier of Persis), with Chitratahma at their head, who also claimed to be of the royal house of Media. Afterwards Gobryas (*Gaubriva*), one of the seven, suppressed a third revolt in Persis. The king in person reconquered the Saca, who had been in subjection before. The generals employed by Darius were Persians and Medes, but there was one Armenian among them. His faithful army was composed of Persians and Medes, but his adversaries were also supported in part by Persians and Medes. Darius must have been a great ruler to conquer them all. Picture his position when he took

the field against Phraortes, Babylonia was his once more, 521-515 and its wealth must have supplied him with the means of war, but almost the whole of Iran and Armenia was in the hands of men whom he calls rebels and hars, but some of whom, at least, had perhaps more right than he to the sovereignty, and whose people were devoted to them. No sooner had he reached Media than Babylon was again in arms. Nothing but great energy and circumspection could have carried him safely through all his difficulties.

The satrap of Sais, Orestes, had not revolted, but his conduct was that of an independent prince. Him Darius put out of the way by stratagem (Herod., iii. 120 *sq.*). At the same time Samos became definitively a Persian province, after a royal army had, with much bloodshed, set up as tyrant Syloson, brother of Polycrates, whom Orestes had put to death. The removal of Aryandes, governor of Egypt, who assumed, even at that date, the royal privilege of minting money, seems to have followed not long afterwards.³ He had extended his power westwards. But we see from Herodotus that to the west of the last mouth of the Nile the Persian rule was always precarious, and that he can have conquered Carthage, whose naval power was perhaps a match for that of the whole Persian empire, is quite incredible. At the most it is possible that the prudent leaders of that commercial state may in negotiations and treaties have occasionally recognized the king in ambiguous phrases as their lord.

The experience gained by Darius in the first unsettled years of his reign must have been in part the occasion of his introducing numerous improvements into the organization of the empire. Governors with the title of satraps (*kshatrapāva*, i. e. land-rulers) there had been before, but Darius determined their rights and duties. Vassal princes of dangerous power were tolerated only with reluctance. The satrap had indeed the power and splendour of a king, but he was nevertheless under regular control. The court received from special officials direct reports of the conduct of the governors, and from time to time royal commissioners appeared with troops to hold an inspection. The satrap commanded the army of his province, but the fortresses he was obliged to leave in the hands of troops directly under the king. But the most important part of the reform was that Darius regulated the taxes and imposed a fixed sum upon each province, with the exception of the land of his fathers, which enjoyed immunity. The Persians were discontented at this, and dubbed Darius in consequence "higgler" (*κάρηλος*); but this is doubtless only the cry of high officials, to whom any regulated fiscal system was objectionable, as making it somewhat more difficult for them to fleece their subordinates. It is not at all to be supposed that the irregular contributions ("*presentes*," Herod., iii. 89) previously levied were less burdensome to the subjects. However imperfect the Persian state system was, and however illusory the measures of control may often have been, still the organization introduced by Darius marks a great step in advance over the thoroughly rude old Asiatic system.

In the Behistūn inscription, which is placed not long after the conclusion of the great revolts, India does not yet appear as a province, though it does in the later inscriptions of Persepolis, and in the epitaph of Darius. Herodotus says that Darius caused the Indus to be explored from the land of the Pactyans (Pakhtu, Afghans) to its mouth by Scylax, a Greek or rather Carian, and then conquered the country. But in any case this Persian "India" was only one portion of the region of the Indus. If this conquest was somewhat adventurous, much more so was

¹ The obvious assumption that the strange name *Anāmaka*, i. e., "anonymous," for a month means an intercalary month would compel us to infer that all the events falling in this month belonged to one and the same year, for two successive years or even any other year cannot each have an intercalary month. But a careful consideration of the particulars shows that all these events could not fall in the same year. Another obstacle to regarding *Anāmaka* as an intercalary month is the circumstance that it corresponds to the tenth Ptolemaic month, Tethi, i. e., probably to December or January, whereas intercalary months usually follow the twelfth or eighth month.

² See below under *Xeixes*.

³ Polygus, vi. 10, 7, calls him Oryndres.

⁴ Wiedemann, *op. cit.* p. 226, fixes as the date the year 517; but his grounds are not conclusive.

515-500 the enterprise against the Scythians. Profound motives for this expedition have been sought for, but it is no doubt spring simply from the longing to conquer unknown lands. That Darius, an energetic and valiant Eastern prince, always hitherto favoured by fortune, should have been hie from lust of conquest is in itself very unlikely. The expedition against the Scythians falls about 515. With regard to the preparations and the beginning of the expedition up to the crossing of the Danube we are well informed. The Greek subjects, of whom even by this time there were many on the European (Thracian) side—such as the inhabitants of Byzantium and the Thracian Chersonese—were obliged to supply the fleet. Mandrocles of Samos built a bridge over the Bosphorus. The Persians must soon have found how useful the skill of the Greeks might be to them, without suspecting the dangers with which the Greek spirit threatened them. The king's march may be followed as far as the Danube, it lay pretty nearly due north, the varlike Getae, a Thracian people, being subdued on the way. With the entry into the Scythian country itself Herodotus's narrative becomes completely fabulous. His chief error is in leaving out of sight the enormous distances in these regions (the southern part of modern Russia) and the great rivers. Hence he represents the native tribes and Darius as marching the distance between the Danube and the Don, or even the Volga, twice in not more than two months, as if the distances were as in Greece. Darius, who passed the Danube by a bridge in the neighbourhood, perhaps, of Isakchi, can hardly have crossed even the Dniester. Stubo, who either possessed more exact accounts of the expedition, or drew correct inferences from the disaster which afterwards overtook King Lysimachus in this neighbourhood, forms a very intelligent judgment on these matters. The expedition failed, not through the superior tactics of the Scythians, who behaved just as might be expected of such nomads, with a mixture of timidity and audacious greed of booty, but through the impassable and inhospitable nature of the country, through hunger and thirst, through exhaustion and disease. After sustaining heavy losses Darius was obliged to retreat across the Danube. The king, or at all events his army, was saved by the Greek tyrants, especially Histæus of Miletus, who refused to follow the advice of their colleague Mitiades to break down the bridge. But the damage to the prestige of the empire was great; the Greeks had seen their lord and master in distress. Nevertheless the district south of the Danube was retained. That the Scythians immediately followed up their enemy, or that they even opened negotiations with the Spartans, as Herodotus states,¹ is not to be supposed. Moreover, Megabyzus, whom Darius on his return left behind in Europe, subdued great districts of Thrace along with the Greek cities on the coast. The king of Macedonia also acknowledged the great king as his liege lord. The cities on the Hellespont,² which after the failure of the expedition made no secret of their feeling towards the Persians, and in part expressed their hostility in overt acts against them, received sharp punishment. The islands of Lemnos and Imbros were occupied. At the mouth of the Hebrus (Maritza) Doriscus was converted into a fortress with a standing garrison.³

The eyes of the Persians were now turned towards Persian Greece proper. While the Greek coast of Asia Minor was indispensable to the power which held the interior, the possession of the mother-country of Hellas was, as we can easily see, not only unnecessary but positively dangerous to the Persians, especially as they were themselves absolutely unfitted for the sea. But to the Persians of those days, absorbed in schemes of universal empire, considerations such as these could not present themselves. Besides, the enterprises of the Persians against the Greeks were to a large extent suggested and furthered by the Greeks themselves. Repressed factions, tyrants in exile or in danger, were but too ready to invoke the help of the foreigner at the price of slavery. When the Persians attacked a Greek state there was always another at enmity with it which at once took their side. Even the inconsiderable enterprise which was the outward occasion of the Ionian revolt, namely, the attack of the Persians on Naxos, was brought about by the banished aristocrats of the island, who applied to Aristagoras, lord of Miletus, and hence to his superior, Artaphernes, the king's brother and satrap of Sardis. The enterprise failed, and in his embarrassment Aristagoras gave the signal for the revolt which he and his father-in-law Histæus, the proper tyrant of Miletus, who was detained at the court of Susa, had planned long before.

The great rising of the Ionians and other Greeks and Revolt of non-Greeks shows a vigorous love of freedom, and much Ionian individual boldness and skill on the side of the insurgents; but, quite apart from the vast odds against them and the unfavourableness of their geographical situation, their enterprise was from the outset doomed to failure, because they did not form a compact party, because not even the Ionian cities practised that discipline and subordination which for war are indispensable, and lastly because Aristagoras and Histæus were adventurous intriguers and tyrants, but without the gifts of rulers or generals. Of the history of the revolt, in addition to the excellent accounts which he derived from Histæus of Miletus, a contemporary and actor in the events he describes, Herodotus has all sorts of popular fables to tell. The chronology is uncertain, probably the revolt began in 500 or 499, and was substantially ended by the capture of Miletus in 495 or 494 (six years later, Herod., vi. 18). Aristagoras made himself master of the fleet on its return from Naxos, took prisoner the tyrants on board at the head of the contingents of their cities, and restored the republic in Miletus, only of course with the view of thereby ruling the confederacy. The Spartans, admittedly at that time the first power of Greece, were sober enough to refuse the help requested. But the Athenians, who had already exalted the wrath of the Persians by refusing to comply with the demand of Artaphernes that they should receive back Hippias as tyrant, had the courage or rather the foolishness to despatch twenty ships to the help of the Ionians. They thus mortally insulted the Persians without really benefiting their friends. The Athenians shared in the march on Sardis. The confederates burned the city, but could not capture the citadel; on the contrary, they were obliged to beat a hasty retreat, and were after all routed at Ephesus. However, the Persian army did not as yet permanently take up quarters in Ephesus. The Athenians, who may have dreamed of pressing forward into the interior of Asia, returned home with their illusion dispelled, and Athens took no further part in the war. But the impression produced by this unsuccessful expedition upon a modern critic is very different from that which it produced upon the Asiatics of those times. They said: "The Ionians have risen against the king; the Ionians from beyond the sea have come to their help; they have

¹ The story of the dealings of King Cleomenes with the Scythians (Herod., vi. 84) rests on a joke,—he drank immoderately, "like a Scythian."

² This expression is used to designate the towns lying on the Hellespont, Propontis, and Bosphorus.

³ To the same time may be referred the foundation on the Asiatic side of Dauenm, named after Darius, just as Harpagum probably has its name from Harpagus. It is to be observed that in the district of Old Phrygia such towns called after persons are found from of old, as Melæum, Gerdæum, Dascyrium, and others.

burned the king's capital," and many added, "It is all over with the king's supremacy!" Not only did the Hellenistic cities, with Byzantium at their head, join the Ionians, but also a great part of the Carians, the Greeks in the Troad, and almost the whole of the very flourishing island of Cyprus. By this time the possession of these lands was really endangered by the revolt. But now the Persians came with a great fleet to Cyprus. The Ionians sailed to meet them, beat them at sea off Salamis in Cyprus, but were beaten by the Persians on land. After great struggles, which are described in an almost epic style, befitting the primitive state of the island, Cyprus came once more under the power of the Persians, after being free only one year. This was the first heavy blow to the insurrection. Much fighting took place on the mainland, and most of the Persian enterprises were successful, but not all. In particular the Carians, who in general displayed great gallantry in this war, annihilated a whole Persian army under a son-in-law of Darius. But the longer the war lasted, the more marked became the progress made by the Persians. Aristagoras led the seat of war, and withdrew to his possessions of Myrcinus on the Lake of Prasias in the south of Thrace, near what was afterwards Amphipolis, but was there slain by natives as early as 497.¹ Darius then despatched Histæus, whom he still continued to believe faithful, to Ionia, probably in order to open negotiations. He availed himself of the opportunity to seek to regain the lordship of Miletus and put himself at the head of the whole revolt, but the Milesians would have nothing more to do with him or with Aristagoras. The great intriguer had connexions on all sides, but no one trusted him in the long run. He became at last a pirate on his own account, and after many adventures he fell into the hands of the Persians and was crucified. It is a noteworthy fact that Histæus had actually conceived a conspiracy with the Persians in Sardis, against Artabernes and Darius, the discovery of which cost many their head. Fidelity has never been an Iranian virtue.

The decisive struggle was concentrated about Miletus. There, at the little island of Lade, as Grote points out, the odds against the Greek fleet (600 triremes against 353) were not so unfavourable as they were at Salamis, and the want of unity of leadership was not much greater than it was there, but the Ionians and Lesbians were not, or were no longer, the equals of the European Greeks in bravery and warlike skill. A complete overthrow was the result, in which treachery on the Greek side had its share. Miletus long defended itself by sea and land, but was at last taken and destroyed, the women and children were sold as slaves. The captured Milesians were carried off into the heart of Asia and settled at Susa. Miletus, up to that time by far the most important of all Greek cities in Asia, though it afterwards recovered, still never regained its old position. The most important city of the coast was henceforward Ephesus, which took no part in the battle of Lade, and perhaps had at that time already submitted amicably to the Persians.

The subjugation of the rest of the Greeks of the mainland and islands, as well as of the Carians, now rapidly followed, not without dreadful massacres and devastations. The Phœnicians, who formed the main body of the Persian fleet, seem to have been especially zealous in the work of destruction. The old bitterness between the Cæneans and the Hellenes, so vividly shown during these centuries in Sicily, cannot have died out in the east. In ruined Ionia a frightful state of things must have prevailed, so that at last Artabernes saw himself obliged to undertake a regular organization to ensure the peace of the country. At

the same time he caused the land to be surveyed, and established fixed imposts.² These were not higher than before the war, but naturally they now pressed much harder on the impoverished Ionians. Thereupon the young Mardonius, son of the Gobryas who has been mentioned before, and brother-in-law and son-in-law of the king, established demoiarchies in all Ionian cities. The weakened communities might well seem to the Persians at that time less dangerous than ambitious tyrants. However, this measure apparently applied only to the Ionians of the mainland, not to the islanders nor to the other Greeks of the mainland.

Mardonius cherished great designs. He wished to conquer Greece itself. He did actually conquer Greeks and non-Greeks in the north-west of the Archipelago, but at the promontory of Athos his fleet was shattered by a storm.

The second expedition against Greece was on a greater scale. Under the conduct of the Mede Datis and the younger Artabernes, son of Darius's brother of the same name, the Persians took Naxos, and destroyed Eretria in Eubœa, the inhabitants of which had sent five ships to help the Ionians at the beginning of the revolt. But at Marathon they were utterly defeated by the Athenians and Plataeans (September or October 490). They quickly renounced the project of subjecting Athens to Hippias as tyrant and to Darius as suzerain, and departed home. Miltiades, who, as lord of the Thracian Chersonese, had once been the king's vassal and had afterwards been obliged to fly, had taken the measure of the Persian. By his victory Athens had rendered immortal service to Europe and the cause of civilization. It was the first great victory of the Greeks over the Persians in the open field, the moral impression had an immense effect in the sequel, when the danger was much greater.

The south-west of the empire alone had hitherto remained free from rebellion against Darius. Darius, who had been with Cambyses in Egypt (Herod., vi. 139), treated the Egyptians with forbearance, and in return royal priests praised him to fellow-countrymen and Greeks. If a notice of Polyseus is to be trusted, he must have gone in person to Egypt in the year 517,³ in order to lighten the burdens of the people. Amongst other measures which promoted the material wellbeing of the land, he made a canal from the Nile to the Red Sea, as an inscription of the king himself testifies to this day. But the hatred of the Egyptians to the Persians was too great. In the year 486 (Herod., vii. 1, 4) the first great insurrection of the Egyptians against the Persians took place. From an inscription we know that during it Khabbash or Khabash was king of Egypt. Darius did not live to see the revolt put down, for he died in the following year, 485.

Darius is the most remarkable king of the dynasty of Darius's the Achæmenians, and perhaps the most remarkable of all the native kings of Iran. So far as we know, only the Sôsmâd Khosrau I. in the 6th and the Safavid Abbas the Great in the 17th century A.D. can be compared with him. He was as energetic as he was prudent. He was of course a despot, and could be ruthless and even cruel, but on the whole he was inclined to be mild. We lay special weight on the testimony of Æschylus, who had himself fought at Marathon against the army of Darius, and who shared the exasperation of the Athenians against the Persians, but nevertheless in his *Persæ* expresses very high respect for the king. This, then, was the judgment of educated Greeks on the prince who had brought such untold misery upon their nation. To such a judgment great weight is to be attached. In harmony with it are the particulars which we know of the doings and ori-

³ See Wiedemann, *op. cit.*, p. 237.

485-479 nances, of Darius. He seems, too, to have shown a correct insight in his choice of the persons to whom he entrusted important positions.

Xerxes I. He was succeeded, apparently without any disturbance, by his son Xerxes (*Khsayarša*) I, who, as son of Atossa, eldest daughter of Cyrus, had probably always been regarded as heir-apparent.¹ The time was not yet come when claimants to the throne and suspects were assassinated. On the contrary, the king's blood-relations played under Xerxes as under Darius a great rôle as leaders and counsellors. But the whole generation was probably deeply degenerate, though the difference could hardly anywhere have been so great as that between Darius and Xerxes, who begins the series of weak and unworthy kings.

The subjugation of Egypt was effected in 484 (Herod., vii. 7). The measures taken by Khabbash to protect the mouths of the Nile against the "fleet of the Asiatics" had thus been unsuccessful. According to Herodotus a much harder yoke was laid on Egypt than before. The king's own brother Achemenes was made satrap of the country.

Babylon too seems to have again risen in revolt. Ctesias assigns to this date the revolt with which the well-known story of Zopyrus² is connected, naming instead of Zopyrus his son Megabyzus. The long siege of which Herodotus speaks does not, as we saw, fit in with the revolt under Darius, it belongs, perhaps, to the time of Xerxes. Ctesias gives us to understand that Xerxes wounded the religious feelings of the Babylonians, and Herodotus speaks expressly of the desecration of their sanctuaries by the same king (i. 183). To the victorious Macedonians, who emphatically asserted that they were come to avenge the destruction of Greek temples by Xerxes, the Babylonian priests afterwards told many tales of the outrages he perpetrated on their sanctuaries.³ Doubtless they grossly exaggerated, but they did not invent everything. Of course such sacrileges may equally well have taken place when the city was reconquered, or have been the occasion of a revolt.

Invasion of Greece. Darius was firmly resolved to wipe out the disgrace of Marathon, and to bring the whole of Greece under the yoke. His mighty preparations for the march thither had been interrupted by the revolt of Egypt, and, if our conjecture is right, of Babylon. They were now vigorously recommenced, and provision was made for the maintenance of the army, at least within the limits of the Persian domain. Xerxes himself went to Sardis, the first great rendezvous. From there he set forward in the spring of 480. We will not further describe the great expedition, which, after the dearly-bought successes at Thermopylae and Artemisium, ended with the defeats of Salamis (September 480) and Plataea (479)—all this belongs rather to the history of Greece—but we will briefly discuss the causes which procured for the disunited and far from numerous Greeks a victory over the mighty power of the great empire. It may very well be said that it would have been possible to subdue even Hellas, and to put an uncalculable check upon the Greek spirit, if the great enterprise had been conducted with more sagacity. There was no lack of Greek traitors, nor even of traitor states, from which the king might have learned how to set about the business. But the blind arrogance of the Asiatic king was bent on bearing down everything by the sheer weight of his masses, and when he failed in this his arrogance passed at once into childish cowardice. The fleet certainly mustered over 1200 sail at the beginning of the war, and even

after the heavy losses by storms at Euboea, losses, however, which the Greeks no doubt exaggerated, it must with reinforcements have numbered fully 1000 ships of war,—a force too large to operate, at least in a single mass, in the narrow Greek seas. Moreover, it was without an able head. If the ships furnished by the Phoenicians and the subject Greeks were fairly a match for those of the free Greeks, on the other hand the Persians, Medes, and Saeae who manned the fleet as soldiers probably cut but a sorry figure, and the Persian officers associated with the native ship captains cannot have contributed to the more efficient working of these powerful engines of war. Again, the army, which in any case numbered over a million men, was far too numerous to find sufficient sustenance for any length of time, in spite of the frugal habits which mostly characterize Asiatics. To this must be added the circumstance that the levies were drawn from peoples many of whom were totally unused to the Greek climate. Famine and pestilence must have wrought dreadful havoc among the soldiers. By far the most of them were a useless rabble. Of the Asiatics proper probably only some Persian and Median regiments of guards were well armed, but even they were not to be compared, man for man, with the heavy-armed soldier-citizens of Greece. Moreover, in the use of their weapons on land the Greeks, and above all the Spartans, were far superior to all the Persians. Even the Greeks on the Persian side were no match for the Greeks of Europe; some of them fought half-heartedly, and an anxious watch was kept on them, so that they were more a hindrance than a help. If the Persians were kept well informed of the enemy's affairs by means of traitorous Greeks, much more so were the Greeks through deserters and friends in the enemy's camp. Even when the Persians were driven by necessity to take the resolution of sending back all worthless troops, and when the king had fled Greece was still in great danger, for an able man, Mar donius, now stood with the best part of the army in the heart of the country. But even with a defeat at Plataea all would not have been over, for the enemy was without his fleet. Add to all this the excellent bearing of those Greeks who remained faithful to their fatherland. Exemplary above all was the conduct of Athens, she durst not allow the laurels won at Marathon to wither. The Spartans, too, with their morbidly exaggerated sense of military honour, earned immortal renown. Even petty Greek communities like Thespiae, Tegea, and Argina came gloriously to the front. At the head of the Greeks stood many distinguished men, above all Themistocles. On the whole, we may say that here Greek intellect, Greek valour, and Greek virtue triumphed over the spiritless and helpless hordes of Asiatic slaves.

Here and there a modern⁴ has expressed the opinion that the conquest of the Greeks by the Persians would have been no such great misfortune after all, inasmuch as the intellectual superiority of the former would have asserted itself even under a foreign dominion, especially as the Persians were not regular barbarians; but this opinion is entirely false. Only in a free country could the Greek spirit fully unfold itself, only in democratic Athens could it accomplish its highest work and achieve imperishable results for all time. In the externals of civilization the Asiatics might, in some respects, be actually the superiors of the Greeks, but genuine free human culture first arose among the latter, and if there was one pride that was justified it was that of the cultivated Greeks as against all barbarians. The Greeks themselves had no inkling of the high sense in which the watchword at Salamis, "All is at stake" (*Æschyl., Pers., 405*), was applicable to the whole of human culture.

¹ In spite of the anecdote in Herod., vii. 9-4, Justin, ii. 10; Plut., *De frat. amore*, p. 488, and *Reg. ægyptiæ*, p. 178.

² This story, with all sorts of variations, is very widely spread in the East, but it can hardly rest on an historical fact.

³ *Ann.* vi. 17, 2; Strabo, 738.

⁴ *Eg., Maspero, Hist. ancienne des peuples de l'Orient*, chap. xiv.

King Xerxes had shown himself in the war a thoroughly commonplace Eastern despot, as boastful as he was effeminate. The dreadful sacrifice described by Herodotus (vii. 114) may be excused on the ground of religious superstition, but the mutilation of the corpse of Leonidas and the decapitation of the Phœnicians who commanded the fleet show the spirit of the man. His disgraceful flight must have been welcome to Mardonius. The latter fell like a man at Platæa; indeed the battle of Platæa did honour to a large part of the vanquished. Of course great masses of the vast army returned to Asia, several doubtless still in good order, but many, very many, must have perished in Greece, and in Thrace, where the savage Thracians cut off large numbers of the fugitives.

Persians
driven
back to
Asia.

The Greek fleet did not at first venture to pursue the Persians to Asia, but afterwards it crossed at the request of the Greek islanders. At the headland of Mycæ, not far from Miletus, the remainder of the Persian fleet was annihilated just about the time of the battle of Platæa. The liberation of the islands and of the greater part of the Greek cities on the coast of Thrace followed. Thrace and Macedonia regained their independence without any effort of their own. The whole of the islands were permanently wrested from the Persians, and the liberation of the Asiatic coast was already begun.

We stand here at the decisive turning-point of Persian history. Henceforward Greece might be coveted and designs against it cherished, but no enterprises were undertaken. The Persians were thrown back upon the defensive. Though they often afterwards exercised an influence on the history of Hellas by means of money or diplomacy, still the respect for their fighting power was gone, and so far it is possible to regard Alexander's expedition as a result and continuation of the old struggles, and the saying of Æschylus, "In Salamis the power of the Persians lies buried," may be called prophetic.¹

Xerxes was still in Sardis when his full brother Masistes came thither with the beaten forces from Mycæ. Disquieted probably by the neighbourhood of the victors, the king retired into the depths of Asia. About the same time he deeply offended Masistes on a point of family honour; in revenge Masistes intended to go to his province of Bactria and there raise a revolt, but was cut down by horsemen despatched after him (Herod., vii. 108 *sq.*). This story (like that told by Herodotus in iv. 13) exhibits all those horrors of a later age which Ctesias loves to paint. The idea of a revolt, moreover, was not far to seek after the profound humiliation inflicted by the Greek war and the dreadful losses of men,—how many Sogdianians, Indians, and Nubians can have returned to their homes! The inhabitants of distant frontier lands may even then have severed their connexion with Persia, and even then mountain and desert tribes in the very heart of the empire may have regained their full independence.

Unfortunately the work of Herodotus breaks off abruptly with the battle of Mycæ, and with it our only continuous ancient history of the empire comes to an end. The fragments of Ctesias and the occasional statements of other writers can only, to a small extent, supply the deficiency. Henceforward we possess tolerable information on the shifting relations between the Persian empire and the Greek states, but on little else.

Persians
driven
back to
Asia.

Under the conduct of Pausanias, the victor of Platæa, the Greeks sailed (477) first to Cyprus and then to Byzantium. At the capture of the latter many distinguished Persians fell into their hands, and Pausanias, who must have appeared to Xerxes as a sort of king of Greece, took advantage of this opportunity to open a correspondence with

the Persian monarch. Artabazus, son of the Pharnaces 479-461 who had held a command under Mardonius, received the satrapy of Hellespontine Phrygia (where his family retained the power thenceforward down to the fall of the empire), for the purpose of conducting the negotiations. The definite statements of Thucydides leave no doubt as to Pausanias's guilt. In particular the king's letter (l. 129) bears every mark of genuineness. Happily he proved himself a clumsy intriguer, and when long afterwards in Sparta retribution at last overtook him he had ceased to be dangerous, at least for the freedom of Greece as a whole. The conduct of Pausanias, together with a want of inclination and capacity for distant naval expeditions, caused the Spartans to resign the conduct of the maritime war against Persia. They withdrew, and the command passed into the hands of the Athenians (476). The naval power of Sparta was quite insignificant, and was certainly surpassed by that of some of her allies, such as Ægina and Corinth; and the advantage to Persia of the absence of the Peloponnesian fleet was far more than counterbalanced by the circumstance that the Greek naval forces were now under a single energetic leadership, which aimed at nothing less than the exclusion of the enemy from all Greek seas and coasts. The war lasted for a long time, but few of its details are known to us, though the scanty statements of the Greek writers are partly illustrated by Attic inscriptions. The European coast was soon completely cleared. Eion fell after an arduous siege (about 470). Doriscus alone continued for long to be a Persian possession.

The most brilliant episode of this period of the war is the Cimon's great naval expedition of Cimon.² He liberated the Greek cities of the Cærian and Lycian coast, and took the bilingual towns, which were occupied by a Persian force; all were incorporated in an Attic maritime league. The important Phaselis on the borders of Lycia and Pamphylia also fell into his hands. At the mouth of the Eurymedon the Persian fleet, under a son and a nephew of Xerxes, was defeated and destroyed, and a land-victory for the Greeks followed immediately. Upon this Cimon sailed hastily for Cyprus, where he captured eighty ships. Here for once the Greeks were numerically superior, but nevertheless it was a great exploit to have advanced victoriously so far beyond their own waters.

About this time Xerxes was assassinated. From various Xerxes writers we can piece together an account of this event by Ctesias, and another by Dinon,³ which differ from each other in numerous particulars; a third version is given by Aristotle (*Pol.*, p. 1311 b). For such scenes, occurring in the interior of the seraglio, an outsider is not a trustworthy authority, but this much is clear: Xerxes was killed by Artabanus, captain of the body-guard; his youngest son Artaxerxes, in league with the murderer, put to death his elder brother Darius, who had a better title to the throne. It does not, however, follow with certainty that Artaxerxes was a parricide. We have here a change of sovereign of the sort which abounds in Oriental history. Artabanus was soon afterwards put out of the way by Artaxerxes. Later chronologists represent him as actually reigning for seven months, but this is probably a mistaken interpretation of expressions used by Dinon.

Artaxerxes (*Artakshathra*)⁴ I came to the throne in Artaxerxes 464. His surname "Longhand" (*Μακρόχειρ*), which Xerxes I. seems to have been first mentioned by Dinon, has no doubt a symbolical meaning, "of far-reaching power;" but later Greek writers took it literally. Ctesias tells of a

¹ About 465. Perhaps it falls within the reign of Artaxerxes.

² He wrote in the time of Alexander.

³ A second form, *Artakshathra*, is represented by Hebrew and Egyptian forms, and by *Artakshathra* on a Greek inscription (Le Bas and Waddington, No. 1861).

⁴ Æschyl., *Pers.*, 596 *sq.* The brevity and simplicity of the expression *ἔχει τὰ ἱεροῦ* cannot be rendered in any modern language.

484-445 rising of the Bactrians immediately after his accession to the throne, which may have been instigated by Hytaspes, the king's elder brother, who was then in his satrapy of Bactria (Diod., xi 69). Two battles took place, the second of which ended in a decisive victory for the royalists, so that Bactria was once more reduced to subjection.

In the early part of the reign of Artaxerxes falls the appearance of Themistocles at the Persian court, so say the contemporary Charon of Lampsaecus (Plut., *Themist.*, 27), and also Thucydides (i 137), to their authority that of all later writers, who here mention Xerxes, must give way. On calmly weighing the trustworthy accounts and taking into consideration the circumstances that even at a later time Themistocles as a "traitor" was refused a grave in Attic earth, we can hardly avoid concluding that the gifted saviour of Greece, the founder of the Attic seapower, a man far superior intellectually to Pausanias, but of boundless ambition, and with a strong propensity to intrigue, was really guilty of entering into traitorous communication with the Persians in his own interest. Certainly he knew admirably how to give himself out as an old friend of the Persians, and to hold out to them the prospect of still doing them valuable service against his countrymen. The king gave him Magnesia on the Meander in Lydia and two other towns, as the tyrant of these places under Persian supremacy the victor of Salamis lived some time longer.² Like this illustrious fugitive, other Greek exiles or adventurers came to the Persian court from time to time, and played there occasionally a certain rôle.

Second Egyptian revolt. Hardly was Artaxerxes seated on the throne when the second great revolt of Egypt broke out. Inarus, son of Psammetichus, a Libyan prince, placed himself at the head of the Egyptians and was made king of the whole country. The satrap Achæmenes, son of Darius, fell in battle. Inarus summoned to his aid the Athenians, who were still at war with the Persians, and the Athenians were rash enough to involve themselves in the struggle (about 460). They had just come once more to Cyprus with 200 ships. They sailed to Egypt, and with the help of the Egyptians shut up the Persians and the Egyptians who sided with them in the castle of Memphis. Persia had recourse to diplomacy: an embassy was sent to Sparta in order to stir up the Spartans to make a vigorous diversion against Athens. When this attempt failed, a large army was at last despatched under Megabyzus, son of Zopyrus, which subdued the country after hard fighting; for, with all their hatred of the Persians, the Egyptians were no match for them in battle. The Athenians in Egypt were annihilated (probably 455), the same fate befell a reinforcement of fifty ships. Inarus fell by treachery into the hands of the Persians and was crucified. His son Thannyras, however, received (Herod., ii 18) his original province (probably the Libyan nome), which points to the war having been concluded by a treaty, of which Ctesias also makes mention. In the swamps of the Delta Amyrteus (Amun-art-rut) maintained himself as an independent king, and by him the Athenians were once more invited to Egypt (450 or 449). Cimon, who was again at Cyprus with 200 ships, despatched sixty to his help, but they soon returned, probably without accomplishing much. Cimon died during the siege of Citium, one of the most important cities of Cyprus, and the manstey of the Phœnician nationality on

that island. The Athenians raised the siege, but achieved on their retreat once more a brilliant victory by sea and land.³

These are the last contests of the Athenians and their allies with the Persians. Peace must have been concluded shortly afterwards. We cannot here enumerate and criticize the arguments which have often been adduced for and against the supposition that a regular peace (though not a "peace of Cimon") was concluded. No one probably would have questioned the reality of such a peace were it not that the Attic orators of the 4th century, by grossly exaggerating the terms of a treaty which in their time had long been a dead letter, had rendered the very existence of the treaty open to suspicion, and that the able historian Theopompus, moved apparently by dislike of the Athenian democracy and a desire to gratify his powerful patron, King Alexander, had attempted by false though learned arguments to disprove the genuineness of the original treaty of peace, of which only a copy was extant in his time. The text of the original document was given by the best authority on Attic decrees, Craterus.⁴ It is hardly conceivable that the great war should have died out of itself without the Athenians getting some security that their possessions and their widely ramifying commerce would be left unmolested. Moreover, all that we are told or can infer as to the contents of the treaty agrees perfectly with the political relations of the time. The treaty was not at all in the spirit of the high-flying plans of Cimon's party, for, while the Persians acknowledged the independence of the Greek towns on the west coast, including the Lycian, and pledged themselves to send no ships of war into Greek waters, the Athenians in return renounced all rights in the eastern seas. The most sagacious of the Athenians had perceived that Cyprus, and much more Egypt and Phœnicia, lay outside the natural sphere of Athenian power. We can understand, however, that Callias, the author of the treaty, earned the dislike of the Athenians for his pains. The balance of advantages secured by the peace was on the side of Athens, but the Persians resigned nothing which they actually possessed, and they were now secured against Athenian raids. It was certainly anomalous that the great empire which owned the rest of Asia Minor should have no rights over the narrow strip of coast, which could everywhere be overlooked from the interior. Even the capital of the Hellespontine-Phrygian satrapy, Dascylium, from which that province is sometimes called Dascylium, was now a member of the Attic naval confederacy. The satraps were still obliged as before to pay to the king the taxes due from the coast-lands, and this must have been a constant incitement to them to reconquer those lands. There was no Persian fleet in the Black Sea. The Greek towns on its coast were free, and some of them belonged to the Athenian league and were occasionally visited by Athenian war-ships. At most a portion of the natives of the countries round about the Black Sea were in a state of loose dependence on the Persian empire. In Lycia and Caria there were districts which obeyed neither the king nor Athens, or at least were not closely dependent on any foreign power.⁵

The condition of Egypt at this time is very obscure. Amyrteus had no doubt been finally overthrown by the Persians, but his son Pausiris was left by them in possession of his father's kingdom. In the year 445 we find an Egyptian or Libyan king, Psammetichus, who presented the Athenians with a great quantity of corn.⁶ This was

¹ But the letter in *Thuc.*, i 137, cannot be regarded as an authentic document.

² Here, too, he coined money. Of the two specimens known to us, one is plated, "which seems to show that with the cunning the cunning Athenian combined a financial speculation," Drandis, *Mon., Mass., und Gemmenschm.* *Vorderasiens*, p. 459.

³ The epigram which Diodorus (xi 62) wrongly applies to the battle of the Amynædon refers to this battle.

⁴ Shortly after Alexander.

⁵ Compare Thuc., ii 69, iii 19.

⁶ Philochorus, in schol. Aristoph. *Vesp.*, 718, schol. Aristoph. *Plut.*, 178, Plut., *Perses*, 87.

perhaps another son of Inarus. But we know nothing more of him and his reign.

The conclusion of peace did not prevent the Persians, or at least individual satraps, from occasionally supporting enemies of Athens. Samian oligarchs, with the help of Pisuthnes, satrap of Sardis, made themselves masters of the island (440 or 439), and estranged it from Athens. The Athenians feared that a Phœnician fleet might come to the help of the oligarchs, but not a Persian interfered when they reduced the island once more to subjection. About 430 Colophon was made over to Itamenes (no doubt a Persian general or governor) and the barbarians by a party among the inhabitants favourable to Persia, and thereupon Notium,¹ a dependency of Colophon, was also occupied by the royalists, for thither also Pisuthnes despatched Persian troops, who entrenched themselves in the town. Amongst these troops were Arcadian mercenaries. This is the first undoubted mention of Greek mercenaries in Persian pay; henceforward they play a very great part in the history of the empire. The Persian rulers had observed how far superior the Greeks were to the Asiatics, and in Greece there were always plenty of stout fellows who were impelled by political events, the love of adventure, or poverty to enter foreign service as soldiers of fortune. Most of them came from the Peloponnesus, presumably from the mountains of Arcadia, which yielded but a scanty subsistence to its inhabitants. The Athenian party in Notium called in the Athenian admiral Paches; by shameful perfidy he made himself master of the entrenchments, and put the garrison to the sword. With Notium, Colophon was now once more a member of the Athenian league. No further consequences followed from these hostilities.

During the early years of the Peloponnesian War the Spartans repeatedly held communications with the Persians, whose assistance they desired against Athens. These negotiations were, for the time being, without result. The Spartan diplomatists were unskilful, and the Persian authorities were cowardly, indolent, ignorant, and selfish.² The impecunious Peloponnesians wished above all for Persian gold, and, moreover, for the Phœnician war-ships. The Athenians also tried to tap the inexhaustible source of wealth for their own benefit, but of course in vain.³

Of the internal state of the empire during the long reign of Artaxerxes I. we know very little. Ctesias, or rather the extract of him made, not always carefully, by Photius, tells us indeed various stories, but he jumbles together fact and fiction, history and anecdote. Of most importance is the quarrel of Megabyzus, conqueror of Egypt, with the Persian court; he maintained a rebellion for several years in Syria, till at last, after several conflicts, a full pardon was assured him by treaty. It is not improbable that this war was the occasion of the destruction of the walls and gates of Jerusalem lamented by Nehemiah (in the year 445). According to Ctesias, Megabyzus afterwards fell into disgrace again, but was again taken into favour. In all these complications an important part is played by those cruel, intriguing, dissolute women, the queen-mother Amestris, daughter of Otanes, of whose character we get a very unpleasing view from Herodotus (vii. 114; ix. 109 sq.), and her daughter Amytis, wife of Cyrus. Even without an exact knowledge of the circumstances, we can well understand how it was that Zopyrus, son of Megabyzus, came to take refuge in Athens. He fell while attempting, in company with the Athenians,

to capture Caunus (in Caria), which had revolted. His 445-410. grandmother Amestris got the Carian who had killed him into her power and had him crucified.

From Nehemiah's memoirs we see that in those days one who was not a Persian might not only fill the tolerably high office of cupbearer⁴ in the royal household, but might also become deputy-governor over his fellow-countrymen.

The history of Ctesias, untrustworthily as it is in particulars, shows us the manner of life at court. Artaxerxes I. was a very weak man, and women and favourites took the government out of his hands. Still, he may have deserved the praise, often bestowed on him, of good-nature. He may also have been of stately presence; as an Iranian chief he was doubtless an excellent huntsman⁵; but his "incredibilis virtus belli" (Nepos, *De regibus*, 1) is precisely "incredibilis." In reading the eulogies of Persian kings we must always remember that the ultimate sources of writers like Ctesias and Dinon are court news, wherein even the deceased kings are spoken of in a courtly tone.

Artaxerxes died in 424. His successor, Xerxes II., the Xerxes only one of his eighteen sons who was legitimate,⁶ was II. murdered after a month and a half by his brother Sogdianus or Sogdianus. But after six and a half months⁷ the murderer was in his turn overthrown by his brother Ochus, satrap of Hyrcania, and, in violation of solemn oaths, put to death.⁸ Ochus assumed the name of Darius, ascending the throne about the beginning of the year 423.⁹ Darius II. is called Nothus or Syrus,¹⁰ because his mother Darius was a Babylonian concubine. From the first mention of II. him by Ctesias his wife and sister Parysatis appears as the prompter of all his acts and all his crimes; and this mischievous woman possessed the greatest influence for many years. The king's full brother Aristés, in conjunction with another son of Megabyzus, Artynphius, raised the standard of revolt, probably in Syria. But his Greek soldiers were bribed, and thus he fell into the hands of the royalists, and, in violation of the oath, was put to death at the instigation of Parysatis. The same fate befell some of those who had taken part in the murder of Xerxes II. Darius had presumably come forward from the beginning as his avenger. Soon after 410 the great revolt of the Egyptians was successfully accomplished. The first independent king was called Amyrteus, and was presumably a grandson or other relative of the former Amyrteus. The deep decay of the Persian military power is proved by the fact that for sixty years it failed to reduce the unwarlike Egyptians, though the latter were frequently divided amongst themselves by internal dissension and double rurs.

The above-mentioned Pisuthnes, satrap of Sardis, had also revolted. Tissaphernes, who here appears for the first time, put down the rebellion by the usual means of bribery and perjury; the Athenian Lycon, leader of Pisuthnes's Greek mercenaries, plays a far from honourable part in the affair. The events fall after 424, and at least some between before 412. But Pisuthnes's son Amorges continued

⁴ Cp. Herod., iii. 84, and Nicol. Damasc. (i.e., Ctesias), 64.

⁵ Cp. the anecdote of Ctesias in Photius about his lion hunt.

⁶ This probably means that the wife who bore him was of a noble Persian family.

⁷ No reliance is to be placed on these numbers in Ctesias. Others assign to the two monarchs two and seven months respectively. In any case they did not together reign a full year, since the astronomical canon ignores them.

⁸ Cp. also Pausanias, vi. 5, 3, where probably we should read *Zōy-don* with Becker.

⁹ The beginning of 411 falls, according to the document in Thuc., vii. 53, in his thirteenth year; this is probably a reckoning which begins the year with the spring, and accordingly reckons his first year (or rather the year in which he came to the throne) from the spring of 424 to 423. The astronomical canon begins the year of his accession with 7th December 424.

¹⁰ Hypothests of Æschyl., *Pers.*, and schol. on v. 6.

¹ In addition to purely political opposition, the local jealousy between Notium and its "superior town" Colophon had its share in the matter. See Aristot., *Pol.*, p. 1308 b.

² See Thuc., ii. 67; iii. 91; iv. 50.

³ Aristophanes, in the *Acharnians* (represented January a.c.), ridicules these long and fruitless negotiations of the Greeks with the Persian king.

410-401 the revolt in Caria, and was supported therein by the Athenians, perhaps because they already knew for certain that Tissaphernes was preparing to help the Spartans.¹

Relations
with
Sparta

When the power of Athens seemed annihilated by the dreadful catastrophe in Sicily, the Persians expected to regain the whole sea-coast. Tissaphernes, satrap of Sardis, and his rival Pharnabazus, satrap of Hellespontine Phrygia, vied with each other in invoking the help of the Spartans. The party hostile to Athens in the cities of the mainland and in the islands displayed great zeal in bringing about the alliance. Moreover, the no less able than infamous Alcibiades strained every nerve to secure so favourable an opportunity of distinguishing himself personally and injuring his native city. Not without reluctance the Spartans resolved on a decisive step. They might have known beforehand that they would only receive real support from the Persians on condition of surrendering to them a great portion of the Greek cities which had once been freed by Athens, though now mostly hostile to her. They chose to attach themselves to the more powerful but, as it soon appeared, wholly untrustworthy Tissaphernes rather than to Pharnabazus. Of course the confederates did the Athenians much damage, and wrested from them a great part of their domain. The Laeodemians actually served the satrap as catchpools against Amorges, who resided in Iassus near Miletus, and so he could be taken captive and carried alive to the king. But the Athenians still exhibited astonishing endurance and resource. It is true that neither of the confederates meant honestly by the other. Whether from avarice or mere whim, Tissaphernes supplied the Peloponnesians in insufficient measure with money and stores, and without these they were not in a position to wage war in Asia. The intrigues of Alcibiades contributed to sow mistrust and confusion. The Spartan leaders repeatedly concluded treaties with the satrap, but they were not ratified. At last it was agreed that the whole mainland of Asia, and therefore all the Greek cities there, should belong to the king, but that in return for this the Persians should give the Spartans effective help. If Tissaphernes had rapidly and energetically carried out the terms of this treaty, the war might perhaps have been ended quickly enough. But to keep faith was contrary to the nature of the man. Moreover, he had probably promised more than he could perform: to bring up the great Phœnician fleet was not quite in his power. The Phœnicians themselves, and perhaps high Persian lords also, had certainly little desire to engage again the Attic galleys which had handled them so roughly at the Eurymedon and at Cyprus. Pharnabazus supported the Spartans much more honourably and effectively. This he showed especially when the Athenians were again making steady progress (410) under the leadership of Alcibiades after his return. The Athenians now devastated the king's territory in various places, and Pharnabazus had at length to engage to forward Athenian envoys to the king for the purpose of conducting negotiations for a peace (409) at the court itself. But events now took a decisive turn. Cyrus, the king's son, was made satrap of Lydia, Great Phrygia, and Cappadocia, and commander-in-chief of all the troops in Asia Minor, Tissaphernes retaining only the coast-cities (408). Cyrus possessed burning ambition, and longed to avenge the defeats which his house had experienced at the hands of the Athenians. Hence he sought to unite himself closely with the Spartans. Just at this time the command fell to the cunning, energetic, and unscrupulous Lysander. These two men were the ruin of Athens. Cyrus granted Lysander, who had

completely won his affection, all the money he wanted, and when after Lysander's temporary recall the relations with Sparta were disturbed, because the noble Callistidas did not care to play the courier to the barbarians, the return of Lysander sufficed to put everything on its former footing. When Cyrus was summoned to the bedside of Darius (either really ill or pretending to be so), he left his Spartan friend the most abundant resources and the fullest authority. With this help Lysander succeeded in at last compelling Athens, now completely isolated, to accept the melancholy peace of March 404. Even after all the misfortunes of Athens it was only Persian gold which enabled the Spartans to humble her.

According to Ctesias, Terituchmes revolted against King Darius, caused his wife Amestris, daughter of the king and Parysatis, to be put to death, but was himself slain by treachery. This event, garished in the usual manner with a full measure of perfidy and cruelty, is perhaps to be connected with the unsuccessful revolt of the Medes mentioned by Xenophon (*Hell.* i. 2, 19) under the year 410/409. In the fall of Terituchmes his sister Statira, wife of the king's eldest son Arsaces,² was nearly involved, thenceforward the interest hatred subsisted between Parysatis and her daughter-in-law Statira.

About the time of the conclusion of peace between Athens and Sparta Darius II. died. Arsaces ascended the throne under the name of Artaxerxes (II) ^{verses} ^{II}. The surname "Memnon" (the mindful) seems again to have been first mentioned by Dinon.⁴ The younger and much abler son Cyrus, preferred by Parysatis, came with 300 Greek Cyrus, mercenaries, no doubt to seize the throne, but he was too late. Tissaphernes, professedly the friend of Cyrus, warned the king against him, and with good reason Cyrus was arrested, but at the instance of Parysatis he was released and sent back to his satrapy,—a very unwise measure, for his ambition was only inflamed by his imprisonment and by his exasperation against Tissaphernes.

Meantime Lysander lorded it over the Greeks. He even possessed sufficient influence to induce Pharnabazus, who in other respects was remarkably respectable⁵ for a satrap, to violate the law of hospitality by causing Alcibiades to be put to death. But even the patience of Pharnabazus was at last worn out by Lysander, he urgently demanded the recall of the latter, and the Spartans, who had allowed the atrocities of Lysander towards the Greeks to pass unnoticed, respected the satrap's demand, and recalled their admiral (402 or 401).

No sooner was Cyrus in his satrapy again than he began to make great encroachments. He gained over the Ionian cities which belonged to the province of Tissaphernes and laid siege to Miletus, which adhered to Tissaphernes. On Orontes, a partisan of the latter, he made open war. Meantime he collected under false pretences an army of Greek mercenaries, and in 401 set out with the real purpose of seizing the throne. He had with him nearly 13,000 Greek mercenaries commanded by Clearchus, a Spartan exile, and a vast host of Asiatics. But Tissaphernes hastened into the interior before him to carry the tidings. Of this expedition we have the well-known account by Xenophon, who took part in it.⁶ The Spartans favoured

¹ Arsakes is the form in Ctesias; *Plut.* *Art.* i. From this Plotus has wrongly made Arsakes. Dinon called him Oorres. The initial sound was perhaps *os*.

² At the very beginning of the new reign Ctesias has again some dreadful stories of murder and intrigue to tell. As court physician of Parysatis he had seen only too much of such things, which are characteristic of the Persian court.

³ See *Plut.* i. c.

⁴ But the worth of his character has been often over-estimated; the contrast with the baseness of Tissaphernes is apt to place Pharnabazus in too favourable a light.

⁵ Good supplementary information is given by Diodorus, who has

¹ On the other hand, Andocides (*De pace*, p. 27), twenty years later, if it is true, represents the support given to Amorges rather as the cause of the king's enmity to the Athenians.

The Ten
Thousand

the enterprise of their friend, but without openly breaking with the king Cyrus advanced boldly, confident in the military superiority of the Greeks, but he had some trouble in carrying them with him as far as Syria and Bablylonia, for they were not engaged for so distant a goal. He made his way without difficulty into the heart of the empire. Neither the passes of the Taurus leading from Cappadocia into Cilicia nor those of the Amanus from Cilicia into Syria were blocked. The vassal-prince of Cilicia, Syennesis, put a good face on a bad business and let him through. Even the line of defence between Bablylonia and the Mesopotamian desert was unoccupied. At Cunaxa, 500 stadia from Babylon,¹ they came upon the mighty royalist army. The Greeks carried everything before them, the king proved a miserable coward and fled. But, in fighting the Asiatic rabble, Clearchus seems to have adhered too pedantically to the cautious Spartan tactics, and not to have dashed with sufficient audacity at the enemy's centre. Cyrus, however, rushed foolhardily into the mêlée and there fell.

Even if we deduct much from Xenophon's idealistic portrait, we must still admit that Cyrus was a very able and in many respects honourable man, far worthier of the throne than his brother. From his grim mother he probably inherited his spirit and energy. Certainly none of the kings after Darius I. can be compared with him, except perhaps Artaxerxes III. But for Greece, as Grote shows, it was very fortunate that at that time the kingdom of Persia did not fall to a man whose most ardent endeavour it would have been to bring the Greeks into subjugation to himself, and who had learned in the school of Lysander and elsewhere the best means of accomplishing that object.

Cyrus's Greeks were an object of terror to the king's troops. All the deception and crimes employed against them had their source in cowardice. The king's hosts were reinforced by the army of Cyrus, which after their leader's fall passed over to the enemy, but all these Asiatics trembled before the dauntless Greek mercenaries, comparatively few in number as they were and strangers to the country. It is characteristic of the state of the empire that Tissaphernes allowed the Greeks to plunder the villages which were the special property of Parysatis, he probably thought that with the death of her favourite son her power was broken, while he himself had succeeded in appearing as the deliverer of the empire. After electing fresh leaders in place of those who were foully assassinated, the "ten thousand" made themselves a way through wild mountains and wild peoples, they had to endure a thousand dangers and hardships, but from the king's forces they experienced no serious hindrance.

This expedition revealed to the Greeks the weakness of the empire and the cowardice of its rulers and defenders. Cyrus had penetrated to its centre without striking a blow, and an army of ordinary Greek mercenaries proved itself more than a match for the power of the whole empire. It was perceived how helpless the colossus was; it was perceived that great territories, which had been regarded as royal provinces, were completely independent.² Independent at that time were the predatory Mysians (in Olympus), Pisidians, and Lycaonians,³ the Lycians (entirely) and the Bithynians and Paphlagonians half and half,—the last two peoples had kings of their own, further, the Greek

cities on the Euxine, finally, the Carduchi and other wild 401-394 peoples in the south and north-west of Armenia.

The death of Cyrus widened the breach between Parysatis and Statira. The former could not forget her daim, and succeeded in bringing to a cruel end one after another all who had participated in his death. Statira was exultant, but she was eventually poisoned by her mother-in-law. Artaxerxes was indignant at this deed and banished Parysatis for ever from his sight, but he could not live without the firm guidance of his mother, and soon recalled her.

Tissaphernes succeeded to all the privileges of the post which Cyrus had occupied. This could not but hasten the inevitable conflict with Sparta, which now, at the War height of her power, could not bring herself to fulfil the treaty and resign to the Persians all the Greek cities of Asia Minor. The Greeks expected to be protected by Sparta against Tissaphernes, who was already enforcing his rights with the strong arm, and the war which the Spartans began in 401 against the Persians in Asia Minor was no doubt popular, but as a land-power with limited resources they were not in a position to conduct much more than a purely predatory war. The state of Ionia and Æolis must have changed very much for the worse since the termination of the Ætæic supremacy, and the Asiatic Greeks were now perhaps for the most part unworthy of the blood that ran in streams on their behalf. Tissaphernes and Pharnabazus sought each to shift upon the other the burden of the war, the conduct of which was not essentially altered when the command of the Spartans devolved on Agesilaus (396), who strove in vain to give the struggle the prestige of a Pan-hellenic enterprise. But, when Agesilaus had gained a great victory close to Sardis, Tissaphernes, who had meantime, more from cowardice than treachery, remained inactive in Sardis, was quietly displaced by a successor in the person of Tithraustes, who succeeded in seizing and executing him.⁴ The real cause of his fall was the hatred of Parysatis. The game of treaties, which neither side meant to keep, and the efforts of the one satrap to thrust the Spartans upon the other, began afresh. In course of time Agesilaus certainly gained ground rapidly. But his successes were in part much exaggerated even by contemporaries.⁵ On the whole, they were predatory expeditions on a large scale, which showed with ever greater clearness the weakness of the empire, but did not directly affect its stability. Even after his great victory, Agesilaus did not venture to attack Sardis—a striking contrast to the speed and thoroughness with which Alexander took possession of these lands. In 394 Agesilaus was recalled, for Sparta needed him in Europe more than in Asia, the intolerable nature of the Spartan supremacy had done more than Persian gold to rouse even the proved allies of Sparta, such as the Thebans and Corinthians, into leaguening themselves with Athens in revolt. When Agesilaus reached the frontier of Boeotia he heard the dreadful tidings of Cnidus.

After the decisive defeat at Ægospotami the admiral of the Athenian fleet, Conon, had fled to Evagoras, prince of Salamis in Cyprus. Evagoras, a tyrant of the "grand" type like Pisistratus or Gelo, favoured Conon's efforts to enter into relations with the Persian king with a view to raise Athens from her fall. When the war between Persia and Sparta broke out, Pharnabazus had made it clear to the court that it was absolutely necessary to raise a fleet, and that no better commander could be found for it than the tried sailor-hero of Athens. Under the leadership of such a man the Persians actually dared to send Phœnician ships once more into those Greek waters which they had long anxiously avoided. But Conon's successes, such especially as the revolt of Rhodes from Sparta (probably in 396),

indirectly made use of the narrative of another writer who shared in the expedition.

¹ So says Ctesias, who knew the country. Xenophon says 360 stadia. These figures are equal to nearly 68 and 42 English miles respectively,—about 93 and 67 kilometres.

² On the effect produced by the expedition, see Xenophon, *Hell.* vi. 1, 12. *Isocrates, pæzanem*.

³ At least in part; such mountain peoples did not, of course, form integral wholes, and if one tribe was independent, another may have obeyed the satrap.

⁴ See Diod. xiv. 80, Plut. *Art.* 23, Polyæmus, vii. 16, 1.

⁵ *Isocrates, Pænez*, 70.

391-376 were crippled by the miserable Oriental amputation, *e.g.*, his tardiness in paying the men. Hecæon Conon went him-self to the king at Babylon, obtained a grant of the necessary money and powers and the king's consent to bestow the nominal command of the fleet upon the trustworthy Pharnabazus. Then at the head of the Persian fleet the Athenian admiral utterly defeated the Spartans at Cnidus (beginning of August 394). In a short time nearly all the islands and cities on the Asiatic coast were freed from the Spartan prefects ("harmosts"), and Conon carried his point of nowhere occupying the citadels with Persian garrisons. The Spartan sovereignty of the seas, after lasting ten years, was over for ever. Pharnabazus sailed to the Peloponneseus (393), and at Corinth was joyfully greeted by the Greeks gathered for the war with Sparta. He supplied them liberally with money and then returned home, while Conon restored the marine fortifications of Athens. Thus as a matter of fact a Persian fleet now ruled the Archipelago, but it was a menace and danger to Greek freedom no more. It was only with Greek help, under the leadership of a man like Conon, that the king's ships could still achieve much.

As the land-war in Greece dragged on for a long time, the Spartans had again recourse to diplomacy. The new satrap in Sardis, Tiribazus, who in some measure revived the vacillating policy of Tissaphernes, met their advances. He overthrew Conon, who escaped death at his hands only with extreme difficulty and fled to Eragoras, at whose court he must have died soon afterwards.¹ But Tiribazus soon received in the person of Struthas a successor more favourably disposed to Athens. Many conflicts of Greeks against Greeks still took place by land and sea, but all the belligerents were exhausted, at least financially. So, when the Spartans at last succeeded through their ambassador Antalcidas and through Tiribazus in bringing about a peace, all the more important states of Greece found themselves obliged to accede to it, however unwillingly. This is the notorious peace of Antalcidas, which Tiribazus laid before the delegates of the Greeks at Sardis or Ephesus in 387. It is not a mutual compact but a simple edict of the king. It sets forth that in the king's opinion all cities of the Asiatic mainland, as well as the islands of Clazomenæ and Cyprus, ought to belong to him; that, on the other hand, all other Greek states, even the petty ones, ought to be independent, with the single exception of Lemnos, Imbros, and Seyros, which should continue as of old to belong to Athens. If any one refused to accept this decision, upon him the king and his allies (particularly the Spartans) would wage war with all their power.

It is hardly likely that the true import of this document was understood at the Persian court. That the great king should issue a simple order was there regarded as a matter of course, but the Persian statesmen, who really knew the state of affairs, may have had trouble in securing the acknowledgment of the freedom of the islands. By this peace the Spartans personally gained a great success; for they gave up nothing which they still possessed, while by the declaration of the independence of even the pettiest communities they secured this advantage, that the cities which had hitherto ruled over wider areas were restricted to their own special domain, that, *e.g.*, Thebes, hitherto head of Boeotia, now remained only one of many independent Boeotian cities. Thus Greece was split up into a thousand petty communities, which Sparta, who did not dream of extending the independence to her own subjects, could with ease dominate collectively. Through this peace the Spartans gained for about sixteen years a much greater

power over the Greek mainland than they had ever possessed before, and they ruthlessly turned it to account. Athens, slowly regaining her strength, was appeased by the three islands, but nowhere was "the peace sent down by the king" felt to be a disgrace more keenly than at Athens. In that peace the king issued orders to the Greeks as to his subjects, and the express and definitive surrender of all the Greeks on the Asiatic coasts was felt all the more bitterly in the intellectual capital of Greece because there was no prospect of ever again freeing them as in the days of Xanthippus and Cimon. And yet it was known that the Persian empire was now much weaker than it had been then, and that it was only maintained by Greek mercenaries.² The real gain to Persia by the peace was a firm hold on the sea-coast. The domineering attitude towards the other Greeks was a mere appearance. In the following decades the king repeatedly commanded peace, even after Thebes had completely broken the power of Sparta (371). The powers for the time being employed Persian intervention as a means to their own ends, and there were plenty of diplomatic negotiations with the king, but Persia had no advantage from them. Moreover, now one, now another Greek state supported rebel satraps and vassals. They all, the king as well as the rebels, procured mercenaries from Greece.³

Meantime another enemy had arisen to the Persian Empire, supremacy in the west—an enemy who, if Athens, his friend and sympathiser, had at that time been once more a great naval power with an aggressive policy, might perhaps have excluded the Persians from all the western seas. Evagoras of Salamis had made himself the almost independent lord of Cyprus, relying on the ancestral antagonism of the Greek to the Phœnician element in the island. As early as 390 forces were levied against him. Athens, under obligations to him on Conon's account, supported him openly, although she was at that time still formally leagued with the Persians against Sparta. After the peace of Antalcidas Persia made great efforts to reduce Evagoras again to subjection. He was in league with Egypt, scoured the seas far and wide, and had even for some time maintained a siege of Tyre. The cunning Cypriot also kept up a secret correspondence with the vassal princes of Caria. After a ten years' struggle he had to yield to superior force, but by skilful negotiation with the satraps he was able to procure a tolerable peace. Soon afterwards he was murdered, but his descendants long continued to be princes of different towns in Cyprus.

About this time probably the expedition of Artaxerxes Cadusian against the Cadusians took place, of which Plutarch, after expedition Dion, has given us a detailed account.⁴ The Cadusians are the inhabitants of the modern Gilan, who were probably never completely subdued, and who certainly by their raids inflicted much annoyance on the neighbouring territory of the king. Darius II. had taken the field against them shortly before his death,⁵ and the repeated mention in the fragments of Ctesias of the Cadusians at the time of the Median empire is presumably a reflex of the state of things in his own day. Artaxerxes's campaign turned out disastrously. The king probably thought to crush the wild mountain tribes—who, however, are only to be caught by small and skilfully led armies—by masses of troops, but he fell into an ambush, from which he was only saved by

¹ This follows, in opposition to other statements, from Lysons, *Pro bonis Aristotelis*, p. 166; cf. Isocr., *Panegy.*, 78, and Dinon in Nepos's *Conon*, at the end.

² Compare many passages in the orators and Plato. Especially interesting is the passage in Isocr., *Epist. ad Archid.*, p. 486, on the wild doings of the Greek mercenaries, who were specially burdensome to the king after the Persian rule.

³ We are told that the king desired the internal peace of Greece, because he hoped thereby to procure mercenaries all the more easily from that country (Diod., xv. 58).

⁴ *Artax.*, 24, c. p. Diod., xv. 6, 10.

⁵ Xenophon, *Hell.*, i. 1, 13.

the negotiations which Tiribazus astutely opened with the rebel chieftains. No doubt he had to pay a large sum for his liberation.

Egyptian war Meanwhile the war with Egypt was never quite at a standstill. Even before the subjugation of Evagoras much fighting took place, but without result. Our knowledge of the particulars, even of the chronology, is very meagre. After the conquest of Cyprus the war was renewed. The Egyptian king invited the Athenian Chabrias to take the command, but Pharnabazus contrived that the Athenians should recall him (376/375). Pharnabazus, who by this time must have been about seventy years old, was placed at the head of the army which was being mustered at Acco on the Phœnician coast. The Athenian mercenaries were commanded by Iphicrates, who had been sent from Athens. The campaign opened successfully, but dissensions arose between Iphicrates and Pharnabazus, whose proceedings were much too slow to suit the dashing fleetness, for Pharnabazus had to report everything to court and to ask instructions from the same quarter. This, along with other circumstances, saved Egypt once more (374). There is the old story, too, of the difficulties of the wars of this period—a mutiny amongst the mercenaries for arrears of pay. The third of the great Athenian condottieri, Timotheus, son of Conon, who fought in the king's service against Egypt in 372, seems also to have been unable to effect anything.

Revolts in Asia Minor. The last part of the reign of Artaxerxes II is filled with revolts of the satraps and chiefs of Asia Minor, of which we have numerous but mostly isolated and, to a large extent, inexact accounts. It is impossible to determine the connexion of events. We do not even know in all cases whether the same names designate the same persons, and we are nowhere exactly informed of the motives which induced the individuals to revolt. It is the more difficult to form a judgment on the events because sometimes the same persons side now with, now against the king. These revolts, which lasted in part into the reign of Artaxerxes III., must have weakened immensely the imperial power in the western provinces, and prepared the way for the Macedonians. Rich Greek cities and energetic tyrants probably won for themselves at that time a tolerably independent position. At the head of those who remained faithful to the king we find Autophradates, satrap of Lydia. He fought the rebels repeatedly. Nevertheless Diodorus (xv. 90) names him among the rebels, and it is, after all, possible that there is here no confusion, but that Autophradates was also a rebel for a time. If we omit some smaller risings, such as that of Tachos, who established himself in a fortress on the Ionian coast (after 380), the series begins with Artobazanes, successor of Pharnabazus in the Hellespontine satrapy, and no doubt a near relative. Before the beginning of the revolt (about 367) he had formed connexions with Sparta and with Athens, which again stood at the head of a naval confederacy, and he was supported, at least indirectly, by both states. Accordingly, by the diplomatic intervention of Sparta, Autophradates and Mausolus of Caria were induced to raise the siege of Assus (in the Troad), into which Artobazanes had thrown himself. The satrap fell by the treachery of his own son Mithradates into the hands of the royalists and was crucified (probably about 365).¹

Mausolus (or rather, according to the inscriptions and coins, Mausollos, Μαυσόλλος), a native hereditary prince of part of Caria (probably 375-351),² had extended his

power tolerably far. These Carian potentates, who bore 376-358, the title of satraps, were in point of fact but little dependent on Persia, and were watched by the Persians with great mistrust. In their cunning and in the sagacity with which they profited by circumstances they recall the Macedonian kings of that period, whom they also resemble in their patronage—often perhaps ostentatious—of Greek art and manners. Mausolus appears to have once been in open conflict with his suzerain, but, though nothing definite is known on the subject, there is no doubt that he came off without serious harm.

Datames, satrap of Cappadocia, of Carian race, had rendered many good services, in particular he had reduced the nearly independent Paphlagonians once more to subjection to the great king.³ But at last he also revolted in league with Artobazanes. He was a man of great shrewdness and versatility, whose stratagems and adventures afforded much entertainment even to later generations. He long kept the king's troops in check, till he was at last treacherously murdered by Mithradates, son of Artobazanes,—the same Mithradates probably whom we found above betraying his father.

The command of the rebel forces was entrusted to Orontes, satrap of Mysia.⁴ From the confused accounts it is unfortunately impossible to determine whether he is identical with one or other of the persons of that name who are elsewhere mentioned. Further, we have no clear conception of the position which he occupied in the revolt, nor of the way in which he came to betray his comrades. We read, moreover, of the treachery of a less conspicuous confederate. The rebels had despatched Rheomithres to Tachos, king of Egypt, who sent them fifty war-ships and much money. Rheomithres summoned the commanders to a rocky fortress on the northern coast of Ionia, bound them, and delivered them up to the king.

In the year 361 Tachos actually assumed the offensive Tachos against the Persians. On his side he had once more of Egypt, Chabrias as leader of mercenaries, and the aged Agesilaus, officially sent by the Spartans, who were utterly enraged at the Persians because they had now, after the destruction of the Spartan power by Epaminondas, recognized the independence of Messenia, though in doing so they only carried out the letter of the peace of Antalcidas. But, when Tachos was engaged in Phœnicia, his nephew Nectanebus set himself up as rival king, and Tachos was obliged to take refuge with the Persians. If the Persians had been still energetic they would have used the opportunity, when the legitimate king of Egypt had fled to them and two claimants were struggling for the throne, to subjugate the country. But they did nothing of the kind, even when Chabrias had returned to Athens and Agesilaus had died on the way home (probably 360).

At the instigation of Parysatis Artaxerxes had married his own daughter Atossa. She used her interest of Ochus, to secure the succession for the energetic and violent Ochus, who is said to have promised to marry her; the Persian religion approved marriage not only with a sister but also with a daughter, and even with a mother. The elder son Darius was already invested with the succession and the royal title, but having engaged in a conspiracy against his father he was tried and executed, and Ochus, it is said, found means of getting rid of his other brothers, who stood in his way. Soon afterwards the aged Artaxerxes died after a reign of forty-six years (in the course of the year 358). Many stories are told of his mildness

¹ Xen., *Cyrop.* vii. 8, 4; Aristot., *Pol.*, 1312a; Herodotus, v. 9; *Διοδοσίτου*. He is to be distinguished from Artobazanes (about 362-357), ancestor of the kings of Pontus, who, however, seems to have belonged to the same house, and was probably heret to a district on the Propontus.

² See *Phryg.*, xxvii. 30, 47.

³ The Greek cities on the southern coast of the Buxus, which Xenophon about 400 found quite free, were again subjugated at this time. Datames extorted money in Europe, as he did also his (probably indirect) successor Armathes.

⁴ Diod., xi. 91. Mysia is not otherwise known as a satrapy proper. But at any rate Asia Minor was the scene of his exploits.

353-344. and affability, but, even if they are true, they have little significance. The contempt for his brother which Cyrus exhibited was perfectly justified; under the effeminate king the empire gradually fell to pieces.

Artaxerxes III.

But his successor, Ochus, who took the title of Artaxerxes (III), was of a different stamp. True, it is not perfectly certain that the great restoration of the empire is to be ascribed to his personal influence; it may be that the whole merit belongs to some of his officials, and that he only lent it his name, but it is much more probable that the initiative was his. He was, it appears, one of those great despots who can raise up again for a time a decayed Oriental empire, who shed blood without scruple and are not nice in the choice of means, but who in the actual position of affairs do usually contribute to the welfare of the state as a whole. At the very beginning of his reign he secured himself on the throne by a massacre of his nearest relatives, though no doubt the statement of Curtius (x. 5, 23) is exaggerated.¹ The judgment of the Greek writers on Artaxerxes III. was too much influenced by such deeds as found an historian in Dinon, as well as by the hatred of the Egyptians, whom he humbled and mortally offended; hence it was one-sided and unjustly unfavourable.

Defection of Artabazus.

But for a while the empire was in a state of absolute dissolution. Artabazus, satrap of the Hellespontine Phrygia, very probably a son of Pharnabazus and immediate successor of Ariobarzanes, had fought against Autophradates as early as 365 and been taken prisoner by him. At that time the Athenians had acted against him openly enough, at least towards the end.² But it is not clear how far Artabazus then rebelled against the king, who was father to his mother, Apama. But at the time of the so-called Social War (about 355) he fought against the king's satraps and was powerfully supported by the Athenians. Chares won for him a great victory over Tithraustes. And, when, at the king's threats, Athens left him in the lurch, he was able, being well furnished with money, to procure the services of the Theban Pammenes, and maintained himself for a long time. The turn in his fortune seems to have come from the Thebans also entering into an understanding with the king. About 350 we find Artabazus a fugitive at the court of Philip of Macedonia, and with him his brother-in-law, the Rhodian Memnon. However, after the subjugation of Egypt, Memnon's brother Mentor, who, like Memnon, was one of the most distinguished generals of his time, succeeded in procuring pardon for both, and thereupon Artabazus remained loyal down to the overthrow of the empire.

Revolt of Orotates

The revolt of Orotates (or Orotas) fell somewhat later. Probably he is the same whom we found above betraying his comrades. He may very well have received the rule over a wide coast district³ as the price of his treachery (see Dioid., xv. 92). He is mentioned in 354 by Demosthenes

(*De symmoris*, 186) as an enemy of the king. In 349/348 the Athenians formed an alliance with him. From the fragmentary inscription in which this is recorded it does not follow with certainty that at that time he was still in rebellion. About his end we know nothing, but perhaps he was removed after the restoration of Artabazus.

That from the outset Artaxerxes III. was believed to be a person of greater activity than his father may perhaps be inferred from the rumour current in 354/353 that the king was preparing a great expedition against Athens and Greece. Many Greek states may certainly have had a guilty conscience towards the king on account of their wavering policy and the purely mercenary support which they had repeatedly lent to rebellious satraps. Demosthenes warned the Athenians against taking up a hostile attitude to the king on the ground of mere rumours.⁴

The war in Egypt still went on. And now the cities of Phoenicia, previously so trustworthy, also revolted, and so did the kings of Cyprus. Even in Judea there must have been an insurrectionary movement. The revolted Sidonians showed such exasperation that we can hardly avoid the supposition that Persian rulers had wounded their religious feelings,—the sensitive side of Semitic peoples. The satraps Mazæus (Mazda) of Cilicia and Belesys of Syria were driven back by Mentor, whom Nectanebus, king of Egypt, had sent to the help of Tennes, king of Sidon. But, when the great king himself took the field at the head of a powerful army, which included 10,000 Greek mercenaries,⁵ Tennes and Mentor made terms. Sidon surrendered—though probably only after a severe siege—and was fearfully punished. More than 400,000 men are said to have burned themselves in Sidon on this occasion. The fate of the first-born of Canaan quickly brought the rest of the Phœnicians to their knees. At this time much blood was shed in Judea also, though we have only scattered notices of the fact.⁶ Mentor now went over to the king's side and fought against his former employers. It was to him and not to the Persian eunuch Bagoses that the king chiefly owed his success; but undoubtedly the royal presence contributed much to the result by facilitating rapid decisions and preventing dangerous jars. Mentor succeeded everywhere sowing dissension between the Greek mercenaries of the Egyptian king and the Persians, and even more by intimidation than by the sword Egypt was, after long independence, again made a Persian province (344).⁷ Artaxerxes seems to have made the "vix victis" thoroughly clear to the Egyptians, and to have treated even their religion with little more respect than Cambyses before him: temples were desecrated and sacred animals slaughtered. For a time the Egyptians had to satisfy their rage with nicknaming the king, after the unclean Typhonian beast, "ass." Cyprus, too, was again reduced. The enterprise was conducted by the prince of Caria, Idrieus, reduced. The Greek mercenaries were led by the well-known

¹ More distant relatives were left alive, as he who was afterwards Darius III. and his brother, Oxathres. A son of the Darius who was executed appears in Artaban, i. 16, 3 (334 B.C.). Thus the king did not extirpate even the branch that was most dangerous to him. It is to be remembered that even Alexander the Great, after ascending the throne, put several near relatives out of the way.

² Owing to the insistent nature of the foreign policy of Athens at that time—a policy too often influenced by the personal interests of the great captains of mercenaries—as well as to the shifting attitude of the satraps, it is impossible for us to form a clear conception of these events from the isolated statements of contemporaries (like Demosthenes and Aneias Tychicus) and later writers. It is to be observed that in these decades violent revolutions took place in some Greek cities under Persian influence, and that they even made war on each other. With the restless character of the Greeks such things were not to be avoided unless each town was occupied by a Persian garrison, which was certainly not the case.

³ There are coins ascribed to Lampiscus and to Clazomenæ bearing the name of an Orotas.

⁴ In the speech *De symmoris*. Similarly in the speech *De Rhodion xux Libertate* (191 sq.) he advises the Athenians not to offend the king frivolously (361 B.C.).

⁵ Though Diodorus and some statements of others we possess by exception fairly good information about these struggles.

⁶ Josephus, *Arch.* vi. 7, 1; by Eusebius's canon 1567 from Abr., and his copies, *Soliman*, xxiv. 4. The king at that time settled a number of Jews in Hyrcania. Judea was forcibly pacified, perhaps by Orophernes (or Olophernes), brother of the then satrap of Cappadocia. Orophernes distinguished himself in this war (Dioid., xxxi. 26); the assumption that it was he who reduced Judea would explain why in the book of Judith—mere romance though it is—an Olophernes appears as the wicked commander who fights against the Jews.

⁷ So Manetho, who makes Ochus reign six years in Egypt. In harmony with this we learn from Isocrates (*Phil.* 102) that in 347/346 Egypt was not yet subdued, while according to the letter of King Philip (Demosth., p. 160) in 340 the reduction of Egypt and Phœnicia had long been effected.

Athenian Phocion,¹ and with him was a pretender Evagoras, of the family of the famous Cyprian prince of that name.

Thus by force and policy the old state of the monarchy was restored in all the western lands. Mentor, the real conqueror of Egypt, was splendidly rewarded. He received the satrapy of the west coast of Asia Minor, and quickly removed by cunning and treachery Hermias, tyrant of Atarnens and the friend of Aristotle, who had concluded treaties like an independent prince² and stood in suspicious relations to King Philip of Macedonia. It has been already mentioned that Mentor procured the pardon of his brother-in-law Artabazus and his brother Memnon. It is not improbable that the bestowal of this province on the skilful general and diplomatist, and the restoration of Artabazus to his hereditary satrapy, may be connected with the attention which the king paid to the plans of the Macedonian, which were gradually disclosing themselves more and more. Of course no one thought of danger to Asia Minor, much less to the whole empire, but Philip's efforts to secure the mastery of the Bosphorus and Hellespont were enough in themselves to excite grave anxiety.

As early as 350 the story went that Philip had sent an embassy to the king,³ and it is definitely stated that he concluded a treaty with Ochus.⁴ The pacific intentions of the Persians, at least for the moment, were no doubt sincere; not so those of Philip, who had to subdue Greece before he could put into execution his designs on Asia Minor, a circumstance overlooked by the honest but politically short-sighted Isocrates in his exhortation to Philip to attack Persia (347/346). Probably Demosthenes was not alone in perceiving that the safety of Greece now lay in an alliance with the Persians against Philip. Negotiations went on busily between Athens and the king, who at all events sent subsidies repeatedly for the conflict with Macedonia. In the year 340 Persia interfered actively by rescuing, in conjunction with Athens, the town of Perinthus on the Propontis (and therefore close to Persian territory), which was besieged by Philip; and the Macedonians could perhaps with some right assert that with this step the war between the Persians and them had begun.⁵ But the Persians did not see, what to us is obvious from the result, that it was necessary for them to prevent the subjugation of Greece; or, if they saw it, they lacked the energy to act.

Artaxerxes probably did not reach the battle of Chærenea (August 338), which made Philip master of Greece. So far as we can judge, however, it was a great misfortune for the empire that this king, the first since Darius I. who had in person energetically conducted a great expedition and restored the empire, died just at this critical moment. Probably he was murdered by Bagoas, who placed Arses, the youngest of the sons of Artaxerxes, on the throne.⁶ But, when Arses was preparing (so it is said) to punish Bagoas, the latter put him and his children to death (335). We know nothing further of this king. Under his reign (spring 336) a Macedonian army first crossed into Asia, after Philip had previously caused himself to be nominated general of the Greeks against the Persians. The Macedonians gained some not unimportant successes, but the undertaking was checked in the very same year by the assassination of Philip. The commander Parmenio returned to Europe, and Memnon, who after Mentor's death commanded in these regions, probably won back from the

Macedonians nearly all their conquests in Asia, though it 344-333. is likely that Alydus, commanding the passage of the Hellespont, and perhaps one or two more strong places, remained in their hands.

In order to rule securely Bagoas placed on the throne, not Darius a near relation of the murdered man,⁷ but Codomannus,⁸ III. who reigned as Darius (III.), a great-grandson of Darius II., and a man of about forty-five years of age.⁹ But the king-maker was caught in his own snare, for Darius soon put him out of the way.

Over the last of the Achaemenians misfortune has thrown a halo of romance, but sober criticism can see in him only an incapable despot like so many whom the East has produced. It may be true that in earlier life, under Artaxerxes III., he once proved his personal bravery in the war against the Cadusians, and was rewarded with the satrapy of Armenia;¹⁰ as a king he always behaved like a coward in the moment of danger. Vast attempts and a shameful flight, feeble or rather effeminate behaviour combined with braggart pride, lack of intelligence, especially in the conduct of war,—these are features which fully justify Grote in comparing him with Xerxes. It is no reproach that he was not a match for perhaps the greatest general in history, but an Ochus would doubtless have made the task a somewhat harder one, and would scarcely have been guilty of the folly of beheading, in a fit of bad temper, so useful a man as the old condottiere Charidemus, who thoroughly understood the mode of fighting the Macedonians.

The history of Alexander the Great is given under the Alex- articles ALEXANDER THE GREAT and MACEDONIAN EMPIRE; under's invasion here we can only enumerate the chief steps in the downfall of the Persian empire. We see how great is the force of cohesion in such an empire, even after all the shocks it has received, and under an incapable ruler. What the giant powers of Alexander achieved in a few years might never have been accomplished at all by the qualities and resources of an Agesilaus.

After placing a terrible curb on the Greek love of freedom by the destruction of Thebes, Alexander crossed the Hellespont in the beginning of spring 334. A few weeks later, on the Granicus, he annihilated the great Persian army which should have barred his onward march. Sardis, the capital, at once fell into his hands. Here, for the first time, we see the miserable spectacle of a high Persian officer going over to the enemy and surrendering to him the town or district committed by his king to his charge. At the beginning of winter the whole coast as far as Pamphylia was Alexander's; Miletus and Halicarnassus were the only places which he had had seriously to besiege, and it was only the narrowly-enclosed citadel of the latter town which yet withstood all attacks. But there was still a great danger. The Rhodian Memnon, who had been joint-commander at the Granicus, undertook with all his might to kindle a conflagration in Alexander's rear, and to force the king to cross over to Greece. The Persian fleet, which he commanded, ruled the sea; several of the most important islands were occupied; and from the Greek mainland thousands of patriots were looking for Memnon's arrival in order to rise against the Macedonians. But Memnon died suddenly. The death of this man, his only worthy adversary, is perhaps the greatest of those pieces of luck which so highly favoured the great Alexander. His successor Pharnabazus, son of Artabazus, continued, it is true, the naval operations, but he was not able to carry out Memnon's plans. Meanwhile Alexander secured

¹ Diod., xvi. 42; the sources from which our biographers of Phocion (Plutarch and Nepos) draw did not mention this fact, which does not accord very well with the pattern of philosophic virtue which they make out Phocion to be.

² On the treaty with Erythrae, Le Bas and Waddington, No. 1535.

³ Demosth., *Phil.* I., p. 64.

⁴ Arrian, II. 14, 2.

⁵ Arrian, II. 14, 5.

⁶ In Plut., *De fort. Alex.*, p. 386 sq., he is called Oerses. The Persian form of the name is not known.

⁷ We read of a son of Ochus in 330 (Arrian, III. 19, 4). We had above a grandson of Artaxerxes II. Thus Bagoas had not killed all "the brothers" of Arses, and the king's family was not extinct, as Diodorus asserts (xvii. 5).

⁸ The name is given only by Justin (from Diod.), x. 8.

⁹ Arrian, III. 22, 8. ¹⁰ Justin, I. 4; Diod., xvii. 8.

333-331. the most important parts of Asia Minor, and then set out on his forward march. At the farthest extremity of Cilicia Darius in person met him at the head of a huge army, but the field of battle was so badly chosen that the numerical superiority of the Persians did not come into full play. The brilliant victory of Issus (about November 333) and the flight of Darius threw wide regions into the power of Alexander, who, with all his daring, was also cautious, and did not follow the Persian king in his flight into the interior. He sought first to make himself master of the whole Phœnician coast, in order to cut off from the Persians every possibility of annoying him any longer at sea. And in reality the fleet, which was chiefly furnished by the Phœnicians, melted away when Alexander had taken possession of their country. The Cyprian ships, too, returned home, and Cyprus also submitted. But Tyre withstood the great conqueror for seven months¹ (333), and had to pay a dreadful penalty for its resistance. Gaza, too, defended itself bravely. Egypt welcomed exultingly the Macedonian who freed them from the hated Persians. After the acquisition of Egypt Alexander possessed a territory large and strong enough to be able to survive, if need be, a reverse. In the spring of 331 he left Egypt and marched through Syria and Mesopotamia to Assyria proper, where Darius awaited him at the head of vast masses of troops, and this time in a favourable position. But on 1st October 331 Alexander defeated the king at Gaugamela so decisively that henceforward the Persian empire, as such, was shattered. Darius fled to Media. Without striking another blow Alexander captured the capitals, Babylon and Susa, with their vast treasures. In vain the wild independent Uxians (better "Huxians") barred a difficult mountain-pass against him, in vain did a Persian army do the same. He quickly forced a passage through the mountains and marched into Persia proper. Pasargadae and Persepolis, the cradle of the monarchy, were his. Persepolis, in the immediate neighbourhood of which another conflict took place, was given up by him to his soldiers to plunder; the royal palace he caused to be burned.² In this act we discern, in opposition to the usual view, a well-considered measure, excellently calculated to work upon the Asiatic mind. The burning of the royal castle was meant to show the Asiatics that their empire was utterly overthrown, and that Alexander was their only lord. Besides the Greeks might see in the step an act of vengeance for the destruction of the Greek temples by Xerxes, as the official phrase ran.

Thereupon Alexander hastened to Media in pursuit, once for all, of Darius. The latter fled eastwards. He had still a considerable army with him, but only the Greek mercenaries were absolutely true to him, like the Swiss guard to Louis XVI. At last Bessus, satrap of Bactria (and Sogdiana apparently), seized the person of the king, in order either to make use of him for his own ambitious purposes or to put him out of the way. As a matter of fact, he murdered him in Parthia, just when the pursuing Alexander had nearly overtaken him (July or August 330). Such was the melancholy end of the last of the Achaemenian great kings.

Bessus thereupon hastened into his satrapy and assumed the title of king and the name of Artaxerxes (IV). We know that he was a "kinsman" of Darius, perhaps in his case this means more than that he was merely connected with him by marriage, and this satrap of Bactria

¹ The resistance of the Tyrians is certainly not explained by their attachment to the Persians, scarcely either by their love of freedom. We suspect here again a religious motive. Alexander desired to offer sacrifice in the temple of Hercules, and probably the pious Cassandres would as little allow this as the Jews would have permitted any foreign ruler to enter their temple.

² Cf. the article *Pasargadae*.

may have actually belonged to the race of the Achaemenians, like his predecessors the princes Masistes and Hystaspes. It would thus be more easy to explain why various grandees favoured his undertaking, and why he was recognized as king, e.g., by the satrap of Arna (the district of Herat), and vigorously supported. That he enjoyed the royal title for some time is due only to the circumstance that Alexander first made himself securely master of eastern Iran before he marched into Bactria and Sogdiana. After many adventures Bessus fell into Alexander's power on the farther side of the Oxus, and was put to death.

After the return from India the satrap of Media conducted in chains to Alexander a certain Baryaxes, who during Alexander's absence had declared himself king of the Persians and Medes. Of course he was executed. He is said to have been a Mede, not a Persian. Certainly his movement had never even a momentary importance, he is only once mentioned (Arrian, vi. 29, 3). But such last throes of a mighty monarchy are, after all, worthy of attention.

Literature.—Rawlinson, *The Five Great Monarchies*, vols. ii., iii. (2d ed., London, 1871), gives a useful account of the Mælo-Persian history down to Alexander, as does also vol. vi. of Fr. Spiegel's *Græciæ Antiquitatis* (Leipzig, 1878). Neither work is exhaustive, and in both we frequently miss true historical criticism. For the time down to Xerxes Ducauck's *Geschichte des Alterthums*, vol. iv (6th ed., Berlin, 1880, Eng. tr. by Abbot, 1877-83), is recommended by its very careful use of all the sources and its acute mode of combining them, though the latter quality often leads to somewhat arbitrary construction. Owing to the close contact between Persian and Greek history the latter works on the latter are obliged to cover much of the same ground as the former. In this department Grote's *Griechen* is to be named above all, unfortunately at the time he wrote it was not in his power to make use of the important Persian inscriptions.

(THE N.)

SECTION II.—GREEK AND PARTHIAN EMPIRES.

After the decisive battle of Gaugamela (331 B.C.) Alexander proclaimed himself king of Asia.³ He never accepted the compromise recommended by Parmenio, which would have left to the Persians the upper satrapies east of Mount Zagros, and established a sharply-marked natural and ethnographic frontier. Soon a symbolic act, the burning of the palace of Persepolis, announced to the Asiatics that the Achaemenian monarchy was dead, and that Alexander claimed its whole inheritance. The punishment of Bessus, exactly modelled on that inflicted on pretenders by Darius I., showed that Alexander claimed to be the legal heir of the Achaemenians. Bessus's ears and nose were cut off, and he was brought to Echabata for execution before the assembled Medes and Persians, for "this Bessus lied and said, I am Artaxerxes king of Persia."

After Alexander had by his rapid and effective movements taken actual possession of the whole empire, Media was swiftly traversed, but the eastern frontier was not subdued and secured so easily. Crossing the mountain wall that separates the southern margin of the Caspian from the rest of Iran, Alexander received in person the homage of the coast-lands. Khorasán and the region of the Oxus were traversed by his armies in all directions; from Bactria the march was obliquely through Sogdiana to the Jaxartes on the farthest limits of the empire, and an onslaught was even made on the Scythians beyond that river.⁴ Alexander was determined to secure a frontier so important for the trade of Central Asia, and to free the peaceful industry of Iran from the incursions of its here-

³ Pint., *Alor*, 34, 37, does not prove that there was another, still less a preferable account of the date of this occurrence.

⁴ There perhaps occurs the first trace in history of the Turkish race. Oathassa, the brother of the Scythian king in Curtius (vii. 7, 1), may be, as Nöldeke observes, Turkish *karišmshy*, "his brother," from *dāsh*, of which *dāsh* is the older form.

Over-throw of Persian empire

Bessus

the conquest

ditary enemies the Turanian nomads. Prestige rather than material advantage was gained by the rapid fall of the supposed impregnable rocky nests of Arimazes in Sogdiana, of Chorienes or Sisimithres in the mountain region of the upper Oxus,¹ and, above all, of the Indian fortress Aornus. Though usually clement to the conquered, Alexander was terrible to those who rose against him—to the Arians, for example, and to the strong cities that headed the insurrection in Sogdiana; when the movement was crushed, he laid the land waste far and wide and slew all the males; 120,000 Sogdians are said to have thus lost their lives. Alexander too, like Caesar, did not shrink from a breach of faith if it served his purpose; this was seen in the massacre of the Indian mercenaries who had defended Massaga, which was meant to spread terror before him as he entered India.² The Achemenian power at its climax had never crossed the Indus; Alexander passed the river and pushed into India proper. This adventurous march was undertaken wholly for the sake of prestige, and was specially meant to impress the imagination of the Greeks, to whom India was a land of marvels. Alexander proposed to reach the Ganges and the ends of the habitable earth; and it was sorely against his will that his own soldiers forced him to confine his plans to the rational scope of securing the Indus as his frontier and adding to his realm its commercially important delta.³ Alexander had now accomplished what, in the eyes of the Arian peoples, was necessary to give the last stamp of legitimacy to the new empire; he had led his armies round all the frontiers and taken personal possession of his lands. To close the circle he had still to march back through Gedrosia and Carmania. But it may well be doubted if he would have faced this last exploit had he known beforehand the full terrors of the burning desert; not a fourth part of the forces that began the march from India survived a journey which has been fitly compared with the retreat from Moscow.

A series of minor expeditions completed the work of the great campaigns by reducing a number of mountain tribes, which had shaken off the weak yoke of the Achemenians, exacted tribute at the chief passes, and in their irremediable savage habits of plunder were like the modern Kurds, the born foes of the Iranian peasant. Such were the Uxians, the Mardians in Persis, and the people of the same name to the south of the Caspian, and finally the Cosseans, whom Alexander disposed of in his last campaign in forty mid-winter days. The future obedience of these brigands was secured by planting fortresses at the most difficult points of the roads, and they were compelled to settle down and take to husbandry.⁴

These vast results were only obtained by the aid of continual fresh levies in Europe, and strong garrisons had to be left in the conquered lands. Alexander's work could not last unless the European occupation became permanent; and therefore he planned a great network of new cities, in which colonies of Greek or Macedonian soldiers were planted. According to Plutarch (*De Alex. fort.*, i. 5, p. 328 F) more than seventy cities owed their origin to Alexander; some forty of these can still be traced.⁵ In Media, in the Cossean neighbourhood, and in Carmania we

know only two by name, though we are told that in the 331-323. first two districts there were really a large number of such towns, seemingly inconsiderable places. In the east of Iran the settlements were more important, and twenty-six can be enumerated in Aria, the country of the Paropamisus, Bactria, Sogdiana, India, and the land of the Orizæ.—Bactria and Sogdiana alone claiming eight of these.⁶ The composition of these settlements is illustrated by the details given for Alexandria in the Indian Caucasus; according to Diodorus, the city and one or more minor settlements within a day's journey of it received 7000 barbarians, 3000 camp-followers, and as many of the mercenaries as volunteered to stay; but Curtius, who certainly reproduces the common source more accurately than Diodorus, names 7000 Macedonian veterans and a number of mercenaries whose engagement had expired. The Greek element in this colony must have been large, for the town still keeps its Greek name (Alasadda) in an Indian book of the 4th century A.D. Alexandria on the Tanais (Jaxartes), again, was partly peopled by Sogdian insurgents, forcibly transplanted from their homes, which the conqueror had destroyed. Some of Alexander's last orders refer to the founding of cities and the transplanting of Europeans to Asia and Asiatics to Europe, a measure designed to promote the assimilation of all parts of the empire. Macedonia alone did not suffice for this gigantic scheme of colonization, and it was chiefly Greeks who were planted in the most eastern satrapies, in Bactria and Sogdiana. At such a distance from home the Greeks could have no other interest than loyalty to Macedon; it was the same policy as dictated to the Romans the establishment of Latin colonies in their new conquests. But the antagonism between Greeks and Macedonians was too great to allow the former to forget that they were, after all, really men deported by the great king (*ἀνέροισι*); and so even from the first there were seeds of discord between them and the rest of the empire.

Alexander's capital was Babylon, the natural centre of Satrapies an empire that embraced both Iran and the West, and recommended also by its command of the great lines of international traffic, and by its historical traditions of empire. The Achemenian system of satrapies was retained; kingships were left only in the exceptional case of India.⁷ The satrapies of the upper country seem to have been fourteen: Persis, Parætacene, Carmania, Media, Tapuria with the Mardian country, Parthia with Hyrcania, Bactria, Aria with Drangiana, Gedrosia with the Orizæ,⁸ Arachosia, the Paropamisus country (which probably was quite independent under the later Achemenians, and was first placed under a satrap by Alexander), India on this side the Indus, India beyond the Indus (from the Bactrian frontier to the confluence of the Indus and the Acesines), and beyond this the province of the lower Indus extending to the sea. The last three satrapies were also new. Alexander retained the old satraps of Darius in three provinces; in Parætacene and Tapuria it would have been impossible to drive the old rulers from their mountains without a tedious campaign, and in Aria Satibarzanes was confirmed in his post to detach him from Bessus. But in all three

¹ The last two places are identical. All the sources know only two fortresses taken by Alexander in these regions: those which mention Sisimithres omit Chorienes and vice versa; and the essential points are the same in Arrian (iv. 21) and Curtius (viii. 2, 19-33).

² Diod., xvii. 84. The official Macedonian account in Arrian (iv. 27) ignores the treachery.

³ As the Greeks then knew India only from Otesias, whose geography is of the vaguest, Alexander probably under-estimated the vast size of the peninsula.

⁴ Arrian, *Ind.*, 40, 8.

⁵ See the careful enumeration in Droysen, *Gesch. d. Hellenismus*, 2d ed., vol. iii. pt. 2, p. 187 sq.

⁶ Strabo, xi. p. 517. Alexandria on the Tanais and twelve other towns are spoken of by Justin (xii. 5, 16), but xii. is perhaps a corruption of vii.

⁷ Oxyartes is sometimes called king by a mere inaccuracy. Dextipus, ap. Phot., cod. 82, p. 64, b. xxii. (Bakker), makes Alexander give Orypius the *ὑπερβασιλῆα* position. The geographical order, and the fact that Sogdiana has been mentioned before, demand the correction *ὑπερβασιλῆα*, and for *καὶ οὐκ* we must read *καὶ οὐκ*; see Justin, xii. 4, 14. Orypius was the successor of Abolites. The province seems to have been officially designated a kingdom, but that does not make it govern a king.

⁸ This province was perhaps formed by Alexander; it was afterwards joined to Arachosia.

331-323 cases the old satraps were superseded on the first opportunity. Most new appointments, however, were given to Persians; at first there were Macedonian satraps only in rebellious Arachosia, Gedrosia, and the three new Indian provinces. This policy helped the subjects to fall in with the new rule, but on second appointments Macedonians generally took the place of Persians, and at Alexander's death there were Persians only in Media (from which Artogates, as the sequel proved, could not have been removed without a fight), in Parthia, and in the Paropamisus, which was held by Alexander's father-in-law. The power of the satraps was considerably reduced, in Parthia, Aria, and the Paropamisus there seems to have always been a Macedonian resident (*ἐπιτοκός*) beside the satrap, with the control of the military. Indeed in all the provinces the command of the forces seems to have been separated from the office of satrap, though it was not always entrusted to a single officer. The satraps also lost the right to engage mercenaries and to coin, and in the western countries, of which we know most, a single officer—always a Macedonian—was sometimes charged with the tribute of several provinces. Perfect order and an exact definition of the functions of every officer could not be attained from the very first, yet even in this period of transition the finances of the empire improved. At Alexander's death 50,000 talents (£11,288,515) lay in the treasury, and the annual tribute was 30,000 talents, or six and three-quarters millions sterling. What was of more consequence, the treasures of the East were no longer hoarded in the old Oriental fashion, but put in circulation and applied to a number of great and useful enterprises. Such were the exploitation of the course and mouths of the Indus, the voyage of Nearchus, which opened the sea-road between the Indus and the Euphrates, the restoration of the trade of Babylon by removing the weirs which obstructed navigation, and by works on the canals and the Pallacopas; the attempt to discover a sea-way round Arabia, in which Hiceto of Soli explored the east coast of the peninsula; and the commission given to Heraclesides for exploration of the Caspian.

Alexander sought to assure the permanence of the empire by fusing Greeks and Persians into one mass. Thirty thousand Persians, the so-called *ἐπὶ νόμοι*, were armed and disciplined like Macedonians, and Persians were received on equal footing in the Macedonian corps and even, to the disgust of the Macedonian nobles, in the *corps d'élite* of the cavalry, in which the latter served. Macedonia, in truth, was not populous enough to keep the *cadres* full. Alexander adopted the regal robes of Persia and the regal state. The court was served by eunuchs, and men kissed the ground before the great king. It was a strange sight for Hellenes when a poor wretch from Messene was ordered to execution because he had inadvertently sat on the kingly throne.¹

To the Greeks a union with a barbarian was no regular marriage; but the Bactrian Roxana was Alexander's queen. His friends were urged to follow his example; eighty of his courtiers married Persians on the occasion of the great wedding at Susa, and 10,000 soldiers who had chosen Asiatic wives received gifts on the occasion. Still more startling was the introduction of polygamy, the king took a second wife, Statira, daughter of Darius, and a third, Parysatis, daughter of Ochus.

All this was Persian fashion; but when Alexander claimed divine honours as the son of Jupiter Ammon he asked both Persians and Macedonians to adopt from the Egyptians the most perfect model of devout submission to their sovereign. Could this compound of nationalities prove more than a kingdom of iron and clay? The answer

lay in the attitude of that part of its subjects which still retained a vigorous life. The western nations, long schooled to slavery, were passive under the change of rule. The Persians, too, and all western Iran acquiesced after the first conflict was decided. In the east it was not so. Here the northern province of Chorasmia had been independent of the later Achemenians, and its kings had ruled the great plains as far as the north-east slopes of the Caucasus.² Bactria, Sogdiana, Aria, Arachosia, Diangiana, and the borderlands towards India had obeyed Persian satraps, but Bessus and his partisans did not forfeit their allegiance by the murder of Darius. These eastern Iranians, who had no close connexion with Persia, opposed the most obstinate resistance to the conqueror. The Arians rose again and again, and an energetic chief like Spitamenes could always stir up a party in Sogdiana. These risings began in the castles of the numerous chieftains (*ἐπαρχοί*), but it was a national spirit that made them so obstinate and bloody, the Iranians of Sogdiana and Bactria had acquired in their constant wars with the Turanians a sense of self-respect which the effeminate Medes and Persians wanted. Their situation, too, favoured their resistance, for their ancient enemies in the desert had a common interest with them in opposing a strong central government, and were easily persuaded to lend them succour or shelter. Sacæ and Dahæ fought for Bessus, and Spitamenes found refuge with the Massagætes, the wilderness offered a retreat where regular troops could not follow, and from which a petty warfare could always be renewed. In India the Brahamans had been the soul of a still more vigorous resistance, they preached revolt to the rajahs of the lower Indus, and were the object of Alexander's special severity. Eastern Iran was the cradle and always remained the chief support of Zoroastrianism,³ and religion must have had its part in the patriotic resistance of Bactria and Sogdiana. Alexander forbade the practice of throwing the dying to the dogs (Onesicritus, ap. Strabo, xi. p. 517), which the Bactrians certainly took from the *Avesta*, and this was just the kind of decree which drives an Oriental people to desperation. The Macedonians did pay some attention to Iranian thought; a magian Oshanes is said to have been in the train of Alexander, and Theopompus, a contemporary of the conqueror, shows the first traces of acquaintance with the *Avesta*. The Persian tradition that Alexander burned the twenty-one *nosts* of the original *Avesta*, and that only one part of the holy book was subsequently recovered from memory, is of course not historical, but it rests on a very true feeling that the new order of things was at irreconcilable war with the old faith.⁴

Alexander desired to fuse the Greeks and barbarians Alexander together, but the practical means directed to this ideal under- am were such as brought him into conflict with the natural failure leaders of the new state. By asking the Greeks as well as the barbarians to worship him as divine he destroyed the whole effect of the theatrical arts in which he was a master, and by which he hoped to recommend his mission as an eminently Hellenic one to the masses; even Callisthenes, the enthusiastic herald of the new era, was bitterly undeceived, and, turning against Alexander, fell a victim to the despotism of the man who had been his idol. But, what was still more fatal, the net result of his efforts at a fusion of races was not to Hellenize the Persians but to teach the Macedonians to exchange their old virtues for the effeminacy and vices of the East. It is not fair to say that if the Macedonians had possessed a riper civilization they

² So in the Middle Ages Khârenm and Kipchak stood under the same sovereign, and were not included in the realm of Juggan.

³ Sumatres's wife was his own mother, a union which the *Avesta* specially approves.

⁴ See Spiegel, *Z. D. M. G.*, ix 174.

¹ Plut., *Alex.*, 78.

might have resisted the foreign influence, their numbers were too small, and Alexander pushed his plans too hastily and with too exclusive regard to surface-effect, to make any other issue possible. Nay, Alexander wished to have it so, and there was no surer path to his favour than to wear a Persian coat and talk broken Persian like the scheming Peucestas. Alexander liked Oriental splendour and the Oriental ceremony which placed an infinite distance between the king and his highest subjects; great statesmen generally love to be absolute, and Alexander enjoyed Oriental despotism and mechanical obedience much more than councils of state and discussions of policy with the Macedonian soldier-nobility, whose sturdy independence was always asserting itself, and whose kings, unless in virtue of great personal qualities, had never been more than *primi inter pares*. Then, too, Alexander, in the splendour and magnitude of his conquests, lost touch of the movements that were going on at home. The true task of Macedonia in the world's history was to unite Greece under its hegemony,—a task clearly marked out, and one which Philip had pursued with masterly skill. But the completion of this task called for a modest and unsensational line of action quite foreign to Alexander's spirit; Antipater's hard-won victory at Megalopolis, but for which his father's war would have fallen to pieces behind him, was received with a characteristic sneer on the war of mice which seemed to be going on in Arcadia.¹ Philip's old generals judged otherwise and judged better; it was not blindness to the conqueror's genius, but a just perception of what was practicable and desirable, and an instinctive dread of the unknown issues of the king's plans, which gradually estranged from him his truest councillors, and it was an evil sign that his only close friend was a poor creature like Hephæstion, who could not boast of a single service. Then came the first conspiracy and the murder of the aged Parmenio, whose son Philotas was mixed up with it,—a crime to which Alexander was led simply through fear. The wild extravagances of grief that marked the death of Hephæstion, and of which a pyre worth two and a half millions sterling was the least, show how Alexander lost himself more and more as he broke with the Macedonian character. His last orders, cancelled at his death by Perdicas, included an invasion of Carthage by land and sea, with a further view to Spain, and the erection to King Philip of a tomb surpassing the Great Pyramid. The extravagance of these plans was as palpable to the Macedonian soldiery as to their leaders, and they too shared the growing alienation from the monarch. There were mutinies as well as conspiracies; the soldiers were tired of following from adventure to adventure, and at the Hyphasis they had their way. In his later days Alexander was repeatedly wounded, a fact significant of a change in the spirit of the troops, for no great general would expose himself as Alexander did—for example, in storming the city of the Malli—unless his men required this stimulus.

The want of coherence in the empire was seen even while Alexander was in India. Many satraps broke all restraint, renewed the old oppressions of the Persian time, hired mercenaries again, and only awaited a fit moment for open rebellion, the generals of the army that lay in Media committed sacrilege and crimes of every kind, the treasurer Harpalus violated his trust and escaped with his plunder. Alexander, on his return, soon restored order with terrible severity, but the ferment was still at work, especially in the west, and was increased through the disbanded mercenaries of the satraps who returned to the coast. There is one event of the time of anarchy when Alexander was in India which, though passed over in the official sources of Arrian, deserves special notice as a pre-

¹ Flut, *Agésil*, 15.

lude of what was to come (326 B.C.). The Greeks settled 331-312. in Bactra and Sogdiana rose against the Macedonians on a false rumour of Alexander's death. Three thousand of them seized the citadel of Bactra, gained the support of the natives, and, crowning their leader Athenodorus, proposed to make their way home. Athenodorus was assassinated, but his followers remained unmolested, and joined the mass of their countrymen in the general rising of the Greek military stations after Alexander's death.

One Macedonian custom Alexander had retained, that of carousing with his generals. A series of debauches in the malarious climate of Babylon brought on a violent fever, which ended in his death (13th June 323).² The object of his life, the fusion of Macedonians and Persians, was not attained. The Persians still felt themselves subject to a foreign power, and in eastern Iran this feeling was bitter. The Macedonians again had been carried by Alexander's genius far out of their true path of development into a giddy career, in which a capable and valiant nation found its ruin. Alexander did not die too soon, if he was not to see the collapse of his work.

Terrible civil wars broke out at once on Alexander's death, and lasted almost unbroken for forty-two years, tearing his work to pieces, and scattering to the winds Macedonia's claims to universal empire. There was no legitimate heir, but the name of "king" was borne by Philip (323-317), a bastard of the elder Philip, and by Alexander II, Alexander's posthumous son by Roxana (323-311). The real power lay at first with Perdicas, who as regent governed the whole empire from Babylon, and, after Perdicas was killed in a mutiny in the Egyptian campaign of 321, passed for the moment to Pitho and Arrhidæus, till in the same year the regency fell to Antipater. As he ruled from Macedonia, the eastern satrapies were pretty much left to themselves, but Pitho, who held the chief of these—that of Media—took the first place, and soon appears as strategus of all the upper satrapies. But his ambition united the satraps against him, and he was driven not only out of Parthia, which he had occupied after murdering the satrap Philip, but out of Media too. The satraps now joined hands with Eumenes and placed themselves under his leadership when he came to Susa in 316 as the king's strategus at the head of the argyraspidæ. Pitho had meantime fled to Seleucus, satrap of Babylon, and with him sought help from Eumenes's great enemy, Antigonus. A war in Media and Susiana ensued, and Eumenes, whose military successes were constantly frustrated by disobedience and treason in his followers, was betrayed to Antigonus and put to death in 315. Antigonus, already furnished with a commission as strategus from Antipater, now lorded it over all. Pitho, still greedy of power, and thinking of conspiracies to recover it, was executed; the Persian satrap, Peucestas, who had led the allies against Pitho, was superseded, and Seleucus fled to Ptolemy. Soon, however, the Seleucus other potentates united against the threatening power of Antigonus, and in the war that followed Seleucus, with some help from Ptolemy's soldiers, repossessed himself of his satrapy of Babylon,—an important event, which forms the epoch of the Seleucid era (1 Sel. = 312/311 B.C.). Presently a victory over Nicanor, who held Media for Antigonus, made Seleucus master of Media and the adjoining provinces. Antigonus had still some temporary successes, but at the end of the war Seleucus was acknowledged lord of Babylonia and the upper satrapies.

In these conflicts we can distinguish two main interests, represented by the cavalry and the infantry, or, what is

² The exact date in our calendar, which cannot be calculated from the Macedonian date 27 or 29 Dæsius, is found by the aid of Pseudo-Callisthenes (Cod. A in C. Müller's ed., p. 151; *Arm. fr.* in Zacher, *Pseudo-Cal.*, p. 100).

812-280. the same thing, by the higher and lower nobility respectively. The former fought for the unity of the realm of Alexander, the latter for the national traditions of Macedonia. In the first years the mass of the army made its wishes very distinctly felt, e.g., in the rising against Perdicas, even the *esprit de corps* of a single body like the *argyraspi* had often a decisive influence on general politics. The fall of Perdicas was really the end of the Perso-Macedonian empire founded by Alexander, as was made manifest by the fact that Babylon ceased to be the capital, and Antipater with the kings passed into Europe. On the ruin of Alexander's political structure the ruin of his house directly followed, all the political and military talent of Eumenes, its one sincere defender, could not avert the catastrophe, for Eumenes, who as a Greek was always looked on with suspicion, soon fell a victim to Macedonian jealousy. With him the kingship really came to an end, though the empty name of it lasted a little longer. The later conflicts have a different character, a certain number of leaders had risen gradually above the mass of the officers, attaching to their parties the less prominent men, and it was the conflicting interests of these leaders which were now represented in politics and war. Last of all, the particular interests of the subject provinces came to find expression in the conflicts of their chiefs, and the signal was given for the formation of distinct kingdoms. In the wild struggles for supremacy the last remains of Macedonian loyalty disappeared, when we are told that the strategoi and satraps of the upper provinces were still faithful to the royal house, and that Antigonus, as late as 315, counted on it in making war against Cassander, the loyalty can hardly be regarded as a genuine sentiment, but was merely a cover for the pride of chieftains who were willing to acknowledge a distant and merely nominal sovereign, but not to obey men who had lately been their equals. And in truth the sentiments of the upper satrapies were of little consequence. The power to give them effectual expression was lacking, and these lands, till much later, received all their political impulses from the west.

To make up for this, Iran was little touched by the civil wars; only Media and Parthia were seats of war, and that for a short time. Among the satraps Peucestas of Persia, Tlepolemus of Carmania, and Stasanor of Bactria are represented as good rulers, beloved by the natives; when Antigonus deposed Peucestas, a Persian notable told him to his face that the Persians would obey no one else, and lost his life for his frankness. Antigonus's realm was less than Alexander's by Egypt, Syria, Thrace, and Macedonia, and the tribute from it was 11,000 talents (two and a half millions sterling). The ordinary taxes, therefore, had not been raised, but Antigonus raised special war-taxes also, 5000 talents at one time in Susiana and as much in Media.

The list of satrapes at this period is known from the records of the partitions of Babylon (323), Tipasaebus (321), and Persopolis (315). There were twelve upper satrapies, Persia, Carmania, Great Media, Lesser Media, Parthia with Hyrcania, Bactria with Sogdiana, Arna with Diangiana, Arachosia with Gedrosia, the Paropanisadae, India from the Paropanisadae to the Indus, India between the Indus and Hydaspes, India on the lower Indus with Pattala. Of Alexander's satrapies we must Parthia, included in Persia, and Tapura, which Alexander himself seems to have joined to Parthia. The only new satrapy is Lesser Media. It was thought proper to place Media, the most important Iranian province, in the surer hands of the Macedonian Pitho, son of Cisteasus, but the north-west part of the province was left to the old satrap Atropates, whom Alexander had sent to Media in 328. He was father-in-law of Perdicas, and so claimed consideration, but probably he could not have been displaced if it had been tried! At the new division on

¹ On Atropates see Arrian, iv. 18, 3, and Pseudo-Call. in O. Müller, p. 149, where after *Ἰνδῶν* read *Ἀρσάκων* *Ὀβόδρον* *μεταρρίθην* *ἀπὸ τῆς Μηδίας*. His connections in north-east Media are illustrated by the fact that he had with him at Gaugamela Cadusians, Albanians, and Sacians.

the death of Perdicas (321) Pitho was confined in Media as far as the Caspian Gates, but nothing is said of Lesser Media, which was really no longer part of the empire. Thus Atropates was the founder of a small separate kingdom, which thereafter continued to bear his name, in Greek Atropatene, in Arabic and Persian Athlath-Athropa, Athpalakan. It was never a very important state, but is with notice as the first new native realm within the empire of Alexander and the first symptom of the Iranian reaction against Hellenism.

Except in the case of Media the partition of Babylon made no change in the holders of the upper satrapies. So we are expressly told (Curt. x. 10, 4, and Just. xii. 4, 19, where for *ulterior* read *ulteriorque*), and the apparent exceptions to the principle are perhaps merely due to our ignorance of previous changes. The most remarkable of these is that Pitho, son of Agenor, who under Alexander shared with a Persian the satrapy of the lower Indus, is now found in India Citeior in room of Nicanor, while his old satrapy has fallen to no other than King Porus.² We may be sure that the Macedonians sanctioned this extension of the power of the Indian king only because they could not help it, and it is probable that Porus had usurped the province in the troubles that broke out in India as soon as Alexander left it in 326 (Arr. vi. 27, 2). Thus one more province was now only nominally attached to the empire. Porus, indeed, was assassinated through Macedonian intrigue between 321 and 315, but the country never again came permanently under their power.

The partition of 321 was less conservative. Nicanor was removed from Asia to Bactria, and Philip from Bactria to Parthia, superseding Phathaphanes. These changes had probably some connexion with the rising of the Greeks in Bactria and Sogdiana after Alexander's death. No Persian satraps now remained except Atropates and Oxyartes, who had connections by marriage with the conquerors. Antigonus, to please the natives, changed this policy, and even put the Media Orontobates in the great province of Media, but he returned at the same time to Alexander's policy of limiting the satraps' power. We hear nothing of strategoi in the satrapies from 321 to 315, so it is probable that Perdicas and his immediate successors had allowed the satraps to hold also the military command in their provinces. Antigonus again appointed strategoi, who were always Macedonians.

In a time of civil war it is not surprising that the old disorders of the Achaemenian period reappeared. During the wars of Eumenes and Antigonus the Uxians and Cosseans again appear as independent, and as plundering travellers. But a much more serious outbreak was that of the Greek settlers in the north-east against the Macedonians. On the news of Alexander's death in 323 the military colonies rose under Philo, the *Ænian*, and with 20,000 foot and 3000 horse attempted to fight their way home. They were met by Pitho, governor of Media, and defeated by an inferior force through the treachery of one of their chiefs. Pitho granted them terms if they would lay down their arms and return home, but the Macedonians refused to respect the convention, they knew Perdicas had ordered the extermination of the rebels, and, falling on the disarmed foe, they massacred them and divided their spoil.

Such a catastrophe could not fail to embitter the relations between eastern and western Iran, between Greeks and Macedonians. It is hardly accidental that the only notice we have as to how Seleucus Nicator (reigned 312-280) came into possession of the upper satrapies is that he subdued Bactria by force of arms. To his Asiatic subjects Seleucus appeared as a king from the first, officially, and among the Greeks, he received this title only in 306. His first care was directed to India, where, probably during the wars of Eumenes and Antigonus, the Macedonian officials had been slain and obedience transferred to Chandragupta, founder of the Maurya kingdom. Seleucus crossed the Indus, but Chandragupta obtained peace on favourable terms, giving Seleucus five hundred war-elephants, but increasing his dominions by the parts of the Paropanisadae, Arachosia, and Gedrosia, that lay towards

² The hypothesis that Atropatene was an important place as a refuge for the fire-worshippers has no other basis than a false etymology, *Attharheydan* = *Parthland*. It became important politically only in the later Middle Ages, when it was the gateway of the Turkish migration westward and received a Turkish population.

³ This is certain from Arrian, ap. Phot. cod. 92, p. 71, b. xl. (Bekker), where Pattala is said to have obeyed Porus.

the Indus. The kings swore to this treaty and became lasting allies.

Instead of the twenty-one Asiatic satrapies of the partitions Seleucus divided his empire into seventy-two, thus diminishing the dangerous strength of the individual governors. But the old arrangement was restored later, and at the beginning of the reign of Antiochus III. we find Media, Persia, Susiana, and the district of the Erythraean Sea (separated off from Babylonia) standing each under one head (Polyb., v. 40-54). Apparently an eparch came to be appointed with military command over all the sections of each old satrapy, and gradually drew to himself all the functions of the satraps in the old régime, so that he could be spoken of indifferently as satrap or strategus.

Seleucus had built for himself a new capital, Seleucia on the Tigris, but in process of time his chief attention came to be more and more engrossed by the affairs of the west, and the seat of power was shifted to Antioch in Syria. A kingdom like that of Seleucus could hardly be governed from Syria, which lay so far from its natural centre, and about 293 or a little later Seleucus found it advisable to make over the upper satrapies to Antiochus, his son by his first marriage with Apama, daughter of Spitamenes, giving him Seleucia as his capital and his stepmother Stratonice as wife. Seleucus, like Antigonus, dreamed of regaining the whole monarchy of Alexander, and fancied himself within reach of his goal after the fall of Lysimachus, when he was himself removed by assassination. Antiochus Soter (280-261) was prudent enough to be content with what he possessed and acquiesce in the actual division of the empire into three realms, practically corresponding to the three continents.

No one had been so zealous as Seleucus in extending Alexander's schemes of colonization; he is said to have founded seventy-five cities. Among such of these as we know an unusual proportion lies in Media—the breast of Iran, as the Orientals call it—where it was doubly important to strengthen the Macedonian element. A Greek settlement in Ecbatana and the cities of Laodicea, Apamea near Rhage, and Europus were his foundations; Alexandria Eschata, in the extreme north-east, was strengthened by new recruits; and even beyond this city, as it seems, in the land of the Scythians, an Antioch was founded. These last undertakings probably came after the association in the empire of Antiochus, who, through his grandfather Spitamenes, had special reasons for interest in these parts. It was then that Demodamas crossed the Jaxartes and raised altars beyond it to the Apollo of Didyma, the patron god of the dynasty. Then, too, Alexander's plan of exploring the Caspian was resumed; the admiral Patrocles made a voyage of discovery, and got only just far enough to be confirmed in the false notion of a north-east passage to India,—probably, therefore, to the extremity of the peninsula of Mangishliak. It was seen, on the other hand, that the Caspian was not connected with the Mæotis; but Seleucus shortly before his death still entertained a plan for a canal from the Caspian to the Cimmerian Bosphorus. Antiochus carried on his father's work of founding cities, and built Laodicea in the east of Persia; but he gave more attention to eastern Iran. A wall of 1500 stadia (about 172 miles) was carried round the oasis of Merv, and there, at the confluence of the Margus and the Zothales, the ruined city Syriana was rebuilt as Antioch, with a circuit of 8 miles. In Aria Antiochus Soter founded Sotira, his general Achaëus Achaia; the older chief towns Artacabane and Alexandria on the Arius received new walls, the latter with a circuit of from 3 to 6 miles. Alexandropolis in Arachosia had been similarly strengthened by Seleucus. With all these efforts, however, Hellenism made no such deep impression on Iran as on the west, nor did the loosely-jointed

empire attain to anything higher than a Hellenistic repro-280-250. duction of the kingdom of the Achemenians. Even in the fragmentary records that we possess we hear from the first of rebellions little favourable to consolidation of the realm; Seleucus, like Alexander, still had an army of Macedonians and Persians together, while the later Seleucids, at least in their western wars, used natives sparingly and only as bowmen, slingers, or the like, and preferred for these services the wild desert and mountain tribes of Iran.¹ Of the Persian troops of Seleucus we read that 3000 rebelled, and were mastered and destroyed only by treachery; another and seemingly connected story speaks of a rising of 3000 Macedonians (Polyenus, vii. 39, 40). Antiochus himself executed his eldest son, Seleucus, on suspicion of conspiracy against his life; the heir of the kingdom was his second son, Antiochus II. Theos (261-246), a drunken and dissolute Antiochus II. prince, who neglected his realm in the society of unworthy oculus II. favourites.

This king is mentioned in a remarkable contemporary Indian inscription. The Seleucids were constant allies of the great Maurya (Magadha) kingdom. Between 311 and 302 Megasthenes repeatedly went as ambassador from Seleucus to Chandragupta, and Daimachus went in like manner from Antiochus to the court of Chandragupta's successor, Amitrabhatta (380-376). The next king, Asoka, became a Buddhist about 263. He then founded hospitals for men and beasts throughout his realm, planted places where nothing had grown before, and provided wells and grew trees along the roads for the refreshment of man and beast. Further, he tells us, he caused his example in these things to be followed by his neighbours, whether southern or western. Among the latter Antiochus, king of the Greeks, has the first place.

Under the weak Antiochus II. north-eastern Iran was lost to the empire. While the Seleucids were busy elsewhere, probably in the long war with Ptolemy Philadelphus, which occupied Antiochus's later years, Diodotus, viceroy of Bactria, took the title of king. The new kingdom included Sogdiana and Margiana from the first, while the rest of the East, with a single exception scarcely noticed at the time, adhered to the Seleucids.² Now the formation of a strong local kingdom, heartily supported by the Greek colonies, and likely to control the neighbouring nomads and protect its own frontiers with strictness, was by no means agreeable to the chiefs of the desert tribes who, like the modern Turcomans, had been wont to pillage the settled lands, and raise blackmail with little hindrance from the weak and distant central authority at Antioch.³ Accordingly two brothers, Arsaces and Tridates, whose tribe, Arsaces the Parthians, a subdivision of the Dahæ, had hitherto⁴ pastured their flocks in Bactria, on the banks of the Oxus, moved west into Seleucid territory near Parthia. An insult offered to the younger brother by the satrap Pherecles moved them to revolt; Pherecles was slain, and Parthia freed from the Macedonians. Arsaces was then proclaimed first king of Parthia (250 B.C.). Such is the later official tradition, and we possess no other account of the beginnings of the Arsacid dynasty. But when the official account transforms Arsaces, who, according to genuine tradition, was the leader of a robber horde and of uncertain descent, into a Bactrian, the descendant of Phriapites, son of Artaxerxes II. (who was called Arsaces before his accession), and makes him conspire with his brother and five others, like the seven

¹ See the accounts of the army of Antiochus III. in Polyb., v. 78, and Livy, xxxiv. 48.

² Justin, xli. 4, 5, exaggerates rhetorically, on the basis of some such expression as that used by Strabo, in speaking of the event.

³ These brigands had destroyed two of Alexander's cities, Alexandria in Margiana and Hecatomia in Media, before the time of Antiochus I.; Ptolemy, vi. 17, vi. 47; 48.

230-220 who slew the false Smerdis, we detect the inventions of a period when the Arsacids had entered on the inheritance of the Achæmenians, and imitated the order of their court. The seven conspirators are the heads of the seven leading noble houses to whom, beyond doubt, the Karen, the Suren, and the A-yahabak belonged.¹ And further, genuine tradition does not know the first Arsaces as king of Parthia at all, and as late as 105 B.C. the Parthians themselves reckoned the year (autumn) 248/247 as the first of their empire.² But 248 is the year in which Arsaces I. is said to have been killed, after a reign of two years, and succeeded by his brother, who, like all subsequent kings of the line, took the throne-name of Arsaces. The first Arsaces must have existed, for he appears as deified on the reverse of his brother's drachma, but he was not king of Parthia. Nay, we have authentic record that even in the epoch-year 218/247, the year of the accession of Tiridates, Parthia was still under the Seleucids. These contradictions are solved by a notice of Isidore of Charax (*Geog. Gr. Min.*, i. 251), which names a city Asaak, not in Parthia, but north-west from it, in the neighbouring Astauene, where Arsaces was proclaimed king, and where an everlasting fire was kept burning. This, therefore, was the first seat of the monarchy, and Pherecles was presumably satrap of Astauene, not eparch of Parthia.

The times were not favourable for the reduction of the rebels. When Antiochus II. died, the horrors that accompanied the succession of his son Seleucus II. Callinicus (248-238) gave the king of Egypt the pretext for a war, in which he overran almost the whole lands of the Seleucids as far as Bactria. Meantime a civil war was raging between Seleucus and his brother Antiochus Hierax, for whom the Galatians held, and at the great battle of Ancyra in 242 or 241 Seleucus was totally defeated and thought to be slain. At this news Arsaces Tiridates, whom the genuine tradition still represents as a brave robber-chief, broke into Parthia at the head of his Parmanians, slew the Macedonian eparch Andragoras, and took possession of the province.³ These Parman Dahæ were a branch of the Dahæ who lived beyond the Sir Darya and the Sea of Aral (the Tanais and Meotis of Strabo, xi. p. 515, and Curt., vi. 2, 13, 14), and were called Xandians or Parmanians, but, in consequence of internal dissensions, they had migrated at a remote date to Hyrcania and the desert adjoining the Caspian.⁴ Here, and in great measure even after they conquered Parthia, they retained the peculiarities of Scythian nomads. The Parthian language is described as a sort of compound between Median and Scythian, and, since the name of the Dahæ and those of their tribes (Strabo, xi. p. 511) show that they belonged to the nomads of Iranian kin, who in antiquity were widely spread from the Jaxartes as far as the steppes of south Russia, we must conclude that the mixed language arose by the action and reaction of two Iranian dialects, that of the Parthians and that of their masters.⁵ Their nomad costume the Parmanians in Parthia gradually gave up for the Median dress, but they kept their old war-dress, the characteristic scale-armour, com-

pletely covering man and horse. The founder of the empire appears on coins in this dress, with the addition of a short mantle, and so again does Mithradates II. The hands and feet alone are unprotected by mail, shoes with laces, and a conical helmet with flaps, to protect the neck and ears, complete the costume.⁶ The conquerors of Parthia continued to be a nation of cavalry; to walk on foot was a shame for a free man, the national weapon was the bow, and their way of fighting was to make a series of attacks, separated by a simulated flight, in which the rider discharged his shafts backwards. Many habits of the life they had led in the desert were retained, and the Parthian rulers never lost connexion with the nomad tribes on their frontiers, among whom several Arsacids found temporary refuge. Gradually, of course, the rulers were assimilated to their subjects, the habitual faithlessness and other qualities ascribed to the Parthians by the Romans are such as are common to all Iranians. The origin of the Parthian power naturally produced a rigid aristocratic system: a few freemen governed a vast population of bondsmen, manumission was forbidden, or rather was impossible, since social condition was fixed by descent, the 10,000 horsemen who followed Surenas into battle were all his serfs or slaves, and of the 50,000 cavalry who fought against Antony only 400 were freemen.

Arsaces Tiridates soon added Hyrcania to his realm and raised a great host to maintain himself against Seleucus, but still more against a nearer enemy, Diodotus of Bactria. On the death of the latter, however, the common interests of the Parthians and Bactrians as against the Seleucids brought about an alliance between Arsaces Tiridates and Diodotus II. With much ado, Seleucus had got the better of his foreign and intestine foes and kept his kingdom together, and in 238 or a little later, having made peace with Egypt and silenced his brother, he marched from Babylon into the upper satrapies. Tiridates at first retired and took shelter with the nomadic Apasacæ, but he advanced again and gained a victory, which the Parthians continued to commemorate as the birthday of their independence. Seleucus was unable to avenge his defeat, being presently called back by the rebellion stirred up by his aunt Stratonice at Antioch. This gave the great Hellenic kingdom in Bactria and the small native state in Parthia time to consolidate themselves. Tiridates used the respite to strengthen his army, to fortify towns and castles, and to found the city of Dara or Dareum in the smiling landscape of Abôvard. Tiridates, who on his coins appears first merely as Arsaces, then as King Arsaces, and finally as "great king" (probably in imitation of Antiochus Magnus), reigned thirty-seven years, dying in 211/10. His nation ever held his memory in almost divine honour.

Seleucus III. Soter (226-223) died early, and was followed by Antiochus III. Magnus (223-187), who in his Antiochian lifetime had ruled from Babylon over the upper satrapies. Molon, governor of Media, supported by his brother Alexander in Persia, rose against him in 222 and assumed the diadem.⁷ The great resources of his province, which followed him devotedly, enabled Molon to take the offensive and even to occupy Seleucia after a decisive battle with the royal general Xenocrates. Babylonia, the Erythraean district, all Susiana except the fortress of Susa, Parapattania as far as Europus, and Mesopotamia as far as Dura were successively reduced. But the young king soon turned the fortunes of the war. Crossing the Tigris in person, he

¹ Moses of Chorea (x. 28) knows only these three lines besides the Arsacids. Other Armenian historians, however (Langlois, i. 108, 199), know four lines of Arsacids which may have taken the place of lost families.

² See the cuneiform tablet in G. Smith, *Assyrian Discoveries*, p. 839, which agrees with Euseb., *Chron.*, p. 299 (Anchor).

³ Justin, xli. 4, 2. What is said of Andragoras in xii. 4, 12, rests on a slip of the memory.

⁴ The common tradition connects the migration with the conquests of the Scythian king Indares, a contemporary of Sesostris. It adds that Parthians means "fugitive" or "exile" (*Zend. pîrtû*). But the name Parthava is found on the inscriptions of Darius long before the immigration of the Parmanians.

⁵ An idea of the difference between the two may be got from the fragments of Khiraman, preserved by Bîrdûn.

⁶ Mithradates I. was the first to adopt the robes of a Persian great king.

⁷ The coins of "King Molon" show that his rebellion has nothing to do with the King Antiochus of C. I. G., 4458. The latter, appearing in a list of dæified kings arranged in the order of their deification or death, is the eldest son of Antiochus III., who died in 193.

penetrated into Apolloniatis and cut off Molon's retreat. Molon was forced to accept battle near Apollonia; his left wing passed over to the enemy, and, after a crushing defeat, he and all his kinsmen and chief followers died by their own hands (220). Antiochus now marched to Seleucia to regulate the affairs of the East. He used his victory with moderation, mitigating the severities of his minister Hermias; but he had effectually prevented the rise of a new kingdom in the most important province of Iran. In the same year, before he returned to Syria, he marched across Mount Zagrus against the aged Artabazanes, the most powerful of the native princes, who ruled not only Atropatene but the neighbouring lands, especially east Armenia (Polyb., v. 55, 7), and by the terror of his approach extorted an advantageous treaty.

A period followed in which the king was fully occupied in the west, but after this he began a campaign of several years in the upper satrapies, to which his contemporary renown was mainly due. First he regulated the affairs of the Armenian kingdom of Arsamosata, whose king, Xerxes, had fallen by the intrigues of his own wife, a sister of Antiochus.¹ Then, descending the Euphrates by ship to Seleucia, he appeared in Media in 209, hardly as an enemy, though he seized the gold and silver decorations of the temple of the goddess Æne in Ecbatana. Thence with 100,000 foot and 20,000 horse he marched against the new Parthian king, Arsaces II.,² son and successor of Tiridates. Crossing the desert obliquely to Hecatompylus, he forced his way into Hyrcania over Mount Labus (the eastern part of the Elburz mountains), defeating the Parthians on the summit, and besieged the fugitives in Sirynca. The Parthians planned an escape by night, and massacred the Greek residents to prevent its betrayal; but the plan failed. The city yielded, and the war ended in a treaty which left Arsaces his kingdom, but beyond question reduced him to a vassal. In 208 began the much more serious war with Bactria. Here the successors of Diodotus had been dethroned by a usurper, Euthydemus of Magnesia, whose coins indicate a long reign. Euthydemus tried to defend the line of the Arius (Herirud), but Antiochus effected a passage a little west of the city Guriāna,³ inflicted a decisive defeat on the hostile cavalry, and forced Euthydemus to retreat to Zariaspā. But the siege of Bactra, the capital, proved tedious, and the war made little progress. Antiochus himself opened negotiations and was impressed by the declaration of the Bactrian king, that if he were reduced to extremities he must call in the help of the nomads, which would be fatal to the Greek civilization of the land. At length, in 206, a peace was arranged, and Antiochus was visited in his camp by Demetrius, the youthful son of Euthydemus, who pleased the king so well that he betrothed to him his daughter; Euthydemus was left on his throne, and the two powers swore an alliance offensive and defensive, which cost Bactria no more than certain payments of money, the victualling of the Macedonian troops, and the surrender of the war-elephants. The Bactrian Greeks were grateful for this moderation; their memorial coins place Antiochus Nicator with Euthydemus Theos, Diodotus Soter, and Alexander Philippi among the founders of their political existence.⁴ Antiochus next

crossed the Paropanisus into the valley of Cabul, renewing 220-164 the friendly relations of his dynasty with the Indian king Subhagassāna, and receiving from him 150 war-elephants. The return march was through Arachosia and Drangiana, the winter being spent in Carmania. Thus it appears that south of the Paropanisus political relations had remained unchanged for a hundred years, and the successes of Antiochus in Upper Asia, together with the prudent limitation of his schemes to what was practicable, did much to give permanence to the empire in the East, notwithstanding its many points of weakness. The series of victorious campaigns was concluded by a maritime excursion in 205 against the rich merchant-community of Gerha on the Arabian shore of the Persian Gulf, in which Antiochus again showed his moderation, receiving from the Gerhaeans a gift, 500 talents of silver, 1000 talents of incense, and 200 talents of oil of myrrh, but leaving them the freedom they had enjoyed from time immemorial.

Under very different circumstances did Antiochus revisit the eastern lands eighteen years later, his prestige broken by the war with Rome, and his position as a great power shattered in a way that could not fail ultimately to react on his Asiatic subjects. His most urgent difficulty, however, lay in an exhausted treasury, and the demands of Rome for a heavy war-tribute. Antiochus came to Susa in search of money and seized a pretext to plunder the rich and famous temple of Bel in Elymais; but the attempt was fatal to its author, who was destroyed, together with his followers, by a rising of the Elymeans (187). This, no doubt, was the moment when Elymais became independent and formed a small separate kingdom in the upland part of Susiana.

Antiochus was followed in the kingdom by his sons, first the weak Seleucus IV. Philopator (187-175), and then the gifted Antiochus IV. Epiphanes (175-164), who Anti- had a clear insight into the evils that were sapping the empire, but attempted to cure them and bind the loose complex of provinces more closely to the centre with such impatience and violence that he only hastened the fall of his dynasty. He too, like all the later Seleucids, was in chronic want of money, and it was chiefly to raise tribute that he marched into the East in 166. He first made for Greater Armenia and the neighbouring Sophene, which had never paid much more than nominal allegiance to Macedon, and after the defeat of Antiochus the Great by Rome (189) had formed themselves into kingdoms under Artaxias and Zadríades, the former strategi. Antiochus penetrated into Armenia and took Artaxias prisoner, but restored him to his kingdom. He was next called by urgent affairs to the shores of the Persian Gulf. Over the Persians we read that his lieutenant in Mesene gained a double victory in one day, by sea and by land, at the promontory of Naumachæa⁵ over against the Carmanian coast. This victory, however, implies that Persis had already cast off the Macedonian yoke,⁶ and that the new kingdom had already extended its sway over the opposite coast of Omān, as we know to have been the case about 70 A.D.⁷

At the mouth of the Tigris Antiochus restored an old city of Alexander's and called it Antioch;⁸ it had been destroyed by an inundation, a sign that the negligent government of the later Seleucids had let the canal system,

¹ John of Antioch, in Müller, iv. 687.

² This king seems to have had Arsaces as his proper name, for Justin always uses the proper name of Parthian kings. Vailant's conjecture, which gives him the name of Artabanes I., has no basis.

³ For Taryaspān, Polyb., x. 49, where all editors adopt the geographically impossible Taryaspān of Reiske, read τὰ Τούρανα, comperting Ptol., vi. 10, 4.

⁴ That Antiochus Nicator is Antiochus III. Magnus follows from Malalas, i. 261; if the style of his Bactrian coins, resembling as they do those of Diodotus, really demands a earlier date, they must belong to the last of the Diodotides not mentioned by the authors, not, as the numismatists suppose, to Antiochus II.

⁵ Pliny, vi. § 153; but one is tempted to suspect a corruption of the text and read Dymnatis, Mace; horum, &c.

⁶ Strabo, xv. p. 736, gives a general confirmation of the existence of a kingdom here in the time of the Macedonians.

⁷ Peripl. M. Er. (Geog. Gr. Mém., i. 288). The connection of the opposite coasts is natural; in the 10th century the Buwāhidis ruled over Omān.

⁸ Pliny, vi. § 139, says "Antiochus quintus regem," reckoning Antiochus Heliæus. We call Epiphanes Antiochus V., but he cannot be meant, and there is no way of counting which would make Sidetes the 5th Antiochus.

191-171. restored by Alexander, fall again into ruin. Another of Epiphanes's measures directed to the strengthening of the Hellenic element in the East was the occasion of the change to Epiphanes of the name of the Median capital. But against these useful efforts must be set the plundering of the temples of the barbarians, a sure way to exhaust Oriental patience, and one which involved the king in a catastrophe so like to that of his father that we should suspect some confusion were the accounts not so well confirmed.¹ The king, we are told, heard of a rich temple of the goddess Nanea in Elymas stored with the gifts of many generations, he marched out to plunder it, but was driven back by the natives to Babylon. In Persia he received tidings of the formidable rising in Judaea, excited by similar acts of violence, apparently he was then on his way against the Persian rebels, but on the journey he died of consumption in the Persian town of Tabae (164).

Antiochus had given Mesene with its capital, Antioch, to a native dynast, Hyspaosmes, as satrap, and, when Antioch, like its predecessor Alexandria, was soon ruined by floods, the city was removed to an artificial hill and protected by an embankment. Under the name of Spasinu Charax (Hyspaosmes's pile-town) the new city rose to commercial prosperity, and became the capital of the petty kingdom of Characene, which probably became independent at the death of Antiochus. Thus the Seleucid empire was now quite cut off from the Persian Gulf by a circle of small native states.²

Now followed the troubled reign of the child-king Antiochus V Eupator (164-163), which was cut short by Demetrius Soter (162-160). The latter was constantly persecuted by the Romans, who raised enemies against him on every side, and so the times seemed to invite a renewal of the enterprise of Molon. Since the time of Epiphanes the satrap of Media had been one Timarchus of Miletus, brother of the intriguing and influential treasurer Hecolides, and, like the latter, a favourite of the late king, who had often sent him to Rome. Knowing the ground there, he went to Rome, and easily persuaded the senate to grant him the title of king (161).³ He made a treaty with Artaxias of Armenia against Demetrius, compelled the neighbours of Media to acknowledge him, and extended his power as far as Zeugma, and finally over Babylonia.⁴ But he fared in the end no better than Molon. The Babylonians were oppressed and hated him, and the self-conceived majesty of Timarchus, who on his coins called himself "the Great," soon broke down in conflict with Demetrius, one of the most gifted princes of a highly-gifted dynasty. Timarchus was slain, his brother fled, and the victor was saluted as "saviour" (Soter) by the grateful Babylonians (160). It was a great victory for Demetrius; he had saved the best part of Iran for his monarchy, and he had shown all who speculated on the support of Rome that the decrees of the republic were powerless in regions to which its arm could not reach.

The true danger for the Macedonian monarchy came not from rebellious lieutenants but from the ever stronger reaction of the Oriental element, of which the little state of Parthia was the most vigorous champion. The kings of Parthia had long kept quiet after the war with Antiochus the Great. Phriapatus, successor of Arsaces II, who reigned fifteen years (c. 191-c. 176), calls himself on his coins

"Arsaces Philadelphus," perhaps because he had married a sister, and (first of all Parthian kings) Philhellen.⁵ By the last title he presents himself, at a time when the Seleucid power was sinking, as the protector of his present and future Greek subjects. His eldest son and successor, Phraates I (Arsaces Theopator of the coins), conquered the brave Mardian highlanders and transplanted them to Charax in the neighbourhood of the Caspian Gates, a proof that the Parthians had already detached Comisene and Choarene⁶ from Media (Strabo, xi 514), probably just after the death of Antiochus the Great.

About 171 Phraates died and left the crown not to his Mithras-sons but to his brother Mithradates (Arsaces Epiphanes and dates apparently also, on tetradrachms of 139, 138, Arsaces Philhellen), a prince of remarkable capacity, who made Parthia the ruling power in Iran. His first conquests, it would seem, were made at the expense of Bactria.

The kingdom of Bactria had made vast advances under Demetrius, whose son Demetrius crossed the Indian ^{Indus} Bactria, Caucasus and began the Indian conquests, which soon carried the Greeks far beyond the farthest point of Alexander. The Punjab was reduced and the city of Çakala, under the name of Euthydemus, became the capital of the Indian conquests, but besides this it appears that Demetrius himself marched down the course of the Indus, conquered Pattala and the kingdoms of Sarosotes (Surashtira) and Sigendia, probably the district of the commercial city Barygaza. The object, it is plain, was to reach the sea and get a share in the trade of the world, and it is possible that the extension of the power of the Bactrian Greeks over Chinese Tartary as far as the Seres and Phaenians had a similar object, viz. to protect the trade-route with China along the Tarim river. For the Seres are the Chinese, and the Phaeni, according to Pliny,⁷ lay west of the Attacori (the mythical people at the sources of the Hoang-ho) and east of the Tochari, whose earlier settlements were east of Khoten. They occupied, therefore, the very region which, according to Chinese sources, was then held by a nomadic pastoral people, the Tibetan No-king. History shows that Chinese Tartary is easily conquered from the Oxus and Jaxartes, but very hard to hold, and there is thus no reason to doubt the truth of the Bactrian advance in this direction. Strabo, unluckily, does not tell us whether the campaign was made by Demetrius, it must have fallen before 177, when the great conquests of the Hsiung-nu began, but after 201, when the founder of the Han dynasty regained the country as far as the Great Wall, and put China in a position to take part in the trade of inner Asia. This is precisely the period of the greatest power of the Greeks in Bactria. Demetrius, having succeeded his father, was displaced in Bactria by the able usurper Eucratides, some time between 181 and 171.⁸ A ^{hundred} thousand cities obeyed Eucratides, and both he and his rival Demetrius sought to extend the Greek settlements, the one founding Eucratidia in Bactria, the other Demetrias in Arachosia. Now Justin tells us that the Bactrians were so exhausted by wars with the Sogdians, Arachosians, Drangians, Arans, and Indians that they at length fell an easy prey to the weaker Parthians; but Eucratides he describes as a valiant prince, who once with 300 men held out during five months, though besieged by 60,000 men of Demetrius, king of India, and then, receiving succours, subdued India.

¹ Comp. Grun. Leaman, p. 9, with the first confused account in the letters of the Jews to Autobulus, 2 Mac. i 10 sq.

² Hyspaosmes was not an Arab, as Pliny states, vi. § 139. The Iranian names of the older kings of Chinese-sea justify Juba's account of their extraction.

³ The corrupt passage of Diodorus, *Exc. Excer.*, 13, ought to run thus, *Τυμάρχῃ ἐξέτατο καὶ ἀντίρ βασιλεὺς ἐγένετο*.

⁴ In Diod., i c., read *τῇ βασιλεύσῃ* for *τῇ βασιλεὺς*. Hence the error of Appian, who does not mention Media at all.

⁵ For these and other Parthian coins P. Gardner's work is the authority. One of them is dated 125 Sel = 187 n.c.

⁶ Choarene contains the only Greek city in the older conquests of the Parthians, and the coin with Greek date and title is of the year of Antiochus's death.

⁷ *N. H.*, vi 65, where read "Pheni et Thocari."

⁸ Sallet's numismatic arguments, which place Eucratides about 200 n.c., are not conclusive, and do violence to the other testimonies.

Characene.

Demetrius I.

Arsaces Philadelphus.

This implies that besides the kingdom of Bactria and that of Demetrius—the latter now confined to India and probably to the lands east of the Indus—there were independent states in various districts still Seleucid in 206. Justin's statement is confirmed by the coins, which also show that Eucratides came forth as victor from a series of wars with the lesser states. Sogdiana, according to Chinese authorities, was occupied by the Scythians in the lifetime of Eucratides. Antimachus, to judge from a naval victory recorded on his coins, once reigned on the lower Indus, the principal place where coins of him and his successor Antialcidas have been found is the Cophen valley, the latter prince, who borrows from Antiochus Epiphanes the title "Niecephorus," may be viewed as his younger contemporary. The neighbouring realm of Plots was ephemeral, but his money is unique as giving a date by the Seleucid era (165 B.C.). Parthian and Agathocles, whose coins are chiefly to be found in Begam, Cabul, Ghazni, Kandahar, and Sistan, were doubtless kings of Arachosia and Drangiana. Before these countries belonged to Demetrius, and even, as the coins show, to his father Euthydemus, who cannot have been contemporary with the last years of Antiochus the Great, so that they were probably given as a dowry to his daughter when she married Demetrius. This marriage really took place, for the Seleucid name Laodice is found on the Bactrian Greeks. The victories of Eucratides are proved by his surrappé coins. Thus he retook coins of Antialcidas and appears posthumously as "God of the city Kairi" on money of Apollodotus, king of the Indians. Helioctes, co-regent and successor of Eucratides, and Strato, apparently the successor of Apollodotus, retook each the money of the other, and Helioctes's name also appears over what is perhaps a coin of Philoxenus, who reigned in the region of Peshawar.¹

On his way back from the conquest of India Eucratides was murdered by his son and co-regent, probably Helioctes.² The date of this murder may be fixed by that of Demetrius, who must have been born not later than 324, and may be taken to have lost his kingdom not later than 159. Eucratides cannot, according to Justin's account, have lived many years longer. This would give c. 155 B.C. as the lowest possible date for the death of Eucratides. A little before this time notable signs of concession to the rising spirit of the natives appear on the coins. The medals of the older Greek kings follow the Attic standard and have only Greek legends, but from the time of Demetrius the reverse bears a legend in the Indian language spoken in the Cabul valley and in the so-called Aramaic character, a letter derived from the Semitic. At the same time we begin to find square coins, and in the later part of the reign of Eucratides a new native standard begins to prevail.³

In the midst of the civil wars, which became more serious after the death of Eucratides, Mithradates of Parthia began to extend his dominions at the expense of Bactria; even in the lifetime of Eucratides he succeeded in annexing the satrapies of Aspiondes and Tururia. These seem to have covered Aria, for the Hindu-Kush is named as the eastern boundary of the Parthians (Justin, xli 6, 8),—whence perhaps the mention of Arians amongst the foes of Eucratides. Another account makes Mithradates rule as far as India, and declares him to have obtained without war the old kingdom of Porus, or the rule over all nations between the Indus and the Hydaspes.⁴ The two accounts are reconciled by Chinese records, which tell that c. 161 B.C. the nomad people See broke into the valley of the Cophen and founded a kingdom in the very place of the

Parthian conquests in India, which must therefore have been ephemeral. This fact has its importance, as illustrating the way in which the internal wars of the east Iranian Greeks helped to prepare the ground for the Scythian invasion. After this success in the east Mithradates turned his attention to the west, where the chances of success were not less inviting. Demetrius had at length fallen before a coalition of the neighbouring sovereigns, powerfully supported by the Romans through their instrument the exile Heracles. A pretender, who called himself son of Antiochus Epiphanes, was put up as king by the coalition; he appeared in Syria in 152, and slew Demetrius in battle in 150. The pretender, who took the name of Alexander Theopator Euergetes, proved quite incompetent, and lost the support of Ptolemy Philometor, who in 147 put up Demetrius, the son of Demetrius, against him. At length, in 145, Alexander, utterly defeated by Ptolemy, was slain in his flight by an Arab chieftain. Demetrius II Nicator, however, soon made himself bitterly hated, and a certain Diodotus of Casiana, in the region of Apamea, a man of Demetrian origin, was able first to set up against him Alexander's young son Antiochus Epiphanes Dionysius, and then to murder his puppet and proclaim himself as King Trypho. Five years of fighting drove Demetrius out of the greater part of Syria. Such was the state of the empire when war broke out between Media and Parthia, and was finally decided in favour of the latter. Mithradates left Bactria in Media and turned to Hyrcania. Media in this account appears as independent, and that this is so is confirmed by the notice in Diod., *Exc. Exc.*, 25, that a certain Dionysius "the Mede" raised Mesopotamia in 143 against Trypho to avenge the murder of the young Antiochus. Dionysius must be a son of Tamarctus; Heracles, when he installed Alexander in Syria, must have thought also of his own family, and raised it again to the throne of Media, which the senate had already recognized as a separate kingdom. But the short-lived independence of Media was, as we have seen, soon cut short by Mithradates, who did not lose the opportunity afforded by the civil wars of Syria in 147. Babylonians followed the fate of Media, Demetrius's lieutenant was defeated, and the whole province, with its capital Seleucia, fell into the hands of the Parthians. Thus the East was finally lost to the Macedonians.

The change of rule was not well received by the new subjects of Parthia, least of all by the Greeks and Macedonians of the upper provinces, who sent embassy after embassy to Demetrius. That prince, who had now little to lose in Syria, at length accepted their invitation to come and take the rule over them, hoping that if he could secure the upper satrapies they would help him against Trypho. In 140 he marched into Mesopotamia, and thence by Babylon to the upper provinces. He was well received by the natives, and even the small native states made common cause with him against the proud barbarians, whose neighbourhood they felt as oppressive. He was joined by the Persians and Elymeans, and the Bactrians helped him by a diversion, appearing now for the last time as an independent people. At first things went well, and the Parthians were defeated in several battles, but in Media in 139 Demetrius was surprised by the lieutenant of Mithradates during negotiations for peace, his forces were annihilated, and he himself taken prisoner and dragged in chains through the provinces that had joined his cause. The Parthian king received his captive with favour and assigned him a residence and suitable establishment in Hyrcania. He even gave him his daughter Rhodogune, and promised to restore him to his kingdom, but this plan was interrupted by death.

Mithradates's last campaign was against the king of Elymais, Demetrius's ally, the rich temples of Elymais,

¹ *I c.* Charsa, a Greek town, which Appian, *Syr.* 57, placed in Parthia with two other towns, really in Aria.

² See in general, A. v. Sallet's "Nachricht Alex. d. Gr.," in *Zeitschr.*

f. Num., vi, and Cunningham, *New Chron.*, ix, x.

³ This is the usual assumption, for Helioctes appears on coins both as contemporary and as successor of Eucratides, and there is a surrappé coin of his which was originally struck by Eucratides for the marriage of Helioctes with Laodice (perhaps a daughter of Demetrius by his Seleucid queen). But there is much to be said for the view of Cunningham (*Journal As. Beng.*, 1840, p. 809; *New Chron.*, ix, 239), that the murderer was Apollodotus, whose title "Philopator" always points to a co-regency.

⁴ Sallet, *op. cit.*, p. 26 sq.

⁵ This account goes back through Oros, v 4 (following Livy), and Diod., p. 597, to the excellent authority of Ptolemaeus.

133-128, that of Athens, and that of Artemis or Nanua in Azania yielded him a booty of 10,000 talents (£2,358,000), and the great town of Seleucia on the Hedyphion was taken¹ (Strabo, xvi p. 744). The country was brought under Parthia, but continued to have its own kings. The coins make it likely that Mithradates simply set up a new dynasty, a branch of his own house.² Mithradates died in a good old age in 138, or a little later.³ His memory was revered almost equally with that of the founder of his house, but his real glory was much greater, for it was he who made Parthia a great power. He is praised as a just and humane ruler, who, having become lord of all the lands from the Indian Caucasus to the Euphrates, introduced among the Parthians the best institutions of each country, and so became the legislator of his nation.

The divisions of the empire which he founded can be sketched by the aid of an excerpt from the itinerary of Isidore of Charax (at the beginning of the Christian era) and of Pliny (*N. H.* vi 44, 112). The empire was divided into the upper and lower kingdoms, separated by the Caspian Gates. The lower kingdoms were seven—

(1) Mesopotamia and Babylonia, (2) Apolloniatis, (3) Chalonitis,⁴ (4) Carina,⁵ (5) Cambedene, (6) Upper Media, (7) Lower or Baganan Media.⁶ The upper kingdoms were eleven—(8) Chorasene, (9) Comene,⁷ (10) Hyrcania, (11) Astanene, (12) Parthiense, (13) Arapantocene, (14) the Magians, a part of Bactria, (15) Aria, (16) the country of the Anasans (a division of Aria), (17) Zazangana,⁸ (18) Arachosia, now called "White India." The eighteen Parthian kingdoms thus correspond to six old satrapies; the new divisions were probably derived from the provinces of Seleucus Nicator (see especially Posidonius in Strabo, xvi p. 748). But upper and lower provinces have changed their meaning; apart from Arachosia, the upper provinces are the old conquests of the Parthians before they occupied Media and became lords of Iran, and the lower all the later conquests in the west. The Parthians, we see, gave much less attention to the west than did their predecessors, and they still left Mesopotamia as the only great satrapy, and perhaps first added Babylonia to it when Osrhoene became the residence of the Arsacids. We notice that they cared little for reaching the sea, which they can have touched only for a little way at the mouth of the Euphrates, and even here they allowed the petty Characene quite to outstrip them in competing for the great sea-trade. As compared with the older Macedonian empire, the Parthian realm lacked the east Iranian satrapies, Bactria with Sogdiana, and the Parnaspada, and also the Indian ones, which, with Patactene, or, as it was afterwards called, Scythia, remained under the Bactrian Greeks and their successors in the north they lacked Lesser Media, which had long been an independent state, and in the south they lacked Sistan, now also belonged to Elymais, and the satrapies of Persis and Carmania, which the Persians held along with the

western part of Gedrosia (*Pers. Mar. Et.* § 37). In the extreme west they lacked Asbehitis proper, which formed a small kingdom under the name of Adiabene, first mentioned in 69 B.C. (Plut., *Lucullus*, 27). The kingdom of Mannus of Orinda (*Márvov* 'Oparas, so read) in north Mesopotamia, which according to Isidore (§ 1) reached a good way south of Idesa, sometimes to have been independent, and, like Adiabene, probably existed before the Parthian time. From these small kingdoms the Parthians asked only an acknowledgment of vassalship. When Parthia was vigorous the vassalship was real, but when Parthia was torn by factions it became a mere name (Strabo, xvi p. 732). The relation was always loose, and the political power of Parthia was therefore never comparable to the later power of the Sassanids. Arsaces Tridates and his successors called themselves "great king." Mithradates, as overlord of the minor kingdoms, first bore the title "great king of kings." The title seems to have been conferred, not assumed in mere boastfulness, for (apart from a single usurper in times of disorder who calls himself "king of kings") none of his successors bears it until Phraates III., seventy years later,—a fact clear from the coins, but hitherto unnoticed. The nobility had great influence in all things, and especially in the nomination of the king, who, however, was always an Arsacid. Next to the king stood the senate of *probyas*,⁹ from whom all generals and lieutenant-governors were chosen. They were called the king's friends and were no doubt the old Persian martial nobility. A second senate was composed of the Magians and wise men, and by these two senates the king was nominated (Posidonius, ap. Strabo, xi p. 515). The Parthians were, in fact, very pious, conscientious in observing even the most troublesome precepts of Zoroastrianism as to the disposal of dead bodies, which were exposed to birds of prey and dogs, the bare bones alone being buried (Justin, xii 8, 5, 8). When the Parthian prince Tridates visited Nero he journeyed overland that he might not be forced to defile the sea when he spat, and his spiritual advisers the Magians travelled with him (Plin., xix 17). The Magians were not, indeed, so all-powerful as under the Sassanids, but it is quite a mistake to think that the Parthians were but lukewarm Zoroastrians.

The complete annihilation of the Macedonian empire in Fall of Iran was closely followed by the destruction of Greek in Greece in dependence in eastern Iran, north of the Parnaspada. The last mention of independent Bactria is in 140, no king of Bactria and Sogdiana is known from coins after the partholice Helioctes. Classical writers give only two laconic accounts of the catastrophe. Strabo says that "the nomadic peoples of the Asii, Pasiani, Tochari, and Sacaraucae (so read for *Σακάρωνες* as in xi. p. 511), dwellers in the land of the Sacae, beyond the Jaxartes [in its middle course] opposite to the Sacae and Sogdians, came and took Bactria from the Greeks." Trogus (*Prol.* xli) names the Scythian peoples Sacariae and Asiatic.¹⁰ Fortunately the lively interest taken by the Chinese in the movements of the nomads of Central Asia enables us to fill up this meagre notice from the report of the Chinese agent in Bactria in 128, as recorded a little later by the oldest Chinese historian, and from other notices collected by the Chinese after the opening of the regular caravan route with the west, about 115, and embodied in their second oldest history.¹¹ According to these sources the Yue-chi, a nomad Chinese people akin to the Tibetans, lived aforetime between accounts Tun-hoang (i.e. Sha-chou) and the Kien-shan mountains, and about 177 were subjugated, like all their neighbours, by the Turkish Hsiung-nu. Between 167 and 161 they renewed the struggle without success; Lao-shang, the great khan of the Hsiung-nu, slew their king Chang-

¹ In giving this order of events it is assumed that the capture of Demetrius, omitted in Justin's epitome of Trogus, vi 6, comes after § 7, not, as has been assumed since Valliant, after § 8. When Trogus mentions such unimportant events as the nomination of Bacaces to Media and the visit of Mithradates to Hyrcania, we must suppose that these facts bore on others of more note, that Bacaces was the captor of Demetrius, and that the royal court was in Hyrcania when the captive was brought before the Parthian king.

² Coins of the venerable Camisacene, whose Pseudo-Lucan *Mithra* calls a Parthian, but separated from the great kings by Armenia and Channene, have been brought from Bagdad and Sinitser, and can hardly have been struck elsewhere than in Elymais. He was preceded by an Arsaces, not one of the main Parthian line. See Sallet, in *Z. f. Num.*, viii 207 sq.

³ Demetrius had married Rhodogune when Antiochus VII. married his deserted wife Cleopatra in 133, and there were children by the marriage, though not earlier than the time of Demetrius's second attempt to escape; hence both attempts must have been after the death of Mithradates.

⁴ These three make up the old satrapies of Mesopotamia (with Asbehitis) and Babylonia. The whole land between the Euphrates and the Tigris was now put together, and the countries to the east of the Tigris detached, Apolloniatis being taken from Babylonia, and Chalonitis from Asbehitis.

⁵ In Isid., § 4 (*Itin.* i, 280), read *Βασιλειον* *Μυθλα* καὶ *Χόρα*. *Kápoa*, *ἀπὸ* *καταρὰ* *αὐτοῦ* *ἐστὶ*, *ἡ ἀρχὴ* *αὐτοῦ*.

⁶ Nos 4 to 7 are all parts of the old satrapy of Media.

⁷ The two most eastern parts of Media that were the first Parthian conquests.

⁸ Nos 10 to 13 form the old satrapy of Parthia and Hyrcania.

⁹ Nos 15 to 17 belong to the old satrapy of Aria with Diangana Sacasene, another part of this satrapy, was not Parthian, but, as Isidore remarks, belonged to the Sacae.

¹⁰ For *populus* *un* (Just., xii 2, 2) a synonym of *senatus* (xlii 4, 1) is wanted, write, therefore, *probydorus*.

¹¹ Modern writers since Beyer make the Greek kingdom in Bactria fall before the Parthians, appealing to Just., xi 6, 3. But the epitome here contradicts its sources, and confronts the fall of the kingdom with the earlier loss of two satrapies to the Parthians under Euergetes. The right account is to be found elsewhere in Justin himself, ii 1, 3, 8, 6.

lun, and made a drinking-cup of his skull,¹ and the great mass of the vanquished people (the great Yue-chi) left their homes and moved westward, and occupied the land on Lake Issyk-kul, driving before them another nomad race, the Sse. The Sse took the road by Uth and Kashgar, ultimately reaching and subduing the kingdom of Kipin (the Cabul valley), while their old seats were occupied by the Great Yue-chi, till they in turn were soon attacked by the Usun, who lived west of the Hiung-nu, and forced to move farther west (160 or 159). The older Chinese account ignores the residence of the Yue-chi at Lake Issyk-kul, which can at most have lasted only for a few years; the later account goes on to say that, moving westward, they conquered the Ta-hia, i.e., the Bactrians. The language of the older narrative has been held to imply that they went by way of Ferghana and remained there for some time, but in reality it only says that they retired beyond Ferghana and conquered the Ta-hia, thereupon pitching the royal camp north of the Oxus, and so it appears that in 159 they moved straight on Sogdiana, reaching that land just at the time when internal wars were undermining the might of Eucratides. The conquest, however, may have been gradual, since Bactria is still named as independent in 140.

When the Yue-chi were already settled in their new homes the king of China sent a certain Chang-kien to urge them to return and help him to clear the eastern-road by thrusting back the Hiung-nu. He was arrested on his way by the latter, but escaped in 129 to Ferghana, and thence was led to the Yue-chi through the land of the Khang-kim, on the middle course of the Jaxartes. But the Yue-chi were too happily settled in a rich and peaceful land to listen to his representations, and after a year's residence (128-127) he returned to China, where in 125, after telling all that came into the hands of the Hiung-nu on the way, he handed over to him almost all the accounts of the country and its inhabitants given by the Chinese historians. These were, we are told, settled and agricultural peoples in Great Wan (Ferghana), Ta-hia (Bactria), and An-si (Parthia). All the races from Ferghana to Parthia had deep-set eyes and strong beard and moustache, their dialects varied, but as they all had a native tongue, they must have been human in speech. Their manners, too, were much alike, they paid great respect to women, and the men were very complaisant to their wives. This is almost exactly what Baudesane says of the position of women in his time among the Kushan in Bactria,² but it was quite other wise in Parthia, where the Oriental seclusion of women was carried to the extreme (Just., xii 8, 1, 2). They were all knowing traders, and understood the preparation of silk and lac, but not metallurgy till they were taught that art by Chinese agents and deserters. They then imported the precious metals from China and made gold and silver vessels, but not money, being in this respect behind the Parthians.³ Great Wan probably corresponds to the *Oxapara* of Ptolemy (though he misplaces them) and the *Varena* of the *Vendidad*; it was a separate kingdom, with a population estimated at 300,000 souls in the 1st century B.C., and seventy subject cities. The king, probably a native who came on the fall of the Greeks, lived in Kuei-shan (probably Khogand, at the mouth of the Ferghana valley), and could call out an army of 60,000 men—lancers, archers, and mounted bowmen. The land was famous for its wine and for horses of divine race which sweated blood, and for the possession of which China went to war with Great Wan in 104-103, and again in 108-96. Lucerne and grapes were exported to China, the name of the "po-hao" is held to be the Greek *Styrax*, which would show that the vine was introduced by the Greeks of Alexandria Eschata. South of the Wei or Oxus lies Ta-hia (probably *Zend Dahyuvu*, the land)⁴. Here there was no king, but the several cities were the seats of chiefs, a state of things such as Alexander had found in the country and as reappeared under the Turks in the 7th century A.D. Chang-kien estimated the population at 2 millions; they were bad and cowardly soldiers, but excelled in trade, and the chief town, Lan-shi, had rich bazars of many wares. This town must be one of the commercial cities on the river Bactrus, along which lay the trade-route from India to the north (Pliny, vi 52), i.e., either Bactra or Eucratida (which, according to Ptolemy, vi 11, 8 (Codd. B., E, Pal. 1), lay lower down the stream on the left bank). In the latter case Lan-shi may stand for *Edapses*. North of Ta-hia lay the Great Yue-chi,

and west of the latter was An-si towards the Oxus. This was a very great country, whose length might be 1000 li (358 miles), and it had 100 cities great and small. The first caravan from China to An-si passed on its way from the east frontier to the capital (called in the 1st century B.C. Fan-tou, i.e., probably Parthia), a dozen valleys or rivers, which lay almost all together, so dense were then the population of the fertile part of Khou-sen. The merchants of An-si visited the neighbouring lands with waggons or with ships for distances of several thousand li. The coinage was silver, with the image of the king, and was called in and re-stamped on a new accession.⁵ Writing was on skins in horizontal lines. Now, though the money as here described fits Parthia, the mercantile character of the races does not at all correspond to that of the Parthian aristocracy. Both here and in the general description given above, which also contains features not applicable to the Parthians, we see that the Chinese did not distinguish the ruling race from their subjects, and mainly described the latter, who were in point of fact very similar to the people of Bactria and Ferghana. As An-si extends to the Oxus the description is taken from the inhabitants of Margiana, a country which must have been then subject to Parthia. A later Chinese account, referring to the period 21-220 A.D., places on the east frontier the city Mo-lu or Little An-si, which is plainly the Moum of the *Vendidad*, modern Meivand, and the Greek Antioch *Ἄντιοχος*; An-si is a corruption of the last name, just as the Persians call the Syrian Antioch Andiv, and so came to be a name for the Parthian rulers of the city. West of An-si, on the western (Caspian) sea, lay Tiao-chi (Mazand), an agricultural country with a dense population, a dependency of An-si, and in part governed by tributary chiefs. Chang-kien is thinking less of the central parts of Media than of Gilan and Mazandaran, for he speaks of the warm moist climate where rice is produced. And in this quarter there were really various petty states, not only Atropatene but Dilem had its own king, as appears for the year 65 in the Ptolemaic *Topog.* 26 (where for *Eubandria* read *Aegyria*), and the Gela and Cadusians doubtless stood under their own mountain chiefs, as they had done under the late Achemenians, and did again under the first Sassanians. It is a proof of the solid power of the empire founded by Mithradates that Parthia was able to assert some kind of supremacy over these hardly accessible districts. North of An-si lay Li-kan (Hycanias), whose wizards, with those of the Yue-chi, had great reputation. From this whole account that the centre of the empire was still in the old Parthian lands, and that the lower satrapies were viewed as mere dependencies, "outer lands." In the following century the Chinese obtained knowledge of the west by the caravan-route which passed through Kipin (the Cabul valley) to U-ghe-shan-h (Aconitosis), and now we find a changed state of affairs; these two countries are bounded on the west by Tiao-chi, and the journey from their capital a hundred days' journey from the frontier. An-si is now only mentioned incidentally as reached from Arachosia by going first north and then east, which is correct if we take the name in its original sense of the subjects of Parthia in Margiana and its capital Antioch. But the empire of Parthia, which now had its centre in Media and the western lands, is certainly Tiao-chi, a word that is probably connected with the word for "land" in the official language of the Achemenians, old Persian *dahyuvu*.

As nomadic peoples Chang-kien names the Great Yue-chi in Sogdiana, the Khang-kim on the middle course of the Jaxartes, and the Yen-tsu in Chorasmia. The Yue-chi could put from 100,000 to 200,000 bowmen in the field, later they were reckoned at 100,000 warriors and then families. The royal camp had been north of the Oxus even after the conquest of Bactria from they finally withdrew entirely to this district. Their capital is called Lan-shi, and the name of Ta-hia disappeared before that of "Land of the Great Yue-chi." At the conquest they had a single king, afterwards they formed five principalities. The fifth of these corresponds to Cabul, so that the division is younger than the Scythian invasion of Asia after the death of Phraortes II. Immediately north of Ferghana, but separated from it by the Oxus and the Hiung-nu in the east by a series of small kingdoms, were the pasture-grounds of the Khang-kim on both sides of the Jaxartes; their force was 80,000 to 90,000 bowmen. North-west of these were the Yen-tsu on the Aral, the northern neighbours of the An-si, and east of Hycanias, that is, in Chiosania. If there is no error in the writing of the number they mustered but 10,000 warriors, then again considerable changes had taken place when the Chinese made war on the Khang-kim in 44 B.C. The small kingdoms south and east of the latter have disappeared, so that the Khang-kim border on the Hiung-nu and the great Yue-chi; but the latter have now moved south, and now, too, the Khang-kim are the northern neighbours of An-si, and not the Yen-tsu; the latter are their dependants, and a tribute of mouse-skins is even drawn from the kingdom of Yen beyond the Yen-tsu. Such a tribute cannot have come from any place south of the Mukhtar moun-

¹ The Lombards had the same custom, learned, no doubt, in the childhood of the race from their Avarian neighbours.

² See Longinus, *Colli et Hist. de l'Arménie*, p. 84.

³ Eusebius, in Ritter, vii, 8, p. 642.

⁴ Certainly not Dahae, for they were never in Bactria.

⁵ On this point the younger Chinese account falls into a confusion with the coins of the kings of Kipin.

138-129 tann. The Khang-kui have been in number as the Yue-chi fall, and have now 1,000,000 bowmen, or a population of 600,000 souls. Like the Yue-chi, they are divided into juncuplantes, which are live in number, and the king is the prince of Sa-hai, with his winter residence in a place of that name east of Fergana, and his summer count much farther west at Lo-yue-nu. The east of the Khang-kui country was often subject to the Hing-nu, and the prince of this Turkish tribe seems to have been the cause which pushed the Khang-kui and Yue-chi farther west. The latter have now at least 100,000 bowmen, and extend westwards to the limits of Great Tan to the Roman empire. This compels us to conclude that the Yue-chi are the Aorsi, the western part of whom ranged between the lower Don and the west coast of the Caspian, while the older upper Aorsi were round the north coast, and so on to the neighbourhood of the lower Jaxartes (Strabo, xi p. 506; Ptol., vi 14, 10). When Plinians ruled on the Bosphorus (64-47 a.c.) both parts of the Aorsi intervened in the affairs of the neighbouring kingdom with large armies, and as Plinians was a client of Rome the Chinese statement is intelligible. Later Chinese accounts relating to the first Christian century give A-lan-nu as the later name of the Yen-tai, which agrees with the fact that the Aorsi appear last in history in 49 A.D. (Tae, *Ana*, xi 15 y.) and that Li-chun, ten or fifteen years later, is the first to name the Aorsi, who succeeded to them as conquerors and allies. When we understand the Chinese data we can speak with more definiteness about the four nations to whom Strabo ascribes the fall of Greek Bactria, and which Ptolemy also seems to name from a source relating to the time when the invasion began. From these data, compared with our Chinese sources, we can be sure that the Tochari are the great Yue-chi, the former being probably the name of the nation and the latter that of the leading tribe. The Aun of Strabo, Assani of Ptolemy, Jatu of Ptolemy, all then be all attempts to render the difficult name of the tribe which the Chinese call Yue-chi. But, while the classical writers place the Sacrae in the west to balance the Tochari in the east, the Chinese know no second great nation between the latter and the Parthians in Magniana. We must therefore suppose that the Sacrae are the Scythians who occupied part of the Greek lands, and were in turn conquered by Parthians according to the (c. 61), that the rest was Magniana is known from a drachma of Phraates II (Gardner, *Parthian Coins*, p. 33), the conquest must have taken place a good while before 128, when Chang-kui visited Sogdiana, since by that time the Parthians had again displaced them. But he must have known and mentioned the Sacrae in some form, and they can hardly be other than the most powerful nation known to him in Transoxania, the Khang-kui. Those, like the Sacrae, who lived beyond the Jaxartes, they are the northern neighbours of Parthia just at the time when the Sacrae are so described. The only other tribe that can be thought of, the Yen-tai, are known to the Greeks and Romans by a different name, as the Aorsi, and Trogus (*Phil.*, xii) mentions the fall of the Sacrae as one of the latest events in Scythian history, which, as he wrote soon after 2 B.C., agrees with the fact that the last mention of the Khang-kui in Chinese history is in 11 B.C., while the Aorsi are mentioned much later. Khang-kui seems to be properly the name of a country identical with the Kathaga of the *Khotan-Asaka* and the Ganggus of Fudansi. Finally, the Pasice or Pasani are the same as the Apasice of the earlier Parthian history; the Sacrae will have conquered them and swept them with them as the Mongols did with many Tartar tribes. The conquest of Bactria probably followed soon after the last hopes of the Eastern Greeks in Demetrius II came to nothing. It is very remarkable that Chang-kui notices no difference between the Greeks who had been rulers and the Iamians who were their subjects. This implies not merely some lapse of time but a marked decrease in the number of the Greeks, and probably also that here, as in other Eastern parts, they had become more and more completely Orientalized.

Phraates II. Phraates II.,¹ who succeeded his father in 138, and continued his work, wresting Margiana from the Scythians of Bactria in an expedition commemorated on extant coins, had also to meet the last and most formidable attempt to restore the sovereignty of the Seleucids. Antiochus VII., one of the ablest kings of his race, had put down the civil wars in Syria, even taking Jerusalem and compelling the Jews to acknowledge his might by paying him military service, and in 130 he marched eastward at the head of a force of 80,000 combatants, swollen by camp-followers to a total of 800,000. Many of the small princes, on whom the hand of Parthia lay heavy, joined him as they had joined his brother, the enemy was smitten on the Great Zab, and in two other battles; Babylon and then Ecbatana

opened their gates to the conqueror; and the subject-nations rose against the Parthians, who, when Antiochus took up his winter quarters in Media, were again confined to their ancient limits. When the snows began to melt, an embassy from Phraates appeared to ask for peace, but the terms demanded by Antiochus—the liberation of Demetrius, the surrender of all conquests, and the payment of tribute for the old Parthian country—were such as could not be accepted without another appeal to the fortunes of war. Demetrius, indeed, was released and sent to Syria, but only to stir up a hostile party in his brother's rear. During the winter the Syrian host had been dispersed over a wide range of cantonnments, the disorderly insolence of the soldiers, for which the general Athenaeus was held to be mainly responsible, and of the levies raised in the towns had disgusted the natives, the Medes made secret terms with Parthia, and all the cantonnments were attacked by concert on a single day. Hastening to relieve the nearest corps, Antiochus was met by the Parthian with a superior force of 120,000 men, he refused the advice of his officers to fall back to the neighbouring mountains, and accepted battle on a field too narrow for the evolution of his troops. The Syrian soldiers, enervated by luxury, were readier to imitate the flight of Athenaeus than the valour of his master, the whole host was involved in the rout and annihilated. Antiochus himself escaped wounded from the fray and cast himself from a rock that he might not be taken alive. This catastrophe (February 129²) freed the Parthians for ever from danger from Syria.

Phraates paid funeral honours to the fallen king, and afterwards sent his body to Syria in a silver coffin. He entertained his captive family royally, married one of the two daughters, and sent the eldest son Seleucus to Syria to claim the sovereignty, and so serve future plans of his own, for an attempt to follow and recapture Demetrius, made immediately after the battle, had proved too late. But dangers in the east soon turned the Parthian's attention away from enterprises in the west. In his distress he had bribed the Scythians³ to send him help, as they arrived too late he refused to pay them, and they in turn began to ravage the Parthian country. Phraates marched against them, leaving his charge at home to his favourite, the Hyrcanian Eubemeros, who chastised the countries that had sided with Antiochus, made war with Mesene, and treated Babylon and Seleucia with the utmost cruelty. But the Scythian war proved a disastrous one; the enemy overran the whole empire, and for the first time for five hundred years Scythian plunderers again appeared in Mesopotamia⁴; in a decisive battle Phraates was deserted by the old soldiers of Antiochus, whom he had forced into his service and then treated with insolent cruelty; the Parthian host sustained a ruinous defeat, and the king himself was slain (spring 128, or somewhat later).⁵

Artabanus I.⁶ (third son of Phriapatius), who now became Artabanus I. an elderly man. The Scythians, according to the too favourable account by our chief authority, were content with their victory, and moved homewards, ravaging the country. But we know from John of Antioch (66, 2) that the successor of Phraates paid them tribute, and the southern part of Drangiana must now have been per-

¹ The date is fixed by Lavy, who, according to Orosius, v. 10, and Orosius, *De Prodig.* 28, places the expedition in the consular year 180. With this it agrees that Antiochus came to the throne in 138 and reigned nine years. Too much weight is often attached to Porphyry's dates by Olympiad, which are merely calculated from the years of regnum.

² Justin xii 2, 1-2, plainly distinguishes these Scythians from the Tochari, so the Sacrae must be meant.

³ Jo. Ant., in Müller, iv 661.

⁴ The remains of Antiochus reached Syria in the reign of Alexander II., who came to the throne in 128 (Justin, xxxix 1, 8).

⁵ In coins Arsaces Theopator Euergetes Euphantes Philhellus

manently occupied by the Scythian tribes, who gave it the name of Sacastane (Sistan), for that name appears in Isidore of Charax (1 a.c.), which implies that the Scythian occupation was even then of long standing. Finally, the coins reveal the existence of Arsacids who were rival kings to Artabanus I. and Mithradates II., and perhaps borrow from individual successes against the Scythians the proud titles which so strongly contrast with the really wretched condition of the empire. One of these pretenders, Arsaces Euergetes Dicaeus Philhellen, resumes the style "king of kings," which had lapsed since Mithradates I.; and his title "the just," which seems to be imitated from the Bactrian Heliocles, suggests that he may have come with the Scythians from the land where Heliocles once reigned. Meanwhile it would appear that the men of Seleucia, driven to desperation, had seized the tyrant Euhemerus and put him to a cruel death.¹ Artabanus, when they sought his pardon, threatened to put out the eyes of every man of Seleucia, and was prevented only by his death, in battle with the Tochari, after a very short reign.

Mithradates II.

His son and successor, Mithradates II. the Great,² was the restorer of the empire.³ We are briefly told that he valiantly waged many wars with his neighbours, added many nations to the empire, and had several successes against the Scythians, so avenging the disgrace of his predecessors. His successes, however, must have been practically limited to the recovery of lost ground, and the eastern frontier was not advanced. It has been common to connect with his successes the appearance of Parthian names among the Indo-Scythian princes of the Cabul valley; but this must be false, for even Candahar (Ughe-shan-li), which lies so much farther west, is represented by the Chinese as an independent kingdom in the middle of the 1st century a.c. On the other hand, Mithradates, if not the first to conquer Mesopotamia, was the first to fix the Euphrates as the western boundary of the empire, and towards the end of his reign he was strong enough to interfere with the concerns of Great Armenia and place Tigranes II. on the throne in a time of disputed succession (94), accepting in return the cession of seventy Armenian valleys. Now, too, the Parthians, as lords of Mesopotamia, came for the first time into contact with Rome, and in 92, when Sulla came to Cappadocia as proprietor of Cilicia, he met on the Euphrates the ambassador of Mithradates seeking the Roman alliance.⁴ This embassy was no doubt connected with the Parthian schemes against Syria; Mithradates about this time was at war with Laodice, queen of Commagene or some neighbouring part; and her cousin Antiochus X.,⁵ who supported her, fell in battle with the Parthians. A few years later Strato, tyrant of Beroea, called in the Arab phylarch Azizus and the Parthian governor of Mesopotamia, Mithradates Sinaces, against Demetrius III., who reigned at Damascus. The Seleucid was compelled to surrender with his whole army and ended his life as a captive at the Parthian court. Mithradates the Great seems to have died just after this event; there is no reason to suppose that he lived to see the disasters which followed so close on his great successes.

¹ In *Diad. Exc. Vol.*, p. 107, there can be little doubt that *ἐκείν* is a corruption of *Εὐκλείδης*.

² In coins Arsaces Theos Euergetes Epiphanes Philhellen.

³ The time of his accession follows approximately from the date 123 on a coin of his rival, Arsaces Niochphorus.

⁴ The ambassador allowed Sulla to take the place of honour, and on his return was punished for this by death.

⁵ The queen *ἡδὲ Γαλατρίων* of *Jos. Ant.* xii. 18, 4 (*Leyden MS.*—the usual text has "queen of Gilead"), is doubtless the Laodice Thea Philadelphos, daughter of Antiochus VII. of Syria, who, as Mommsen has shown (*Mith. Arch. Inst. Athen.*, i. 52), was successor of the latter sovereign of Commagene. The word in *Josephus* is not perhaps a corruption of Commagene but of some neighbouring place—*ἡδὲ Γαλατρίων*.

Artabanus II. was the next monarch,⁶ but after him the 128-66. style of king of kings was taken by the Armenian Tigranes, one of the most dangerous foes Parthia ever had. In Tigranes 86 it was still a reason for choosing Tigranes as king of Armenia. of Syria that he was in alliance with Parthia (Just., xl. 1, 3), but very soon the latter state was so ruined by civil and foreign war that it was no match for Armenia (*Plut., Lucullus*, 36). Of the details in this history we know only the last act. In 77 the Arsacid Sinatruces⁷ returned from the land of the Sacaracae to take the throne at the age of eighty, and reigned seven years. There were probably other usurpers; the silence of the coins does not prove the contrary, but rather that the times were so bad that no money was struck, a case of which Parthian numismatists offer other examples. Tigranes conquered Media—primarily, that is, Atropatene—but he also entered Great Media and destroyed the city of Adrapan, 7 miles west of Ecbatana, "the castle of those who have their seat in Batana" (*Ecbatana*),⁸ i.e., of a line of the Arsacids, for, though Mithradates I. had had his seat in Hyrcania, Phraates II. and his successors down to Mithradates III. held their court in Media (*Diad. Exc. Vol.*, p. 603). The seventy valleys which had been the price of his throne were restored to Tigranes, and he also ravaged the country of Arbela and Nineveh, and compelled the cession of Adiabene, hitherto a Parthian dependency, and of Mesopotamia, with the fortress of Nisibis. This last war was against Sinatruces,⁹ and was probably going on in 73 when Mithradates Eupator of Pontus made a vain appeal for help to both combatants (Memnon, in Photius, p. 234 b, 27).

Phraates III. succeeded his father Sinatruces a little Phraates before the arrival of Lucullus in the East in 70,¹⁰ and in 69 refused a second invitation to give help against Rome which Mithradates and Tigranes addressed to him jointly, the latter offering to reward him by giving up all that he had taken from the Parthians. His hatred of Tigranes made him more disposed to alliance with Rome; and after a period of hesitating neutrality Phraates accepted the overtures of Pompey and prepared to invade Armenia (66), guided by the younger Tigranes, who had quarrelled with his father and taken refuge in Parthia, where he wedded the daughter of the king. Tigranes the elder fled to the mountains; and, after forming the siege of Artaxata, which proved tedious, Phraates turned homeward, leaving young Tigranes with part of the army to continue the war. The latter, who alone was no match for his father, fled after an utter defeat to Pompey, who was Pompey just preparing to invade Armenia, and to whom the elder in Artixanes presently surrendered at discretion. The Roman, however, gave him very good terms, altogether abandoning his son's cause and even casting him into chains.

⁶ In *Trogus, Procl.* 41, the sentence "successores deinde eius Artabanus et Tigranes cognomine Deus a quo subacta est Media et Mesopotamia detempore in excessu Amisii eius" is wrongly referred (after Velleius) to Mithradates I. of Parthia. It can really refer only to the famous Tigranes, and in that case must have originally belonged to *Procl.* 42, having dropped out by homoteletion, and been restored from the margin in a false place. Artabanus II., therefore, followed Mithradates II., and his probably are the base coins of Arsaces Euergetes Epiphanes Philhellen, which according to Gardner, p. 38, seem to belong to this time.

⁷ On coins Arsaces Eupator Philopator Epiphanes Philhellen.

⁸ *Isid. Char.*, in *Geog. Gr. Min.*, i. 250.

⁹ *Sallust, Hist.*, iv. fr. 19, § 3.

¹⁰ So Memnon, in Photius, p. 239 a, 18, confirmed by Philogon, *vid.*, p. 84 a, 15. These sources, being independent, have more weight than Appian, *Mit.*, 104, and Dio Cassius, xxxvi. 46, who speak of the arrival of Pompey. Phraates III. is the "king of kings, Arsaces Eupator Epiphanes Theos Eupator Philhellen," whose coins Gardner correctly describes to Mithradates III. We have express testimony that Phraates was styled "king of kings" and had the epithet "Theos" (*Plut., Pomp.*, 83; Dio Cass., xxxvi. 6; Philogon, *sup. cit.*).

63-53 B.C. Meantime Phraates had occupied the Parthian conquests of Tigranes, which the Romans had promised him, and invaded Corduene (Beth-Nairdo, now Jezhat bent 'Omar), whence he sent an embassy to Pompey to intercede for his son-in-law. But the Romans had no further occasion for Parthian help; and, instead of granting his request, Pompey commanded him to leave Corduene, and followed up the command by sending Afranius to clear the country and re-take it to Tigranes. Immediately afterwards Pompey's officer marched into Syria through Mesopotamia, which by treaty had been expressly recognized as Parthian; and it was another grievous insult that Pompey in writing to Phraates had withheld from him the style of "king of kings." This no doubt was done out of regard to Tigranes, who claimed the sole right to the title, and had probably enforced his claim upon the weak predecessors of Phraates. Of the four subordinate kingdoms, the patronage of which was held to give a right to the title, Atropatene, Adiabene, Corduene are known, and the fourth was probably Orhene. All these had once stood under Parthian suzerainty, and now that Phraates had recovered the lost territory of his predecessors including these states, he resumed, as his coins show, the proud title which had dropped since the days of Mithradates I., and to which Tigranes had lost his real claim. Nevertheless Phraates at first contented himself with again sending a fruitless embassy to demand that Pompey would observe the treaty and acknowledge the Euphrates as the Parthian frontier, and it was only when Pompey had gone to Syria (64) that he again attacked and defeated Tigranes. Pompey declined to interfere by force and burden himself with a Parthian war while Mithradates of Pontus was still under arms, but, as both sides appealed to him, he sent umpires to settle the dispute (which probably turned on the possession of Corduene), and a peaceable solution was effected.¹ The Romans had done more than enough to irritate Parthia and not enough to inspire respect, but, as the Parthians were only beginning to recover from the inner and outer troubles of the last two decades, they were not yet prepared to enter on a struggle with Rome.

For a century and a half up to the death of Mithradates the Great there had been an unusual degree of unity in the house of the Arsacids, but the corruptions to which every Eastern dynasty ultimately falls a prey appeared at length. About 57 Phraates, the restorer of the empire, Orodes I. was murdered by his two sons, one of whom, Orodes or Hyrodes I. (Zend, *Harnodha*), took the throne, while his brother Mithradates III. got Media;² but the latter ruled so cruelly that he was expelled by the Parthian nobles, and Orodes reigned alone. Mithradates, with a loyal follower, Orsanes, fled to Gabinus, proconsul of Syria, who had already crossed the Euphrates to restore him by force when he was summoned by Pompey to restore Ptolemy XI. to the throne of Egypt (55). Mithradates, dismissed by the Romans, now tried what he could do without help. Orodes had at first to flee, but soon regained his position, mainly through the help of Surenas, a young noble who had the hereditary right of crowning the king, and was the second person in the empire in point of wealth, nobility, and

influence, and the first in courage and political skill. Surenas took Selucia by storm; Babylon received Mithradates, but was reduced by famine; Mithradates then surrendered to his brother and was killed before his eyes. These events carry us far into the year 54.

Meantime Crassus, hoping for a rich and easy prey, Cam- had invaded Mesopotamia without a shadow of pretext, ^{Crassus.} and had defeated a small Parthian force at Ichne, and occupied a number of large towns, such as Nisibis, Ichna, Carhae, whose Greek inhabitants welcomed the Romans as liberators. As Mithradates was at this time in arms in Babylonia, we can understand why Crassus was blamed for a grave error of judgment in not marching direct from Nisibis to Selucia and Babylon (Plut., *Crassus*, 17). Instead of this, he retired to winter-quarters in Syria, leaving 7000 foot and 1000 horse to garrison the Mesopotamian cities. Thus his hands were tied for the following campaign, and he could not accept the invitation of Artavasdes II. of Armenia to advance through his country and have his co-operation. A Parthian embassy appeared in Syria in spring to remonstrate against the faithlessness of Rome, but at the same time the Parthians were ready for war. Surenas, with Silaces, satrap of Mesopotamia, was passing the Roman garrisons, and prepared to confront Crassus with an army wholly composed of cavalry, while Orodes in person invaded Armenia. In the spring of 53 Crassus crossed the Euphrates at Zeugma with seven legions and 8000 cavalry and light troops, making up a total of 42,000 or 43,000 men,³ and was persuaded by Abgar of Orhene to leave the river and march straight across the plains against Surenas. At mid-day, 6th May (9th June as the calendar then stood) the Romans had crossed the Balisus (Nahr Belik) and met Surenas half way between Carhae and Ichna, or a little nearer the latter town. They were not, therefore, in the desert—as the older account represents—for it begins beyond the Chaboras.⁴ Surenas kept the mass of his troops concealed by a wooded hill, showing only the not very numerous vanguard of cataphracts till the Romans were committed to do battle. The Roman cavalry under Publius Crassus, son of the proconsul, charged the enemy to prevent a threatening flank movement, and were drawn away from the mass of the army by the favourite Parthian manoeuvre of a simulated flight, and then surrounded and cut to pieces. The mass of the Roman host lost courage at this disaster, and already had suffered terrible loss from the light-armed hordes of Parthian serfs who hovered round the enemy at a safe distance and galled it with arrows shot with deadly precision. The legionaries serried their ranks and covered themselves with their shields; but in this close order they were easily broken by the charge of the Parthian firemen with their long heavy lances and almost impenetrable suits of complete armour. The heat, too, thirst, and dust oppressed the Romans, and this first day would have decided their fate but that the Parthians withdrew before evening, true to their rule of encamping

¹ Dio, *lxxxviii* § 6 a different source from that which lay before him at *xxvii* § 51, has not observed that the former recapitulates the whole story from the beginning, including the rebellion and defeat of the younger Tigranes as related above.

² This is Dio's account, and, though other writers dissent, it is justified by the coins. The sons of Arsaces Philopator (or Theopator) Evergetes Euphrates Philhellen belong to Mithradates, —not, as Gieseler thinks, to his father, for Theopator denotes a king whose father was Arsaces Theos, and these coins call him only "great king," while Orodes (Arsaces Philopator—or Evergetes)—Dionos Euphrates Philhellen is called "king of kings." Both princes, it will be observed, ultimately gave up the title of Philopator, which marks them as colleagues or recognized heirs of their father,—an indirect confirmation of their guilt as parricides.

³ Florus says eleven legions and Appian 100,000 men, but Appian has made the mistake of adding to the legion its auxiliaries and counting the whole at the higher footing adopted under the empire. Seven such legions with the 8000 cavalry and light troops, and the 8000 men in garrison, make up his total. For the campaign of Crassus we have two independent narratives preserved in Plutarch and Dio; Plutarch's is the older account, full of colour and valuable detail, but lacking in topographical precision, in this respect Dio's source is much to be preferred, but it has suffered from that author's somewhat arbitrary way of melding with his materials. The accounts based on Livy (*Periplus* lib. 108; Florus, *lvi* 11; Festus *Rufus*, *Pres*, 17, and Orosius, *v* 18) agree in all essential points with Plutarch, who, however, draws not from Livy but from some Greek writer, perhaps Nicolaus of Damascus.

⁴ Plutarch himself speaks of marshes (*cap* 25); the only modern account that agrees with the facts is that of G. Rawlinson, p. 168 *sq.*

at a distance from the foe. Crassus retired at night, leaving all who were badly wounded behind him, and reached Carrhæ safely; but his army was sadly demoralized, and he himself lost his head, and, though fairly secure at Carrhæ, thought only of immediate retreat to Syria.¹ He marched by night northwards towards the mountains; the several divisions lost one another and each sought only to shift for itself. The quaestor Cassius, one of Crassus's best officers, returned to Carrhæ and thence regained Syria in safety. Crassus himself, after getting dangerously entangled in marshy ground, had almost reached the mountains when he was induced, by the despair of his troops rather than by error of his own judgment, to yield to treacherous proposals of Surenas and descend again into the plain. As he mounted the horse which was to convey him to a meeting with the enemy's general the gestures of the Parthians excited suspicions of treachery, a struggle ensued, and Crassus was struck down and slain. Scarcely 10,000 men out of the whole host reached Syria by way of Armenia (Appian, *B. C.*, ii. 18); 20,000 had fallen and 10,000 captives were settled in Antioch, the capital of Margiana. The token of victory, the hand and head of Crassus, reached Orodes in Armenia just as he had made peace with Artavasdes and betrothed his eldest son Pacorus to the daughter of the Armenian king. The Roman disaster was due primarily to the novelty of the Parthian way of assault, which took them wholly by surprise, and partly also to bad generalship; but the Romans always sought a traitor to account for a defeat, and in the present case threw the blame partly on Andromachus of Carrhæ, who really did mislead Crassus in his retreat, and was rewarded by the Parthians with the tyranny of his native town (Nic. Dam., in Athen., vi. p. 253 D.),² but had no great influence on the disaster, and partly on Abgar, whose advice was no doubt bad, but not necessarily treacherous,³ while the silence of the older account disposes of Dio's improbable assertion that the men of Orrhoene fell on the rear of the Romans. That the Parthians did not count Abgar their friend and punished him with deposition may be fairly inferred from the list⁴ of kings of Edessa given by Dionysius of Telmahar, which shows that the reign of Abgar II. ended in 53, and was followed by a year of interregnum.

Surenas, the victor of Carrhæ, whose fame was now too great for the condition of a mere subject, was put to death a little later, the victim of Orodes's jealousy; the victory itself was weakly followed up. Not till 52 was Syria invaded, and then with forces so weak that Cassius found the defence easy. In July 51 (Sextilis, according to the old calendar) the attack was renewed with greater forces; the Romans were still weak in troops, their harshness and injustice had alienated the provincials, and some districts—as Judæa—openly sympathized with the foe. Thus all the chances were still favourable to the Parthians, who indeed overran the open country, but were too unskilled in siege to take Antioch. As they drew off, Cassius stopped their way at Antiochia and inflicted on them a defeat in which Osaces, the real leader of their host under the young prince Pacorus, was mortally wounded (August 51). Pacorus wintered in Cyrrhestica, the Romans under the new proconsul Bibulus not venturing beyond the walls of Antioch;

but, the satrap of Mesopotamia⁵ having raised a revolt 53-38 a.c. against Orodes in the name of Pacorus, the latter was recalled by his father and Syria was entirely evacuated by May 50.

Orodes avoided the threatened breach with his son by associating Pacorus in the empire;⁶ but the Parthians took little advantage of the civil wars that preceded the fall of the Roman republic. They occasionally stepped in to save the weaker party from utter annihilation, but even this policy was not followed with energy, and Orodes refused to help Pompey in his distress because the Roman would not promise to give him Syria. The Pompeian Cæcilius Bassus was saved from Cæsar's general Antistius Vetus by the sudden appearance of a Parthian force under Pacorus, which, however, retired when winter came on (December 45). In 43, again, Cassius had a force of mounted Parthian bowmen with him in Syria, but dismissed them when he marched to join Brutus and face the triumvirs. Labienus was with Orodes negotiating for help on a larger scale when the news of Philippi arrived, and remained with him till 40, when he was at last sent back to Syria, together with Pacorus and a numerous host. The Roman garrisons in Syria were old troops of Brutus and Cassius, who had been taken over by Antony; those in the region of Apamea joined Labienus; Antony's legate Decidius Saxa was defeated, and fled from the camp afraid of his own men. Apamea, Antioch, and all Syria soon fell into the hands of the Parthians, and Decidius was pursued and slain. Pacorus advanced along the great coast road and received the submission of all the Phœnician cities save Tyre. Simultaneously the satrap Barzaphanes appeared in Galilee; the patriots all over Palestine rose against Phasael and Herod (see *ISRAEL*, vol. xiii. p. 429); and five hundred Parthian horse appearing before Jerusalem were enough to overthrow the Roman party and substitute Antigonus for Hyrcanus. The Parthian administration was a favourable contrast to the rule of the oppressive proconsuls, and the justice and clemency of Pacorus won the hearts of the Syrians. Meantime Labienus had penetrated Asia Minor as far as Lydia and Ionia; the Roman governor Planus could only hold the islands; most of the cities opened their gates to Labienus, the "Parthian Emperor," Stratonicea alone resisting and successfully standing a siege. But Rome even in its time of civil divisions was stronger than Parthia; in 39 Ventidius Bassus, general for Antony, suddenly appeared in Asia and drove Labienus and his provincial levies before him without a battle as far as the Taurus. Here the Parthians came to Labienus's help, but, attacking rashly and without his co-operation, they were defeated by Ventidius, and Labienus's troops were involved in the disaster. Labienus himself escaped to Cilicia, but was captured and executed by the Egyptian governor of Cyprus. In the passes of the Amanus the Romans were again in danger, but Ventidius at length gained a decisive victory at Trapezus, north of the Orontes valley, where Phraurates, the ablest lieutenant of Pacorus, fell; and the Parthians evacuated Syria. Before Ventidius had completed the resettlement of the Roman power in Syria and Palestine, and while his troops were dispersed in winter-quarters, the Parthians fell on him again with a force of more than 20,000 men and an unusually large proportion of free cavaliers in full armour. Ventidius, however, gained time to bring up legions from Cappadocia by deceiving a dynast of Cyrrhestica, who was Pacorus's spy. Then a battle was fought near the shrine of Heracles at Gindarus in Cyrrhestica, on the anniversary, it is said, of the defeat of Crassus (9th June 38), and the Parthians were

¹ That he waited for the new moon—i.e., some twenty days, as Dio says—seems to be a mistake. Perhaps it is due to Dio himself; at all events, the older account is preferable.

² The Parthians learned much on the despots of the Greek cities. Zenoctia, the only Mesopotamian town that Crassus had to storm, had a Despot, Apollonius.

³ The alternative of a march along the Euphrates was also open to serious military objections.

⁴ It must be remembered that a correction of four years has to be applied to all the dates in this list.

⁵ The name was Orontidætes, corrupted to 'Orontidætes' in Dio, xi. 30.

⁶ So the coins show, Gardner, p. 41.

38-37 B.C. utterly routed and Pacorus himself slain. His head was sent round to the cities of Syria which were still in revolt to prove to them that their hopes had failed. There was no further resistance save from Aradus and Jerusalem.

Orodes, now an old man and sorely afflicted by the death of his favourite son, nominated his next son, Phraates, as his colleague, and the latter began his reign by making away with brothers of whom he was jealous as the sons of a princely mother, daughter of Antiochus of Commagene, and then strangling his father, who had not concealed his anger at the crime (37). The reign of Orodes was the culminating point of Parthian greatness, and all his successors adopted his title of "king of kings, Arsaces Euergetes" (taken from Phraates II) "Dicaeos" (first borne by the pretendant spoken of at p. 593, who was perhaps father of Sinatruces, and so ancestor of the succeeding princes) "Euphanes" (like Mithradates I) "Philhellen" (like Philopatris). It was he who moved the capital westward to Seleucia, or rather to Ctesiphon (Tasftein), its eastern suburb.¹

Phraates IV. Phraates IV. continued his reign in a series of crimes, murdering every prominent man among his brothers, and even his own adult son, that the nobles might find no Arsacid to lead their discontent. Many of the nobles fled to foreign parts, and Antony felt encouraged to plan a war of vengeance against Parthia.² Antony had no hope of forcing the well-guarded Euphrates frontier, but since the death of Pacorus Armenia had again been brought under Roman patronage, and he hoped to strike a blow at the heart of Parthia through Atropatene. Keeping the Parthians in play by feigned proposals of peace while he matured his preparations, he appeared in Atropatene in 36 with 60,000 legionaries and 40,000 cavalry and auxiliary troops, and at once formed the siege of the capital Phraaspa (Takht-i-Suleiman). The Median king Artavasdes, son of Ariobarzanes,³ had marched to join Phraates, who looked for the attack in another quarter. Phraates had only 40,000 Parthians, including but 400 freemen who never left the king, and probably 10,000 Median cavalry;⁴ but these forces were well handled, and the two kings had reached the scene of war before Antony was joined by his baggage and heavy siege-train, and opened the campaign by capturing the train and cutting to pieces its escort of 7500 men under the legate Oppius Sittianus. Antony was still able to repel a demonstration to relieve Phraaspa, but his provisions ran short, and the foraging parties were so harassed that the siege made no progress, and, as it was now October, he was at length forced to open negotiations with Phraates. The Parthian promised peace if the Romans withdrew, but when Antony took him at his word, abandoning the siege-engines, he began a vigorous pursuit, and kept the Romans constantly on the defensive, chasing one officer who hazarded an engagement by a defeat which cost the Romans 3000 killed and 5000 wounded. Still

¹ Orodes indeed knew Greek and caused for Greek literature. The *Biographia* was performed at his son's betrothal.

² Ctesiphon was capital at the time of Crassus's invasion, and Ammianus (xviii 6, 32) calls Pacorus the second founder of the city, the first Vardanes being perhaps a mythical person. A com of Orodes with the title *κτίστης* (Gardner, 39) may refer to this.

³ Of this war we have three accounts, all based on one source, probably a monograph by Diodorus. The best is Plutarch's (*Ant.* 37 *sq.*, favourable to Antony). The later minor historians (who drew from Livy) and Dio (xlix 23 *sq.*) are hostile to Antony (Octavianus), but the former, while sharing Dio's general point of view, approach Plutarch in many points of detail. Plutarch drew from the original source, indirectly perhaps through Nio Dam; Dio used Livy, but not exclusively. The point in the story where the mutual relations of the several narratives differ, but not clearly in its what is said of the adviser who saved the Romans from utter destruction.

⁴ *Mon. Aug.*, col. vi. l. 12.

⁵ Plut., *Ant.* 44; Justin, xii 2, 6. The number 10,000 is given by Apollonius in Shabo, xi p. 528.

greater were the losses by famine and thirst and dysentery, and the whole force was utterly demoralized and had lost a fourth part of its fighting men, a third of the camp-followers, and all the baggage when, after a retreat of twenty-seven days from Phraaspa to the Araxes by way of Manah (276 miles), they reached the Armenian frontier. Eight thousand more perished of cold and from snow-storms in the Armenian mountains; the mortality among the wounded was terrible; the Romans would have been undone had not Artavasdes of Armenia allowed them to winter in his land. The failure of the expedition was due partly to the usual Roman ignorance of the geographical and climatic conditions, partly to a rash haste in the earlier operations, but very largely also (as in the case of Napoleon's Russian campaign) to the lack of discipline in the soldiers of the Civil War, which called for very stern chastisement even during the siege of Phraaspa, and culminated at length in frequent desertions and in open mutiny, driving Antony to think of suicide. The Romans laid the whole blame on Artavasdes, but without any adequate reason. At the same time the disaster of Antony following that of Crassus seemed to show that within their own country the Parthians could not safely be attacked on any side, and for a century and a half Roman cupidity left them alone.

The Median Artavasdes, whose little country had borne the whole brunt of the war, fell out with the Parthians about the division of booty, and made overtures to Antony for alliance with Rome, and in 33, when the Romans had treacherously seized the person of the Armenian Artavasdes and occupied his land, a treaty was actually concluded by which Symbace, which had once been Median, was again detached from Armenia, and Roman troops were sent to co-operate with the Median king in repelling the efforts of the Parthians to reseat on the throne of his father Artaxas, son of the deposed king of Armenia. These troops, however, were recalled before the battle of Actium, and then Media and Armenia fell before the Parthians; the Romans who were still in the country were slain, and Artaxas II. was raised to the Armenian throne (30). In the very next year, however, the course of Parthian affairs led Artaxas to make his peace with Rome.⁶

Phraates's tyranny had only been aggravated by his successes, and open rebellion broke out in 33. We have coins of an anonymous pretender dating March to June 32.⁷ To him succeeded Tiridates II., whose rebellion was at a Thidates climax during the war of Actium. Towards the end of II. 30 Tiridates succumbed and fled to Syria, where Octavian, who was wintering in the province, allowed him to remain. A fresh attempt made from this side, with the help perhaps of the Arabs of the desert, and by crossing the Euphrates at the island now called Koba, had better success. The order of events here given is that deduced by Vaillant and Longuerue, combining the Roman history of Dio with the Parthian of Trogus—Lachmann, who makes Tiridates be expelled only once and supposes a mistake on the part of Trogus as to place and date of his meeting with Augustus, assigning 1st March 29 as the date of Horace, *Carm.*, ii. 8, but the chronological difficulties of this view are insuperable. Phraates was taken by surprise and fled, slaying his concubines that they might not fall a prey to his victor (*Ibid.* Char., 1). Tiridates seated himself on the throne in June 27,⁸ and Phraates wandered for some time in exile till he persuaded the Scythians to undertake his cause.

⁶ See coins in Eckhel, vi. 82, compared with Dio, li. 16, and the reference in Horace, *Carm.*, ii. 8, 20-22.

⁷ Ascribed to Tiridates II. by Gardner, p. 44 *sq.*

⁸ *Darius*, 285 *Sel.* In this month there are coins of Phraates and also of an Arsaces Euergetes Antiochus Euphanes Philhellen, who must be Tiridates II.

27 B.C. — En route with his host on one side and the mountain Dnieper on the other will still have had course. South-west of Kipin lay the hot plain of U-ghe-shan-h (Kaudshar and Sistan), where the southern road ended (necessarily at a considerable commercial town, therefore at Alexandria in Asiaehia). Hence a road leads to Au-si (in its original sense, *supra*, p. 595), first northward (to Hecata) and then east (to blav). The inhabitants of U-ghe-shan-h, which was too remote to be often visited from China, hunted bloodshed and had weapons adorned with gold and silver. Then come are described in the same terms as those of Kipin, and probably the latter had come, and there was no native mint. But there was an independent kingdom, and, as it is certain that Diargiana and Asiaehia were not at this time (middle of 1st century B.C.) subject to the Greeks—no sons of the successors of Apollodotus having been found there—we conclude that this kingdom was that of the Saka, who crossed Iran in 123. Later Chinese writers say that the country was subject to Au-si (Parthia), and Iwino of Charax (1 B.C.) makes Asiaehia a Parthian satrapy. It was probably under Orodes that Asiaehia was conquered and the Saka confined to Sacastane.

The latest coins of Hormizd bear also the name of a king, Kiyula-Kash, but in the Armenian and finally also in the Greek legend (Κυροβασιλεως). Now the Chinese tell us (*Mem. de l'Asie*, xxi, 27, 28) that about a century after the Tchouai (Yueh) conquered Bactria (c. 39-27—Kien-tsen-kho, prince of Kien-shuang, conquered the other four principalities of the Tchouai and named his whole kingdom Kien-shuang (Kashan). He then warred against the Parthians and took the great land of Kso-fu (Cabil), which had been subject to India, Kipin, and Puthia, as well as the neighbouring lands of Po-fu (north of U-ghe-shan-h), to be identified with the Pactyæ or Pactia originally settled in Ghôr and Kipin. The last fact shows that Kien-tsen-kho is none other than Kiyula-Kash, whose name indeed is called on the coins Kashana-Yarigo, "king of Kashan," and "standfast in the faith," i.e., in Buddhism, which early found entrance among the Tchouai. With this account of the conquest of Cabil it agrees that Asiaehia was Asiaehia but not Cabil as Parthian. Now the war of the king of Kashan with the Parthians is none other than that undertaken by the Scythians to restore Phraates to the throne. Troops had an excuse in this connection on the Asiatic kings of the Tchouai and the fall of the Sacastane (doubtless before the increased might of the realm of the Tchouai). These intestine conflicts of the Scythians seem to have been at their height during the exile of Phraates, and then issue decided his fortunes. The Romans followed these movements with attention, because they threatened Tiridates, and Horace has repeated references to them of a kind that is more than poetic fancy (*Artur*, i, 26, 3 *seq.*, and especially in 29, 26 *sq.*,—"Tanais divora," was of Tchouai and Sacastane, "plans of the Saks," the Chinese stood in close relation to these lands and had powerfully intervened in the affairs of the Sacastane in 44).

Was
and
anarchy

Before the great host of the Scythians Tiridates retired without a contest. On 1st March 26¹ the news of this had not reached Rome, but in June, as the coins prove,² Phraates again held the throne. Tiridates fled to Augustus, who refused to give him up, but agreed not to support him, and restored to Phraates a son whom Tiridates had carried off and placed in his hands as a hostage. The Parthian in return promised to give up the captives and ensigns taken from Crassus and Antony, and fulfilled his promise in 20, when Augustus was in Syria. He would hardly have done so perhaps had not his throne been again insecure, there is a break in the Parthian coinage after October 23, and it is not resumed for many years—a sure sign of inner troubles. There is just one coin known of Phraates's later years (October 10 B.C., Gaidner, p. 62), which probably marks his return from a second exile; for we know from Josephus (*Juf*, xvi, 8, 4) that between 13 and 9 B.C. Mithradates IV. was on the throne of the Arsacids, and that Meiod of Judæa was accused of plotting with him against Rome.³ The revolt of Media Atropatene, which asked a king from Rome some time between 20 B.C. and 2 A.D., and received Artio-

laizes II., son of Artavasdes, was probably about this time (*Mon. Anc.*, vi, 9). In 10 or 9 B.C. Phraates took the precaution of sending his family to Rome so that the rebels might have no Arsacid pretender to put forward, keeping only and designating as heir his youngest son by his favourite wife Thea Musa Urama, an Italian slave-girl presented to him by Augustus. This was mainly a scheme of Uiana's, and she and her son crowned it by murdering the old tyrant Phraates V., or as he is usually called Phraataces (diminutive), was thus the third Arsacid, in successive generations, to reach the throne by parricide.⁴

Phraates V., whose first coin is of May 2 B.C., tried an energetic policy, expelling Artavasdes III. and the Roman V. troops that supported him from Armenia, and seating on the throne Tigranes IV., who had been a fugitive under Parthian protection. Ariobarzanes of Atropatene was probably expelled at the same time; a little later we find him in exile at Rome, and (in spite of Strabo, xi, p. 523, who perhaps had not the latest news) the old line of Atropatens seems now to have been superseded by a line of Parthian princes. As Augustus did not wish to extend the empire, and Phraates was not very secure on his throne, neither party cared to fight, and an agreement was patched up after some angry words, Phraates resigning all claim on Armenia and leaving his brothers as hostages in Rome (1 A.D.). Phraates now married his mother, who appears with him on coins from April 2 A.D., a match probably meant to conciliate the clergy, as he knew that the nobles hated him. In fact he was soon driven by a rebellion (after October 4 A.D.) to flee to Roman soil, where he died, it seems, not long afterwards.

The Parthians called Orodes II. from exile to the throne. Of him we have a coin of autumn 6 A.D., but his wild⁵ and cruel temper soon made him hated, and he was murdered while out hunting. Anarchy and bloodshed now gaining the upper hand, the Parthians sent to Rome (before 9 A.D.), and received thence as king Vonones, the eldest of the sons of Phraates IV., a well-meaning prince, whose foreign education put him quite out of sympathy with his country. He preferred a litter to a horse, cared nothing for hunting and carousals, liked to be with Greeks, and relaxed the stringent etiquette that barred approach to the sovereign, and at the same time he tried to check speculation. A strong reaction of national feeling took place, and the main line of the Arsacids being now exhausted by death or exile, Artabanus, an Arsacid on the mother's side, who had grown up among the Dahæ and had afterwards been made king of Media (Atropatene), was set up as pretendant in 10 or 11 A.D. Artabanus was defeated at first,⁶ but ultimately gained a great and bloody victory and seated himself in Ctesiphon. Vonones fled to Armenia and was chosen as king of that country (16 A.D.), but Tiberius, who was anxious to avoid war, and did not wish to give Artabanus III. any pretext to invade Armenia, Artabanus persuaded Vonones to retire to Syria. By and by he was interned in Cilicia, and in 19 A.D. lost his life in an attempt to escape.

The clearest proof of the miserable results of continual civil war in Parthia at this time is that a Jewish robber state maintained itself for fifteen years in the marshes of Nearda and the Babylonian Nisibis a little after 21 A.D.,

¹ Hor., *Car.*, iii, 8, 19-20, belongs to this year, as appears from Phraates's coinage of Dec. 28 B.C. The return of the Christians to Augustus's personal residence in Spain in the end of 27 (Dio, lvi, 22), not to their second reduction in 25, which could hardly be known in Rome on 1st March. The retreat of the Scythians refers to the Samatran war (Florus, iv, 12, 20).

² Prokosh-Osten, *Monnaies des Rois Parthes*, p. 87.

³ Valliant has missed this passage, no later writer cites it.

⁴ Of the Benê Jellâb, who reigned in Tuguri till after the middle of the present century, every sultan is said to have murdered his father and Mahurud Shah of Guzerat (1588-64) made all his wives procure abortion as the only possible protection for a king against attempts of sons on his life.

⁵ A dashman of King Vonones when he had conquered Artabanus is one of the earliest examples of the use of the personal name of the king instead of the throne name. The practice became common, and marks an era of disputed successions, when it was necessary to indicate to which pretendant a coin belonged.

and that, when some satrapies were in revolt and others threatened it, the great king made a pact with the landtits to keep Babylonia in control in his absence. Yet amidst such constant rebellions Artabanus III, shrewd and energetic, not merely held his own but waged successful foreign wars, set his son Arsaces on the throne of Armenia, and challenged Rome still more directly by raising claims to lordship over the Iranian population of Cappadocia. Through the whole first century of the Roman empire all relations to Parthia turned on the struggle for influence in Armenia, and, much as he loved peace, Tiberius could not suffer this disturbance of the balance of power to pass unnoticed. He persuaded Pharasmanes, king of Iberia, to put forward his brother Mithradates as claimant to the Armenian throne. The Iberians, after having procured the assassination of Arsaces, advanced and took Artaxata, the capital, and, when the Parthians came against them under Orodes, another son of Artabanus, Pharasmanes strengthened himself by opening the Caucasian Gates to the Sarmatians,¹ whose chiefs were easily gained to fight where there was money or booty to be got. A bloody battle ensued, Orodes was wounded in single combat with Pharasmanes, and his troops fled, believing him to be dead. In 36 Artabanus himself took the field, but a widespread revolt, long prearranged by Tiberius with a Parthian party led by Sinaces, rose behind him in the name of Tiridates, a grandson of Phraates IV., who had been chosen as pretendant from the Parthian princes at Rome, and Artabanus retired to Hyrcania to resume his old relations with the adjacent nomads. The Roman legate of Syria, Lucius Vitellius, with his legions, led Tiridates into Parthia, where his followers joined him; Mesopotamia, Apolloniat, and Chalontia did homage; and the Syrian and Jewish population of Seleucia, which hated the party of Artabanus (the oligarchy of the 300 "adiganes" drawn from the old Greek families), were gratified by democratic institutions. In Ctesiphon Tiridates was crowned by Surenas, but without waiting for Phraates and Hiera, satraps of two chief provinces (Upper and Rhagian Media²), who became his enemies for this slight. Nor were they alone in their jealousy of the absolute court-influence of Sinaces and his father Abdagases. Artabanus was called back and appeared from Hyrcania with an auxiliary force of Dahæ and Sacæ, Tiridates retired to Mesopotamia, where his party was strongest, but his army melted away, and in 36 A.D. he took refuge in Syria. Much as Artabanus hated the Romans, his insecure position at home drove him in 37 to make an accommodation on terms favourable to them and send his son Darius as hostage to Tiberius. Indeed, he was again for a short time an exile with Izates of Adiabene, who, however, effected his restoration and was rewarded by the transference of Nisibis to him from Armenia, which the Parthians had again got in their hands, taking advantage of the foolish policy of Gaius Cæsar, who had tempted Mithradates of Armenia to Rome and imprisoned him there. Artabanus died soon after his second restoration, probably in 40 A.D., as Josephus (*Ant.*, xviii. 7, 2) still mentions him in 39.

In Artabanus's lifetime the second place in the empire had been held by one Gotarzes, who appears to have been his colleague in the upper satrapies, and perhaps his lieutenant in his fight to Adiabene. But there is monumental evidence³ that he was not, as Josephus says and Tacitus

implies, Artabanus's son (except by adoption), and so we live 21-45 A.D. find that the succession first fell to Vardanes, who came to money in September 40. But in 41 Gotarzes appears as king. The cruelties of Gotarzes gave Vardanes an opportunity of return, in two days he rode 345 miles, and taking his rival by surprise forced him to flee, and occupied the lower satrapies, where he came regularly from July 42 onwards. Vardanes now laid siege to Seleucia, which had been in rebellion since it opened its gates to Tiridates in 36, but was presently called away to meet Gotarzes, who had secured the aid of the Hyrcanians and Dahæ. The renewal of civil war enabled the emperor Claudius, with the aid of the Iberians, to drive the Parthian satrap Demonax from Armenia and resseat Mithradates on the throne.⁴ Meantime Gotarzes and Vardanes were face to face in the plan of western or Parthian Bactria, but an attempt on the life of the latter having been disclosed by his foe they made peace, and Gotarzes withdrew to Hyrcania, while Vardanes, confirmed in his empire, returned to Seleucia and took it in 43 after a siege of seven years.

Seleucia was then a city of vast resources. Flavius Josephus reckoned 600,000 souls, and the neighbourhood of Ctesiphon had not ruined it as Seleucia had ruined Babylon. Indeed Strabo (*Str.*, p. 748) is probably to be believed when he says that Ctesiphon was founded as the winter residence of the Parthian kings mainly out of consideration for Seleucia, whose merchants would have been incoordinated by the quartering on them of the rude hordes of nomads who formed the larger part of the army which surrounded the court. The friendship of the Parthians was necessarily impaired by the long rebellion and the insolence of the Seleucians. In 41 the Syrians and Greeks put aside their own quarrels and united to slay the Jews; the survivors fled to Ctesiphon, and even here the hatred of the Seleucians followed them in despite of the great king. Probably, therefore, it was as a rival to Seleucia that Vologases (or Vologeses) I. founded a little town Vologasesia (near Hina) on a site very favourable for commerce, from the middle of the first Christian century Greek influence declined, and Orientalism revived in Parthia. The types of the Asiatic drachme—the imperial money—grow more and more barbaric from the time of Artabanus III., and Pahlavi legends, first found on coins of Vologases I., become predominant with Mithradates VI., the contemporary of Trajan.

Vardanes was deterred from an attempt on Armenia by the threatening attitude of Vibius Marsus, legate of Syria from 42 to 44, and the rest of his reign was fully occupied by internal affairs. In February 45 Gotarzes had renewed his pretensions and struck money, supported by the rebellious nobles, and Vardanes, after defeating him at the Var-passage of the Eridres,⁵ pursued him eastwards through the deserts, driving the nomads before him as far as the Sindes (Tejend), which divided the Dahæ from the Arians, and returned boasting "that he had reduced nations who never before had paid tribute to an Arsacid." The glory that was held to surround these exploits on a stage scarcely different from that on which the oldest Parthian history had been enacted is a striking proof of the neglect of the original home of the monarchy under the pressure of Western affairs; but that Vardanes was a great king is plain from the high praise of Tacitus and the attention which the greatest of Roman historians bestows on a reign which had no direct relations to Rome. Vardanes, whose last coin is of August 45, was murdered while hunting—a victim, we are told, to the hatred produced by his severity to his subjects. But in judging of the charges brought against him and his two predecessors we must remember that the rise of a new dynasty like that of Artabanus is of Asiatic date. The last title seems to mean "alter ego"; it appears in the *Takht-e-Nasir* in Dio, xi. 12, as applied to Sinaces, whom Orodes I. sent against Crassus; comp. *New Persian literature*, "agent." Philostratus, in his life of Apollonius, which contains much that is useful for this period, regards the expulsion of Gotarzes as a restoration of the Arsacids.

¹ In the chronology of what follows Longueville's arrangement has been brilliantly confirmed by the coins.

² Or Charandis (*Ptol.*, vi. 2, 2), now the Karand, which separates Mazandaran from Astardabed.

45-75 A.D. always accompanied by deeds of violence, and that the oppressed subjects are simply the utterly unruly Parthian nobles who had lost all discipline in the long civil wars, and could only be controlled by force

Gotarzes. A little another period of dispute we now find Gotarzes again on the throne and coming regularly from September 46 onwards. But his qualities had not improved, and in 47 a secret embassy of malcontents was at Rome asking Claudius to send them as king Meherdates, son of Vonones. In 49 the legate, Gaius Cassius, did in fact conduct Meherdates (Mithridates V), as far as Zeugma, where he was met by diverse Parthian magnates, and ultimately, after a detour through the snows of Armenia, got as far as Nineveh and Arbela. But his only real strength lay in Caesene, satrap of Mesopotamia; Abgar V and Izates, the kings of Orlhoene and Adiabene, pretended to be with him, but were in private understanding with Gotarzes, and deserted before the decisive battle in which Caesene was surrounded and Meherdates taken (50 A.D.). Gotarzes cut off his rival's ears, but spared his life—an act of leniency most unusual in the East, which proves how much the national feeling of the Iranians despaired the pretenders foisted on them by Rome

Volagases I. Gotarzes died of a sickness, not before June 51, and was followed by Vonones II, who had been king in Atropatene, and was probably a brother of Artabanus III. According to the coins his short reign began before September 51 and did not end before October 54.¹ He was succeeded by his eldest son, Volagases I., the brothers acquiescing in his advancement, although his mother was only a concubine from Miletus (comp Tac., *Ann.*, xii. 44, with Plut., *Crassus*, 32), and receiving their compensation by being nominated to kingdoms which gave them the second and third places after the "king of kings,"—Pacorus to Media or Atropatene and Tiridates to Armenia,² which the Parthians invaded (in 52) to expel the usurper Radamistus, murderer of King Mithridates. Radamistus was not finally disposed of till 54, when his own people rose against him. The Armenians now offered no resistance to the Parthians, but the Romans were not content to lose their influence in the land, and their plans were favoured by the rising of a new pretendant, the son of Vardanes, against Volagases. The latter had marched to chastise Izates of Adiabene, whose conduct had been very ambiguous in previous embroilments with Rome, when a great army of Dahn and Sacae entered Parthia. Of the son of Vardanes³ we have coins from December 55 to July 58, and as the series of coins of Volagases begins only in 61 it was probably not till then that he had quite mastered his more powerful rival and consolidated his own authority. At first he had to evacuate Armenia, and in 55 he even gave up the chief Arsacids as hostages to Domitian Corbulo, Nero's commissioner on the frontier. In 58, however, Volagases was again able to commence great operations in Armenia, though direct war between Parthia and Rome was still avoided, both sides accepting the fiction that what was done in Armenia was the private affair of Tiridates. The Parthians, indeed, were still in no condition for a great war, the intestine discords continued, and in 58 Hyrcania,

one of the oldest Parthian lands, revolted and sent an embassy to seek alliance with Rome. In the same year, and in that which followed, Corbulo was able with little resistance to destroy Artaxata, occupy Tigranocerta, and set on the Armenian throne, supported by Roman troops, Tigranes V, a prince of that branch line of the Herods which had been established in Cappadocia. At length, in 61, Volagases made peace with the Hyrcanians, acknowledging their independence, then, solemnly crowning Tiridates as king of Armenia, he directed his whole forces against Tigranes. Open war with Rome, however, was still delayed by negotiations with Corbulo, who proposed a peace with a secret condition that the Roman troops should be withdrawn from Armenia. He felt, no doubt, that Tigranes, who had inherited the servility but not the vigour of his ancestor Herod, was not strong enough to secure the obedience of a population which greatly preferred the rule of the Parthians as their brethren in faith, manners, and descent. But Rome refused to confirm the treaty, and war was declared.⁴ The first year of the war (62) was unfortunate for the Romans, and ended with the capitulation of Cassius Pictus (who now commanded in Armenia) at Randa, on the southern bank of the Arsianus (i.e., Arax), the Armenian name for the upper Euphrates, near Arsamosata. The Romans evacuated Armenia and had also to build the Parthians a bridge over the Arsianus. Corbulo meantime was in Syria, and had purposely left Pictus in the lurch, contenting himself with securing the passages of the Euphrates and guarding them by castles on Parthian soil. He now came to an agreement with the Parthian general, Moneses, to raise the castles in return for the evacuation of Armenia by the Parthians till Rome should be again consulted. Next year the war was resumed, and Corbulo, crossing the Euphrates at Melitene, had penetrated into Sophene when the Parthians earnestly sought peace. It was agreed that Tiridates should lay down his diadem and go to Rome in person to receive it again from the emperor, which was done accordingly in 66. The real advantage of the war lay more with Parthia than with Rome, for, if the Roman suzerainty over Armenia was admitted, the Parthians had succeeded, after a contest which had lasted a generation, in placing an Arsacid on the Armenian throne. After Nero's death Volagases formed very friendly relations with Vespasian, which endured till 75. Meantime all Iran was sorely troubled by the Alans, Alan who had spread themselves a little before over the plains around on the north-west slopes of the Caucasus as far as the Don and the Sea of Azoff. In 72 the king of Hyrcania opened the pass of Derbent to these barbarians, who ravaged Media and drove King Pacorus into the recesses of his mountains, even capturing his harem. Armenia was also plundered, and the bandits retired laden with booty. In 75 the Alans entered Parthia itself and pressed Volagases so hard that he made an ineffectual application for help to Vespasian.⁵ Vespasian's refusal very nearly led to war, and Trajan, who was now governor of Syria, was prepared for a Parthian invasion,⁶ but Vespasian's pacific firmness ultimately averted an outbreak.⁷

We have the evidence of Tacitus (*Ann.*, xi. 8) and Josephus (*Ant.*, xii. 4, 2) that Bactria was the eastern limit of the Parthian empire

¹ Gardner (p. 61) is wrong in ascribing this coin to Volagases I. Tacitus makes Volagases come to the throne in 52 or 53, but if this is right he must have been associated in the empire under Vonones

² Tac., *Ann.*, xv. 2. There was at this time a fourth monarchy under a Parthian king in east Iran and on the Indus, and a fifth among the Scythians (or rather the Massagetae) on the northern slopes of the Caucasus, where an Arsacid reigned in 19 A.D. (Tac., *Ann.*, i. 68). As the Median kingdom was subsequently united to the chief empire, the later Armenian historians Agathangelus (Langdon, i. 109) and Sebeos (*ibid.*, p. 198), are right in speaking of four Arsacid kingdoms

³ His name was probably Nanes, for NĀNANO on a copper coin (Gardner, p. 51) must be read [Nānānō] Nānō[s]

⁴ Tacitus and Dio in this part of the history are both dependent on the very meagre memoirs of Corbulo. Tacitus, as appears from *Ann.*, xv. 16, distrusted his source and followed it with more discrimination than Dio, but is still more favourable to Corbulo than a criticism strictly proceeding on the known facts can admit to be right.

⁵ It must have been against the Alans that Vespasian in this year, according to a Greek inscription of Mithradates (*Journ.*, *As.*, ser. 6, xii. 98), fortified the castles of the Iberian Mithradates and the Jamaspides

⁶ This is all that is meant by "Parthica laurus," Pim., *Panegy.*, 14. In Victor, *Cass.*, 9, 10, read "ab illo" for "ac bello," compounding the epitoma.

in 42 and 54 A.D., but in 59 the Hyrcanian ambassadors were able to return home from a port on the Persian Gulf without touching Parthian soil (Tac. *Ann.*, xiv 25). This implies that all the upper satrapies had been lost to the empire. The Hyrcanians were still independent c. 165 during the reign of Antoninus Pius (Victor, *Eph.*, 15, 4). In 72 they held the whole southern coast of the Caspian, and for a time at least banded on a Parthian kingdom which had succeeded that of the Scythians in Sogdiana at a date subsequent to that of Isidore of Charax (180). The names of seven kings of this dynasty, beginning apparently with an Arsaces Darius, are known from coins. The most powerful of these was the Gondophares under whom, according to the legendary *Acta Thomae*,¹ the apostle Thomas came to India in 29 A.D., he reigned over a great territory, which in large part had formerly belonged to Ptolemy, his coins being found mainly in Herat, Baluchistan, and Kandahar, but also in Bagram and sometimes in the Punjab, an inscription at Takhti-Bah, north-east of Peshawar, makes his twenty-sixth year the hundredth of an era which is probably that of the introduction of Buddhism in the Kabul valley.² The dynasty of Gondophares, however, was but loosely constituted: we often find two kings at one time, and the *Periplus* (70 A.D.), which tells us of the possession of old Indo-Scythia by these Parthians, says that one king was constantly displacing another, a sure symptom of a moribund condition. One of the last kings, Sanabares, reigned a little after 78 A.D. (Sallet, *op. cit.*, p. 168). The author of the *Periplus* had also heard of the independent and very warlike nation of the Bactrians, i.e., the Tochari, whose greatest conquests fall at this time. Kieu-tsu-kho, the founder of their power, died, according to Chinese accounts, at the age of eighty, and was succeeded by his son Yen-kao-chun, who conquered all India, Sistan, and Kandahar; he was then more powerful than ever, and ruled as far as Shao-ki or Oude. The coins, on the other hand, lead us to distinguish between Kozlo-Kadaphes, the immediate successor of Kozlo-Kadphuz (who borrows the latter's name and titles, and whose copper money found at Manikyalu in the Punjab may be dated by its offering a close imitation of the head of Augustus on denarii struck between 4 B.C. and 3 A.D.), and the real conqueror of India, Ooemo-Kadphises (Ar. Himak), whose reign began about the middle of the 1st century A.D., and whose might is proved by his striking gold, which no one had done since Euclatides. His coins, frequent in Kabulistan and the Punjab, have been found as far as Benares. This evidence is reconciled with the Chinese account by an Indian notice in Kien *Varaha-Mihira*, p. 38, which shows that the conquests of the Tochari were for a time interrupted. It speaks of a robber Caka king, who was very powerful (i.e., Yen-kao-chun, Kozlo-Kadaphes) after whom there were five native kings. Of these the first four reigned but a few years, while the fifth, who is unnamed, had a reign of twenty years over a happy land, after which the Cakas began their depredations again. The unnamed king may be identified with a king wearing earrings, and therefore Indian, whose coins, found by sackfuls in Bagram, and occasionally in the Punjab, Malwa, and even farther east, mark him as a neighbour and probably contemporary of Gondophares; they bear no name, but only the title "king of kings" and "great saviour."³ The recommencement of the Caka conquest will thus begin with Ooemo-Kadphises, who was the immediate predecessor of Kanishka or Kanishka, the founder of the Kushan dynasty, whose accession in 79 A.D. is the epoch of the Caka era (Oldenberg, *Z. f. Num.*, viii 280 sq.), and marks the consolidation of affairs in the East.

Vologases I. died soon after the Alan war, leaving a just reputation by his friendly relations to his brothers—a thing so long unknown—his patient steadfastness in foreign war and home troubles, and his foundation of a new capital. Perhaps also he has the merit of collecting from fragments or oral tradition all that remained of the *Avesta*.⁴ From June 78 we find two kings coming and reigning together, Vologases II. and Pacorus II., probably brothers. From 79 there is a long break in the coins of the former, and Artabanus IV. takes his place with a coin struck in July 81. This Artabanus appears as the protector of a certain Terentius Maximus, who pretended to be Nero;⁵ he threatened to restore him and displace Titus by force, and, though the pretender was at length given up, the farce, which was kept up till 88, might have ended

in earnest but for the disorders of the times, indicated by 75-115 A.D. a break in the Parthian coinage between 84 and 93, in which latter year Pacorus appears as sole king.⁶

At this time the political horizon of Parthia was very wide, and its intercourse with the farthest East was livelier than at any other date. In 90 the Yue-chi had come to war with the governor of Chinese Taryar and been reduced to vassalship, in 94 a Chinese expedition slew their king, and, advancing to the "North Sea" (Lake Aral), subdued fifty kingdoms.⁷ The Tochari, one sees, like the Greeks before them, had neglected the lands north of the Hindu-Kush in their designs on India, even of Ooemo-Kadphises no coins are found north of that range. In 97 Chinese envoys directed to Rome actually reached the Mediterranean, but were dissuaded from going farther by Parthian accounts of the terrors of the sea voyage, and in 101 Muon-kun, king of the An-si (Parthians), sent lions and gazelles of the kind called "fu-pa" (*Boi-paōas*) to the emperor of China. Muon-kun reigned in Ho-to, i.e., Caria or Zadracarta in Hyrcania, he was therefore a king of the Hyrcanians, who also held the old Parthian lands east of the Caspian Gate, and may be identical with a king, rival to Pacorus, who struck copper coins in 107 and 108, if the latter is not identical with the later monarch Osroes. But anyhow the representative of the Parthian power in the west was still Pacorus II., who in 110⁸ sold the crown of Edessa to Abgar VII. bar Isat, and died soon after, making way for his brother Osroes, who coins in the same year, but had to reckon with two rivals, viz., Vologases II. (who reappears after an interval of thirty-three years), from 112 onwards, and Mehrades (Mithradates) VI. The latter was a brother of Osroes, and so probably was the former. None of the three was strong enough to conquer the others, and continual war went on between them till Osroes was foolish enough to provoke Roman intervention by taking Armenia from Ebedes, son of Pacorus, to whose appointment Rome had not objected, and transferring it to another son of Pacorus called Parthamasiris. Trajan, who had quite thrown over Trajan's the principle of the Julii and Flavi, that the Danube and the Euphrates were the boundaries of the empire, and was fully embarked on the old Chauvinist traditions of the republic, would not let such an occasion slip, and, refusing an answer to an embassy that met him at Athens, he entered Armenia and took Arsamese⁹ without battle, after receiving the homage of western Armenia (114). Parthamasiris submitted himself to the emperor, but Trajan declared that Armenia must be a Roman province, appointed an escort to see the Parthian over the border, and when he resisted and tried to escape ordered his execution—a brutal act, meant to inspire terror and show that the Arsacids should no longer be treated with on equal terms. Armenia and the neighbouring kings to the north having given in their submission, Trajan marched back by Edessa, receiving the homage of Abgar. The campaign of 115 was in Mesopotamia, and the burden of it fell on Mehraspes of Adiabene and his ally Mannus of Singara. At

¹ There is a naive personal character about all the feelings of the Arsacids towards the Caspars. Artabanus III. orders deep mourning for Germanicus, and sends Tiberius an insulting letter, advising him to escape the hate of his subjects by suicide. Vologases I. urges the senate to honour the memory of Nero. In the support given to the pseudo-Nero legitimist sympathies with the Julii may have combined with the wish to pay back in their own coin the Romans who had so often backed Parthian pretendants. ² *Hist. Gén. de la Chine*, in 893 sq.

³ The third year of Abgar VII. was the fifteenth of Trajan (Ortman, *Asia Syr. Dec.*, p. 41); this involves a correction of +23 years applied to all Diogenes of Laertius's dates for the later kings of Edessa, as well as a blank of nineteen years before Abgar VII.

⁴ Read *péyus* *Aparanowarow* in Dio, lxxv. 19. Samosata was a Roman town, and if they had lost it first this would have been mentioned.

¹ See *N. Rhein. Mus.*, xii. 161 sq.

² This was 500 years after Buddha (*Z. f. K. d. Morgenl.*, ii. 129), which would give the date 57 A.D.

³ This is perhaps the king *gus regnans sine nomine* of Suetonius, *De Regibus* (Auzon, *Ep.*, 19).

⁴ Dinkart, in *Hang. Fohi-Pan. Gloss.*, p. 144, calls the king who did this only Volksh (i.e., Volkshak), descendant of Ashken.

⁵ Zonaras, xi. 18; *Onas. Sib.*, xv. 124, 137.

115-191. its close Mesopotamia was made a Roman province, the Caudium and the Marcomedi¹ of the Alimucan frontier had also been reduced, and Trajan received the title of "Parthicus." In 116 the Tigris was crossed in face of the enemy (probably at Jazīrat iln 'Omā), and a third new province of Assyria absorbed the whole kingdom of Melarsapes. Once more the Tigris was crossed and Babylonia invaded, still without resistance from the Parthians, whose intestine disorders continued. A Roman fleet descended the Euphrates and the ships were conveyed across on rollers to the Tigris, to co-operate with the army, and now Ctesiphon fell and Osroes fled to Armenia, the north-east parts of which cannot have been thoroughly subdued. The Roman fleet descended the Tigris and received the submission of Mesene, but now, while Trajan was engaged in a voyage of reconnaissance in the Persian Gulf—plainly aiming at Bābren—all the new provinces revolted and destroyed or expelled the Roman garrisons. The rebels, whose centre was in Mesopotamia, set Meherdates VI. at their head,² and when he died by a fall from his horse in a foray on Commagene, his son, Sinatruces II., took his place, and was aided by an army which Osroes sent from Armenia under his son Parthamaspatēs. The reconciliation of the Arsacids among themselves was rewarded by the defeat and death of the Roman general Maximus, but jealousy now sprang up between the cousins, and of this Lusius, a second general sent by Trajan from Babylon, took advantage to draw Parthamaspatēs to the Roman side by a promise of the Parthian throne. Sinatruces was defeated and slain, Nisibis retaken, Edessa stormed and destroyed, and the whole rebellion put down, but Trajan now saw what it would cost to maintain direct Roman rule over such wide and distant conquests, and Parthamaspatēs was solemnly crowned in the great plain by Ctesiphon in the presence of Romans and Parthians (winter 117). An unsuccessful siege of Atia (Hatrā) in the Mesopotamian desert was Trajan's next undertaking, illness and the revolt of the Jews prevented him from resuming the campaign, and after Trajan's death (7th August 117) Hadrian wisely withdrew the garrisons from the new provinces, which would have demanded the constant presence of the imperial armies, and again made the Euphrates the limit of the empire. Parthamaspatēs too had soon to leave Parthia, and Hadrian gave him Orhoene.³ Thus Trajan's Chauvinist policy had no other result than to show to the world the miserable weakness to which discord had reduced the Parthians.⁴ And the discord did not cease even now, for, though Osroes was restored, Volagases still continued to coin, whether as rival or as partner of his rule, in some part of the realm. Hadrian continued to preserve peace, though a war threatened in 123,⁵ and in 130 he restored to Osroes his daughter taken captive by Trajan at Ctesiphon. Osroes died soon after, and Volagases II. became sole monarch, dying in November 148 at the age of about ninety-six, after a reign of seventy-one years.⁶

¹ Eut., viii. 3, Festus Rufus, *Brev.* 20. Marcomedi are the Medes called Marthi, the plural of Mar, "Made" in Armenian.

² What follows is drawn from Malalas, who has two passages (i. 261-362 and 367-368) drawn from Arian's *Parthica*, but placed in a wrong context.

³ He is the Parthaspates who was king of Edessa from 119 to 123; this fact and its relation to Spart., *Hadri.* 5, has escaped notice owing to the false chronology of Dion. Telm.

⁴ A proof of this is that very few silver drachms and no tetradrachms were struck between 96 and 120.

⁵ See Durr, *Reisen des K. Hadrian*, p. 48. The removal of Parthamaspatēs and restoration of the old dynasty of Orhoene may have been a concession made on this occasion.

⁶ The Volagases who appears in connexion with an Alan invasion of Media, Armenia, and Cappadocia in 136 is from the context a different person, viz., the unnamed king of Armenia who was appointed by Hadrian in 117 (Spart., *Hadri.*, 21), and whose successor took the throne between 140 and 148 (Eckhel, *Doch. num. vet.*, vii. 14).

Volagases III., who succeeded, had designs on Armenia, Volagases III. but an interview between him and Antoninus Pius (spring 155) delayed for a time the outbreak of war.⁷ However, martial preparations went on, and on the death of Antoninus Volagases entered Armenia (162),⁸ expelled the Arsacid Sohemus, who was a client of Rome, and made Paconius king. The destruction of a Roman legion under the legate of Cappadocia (Zelus Severianus), who fell on his own sword, laid Cappadocia and Syria open to the Parthians, Attidius Conellanus, legate of Syria, was routed, and the provincials were in such distress that they even began to speak of revolt from Rome. When late in the year Aethus Verus arrived from the capital he found the troops so demoralized by defeat that he was ready to offer peace; but, when Volagases refused to treat, the able lieutenants whom Verus directed from Antioch soon changed the face of affairs. The war had two theatres, and was officially called the Armenian and Parthian war.⁹ Armenia was regained and Sohemus restored by Statius Priscus and Martinus Venus (163, 164), while Avidius Cassius drove Volagases from Syria in a bloody battle at Europus, and, entering north Mesopotamia, took Edessa and Nisibis, though not without serious opposition.¹⁰ At length, deserted by his allies (i.e., by the local kings, who were becoming more and more independent), Volagases abandoned Mesopotamia, and Cassius entered Babylonia, where, on a frivolous pretext, he gave up to rapine and fire the friendly city of Seleucia, still the first city of the East, with 400,000 inhabitants. The destruction of Seleucia was a hideous crime, a mortal wound dealt to Eastern Hellenism by its natural protectors, that Cassius next, advancing to Ctesiphon, razed the palace of Volagases to the ground may, on the other hand, be defended as a symbolical act calculated more than anything else to impair the prestige of the Parthian with his Oriental subjects. Cassius returned to Syria in 165, with his victorious army much weakened through the failure of the commissariat and by the plague, which, breaking out in Parthia immediately after the fall of Seleucia, spread over the whole known world. In the same year Martinus Verus won hardly less considerable successes in Media Atropatene, then apparently a separate kingdom.¹¹ The peace which followed in 166 gave Mesopotamia to Rome. This was the greatest of all wars between Rome and Parthia, alike in the extent of the lands involved and the energy of attack shown by the Parthians. The Romans used their victory with moderation, but Parthia, after this last effort, continued steadily to sink.

The Romans at the same time made an effort to compete with Parthia for the Chinese trade (especially in silk), which the latter had jealously kept in their own hands, and in 166 an envoy of An-t'ihun (M. Antoninus) reached the court of the emperor Huan-ti, *via* the sea and Tongking. But the effort to establish a direct trade with China was unavailing, and the trade still flowed in its old channels when a second Roman agent reached China in 226, a little before the fall of the Parthian empire. The Chinese tell us that with India also the Parthians drove a considerable trade.¹²

Cam-
paigns of
Severus.

Volagases III. died in 191, having reigned forty-two years without civil war, and was succeeded by Volagases IV. During the civil troubles of Rome which preceded the establishment of the military empire this prince maintained friendly relations with Pescennius Niger; and his vassal Barsenus of Atra was permitted to supply a force of bowmen, who took part in the fighting against Septimius Severus at Nicea (194). When Niger's cause declined, however, Volagases allowed his clients of Adiabene to join with Orhoene, now in revolt against the Roman power. The strongholds of Mesopotamia were taken, and their garrisons put to the sword; Nisibis itself was besieged. In truth, the Parthian could no longer pretend to control the policy of the princes on his frontier, who felt themselves their own masters since they had borne the chief brunt of the last two Roman wars. But in summer 195 Severus appeared in Mesopotamia, received the submission of Abgar VIII of Orhoene, and from Nisibis (which, with true insight into its strategic importance, he raised to a colony and great military station) directed two successful campaigns against Adiabene¹ (196) and the Arabs of the Singara district, incorporating the latter in the province of Mesopotamia.² The Parthians made no movement till Severus was busy with Albus, when they ravaged Mesopotamia and besieged Laetia in Nisibis; but in 198 Severus was again on the scene of war, and they fell back without fighting, leaving the emperor free to prepare for next year a campaign on a great scale. In 199 a fleet on the Euphrates co-operated with the Roman army, and Severus, taking up an unaccomplished plan of Trajan, dredged out the old Naarmalea canal, through which his ships sailed into the Tigris, and took the Parthians wholly by surprise. Seleucia and Coche³ were deserted by their inhabitants; Ctesiphon was taken by the end of the year with terrible slaughter, 100,000 inhabitants being led captive and the place given up to pillage, for the great king had fled powerless at the approach of the foe. Severus, whose force was reduced by famine and dysentery, did not attempt pursuit, but drew off up the Tigris. The army was again in its quarters by 1st April 200 (*C. I. L.*, vi. 225 a), and for some time thereafter Severus was occupied in Armenia. But in 201 he undertook a carefully organized expedition against Atra, from whose walls the Romans had been repulsed with great loss when Severus, returning from the Tigris in the previous year, had attempted to carry it by a *coup de main*. This city, which in Trajan's time was neither great nor rich, was now a wealthy place, and the sun-temple contained vast treasures. The classical authors call Atra Arabian, but the king's name is Syriac, Barsenus, i.e., Bar Sin, son of the moon, and we may suppose that it was really an Aramean principality,⁴ which, like Palmyra, had its strength from the surrounding Arab tribes that it could call into the field. Severus lay before Atra for twenty days, but the enemy's cavalry cut off his foraging parties, the admirable archers galled the Roman troops, a great part of the siege train was burned with naphtha; and, when, in addition, two assaults had been repulsed with tremendous loss on two successive days, the emperor was compelled to raise the siege,—a severe blow to Roman prestige in the East, and one that greatly raised the name of Atra and its prince, but did not help the decaying power of Parthia in the least.

xxxii (1788), p. 358; Pan-t-tan, in *Mém. Ac. Insér.*, viii. (1827) p. 124 sq., and *Journ. As.*, ser. 8, vii. 278, 280 sq.

¹ In Dio, lxxv. 8, read *την Ἀρβήνιν* for *την ἀρχήν*.

² Not only Herodian, ii. 9, but Capitol, *Macrinus*, 12, implies that these Arabs were Yemaites, the great migration of southern Arabs, which led to the foundation of the kingdom of Him, had therefore already taken place.

³ Dio, *Eccl.*, lxxv. 9, has Babilon, but it was a mere heap of ruins in the beginning of the 2d century a.d.

⁴ Cp. Noldeke, *Tabari*, p. 84.

In 209 Volagases IV. was succeeded by his son Volagases 191-219 V., under whom in 212 the fatal troubles in Persia began, while in 213 his brother Artabanus rose as rival claimant of the kingship,⁵ and the civil war lasted for many years. A fresh danger arose when Tiridates, a brother of Volagases IV., who had long been a refugee with the Romans and had accompanied Severus's campaign of 199, escaped, in company with a Cilician adventurer, the Cynic Antiochus, to the court of his nephew Volagases; for the emperor Antoninus (Caracalla) demanded their surrender, and obtained it only by a declaration of war (215). About the same time Artabanus gained the upper hand, and in A.D. 216 he held Ctesiphon and its district; but Volagases still ^{banus} held out in the Greek cities of Babylonia, as his tetradrachms prove (till 223). Artabanus's strength lay in the north; the Arab histories of the Sasanians make him king of the Median region, and agreeably with this he coins only drachme.⁶ Presently Artabanus had a war with Rome on his hands, the pretext was that he had refused his daughter to Antoninus, but the emperor was mindful of his father's dying advice to enrich the soldiers and despise all other classes, and saw a prospect of rich booty. In 216 the Romans penetrated to Aibela by way of Carduene and Calachene,⁷ and violated the graves of the kings of Adiabene, which they falsely took for those of the Arsacids. Thus far the Parthians, who had been taken by surprise in full peace, had offered little or no resistance, but Antoninus was murdered (8th April 217) while he was preparing for a new foray, and his successor Macrinus at once found that Artabanus was now armed, and was not the man to let the insult to his territory pass with impunity. An overwhelming Parthian force fell on Mesopotamia and refused to be appeased by the restoration of the captives of the previous year; Macrinus was beaten in two engagements⁸ and compelled to retire to Syria, abandoning the Mesopotamian peace; and in the winter of 217/218 he was glad to purchase peace for an indemnity of 50,000,000 denarii (£1,774,298). In or about 223 Artabanus must also have displaced his brother in Babylonia, for he was a patron of Rab Abba, who became head of the Jewish school of Sura in 219.⁹

Persia, which dealt the last blow to the Arsacids, had Persia through the whole Parthian period held an isolated position, and is so seldom mentioned that our knowledge of its history and native princes is almost wholly due to recently-found coins.¹⁰

These embrace a triple series of silver coins and a class of copper pieces. The oldest of the latter class bears the name of Camnasaces, and his is the only name in the class known to us from other sources, for Hyrodes and Phraates (each of which names was borne by two kings of the series) are not Arsacid great kings, as their title is only "king," not "king of kings" (against Mordtmann). Nor do they seem to have ruled in the same quarter with the kings who struck silver, the latter were native kings of Persia, the former rather Elimeans, who in the times after Camnasaces were forced back in a south-east direction (as appears from the places in which the coins are found), and ruled parts of Persia side by side with the

⁵ According to Mani, in the book *Shahnameh*, the 4th year of Artabanus=216/217; see Al-Bérûni, t. ii. by Sachau, pp. 121, 190. This proves that in 216 Artabanus was the recognized sovereign in the district of Ctesiphon to which Mardian (on Habel Brâhmî) belongs; cf. Noldeke, *Tabari*, p. 15.

⁶ See above, p. 601.

⁷ Dio says they invaded Media, but Antoninus had not such a hold of Armenia as to open to him the route of the *triumvir* Antony, and a march from Gagesa to Arbela over Mount Zagros is incredible. But, if Media at this time extended so far west as to include Arrapachitis and Calachene (the Marcocedians of Trajan's wars), the campaign is intelligible, and Spartan's mention of the Caucasian and Babylonians can be explained as a misreading of *Ἐκβαλόντες καὶ Ἀρβήνους* in a Greek source.

⁸ The locum in Dio, lxxviii. 24, is to be supplied by a passage of Xiphilinus, not given in recent editions.

⁹ Jos. *Geogr. d. Jud.*, ii. 139.

¹⁰ See Mordtmann in *Z. f. Num.*, iv. 152 sq., vii. 40 sq.

219-228 native princes. Camisanes appears as an old man on coins of S2 and S1 u.c., and his tin successors whom we know from the coins carry us down to 36 a.u., the latest date at which the Elymians are mentioned as independent (Thec. *Ann.* v. 44). The older coins have Greek inscriptions and often figures of Greek gods, an interesting glimpse of the faiths of the Indo-Iranian frontier. The silver coins, again, has in all three series Pahlavi legends and the tin-alitas on the reverse. The first series has seven pieces with the unexplained title "Fartakidā," the second has three kings (Malkā), the third ten kings, the names are throughout either Achaemenian (Artababshtr, Dāyav), pointing perhaps to a claim of Achaemenian descent, or sacred names like those common with the Sāsānians (Nereh, Gedabshtr), or are taken from sacred legend (Mundabshtr). The second and third series appear to be continuous (against Meißmann), the last king of the second series is Zafidat II, the first of the third Dāyav I (I son of Zafidat). With Dāyav I the kings assume a Parthian costume, and his son Artababshtr II is the only king of that name who from the number and various types of his coins can be fairly identified with the Artavaxes of Tacitus of Chios, who reigned "in the time of the fathers" (c. 80-50 b.c.), and was slain at the age of ninety-three by his brother Gouthas. As Dāyav I must also have reigned for a considerable time this datum places him about the commencement of the Parthian supremacy, which naturally explains his Parthian dress. Then the princes of the first silver series will be Seleucid vassals, and the shorter series of kings before Dāyav independent princes falling between the Seleucid and Parthian supremacy. Finally Gouthas, brother of Artababshtr II, has the same name as Gōshn, the last Bactrian king before the rise of the Sāsānians, so that it was probably one dynasty. The eight kings, in at least six different generations, who appear on coins between Artababshtr II and Tidat II, will carry us roughly to the middle of the second Christian century, leaving a space sufficient for Gōshn, the last Bāzrangian, and the anarchy of the first days of the Sāsānians.

The emblems on the coins show that Persia was always loyally Zoroastrian, and at Istakhr stood the famous fire-temple of the goddess Anāhīd. Its priest was Sāsān, whose marriage with a Bāzrangian princess, Rāmbelishtr, laid the foundation of the greatness of his house, while priestly influence, which was very strong, doubtless favoured its rise. Pābak, son of Sāsān, and Ardāshir, son of Pābak, begin the history of the Sāsānian dynasty, which occupies the next section of this article. Artabanus did nothing to check the use of the new power till Ardāshir had all Persia in his hand (224) and had begun to erect a palace and temple at Gōr (Fruzbād). Nīrōfār, king of Elymais, was then sent against him, but was defeated, and now Ardāshir passed beyond Persia and successively reduced Ispahan (Parsace), Ahwaz (Elymais), and Mesene.¹ After this victory Ardāshir sent a challenge to Artabanus himself; their armies met by appointment in the plain of Hormizdān, and Artabanus fell (28th April 227). Ctesiphon and Babylon must have fallen not much later, though Volagases V. seems to have re-established himself there on his brother's death, and a tetradrachm of 539 S.E. shows that he held the city till autumn 227. The conquest of Assyria and great part of Media and Parthia is assigned by Dio expressly or by implication to the year 228, and so the Parthian empire was at an end.

Indo-
Iranian
frontier

The part of Parthia of which Dio speaks can only be Chosroene and Comene, it was only in a later expedition that Artababshtr reached Susacania, Hyrcania, Naxos, and Merv, and these do not seem to have been Parthian. Indeed, from 58 a.u. Comene appears to have been the most eastern satrapy of the Sassanid empire. Eastern Iran was in this period very flourishing under the Tochari; the dynasty which Indian sources call Turashka, and which can be traced on inscriptions till 218 and 259 (or 269). Kamshika, the founder of the dynasty, is said to have ruled Cabul and all Hindustan, and in fact his coins extend over all northern India. The empire of which Kashmir was a main province was vaster than that of the Greeks had been, and also more consolidated, for stratagems took the place of the native kings (*Journal As.* ser 3, viii 264, and ser 4, x 55) So,

¹ The flourishing state of Mesene had, as its coins show, been long sinking into barbarism, the latest date they supply is 167 (*J. Num.* viii 215 sq.). A little earlier, in 148, they are associated with coins of Meretades, son of Phobas, king of the Omannus. The latter, already known to Ptolemy as dwelling in the desert west of Chios, must be the Azd from Oman, a part of whom shared the great migration and finally settled in Andhr and Hīra.

too, Kamshika banished the native language from his coins, using Greek letters and his own foreign language. His predecessors had supplanted the Greek gods, except Helios, by Oriental divinities, and now Helios too gives way to the Iranian *Mithra* or *Mithra*. The middle parthians on the coins of Artabanus and his successors are an interesting glimpse of the faiths of the Indo-Iranian frontier. We find here the old Iranian popular deities. Mithra, the moon-god, *Mithra*, the sun-god, *Nava*, the goddess of water, *Oaoth*, the wind-god, *Ophayro*, i.e., *Vēstāghān* (see Bouffey, *J. D. M. G.* viii 458), *Avro*, identical with the Zoroastrian Ahura-mazda, we find also abstractions like the frods of the heavenly hierarchy in official Zoroastrianism. *eg. Ova*, i.e., Anan, the eternal self-created light, and *Phappo* (Pers. *far*), synonymous with *Zam*, *Manu*, the royal majesty, sale by sale with Indian deities, such as *Siva*, and a number of unknown deities with barbarous names brought from the old homes of the Tochari. Heracles and Helios appear transformed by barbarous pronunciation or epithets, and *Zepparo* is the cosmopolitan Scapi, probably introduced, as in Elymais, by Alexandrian sailors. Buddha, too, appears (Sallet, *Nachf. Al.* p. 189 sq.). The Buddhists were the most active religious body in the kingdom, and the king, if not actually a convert, as the legend claims, showed the warm sympathy as gave their faith a wide missionary field and unparalleled success. The king built many Buddhist meeting-houses, monasteries, and shrines, and it was Kamshika who called together in Kashmir the council of 500 fathers that finally redacted the Triptaka collection. Ptolemy (vi. 1, 47) speaks of Tochari as the *Kaempirioi*; the Chinese bear witness to them not in 159, and from 220 to 265 then empire retained its old complexion (*Journal As.* ser 3, viii 268, 269). Kashmir was lost in the course of the 5th century, and the eastern portion remained. About 100 a.u. *eg. Ova* ceased to be understood in east Iran, and from this time we can trace a growing Iranian influence on the coins of the Tochari, especially in the Sāsānian period. The latest coins of the Tochari come mostly from Balkh, so that they seem to have been gradually pushed backwards to the point from which they started. Finally, then empire was overtaken by another branch of their own race, for, early in the 6th century, those of the Great Yue-chi who had remained in their old land, a little west of Badkhashan, were compelled, by the pressure of the Juan-juan of Taitary, to move west to Pōlo o Balkh, and thence, under their valiant king Kō-to (Kidar); whence they are called Kidārie the Huns by Ptolemy, in *Er. H. G.* iv 102, crossed the Hindu-Kush and destroyed the old empire of the Tochari, founding in its place the kingdom of the Little Yue-chi. The date of this invasion can, from a variety of data, be placed as c. 480, or about the time when the Sāsānians, in 429, destroyed the last of the Arsacids in Armenia, and with this agrees the Indian statement that eighteen *Chaka* kings reigned 380 years (60-480 a.u.). Their successors were still powerful in India about 520, and in their old homes their empire fell in 562.

Sources.—1. FOR THE MACEDONIAN PERIOD.—For Alexander the sources are of two classes. (1) Asian, and for the most part Ptolemy also, draw from official Macedonian sources, especially the works of King Ptolemy and Aristobolus of Cassandria. (2) An official history written by *eg. Ova* of the Greek class, is faithfully excerpted by Diodorus. Curtius and Justin (or rather Trogus) draw from a later work based on the same source but supplemented by extracts from a book of the first class and another book hostile to Alexander and of very indifferent authority. Droysen follows the writings of the first class exclusively, and indeed for military and historical points they alone are to be trusted. Droysen uses also the works of the second class, which, though rhetorical, romantic, and uncritical, have the advantage of telling us many things that the official histories pass over, and, though they show little judgment in their details, are rich in material. The chief defect of the first class must deal with the material as a philologist would deal with a book preserved in two classes of MSS., one good, the other interpolated but independent. One must first restore as nearly as may be the original text of the first class and then use it to correct the text—or here the history—based on the first class. For the immediate successors of Alexander, Diodorus, the excerpts from Arrian in Ptolemy, and Ptolemy's lives, and Strabo, are the best sources. The guides, all these drawings from the excellent Hieronymus of Cardia. Trogus (*Justin*) makes a defective use of indifferent sources, and is good for little. Droysen is the best modern book; Grote is useful because he does not rest on purely Macedonian a standpoint, but he deals less fully with the West. We have no really continuous account for 401-280 b.c., for Justin's narrative is over less worthy of the name of a history than of a romance. On the other hand, the scattered material is best collected by Droysen. From 220 onwards we have the excellent work of Polybius, at first complete and then in large extracts. There are some good modern monographs, but none so good as Droysen's, and even a tolerable general history of the latest period of Macedonia: *Iran* in Asia.

2. FOR THE PARTHIAN PERIOD.—The only continuous account of Parthian and Bactrian history which has reached us is Justin's abridgment of Trogus Pompeius, ending with 9 a.c., and having also a lacuna, due to Justin's carelessness, between 94 and 95 a.c. For the Parthian period, between 94 and 95 a.c., Justin's *Parthians* and *Antiochus* give little information. On the other hand, the Parthians were, in a sense, viewed as sharing the empire of the world with Rome (Strabo, vi. p. 615, *Just.* xli 1, 2), and Roman historians began to insert notes even in Parthian history which were not connected with Rome. Thus, from 69 a.c. to 73 a.c., Dio, Josephus, and Thucydides give us pretty complete accounts. Between 94 and 95 a.c. and between 73 and 72 a.c. the last years of the last king are most valuable, especially the account of 87 a.c., when they have to be dated, for the later period they are out of context, the events from Dio not helping us much.

3. For the Sassanid period, see *Iran* (Paris, 1738), and Du Four de Longueville, *Annales Sassanides* (Ginebra, 1738), are still indispensable compilations, to which G. H. J. Goudier de Sainte-Croix, "Mém. sur le gouvernement des Parthes," *Ann. de l'Asie*, i. 48 ff., and *Iran* de J. de Guignes, are the most important modern books to which these facts explain the coins introduced—

E. Q. Vrontos, *Ikon* (P., 11), Bartholomae, "Reich sur la num. Asiac.", *Mém. Soc. Arch.*, 11, 1. A. de Longperrier, *Mém. sur la dynastie et l'époque des rois Parthiens d'Asie* (Paris, 1889), and the catalogues of coins in *Erskine's Coins of Mesopotamia* (Paris, 1874-75) and *P. Guélin's Parthian Coins* (London, 1877). There are also recent histories of Parthia by Rawlinson, Schwanitz, and Spiegel, and a book on the coins by Lindsay. As regards Bactria, Beyer's *History of Bactria* (St. Petersburg, 1913) is recent, and quite up-to-date. The Chinese material is still best given by Deignes in *Mém. de l'Acad.*, 3, 11, 17 sq. Of recent books see II. H. Wilson, *Armenia Antiqua* (London, 1911), Lassen, *Zur Gesch. der Persia und Indog. Rasse* (Bonn, 1848) and *Ind. Alt. Indog.*, 1. The best works on the coins are by Thomas, in his edition of Pridmore, *Essays on Ind. Antiquities*, 11, 174 sq., A. Cunningham, in *Penn. Mag.*, vols. xiv-xv, and Schäfer, *Nachrichten Alexanders des Gr. in Bactrien* (Berlin, 1878).

SECTION III.—SÁSÁNÍAN EMPIRE

Of the minor kings who ruled in Persia, in the Arsacid period, in real or nominal allegiance to the Parthian "king of kings" we know some names from coins or ancient writers, but we cannot tell whether they were all of one dynasty. In the beginning of the 3d century the kings, who then belonged to a dynasty of which the name probably was Bázrangik, had lost much of their power, lesser potentates ruled in various parts of the land, which, by being all mountainous, falls naturally into ill-connected sections. One of these local princes was Pápak, or, in the more modern pronunciation, Pápak,¹ son or descendant of Sísán, a native of the village of Khir on the southern margin of the great salt lake east of Shíráz. Pápak overthrew Gózhir, the last prince of the Bázrangik, and became master of the district of Istakhr (Persepolis), and the coins and inscriptions of his son gave him the title of king. His legitimate heir was his son Shápur, for whom Pápak is said to have asked recognition from the Arsacids, but on Pápak's death a second son, Ardashir, refused to acknowledge his brother, and was in arms against him when Shápur died suddenly, and hardly by mere accident. That Ardashir's claims were opposed by his brothers and that he put them to death are not to be doubted, as we have these facts from a tradition of strictly legitimist tendency.

Tradition names various local princes conquered by Ardashir for himself or for his father, and perhaps Pápak before his death was already lord of all Persia. Ardashir, at least presumably, was so when he struck the coins still extant.² Ardashir, who is to the Sásánian what Cyrus was to the Achemenian empire, probably came to the throne in 211/212 A.D.³ From the first he plainly leaned on the clergy of the Zoroastrian faith, which all through the Macedonian and Parthian eras had undoubtedly continued to be the religion of the people in Irán proper, and especially in Persia. The Parthian monarchs were Zoroastrians, but probably often very lukewarm in the faith. Ardashir, on the contrary, ostentatiously placed symbols of fire- worship on his coins, and on his inscriptions boasts himself a "Mazdayasn," or orthodox Zoroastrian. From his days onward the often fanatical and persecuting clergy enjoyed great power in the Sásánian empire, so similar to that of the Christian organization of the state church, so similar to that of the Christian church, probably dates from Ardashir, it is referred to, at least, on the inscriptions of his immediate successors. Popularity and a certain religious prestige were the natural fruits of this orthodox zeal on the part of Ardashir, but his success was essentially the fruit of his energy and

valour. Slowly and not without toil he rose from king 219 238. of Persia to be king of the kings of Irán. He began by subduing successively Kirmán, Susiana, and the petty states at the mouth of the Tigris. But after this he came into conflict with the great king, whom, according to the contemporary account of Dio Cassius, he smote in three battles. The decisive engagement with Aidaván (Artabanus) in which the last Parthian monarch fell, and where Ardashir gained the title of "king of kings," seems to have been on 28th April 224 (or 227, according to A. v. Gutschmid), and was probably fought in Babylonia or Susiana, for the next enterprise of Ardashir was an unsuccessful attack on the strong walls of Hatra, which perhaps was not taken and destroyed till the reign of his successor. Ardashir conquered Media, where an Arsacid prince was his adversary, and gained the greater part of the Iranian highlands, but failed in Armenia, whither a son of Artaban had fled.

The Romans saw with concern the rise of a prince who already directed his aims against their Asiatic possessions, and seems to have had some success in this quarter, till in 233 he was smitten by Alexander Severus in a great battle.⁴ Henceforth, though peace was often made between the two powers, they remained constant rivals,—and rivals on equal terms, for, though under able rulers and when the inner condition of the empire was not greatly disturbed, the Europeans of Rome or Byzantium were still too strong for the Asiatics, the tables were not seldom turned, and Rome sustained many a shameful defeat. This struggle fills the chief place in the political history of the Sásánians; and the inner development of the empire, its martial and political institutions, its art and industry, were also most powerfully influenced by the superior civilization of the West.

The nominal capital was always at Istakhr, where, for Sásánian example, the holy "pyreum" of the royal house stood, and where the heads of conquered foreign kings were hung up.⁵ But the real metropolis was the Arsacid capital of Ctesiphon, with Ardashir's new foundation of Veh-Ardashir, just across the Tigris on the site of the old Seleucia. The rich alluvial land that surrounded these twin cities was no part of Irán proper, and its inhabitants were mainly Semites, but old example, and probably its vicinity to Roman soil, marked it out for the true seat of government.

The extent of the empire at the time of Ardashir's death is uncertain, for the national tradition ascribes to him some conquests that were really made by his successors, and others which the Sásánians never made at all. Shápur, his son, calls himself on his inscriptions king of the kings of Irán and non-Irán, where his father says only "of Irán"; so that it was the son who first extended the realm beyond the bounds of what was then known as Irán. Non-Irán may refer to districts in the far East, where, however, the Sásánian power never reached so far as that of the Achemenians, and it may also include Armenia. At any rate, Ardashir won a great empire and consolidated it, so that it held together for four centuries. He gave a powerful blow to the system of vassal states, which had become more and more prevalent under the Arsacids, and reduced most of these states to provinces. In this sense he is justly viewed by tradition as the restorer of the unity of Irán,⁶ but the

¹ The name, having no *p*, pronounced Bábak, but this is not Persian. In general the forms of proper names followed in this article give the more recent pronunciation, which may have prevailed about the end of the Sásánian period.

² These show a full-face portrait with the legend "Artakshahshir king." The reverse has his father's portrait in profile with the legend "son of the divine Pápak." The older form of Ardashir's name, Artakshahshir, is the ancient Achemenian name, which the Greeks wrote Artakshases, and which, singularly enough (together with the name Darius, Dáryav, Dáriv, Dáriv), had survived in the home of the Achemenians, although genuine Persian tradition had lost all memory of the old empire.

³ See A. v. Gutschmid, in *Z. D. M. G.*, xxxiv 734.

⁴ Lampridius, *Al. Sev.*, 56. His statement rests on documentary evidence, and is accepted by Tillemont and by Clinton, who confirms it from coins. The attachment of the troops from Orhene to Alexander (Capitol, *Maximianus*, 1) was probably connected with his liberation of their country from the Persians. Rawlinson's and Spiegel's preference for the statement of the romancer Herodian, that the Persians were the victors, is pseudo-criticism.

⁵ It must not be supposed that the Persians had a clear recollection of the might and breadth of the Achemenian empire, though Western writers, who knew the old history from books, sometimes make Persians speak as if they shared in that knowledge. No doubt a Sásánian would sometimes hear from a Greek or Syrian how his predecessors

233-232 unity, of course, was not such as in a modern European state. The great barons in particular were still very powerful, and were more than once a danger to the kings. At bottom they were a continuation of the Parthian nobility, falling into divers classes, headed, as in the Achemenian empire, by the seven noblest houses. There was also a numerous minor nobility. Later generations looked back upon the founder of the empire as the best of lawgivers and the ideal monarch, and, of course, so great a patron of Zoroastrianism left a high reputation for piety. A man of mark he certainly was, but the fanaticism that opened his reign, and such a barbarity as tradition itself relates of his conduct to the conqueror Artaban, whose head he spurned with his feet, show him to have been very far from a pattern character. It is interesting to find his memory intertwined with similar romantic legends to those told of Cyrus. He was born of (we are told) a mean father, and lived as a page at the court of Artaban, as Cyrus lived at that of Astyages, and so forth. Dreams and portents figure in the later as in the earlier legend, and even a mythical conflict with a dragon is recounted.¹ Fortunately a much more historical picture has been preserved by genuine tradition.

Shāpūr I's wars with Rome.

Artashir is said to have adopted his son Shāpūr as partner of his throne, and this is confirmed by coins on which a youthful head appears along with Artashir's likeness. He died late in 241 or early in 242. Shāpūr I. (older form *Shāhpūr*; Sapor or Sapoires of the Westens) was probably crowned on 20th March 242. Legendary tradition makes his mother an Arsacid princess taken at the capture of Ctesiphon; but, according to a more probable account, Shāpūr was already able to bear arms in the decisive battle with Artaban. Nor can he have been a mere strapping when his reign began, as his prowess against Rome shows; for in Artashir's last years, in the reign of Maximin (236-238), the war had been renewed, and Nisibis and Carrhæ (Haran), two fortresses which constantly reappear in this history, had been taken. In 242 Shāpūr had penetrated to Antioch, before Gordian III., or rather his father-in-law Timesitheus, drove him back and retook the Mesopotamian strongholds. The Persians were defeated at Rēshamā, and Gordian proposed to march on the capital by way of the Euphrates, as Julian subsequently did; when almost on the frontier, a little below the junction of the Euphrates and Chaboras, he was murdered by Philip the Arab (244), who concluded a humiliating peace with Shāpūr, and is said—for the details are obscure—to have given up to him Armenia and Mesopotamia. Our whole knowledge of the Perso-Roman wars in the 3d century is very defective; but there seems now to have been a lull for some years, till in 251 or 252 Shāpūr again was in motion, now at length effecting an occupation of Armenia and compelling its king to flee to Roman soil. The Roman world was at this period so shaken that Syria was again and again invaded,—how often we can hardly say, nay, a Syrian, Cyriades, himself led the Persians to Antioch and assumed the purple under their protection. At last the emperor Valerian took the field in person, but, after protracted operations in Mesopotamia, fortune turned against the Romans and Valerian himself became Shāpūr's captive (260), under unknown circumstances, and, according to

Roman accounts, through treachery, but certainly not till he had entered into negotiations and vainly sought to purchase a free retreat for his army with gold. Shāpūr now penetrated with an invading host far into Roman territory towards Asia Minor, but he met with not unsuccessful opposition. The general Ballista cut off many Persians, but a heavier blow was struck by Odenathus at the head of his Palmyrenes, who, in this or a subsequent campaign, smote the retreating Persians and even captured the royal harem, nay, once, if not twice, he laid siege to Ctesiphon itself (for details see PALMYRA). Presumably now as in later times the Persian empire proved unable to sustain the cost of prolonged campaigns. These Oriental kingdoms are on the whole poor, though they include some fertile regions, and though the kings accumulate large stores of treasure. The Persians had no great standing army like the Romans, and the levies summoned to the standard could not long be kept together, hence so many brilliant debuts in warfare without lasting result. Shāpūr effected no permanent gain of territory, for even Armenia seems now to have fallen again under Roman suzerainty.² But Valerian was not delivered, and died in captivity. The figures of the victorious king and the captive Caesar are still to be seen hewn, perhaps by Roman subjects, on the rocks of Persis, and Persian tradition, which preserves so few historical facts as to the immediate successors of Artashir, has not forgotten this crowning humiliation of Rome. Some of the traditional deeds of Shāpūr I really belong to Shāpūr II, but we may accept him as the author of the great irrigation works at Shūshār, and it was he who built Gündēb Shāpūr (Ar. Jundāb-Shāpūr, Syr. Bēth Lāpūt), which was often used by the kings as their second residence, and stood to Ctesiphon as its neighbour Susa in Achemenian times did to Babylon. Shāpūr's sway over non-Iranian peoples has been already referred to, but the Angustan historians are certainly right in speaking of the Bactrians as a nation still independent and often hostile to Persia, and the same is true of the Cadusians (Pollio, *Val.*, ch. i.), &c., the Delamites of Gilan, who were never subdued by the Sāsānians. At the very beginning of Shāpūr's reign Mani, founder of the Manichean sect (see MANICHÆISM), began to preach, against which the Persian priests fought for centuries as vigorously as against the various sections of Nicene Christians.

The close of Shāpūr's reign saw great changes in the Roman east (see PALMYRA). At the fall of Palmyra Shāpūr was probably no longer alive. His son Hormizd Successor (*Ohmazd*) I came to the throne in 272 or 273, having sons of previously been governor of Khōrāsān. His title, "the hero," appears to have been gained by prowess against the Romans before his accession, for his reign of one year gave little time for great deeds.

His successor, Bahrām (*Varahrān*) I., was not his son as tradition represents, but, according to an inscription, his brother. He is said to have been a weak prince, given to pleasure. The execution of Mani falls within his reign, which (subject to a possible error of as much as two years, which affects all dates of reigns between Bahrām I. and Shāpūr II.) may be dated between 274 and 277.

Of his son, Bahrām II. (c. 277-294), Persian tradition has next to nothing to tell. To him may be properly ascribed two long but ill-preserved inscriptions, religious in content, almost sermonizing, and of very clerical colour. He had wars with Rome, of which we only know that they were terminated by a peace with Probus (276-283),³ and that Probus was murdered before he could renew the con-

had reigned as far as Constantinople, but this was not living tradition. Western scholars again sometimes mixed up the old and the new state, as when Labanous supposes that Susa, the residence of Xerxes and Artabazanes, must also be the residence of his contemporary Sapor (Shāpūr). The Sāsānians, however, regarded themselves as successors of the mythical kings of Irān.

¹ An abridged extract of the Manichean history of Artashir has been preserved in the original Pahlavi, and has been published by Noldeke (see p. 186, note 1, above). The same legendary material is used by Euticius; cp. also *Z.D.M.G.*, xxxiv. 585, 599.

² See an essay by Gutischiold, *Z.D.M.G.*, xlii. 51, which is instructive as to the relations between Persia and Armenia generally.

³ Vopiscus, *Probus*, 17, who, as Tillemont remarks, wrongly puts "Narsenus" for "Bahram."

flict. Carus, however, in 283 led his army as far as the hostile capital, and had taken Ctesiphon and Coche (a part of Seleucia) when he suddenly died (by lightning, it is said), and the Romans drew off. Carus is said to have been favoured by intestine disorders, which at this period were certainly common in Persia. In 291 a rhetorician mentions the rebellion of a certain Hormizd (Ormes) against his brother the king, in alliance with barbarians.

A youthful son, who appears opposite the queen on coins of Bahrán II., seems never to have ascended the throne, which was probably contested between Bahrán III. (a son of Hormizd I.?) and Narseh (according to an inscription, son of Shápúr I.). Bahrán III., called Sagán Sháh, because he had been governor of Sagastán (Sistán), reigned, or at least held the capital, for a very short time; Narseh reigned from c. 293 to 303, and, following up Shápúr's policy, occupied Armenia and defeated Galerius (probably in 297) between Carrhæ and Callinicus (Rakka) in Mesopotamia. But under Diocletian's wise rule Galerius soon restored the honour of the Roman arms, totally defeating Narseh in Armenia and taking his wives and children. A brilliant peace (298) rewarded the victors; to recover his family the Persian ceded Armenia and Mesopotamia, and even some districts east of the Tigris as far as Kurdistan. The peace lasted forty years.

Narseh's son, Hormizd II., came to the throne about 303 and was succeeded early in 310 by his son, Ádharnarseh, who was soon deposed, and probably slain, ostensibly for his cruelty. The nobles now held the reins of power, and, having blinded one brother of the fallen king and imprisoned another (Hormizd?), crowned Shápúr II., the newborn (or unborn) son of Queen Ífrá (?) Hormizd (310). The rule of the queen-mother and nobles was what may be readily imagined in an Oriental empire, which above all things needs a strong man at the head, but such a man young Shápúr, one of the greatest princes of the dynasty, soon proved himself to be Persian tradition preserves few really historical notices of Shápúr II., but is full of stories of astounding campaigns against the Arabs, highly coloured by hatred of that race; and there is no doubt that Shápúr did devote himself with energy to the always important task of repelling the plundering Bedouins from the civilized lands on which their deserts border. Another notable undertaking was the new foundation of Susa after it had rebelled and been chastised by total demolition, the very ground being stamped down by the king's elephants. *Nishápur* (q.v.), i.e. *Néshápur*, may be his foundation, or that of Shápúr I.

In Shápúr's youth fell the victory of Roman Christianity over paganism under Constantine, and the Christians of Persia at once threw in their sympathies with the Christian state. These feelings were openly shown when Shápúr in 337 or 338 began a Roman war, as appears in a homily of the Syrian bishop Aphraates, a subject of Persia. The bishop of the capital, too, ventured to use language against the king which no Oriental prince, least of all one like Shápúr, could submit to. And so almost simultaneously with the Roman war a terrible persecution of the Christians broke out (339/340), of which the Syrian *Acts of Persian Martyrs* give a lively picture,—instructive, too, for the light cast on persons and affairs in the realm. Shápúr was no fanatic, as even the *Acts* of the martyrs show; and he did not molest the Jews, whom his priests hated quite as much as the Christians. But, like Diocletian, he wished to destroy the organization of the church, and therefore used the utmost rigour against the lower as well as the higher clergy, and destroyed the ecclesiastical

buildings. To break up congregations he often constrained prominent church members to stone their own priests. The Persian priests, of course, used the opportunity to gratify their hatred of the Christians, and other impure passions increased the cruelty of Shápúr's hard measures. The Christians on their part showed much heroic courage mixed with not a little cowardice.

Roman sources tell us that the war was begun by the Shápúr Persians with an invasion of Mesopotamia. Constantine II. died on 22d May 337, before he could march against them. But Shápúr's great preparations, as we learn from Aphraates, fell in the year that begins with autumn 337. With many vicissitudes and long pauses the war endured for twenty-five years, but only for its second part do we possess fuller accounts by contemporaries and in part eye-witnesses. Shápúr's aim was to drive the Romans from the upper Tigris, where they were dangerously near Ctesiphon, and especially to seize Nisibis, and then to reduce Armenia, that old apple of discord between East and West. Three times Nisibis victoriously resisted a severe siege (338, 346, 350), and other sieges occupy a great place in the story of the war. Constantius, when he took the field in person, was always defeated, as in 348 at the great battle of Singara (Shingár, Ar. Sijnár). Yet Shápúr's successes bore little fruit, mainly perhaps because Diocletian and Constantine had put the fortresses in the best condition, and in all respects had made wise provisions to cover the threatened districts. Even when victorious the Persians could hardly penetrate into western Mesopotamia, and if Shápúr had taken all the strong places he could hardly have garrisoned them. Thus he took Amida (Ámid) after long and costly sieges, and in the very next year (360) the Romans found it ungarrisoned. The Romans were helped, too, by the trouble which Shápúr had with barbarous enemies; the third siege of Nisibis was all but successful when the Persian was called away to Khorásan by urgent affairs there. These eastern conflicts were the prelude to a long pause in the contest (360-368), broken only by small forays. When, however, the Romans opened negotiations (366 to 368) Shápúr had made peace in the east and offered no conditions that could be accepted. In 359 and 360 the war was again hotly renewed, and Shápúr took several important fortresses. Then there was a lull till 363, when the warlike, active, and ambitious Julian, now sole emperor, resolved to strike at the capital of the enemy, as Trajan, Severus, and Carus had done. He left Antioch for Mesopotamia in March and swiftly descended the Euphrates, wasting the enemy's land with fire and sword and taking several cities by short sieges, among others the royal city of Máhóz Malká, not far from Ctesiphon. Julian now occupied Seleucia, but, finding he was not strong enough to take Ctesiphon, the fortified capital on the opposite bank of the Tigris, he ordered a retreat along the left bank. And now for the first time Shápúr's troops began to harass him, but the army might have regained Roman soil without serious loss had not Julian fallen mortally wounded in a skirmish (26th June 363). The army chose Jovian emperor, a man too weak for such an occasion, who managed his soldiers and the negotiations so badly that a shameful peace was the result, and Shápúr regained the lands east of the Tigris lost to Galerius, and part of Mesopotamia with Nisibis and Singara. Nisibis was the gravest loss, for in all future wars it was to the Persians a sure base for advance and a bulwark for defence. But a still more shameful condition was that the Romans should not help their ally Arsaces of Armenia against Shápúr. The Persian, nevertheless, did not find Armenia an easy conquest. He took Arsaces captive, but this did not decide the fate of the whole country, divided as it was by nature into a number of separate regions under almost independent

Shápúr
II.

Persecution
of
Christians.

¹ Hormizd escaped to the Romans in 323 and remained with them all his life. As late as 363 he shared the Roman campaign against his half-brother Shápúr.

363-429. captains. The Christian Armenians leaned on the whole towards Rome, while the Zoroastrians, who still formed a large part of the nation, inclined to Persia, and the personal interests of the great barons, who preferred to recognize no lord, inclined them now to this side, now to that. Papas, son of Asaces, fled to the Romans and got help from them, first secretly and then openly, but he was only their tool in the design of reducing Armenia to a province. Conflicts between the rival empires took place also to the north of Armenia in Iberia, and after five years they were practically again at war. In 371 Shāpūr was openly met by Roman troops in Armenia, which both parties were determined to have by force or by fraud. Once and again negotiations failed, but a general war was still averted by external circumstances (on Rome's part by the Gothic war) and considerations of prudence.

Ardashir II to Bahram IV.

Shāpūr II, who is justly celebrated by the later traditions, died towards the end of the summer of 379, and was succeeded by his brother, Ardashir II, an old man, who was perhaps chosen king for similar reasons to those which governed the choice of Shāpūr as an infant. As prince and governor of Adiabene Ardashir had taken an active part in the suppression of Christianity in 344 and as late as 376, but with his accession the persecution ceased—whether of purpose or merely from the Oriental lack of persistency we cannot tell—and a bishop was again admitted even in the capital. Ardashir was deposed in 383 or 384, having taken strong measures against the nobles and put some of them to death.

His successor, Shāpūr III, son of Shāpūr II, at once sent ambassadors to Constantinople and made a definite treaty of peace (384). In 388 or 389 he was murdered by the nobles. His successor (a son, or perhaps a brother), Bahram IV, called Kirmān Shāh,¹ kept peace with Rome and was clement to the Christians. In 390 Armenia was divided by treaty, much the larger part becoming a vassal state of Persia and the rest falling to Rome. The division, with various modifications and vicissitudes, lasted into Arab times. Bahram was shot by a band of "miscreants" in the summer of 399.

Yazdegerd I.

Yazdegerd I., son of Shāpūr II or Shāpūr III, seems to have been designated heir to the throne while Bahram IV. was still alive, or at least he held such high dignity that his name appears on coins of his predecessor. Persian tradition makes him wise but very wicked. Christian witnesses, on the other hand, speak very favourably of him, and it appears certain that his surname, "the Sinner," was gained by a severity, perhaps tyrannical, towards the grandees, by tolerance towards the Christians, and little favour shown to the priests. In 410 the Christians were even allowed to hold a regularly constituted synod in the capital, and the king employed the "Catholicus"—i.e., the primate of the church, a functionary possessed of full religious autonomy—on a mission to the emperor, and even in settling differences with his own brother, who governed Persia. Yazdegerd had no personal inclination towards Christianity, and he severely punished the fanaticism of Bishop Abdi, who had insulted a Zoroastrian sanctuary in Susiana, but his habitual tolerance was enough to make him hated of the Persian priests. The wall-like nobles also found cause for dissatisfaction in his earnest endeavours to keep on quiet terms with Rome, with whom he made a treaty of peace and friendship in the summer of 408, when he seems to have pledged himself to support the throne of Theodosius II. during his minority. Over Persian Armenia he set his own son Shāpūr. We have every reason to deem Yazdegerd an excellent prince for the time and circumstances, but he was not well pleasing to the god of the

Persians, who smote him with sudden and miraculous death in distant Hyrcania. The explanation of the miracle is no doubt that he was murdered by the magnates (probably late in summer 420).

Shāpūr, hurrying from Armenia on the news of his father's death, was slain by the grandees, who had resolved altogether to exclude from the throne the seed of the hated Yazdegerd. A distant relation, Khosrau, was made king, but had to contest the throne with another son of Yazdegerd, Bahram, who in his father's lifetime had dwelt apparently in a sort of exile, with the powerful vassal prince Al-Mondhir (Alanundaros) of Hira, on the borders of the desert to the west of the Euphrates. Mondhir energetically supported the claims of his guest-friend, and appeared with a vast Arab horde before the gates of Ctesiphon, which is only three or four days' march from Hira. As Bahram doubtless had support among the Persians also, Khosrau gave way, and Bahram took the throne, but with a promise to reign in a different spirit from his father and please the magnates and the priests. This is the first important intervention of the Arabs in the affairs of Persia.

Bahram V., surnamed Gōr or Wildass, is the favourite Bahram hero of Persian tradition, which tells many incredible stories about him. He came to the throne young, and was always a jolly prince, very fond of women, and whose personal strength and prowess as a huntsman, perhaps also in war, blinded men's eyes to the real weakness of his sway. The change of policy was at once announced in a systematic persecution of the Christians and in war with Rome. For the latter there were pretexts enough on both sides, but the Romans would not have begun the war merely because the Christians were persecuted, its real authors were presumably the Persian nobles. The chief seat of war was the north of Persian Mesopotamia and the mountain-land above. The Persians were led by one of the greatest nobles, Mihr Narseh, whom Persian tradition represents as taking Constantinople, while we know that he really sustained heavy defeat at the very commencement of the war (August 421). Nisibis was attacked by the Romans, but relieved after a siege of some length. In 422 both parties were glad to make peace; religious freedom was given to Christians in Persia and to Zoroastrians in the Roman empire. There seems to have been no change of frontier, but the Romans promised to receive no Arabs who wished to change their allegiance,² and to pay an annual sum towards the maintenance of the defences of the Caucasian Gates (the pass of Darfel), which protected both powers from the incursions of the northern barbarians. This last condition reappears in almost all treaties and always caused soreness. For, however carefully the provision was worded, both sides looked on the contribution as a tribute, of which the Romans evaded payment whenever they could.

The Persians, we may suppose, were the readier to make peace that they were again embroiled with the nation of Kūshān or Hūn, the Hephthalites or "white Huns," who then ruled in Bactria and the surrounding lands. Constant wars of Persia with this people went on during the 5th century and gave the Romans repose, and we are hardly bound to believe the Persian tradition that Bahram had a glorious victory over the Hephthalites. A movement for freedom had taken place in Persian Armenia during the Roman war; but after the peace Bahram established a new vassal king, till in 429 the conduct of the selfish Armenian nobles led the Persians

¹ He had ruled in Kirmān, and from him two towns, in Kurdistan and in Kirmān, take the name Kirmānshāhān.

² The Bedonni tribes, "see amici nobis unquam nec hostes optandi." (Ammon, xiv. 4, 1), and the petty states that had been forced out of them, under Roman or Persian suzerainty, were a constant trouble to both empires in war and in peace.

to make Armenia a province,—a change which was supported by a strong party among the Armenians themselves But the Persian governors had as much trouble with barons and clergy as the old kings had had

Yazdegerd II. Bahram, dying in 438 or 439, was succeeded by his son, Yazdegerd II., of whom little good can be said. He persecuted both Jews and Christians, abolished the audiences on the first day of each month on which every man of position could approach the king with petitions or complaints, and is recorded to have married his daughter (that, of course, was no crime in a Zoroastrian) and then murdered her.

In 441 he very nearly came to war with Rome, but peace was concluded without further conflict than some harrying of the marches, and it was provided (as in later and probably in earlier treaties) that no new fortresses should be erected on the border by either party. Yazdegerd was much in Khorásán, where he sustained repeated defeats from the Hephthalites; and in 450/451 he had to deal with a serious rebellion in Armenia, mainly produced by persecution of the Christians, which was not quelled till he promised complete freedom of Christian worship.

On the death of Yazdegerd II. (457) the throne was for two years contended between his two sons by Dinak¹— Hormizd, prince-governor of Sagastán, and Péroz. The latter, who was the younger, proved successful by aid of the Hephthalites and the enegy of Bahám of the house of Míhrán, and put his brother and three others of the nearest royal kin to death. Péroz was again a persecutor of Jews and Christians, but had political wisdom enough to favour the reception of Nestorianism by his Christian subjects when that party was driven from the Roman empire. At the synod of Bétb Lápát (483 or 484) the old Christian church of Persia adopted the Nestorian confession, and was thus separated from Byzantium by a wide breach. But in truth Christianity in Persia had never been really much of a danger to the state.²

The Hephthalites and Péroz soon fell out about the reward for their services, and fierce fighting ensued, in which Péroz gained several victories; but the seat of war was a desert very unfavourable to his operations, and twice he had to make peace on disadvantageous terms, while at least once he was himself taken prisoner and released on heavy ransom, leaving his son Kavádth a hostage for its payment for the space of two years. But Péroz always broke faith again with the foe, and at length, in 484, he was among the missing after a terrible battle, in which his daughter was taken captive and placed in the harem of the Hephthalite king. The conquerors now overflowed Persia, which for a time was without a monarch till order was restored by Zarmírh, of the great house of Káren, who at the time of Péroz's death had been successfully dealing with a revolt in Armenia, and now hastened to the capital and made Balásh, Péroz's brother, king. The Hephthalites seem to have been bought off by a yearly tribute.³ Balásh's brother, Zareh, who also claimed the crown, was vanquished and put to death. But the new king had little power, and secured the obedience of the Armenians only by granting that the Persian state religion should be wholly excluded from their land. The clemency of Balásh is praised by the Syrians and Armenians, possibly for no other reason than that his relations with the Persian priesthood were unfriendly. Their enmity proved fatal to him; his treasures were empty, so that he could neither

gain a party among the nobles nor secure the support of 429-526 an army, and in 488 or 489 he was deposed and blinded.

His nephew and successor, Kavádth I, son of Péroz, Kavádth found the land in a very disturbed state; there were⁴ rebellions among the barbarous mountain tribes and there was another rising in Armenia. Now Kavádth was not disposed to be the humble servant of the priests and nobles to whom he owed the crown, and to humiliate them he played the dangerous game of encouraging Mazdak, the energetic priest of a new religion, which demanded in the name of justice that he who had a superfluity of goods and several wives should impart to those who had none. This theory was actually put in practice to some considerable extent, but then the nobility and clergy rose, deposed Kavádth, and imprisoned him in the "Castle of Oblivion,"⁵ placing his brother Jamásp on the throne (c. 496). But Kavádth escaped to the Hephthalites, where he had once lived as a hostage, received in marriage the daughter of the king (whose mother was the captive sister of Kavádth), and with his help expelled Jamásp and recovered his kingdom (498 or 499).⁶ Kavádth held severe judgment on the traitors, and it was probably at this time that he gave up Zarmírh into the hands of his most dangerous rival, Shápúr of the house of Míhrán. He does not seem to have carried his Mazdakite experiment farther, and he had put the realm into fair order when he began a war with Rome.

Between Rome and Persia there had been such a series of negotiations and compacts, none of which had been scrupulously observed, that either side could find a *casus belli* at will. Kavádth had the will, and in summer 502 he opened that era of indecisive strife between Rome and Persia which so exhausted both powers as to pave the way for the new empire of the Arabs. In August he seized without a fight Theodosiopolis (Kain, Erzerúm), capital of Roman Armenia. On 10th January 503 Amida fell after a siege of three months and was cruelly chastised for its resistance, tens of thousands of the inhabitants being put to the sword.⁷ The Romans acted with little energy or unity of plan, and in the course of the war Mesopotamia suffered terribly. Amida was restored to the Romans by compact, or rather by purchase, after a long siege in 504, and after much fighting a peace was concluded in the autumn of 506, leaving things as they were before the war. The Persians, we are told, were ready for peace because they had on their hands a war with the "Huns,"—a very vague word in the mouth of a Greek. But Kavádth must have been in considerable difficulty, for he tamely submitted to a gross breach of the treaty when Anastasius raised the village of Dara to a great fortress to hold Nisibis in check. There was no more war while Anastasius was emperor, but Justin I (518-527) seems to have ceased the payment for the Caucasian Gates again stipulated in the peace of 506, to which Kavádth replied by letting loose his Arabs on the empire, and the Romans retaliated by forays in Persian Armenia. There were also serious disputes about the suzerainty of the lands between Caucasus and Pontus, but Kavádth was still anxious to avert war, from which presumably he saw that no permanent advantage could flow. At the same time he was very eager to secure the succession for his favourite son, Khosrau, who was not his eldest; and he thought that if he could induce the emperor to adopt Khosrau as his own son this would form a sort of guarantee and greatly impress the Persians. A nego-

¹ Dinak's likeness is preserved on a gem; see B. Doan, in *Comptendu de la Com. Arch. pour 1876, 1878*, p. 162 sq. (St. Petersburg).

² The Armenians, on the other hand, joined the Monophysites, who had a large party in the Roman empire and often had the upper hand there.

³ Persian tradition makes Šákhri (i.e., Zarmírh) humble the enemy and compel them to restore their booty.

⁴ Identified by Sir H. Rawlinson as Gilgud in northern Susana.

⁵ Kavádth's escape and restoration seem to have been favoured by some of the greatest nobles, and Persian tradition, which, however, is very confused in this whole chapter, makes Zarmírh the companion of his flight.

⁶ Of this war we have good accounts in contemporary Syriac sources.

526-546. tiation on this and other matters at Nisibis (525 or 526) seems, however, to have been badly managed on both sides, and its failure cost the Roman ambassador his place and the Persian his head. War now began on the borders in 527 before Justin's death (*i.e.*, before 1st August).¹ A Roman attack on Nisibis and a Persian on Dara failed. Fighting, broken by negotiations, went on for several years, and in it Belisarius first came to the front as a general.

Mondulū
of Hīla

An important episode in this war is the invasion of Syria by Mondulū of Hīla. This prince seems to have been more powerful than was safe for Persia, and Kavādh had stripped him of all a part of his possessions and given them to Hāthi, a son of the widespread house of the kings of the Kinda. When war broke out Mondulū, who was an experienced warrior, was restored to his old sway, and in 529 he fell on Syria, pillaging and holding captives to ransom as far as Antioch. Mondulū was a savage heathen, who on one day sacrificed 400 nuns of a Syrian cloister to his goddess 'Uzā (the planet Venus). In the same year he slew Hāthi in battle and executed in Hīra a number of captives of the Kinda house. For half a century he was the terror of the subjects of Rome, little recking whether they were at peace or at war with his master, till in 554 he fell in battle with a Roman vassal, Hāthi ibn Jabala, whose son he had also sacrificed to 'Uzā.

Under Mondulū's influence Kavādh in 531 undertook a regular campaign against Syria, the first since centuries. The Persians crossed the Euphrates and had pressed far to the north when Belisarius compelled them to turn back. In a battle at Rakka Belisarius was defeated, but the Persians found it expedient to continue their retreat (19th April 531). In Mesopotamia the Persians were this year successful, and had almost reduced the great fortress of Martyropolis (Maferkat, Arab. Mayāfāriqn) when news came of Kavādh's death, and a truce was made.

In 538 or 539 Kavādh, through his son Khosrau, had made a bloody end of the Mazdakites, whose success proved too dangerous to society to be longer endured.

Kavādh died, eighty-two years old, 13th September 531, and was succeeded by his destined heir, Khosrau (Chosroes), surnamed Anōshāvrān, "the Blessed," whom his father is said to have caused to be crowned as he lay on his death-bed.² Khosrau I. was a great king, and deserved the title of "the Just," though he was not the ideal prince that Eastern writers make him. By carrying out the regulation of the land-tax already commenced by his father, and by measures to control the collection of taxes, he benefited his subjects as well as the treasury. In Babylonia at least, the richest province, his fiscal ordinances proved productive, and, according to an Eastern standard, not too oppressive, down to the fall of the Sāsānīan empire; the Arabs themselves contrast the old Persian system with the oppressive taxation of Moslem times, which was ruinous to the finances of the state as well as to the inhabitants. The public welfare, too, was served by the construction or repair of bridges, canals, embankments, and the like. The priests favoured Khosrau for his extirpation of the Mazdakites, which he completed at the beginning of his reign, but they were not permitted to rule his policy. He managed the great nobles with tact, rather strengthening than weakening the aristocratic basis of the realm, but making it servicable to himself. Measures were taken to relieve the insecurity which the Mazdakites had introduced in relations of property and the family, and the army was the object of special care. Khosrau had a decided leaning to Western civilization; and, though an Oriental despot could not be expected to sympathize with the highest fruits of Hellenic genius at a time when they

were little appreciated even in Europe, and the heathen philosophers who came to Persia to seek a philosophic state soon returned undecieved, it is to his honour that the Persian secured for them the free exercise of their faith by a clause in the treaty of 549. The Christians, so long as they obeyed the laws, were unmolested; nay, Khosrau helped to maintain the worship not only of the Nestorians but even of the Monophysites, who had much more friendly relations to the Roman empire. Apostasy from Zoroastrianism was forbidden by ancient law, and proselytizing by Christians was strictly prohibited, yet the Monophysite abbot Ahūdēmeh, who had got a large contribution from the king to build his monastery, and thereafter baptized a son of Khosrau, who presently fled to the Romans, was punished only by a mild imprisonment, in which he was allowed to see his scholars.³ Nor did the Christians suffer for their sympathy with the rebellious prince Anōshāzād, and yet Khosrau was no weakling, but energetic, warlike, and on occasion cruel.⁴

The negotiations begun in 531 issued in September 532 in a "perpetual peace," the Romans promising a large annual subsidy and other concessions, while the Persians gave back certain castles in Lazistān at the eastern end of the Black Sea. Khosrau had need of peace, and used it probably to protect the frontiers from diverse barbarous foes, for tradition speaks of his measures for the safety of the borders towards the Caucasus and on the east. Unmanageable tribes, too, were moved to new homes. In a few years he was strong enough to go to war again, feeling perhaps that Justinian's successes in Africa and Italy had made the hereditary foe too strong. This danger, no doubt, was forcibly set before him by the emissaries of the Gothic king Vitiges, and a tempting opportunity was presented by an appeal which came to him from the rebel nobles of Roman Armenia, Christians though they were. Pretexts for war were never lacking, if only through the Arab subjects of the two powers. But Khosrau certainly desired the war, and early in 540 he set forth to attack Syria as Shāpūr I. had done, and marched through the land to the shore of the "Roman sea," taking and pillaging such strong cities as did not buy him off. Antioch in particular yielded an enormous booty, it was burned and the inhabitants carried captive. Turning homewards, the Persian traversed north Syria and Mesopotamia from west to east, leaving a contribution even from the hated fortress of Dara. Carrhae alone, whose population was still mainly heathen, and so presumably inclined to the non-Christian empire, escaped scot free. Ctesiphon was reached at the close of summer, the whole campaign having come off without a single pitched battle. Khosrau, still more than Shāpūr II., sought in the barbarous old usage of wholesale captivities a means of appropriating to his own service the culture and technical skill of the West. Thus he made for the captive Antiochians a new municipality (Khosrau-Antiochia, or "the Roman town") hard by the royal residence, which was a notable tribute to the superiority of Roman culture and life. The town was made as Western in character as could be, and the inhabitants were established in comfort, and had religious freedom, and even a Christian mayor. They retained their national manners till the fall of the empire. Chariot-races, for example, were as popular as they had been in old Antioch.

Next year Khosrau was invited to Lazistān by the natives, and penetrated to the Black Sea and took the strong place of Petra. In Mesopotamia war went on for several years.

² This is known from an unpainted Syrian biography by a disciple of Ahūdēmeh, who manages to make the king a tyrant by inventing a silly miracle to explain his clemency. Ahūdēmeh died, after two years' imprisonment, 22 August 576.

⁴ Procopius naturally speaks unfavourably of so dangerous an enemy of the Romans.

¹ The principal sources for this war are Procopius and the Syrian account in *Lam. descend.*, *lit.*

² That the nomination of Khosrau surprised the Persian nobles is simply impossible. Procopius, it must be remembered, drew for the events at Khosrau's accession on the tales of the (true or false) pretents Kavādh, son of Jam, and grandson of King Kavādh. But it is quite possible that such things as the removal of princes and the execution of valuable officials took place under Khosrau.

Khosrau
I's internal
rule

years with chequered fortune. In 546 the Romans paid a large sum for a five years' truce, and another five years' truce followed in 553, though Lánstán was excluded from both truces until 556, when the Romans had gained successes there, but during all this time the Persian and Roman Arabs never laid down their arms. At length, about Christmas 562, a fifty years' peace was concluded, the Romans again promising a considerable yearly subsidy, and the Persians withdrawing their claims on Lánstán, though the possession of the neighbouring Suania was left an open question. The treaty also provided for religious freedom to the Persian Christians, while all proselytizing among Zoroastrians was strictly forbidden.

Eastern
con-
quests.

During the truces (546-562) great changes had taken place in the East, where a powerful empire had been formed in the northern steppes by the Turks, whose name then, for the first time, became known in the West. The khákán of the Turks, whom the Greeks call Silzibulos and the Arabs (after the Persians) name Simjibí, took from the Hephthalites the right bank of the Oxus, while Khosrau (seemingly in alliance with the khákán, whose daughter he wedded) occupied the left bank (c. 560). Thus Bactria, from which the Sásánians had suffered so much, was at length embodied in their empire, and Péroz was fully avenged.¹ But the friendship of Turks and Persians was soon changed to that hostility which has long made the rulers of Turkestan and the deserts appear the natural enemies of the lords of Khorásán. Khosrau must have made other conquests about the same time, for in the negotiations with Rome the Persian representative boasts that his master had conquered ten nations, and tradition enumerates the conquest, or rather recovery, of seven eastern lands. These statements must be taken with some discount, and it is not to be believed that Khosrau really ruled in Afghanistan or Sind, as tradition says, though he doubtless widened and secured the eastern limits of the empire.²

About 570 an expedition was sent against Yemen, which the Christian Abyssinians had conquered in 525. A native prince invited Khosrau to expel the Blacks, and, after some hesitation, he sent a small force under Vahriz which easily effected this object. Persian rule was nominally maintained in Yemen till the time of Islám, and tribute was paid more or less irregularly, but, as the Persians were not a seafaring people, this remote province beyond the waters was of no practical use to them in the way of diverting trade from the hands of the Romans. Khosrau had presumably hoped otherwise, for affairs of trade, especially the overland silk trade in inner Asia, had considerable influence on Sásánian policy.

About 551 Khosrau had to deal with a rebellion of his son Andehazádh, who was then in disgrace in Susiana; hearing that his father was dangerously ill, he claimed the crown, leaning on the Christians, whose religion was that of his mother. The rebel was easily overpowered and taken; his punishment was not death, but such a partial blinding as made him unfit to reign.

Second
Roman
war

In his last years Khosrau had again to face the Romans. The Roman alliance with the Turkish khákán, the efforts of Khosrau to hamper their intercourse with that potentate, now his dangerous foe, the annoyance of the Christian empire at the fall of the Christian realm in Yemen, and the refusal of Justin II. (565-578) to pay the stipulated subsidy were all pretexts for war, but the decisive thing was that all Armenia suddenly threatened to become Roman. There were already plans of rebellion among the

¹ A curious proof of the late character of Persian tradition is that it regards the Oxus as having always divided Ián and Thírán, and the Turks as having always been next neighbours of Persia.

² Purely fabulous exploits, like the conquest of Ceylon, mean only that to the Persians Khosrau, like Bahrán V., was lord of the whole world.

Armenian nobles when an outburst of popular fanaticism³ was caused by the attempt to erect a fire-temple in the capital Dvín, and the Persian Súrén⁴ was slain (spring 571). The rebels and the king of Iberia turned to Constantinople, and were taken under the protection of the meapable emperor, who fancied that he could regain both countries. This, of course, was a declaration of war. The events that followed are known from good contemporary sources, but cannot be arranged in clear chronological order. One of the first operations was an unsuccessful siege of Nisibis by the Romans. Khosrau, on the other hand, took Dara in 573, after a siege of six months, and was joined beneath its walls by his captain Adharmahán, returning from a successful campaign in Syria on the model of that of 540, in which he had destroyed Apamea.⁵ Tiberius, who with the empress Sophia held the reins of power in Constantinople and was recognized as co-regent in the end of 574, desired peace, but Aimenia was excluded from the three years' truce that he procured. In 575 Khosrau penetrated through that country into Cappadocia, and, though he had to retire before the Romans and leave his camp to be pillaged, he escaped safely, burning Sebastia and Melitene on the way. The Romans pressed forward and spent the winter in Persian Armenia, but were driven back next year; they had not even secured the sympathy of the Monophysite population. Even beyond Armenia the war broke out again before the truce had expired, and the Romans conducted it with no more humanity than the Persians, leading captive the Christian inhabitants of Aizanene, and making it a special favour to give them a place in Cyprus (577). Negotiations for peace were frequent; the Romans saw that it was vain to try to hold Armenia and Iberia, and might even have consented to give up the temporal and spiritual heads of the rebellion who had taken refuge at Constantinople, but they very naturally would not make peace without recovering Dara. So things stood when Tiberius became sole emperor, and some months later Khosrau died (c. February 579).

Hormizd IV., son of Khosrau by the Turkish princess, Hormizd was a proud enterprising prince. The Greeks speak ill of him, and indeed were much offended from the first that he neglected the usual courtesy of formally announcing his accession at Constantinople. Persian tradition makes him ill-disposed and a shedder of blood, and we know that his put his brothers to death when he took the throne, but that, as the contemporary Christian narrator says, was a Persian custom. On the other hand, tradition acknowledges the strict impartial justice with which he upheld the cause of the poor against the great. It was the great man who felt his severity. In the army, too, he was careful of the plebeian troops, and lowered the status of the aristocratic cataphracts. Much to his honour is his reply to the priests when they asked him to withdraw his favour from the Christians. "As our royal throne," he said, "cannot stand on its front legs alone, so our rule cannot stand and be firm if we turn against us the Christians and members of other alien religions. Cease, therefore, your attacks on the Christians and follow zealously good works, that the Christians and others of alien faith may see them, and give praise and be drawn towards your faith." In many respects Hormizd seems to have resembled Yádagérd I., whose fate, too, he shared; the misfortune was that he had not his father's tact in managing the nobles and the clergy.

The war with Rome went on throughout his reign with varying fortune. There was a serious war, too, with the Turks, but over these, or rather over one of their vassals, the Persian general Bahrán Chóbin gained so complete

³ A member of the same house with the conqueror of Ctesius.

⁴ Part of the captive Apameans were settled in New Antioch.

589-623 a victory that he is said to have made the Turks pay instead of receiving tribute. Bahram was next sent into the lands south of the Caucasus to strike a great blow at Rome (589), but here he was utterly defeated, and Hormizd was foolish enough to dismiss him with disgrace. The general, who was head of the great house of Mihrān, repaid by open revolt, feeling, no doubt, that he could reckon on the discontent of the nobles and the other armies. The troops in Mesopotamia which had been driven back on Nisibis by the Romans and were afraid of punishment did in fact mutiny and open communication with Bahram, who marched against the capital and reached the Great Zab. An army sent forth against him also mutinied, but declared for Hormizd's son, Khosrau, who was on bad terms with his father. Next, part of the troops rose in Ctesiphon, whether Hormizd had hurried from Media. Bindōe, Khosrau's maternal uncle, was in prison there, and his brother Bistām (Vistāhm) set him free by force. Hormizd was deposed and soon after put to death, and Khosrau, who had probably consented to a crime he could not prevent, was proclaimed king (summer 590).

Civil war Khosrau II Parvōz, "the conqueror," had now to deal with Bahram, who sought the crown, or at least the regency, for himself. But the pusillanimous king could not inspire his troops with courage to face the experienced general; he was deserted in the first shock of battle, and fled to Ctesiphon to cast himself on the aid of the emperor Maurice, who undertook to restore Khosrau, but, able prince as he was, missed the great opportunity of securing an adequate equivalent for the service. Himself a man of obscure descent, he seems to have been flattered by the idea of posing as "father" of a legitimate king of ancient stock. The enterprise was not very difficult, for though Bahram had seized the crown and begun to coin in his own name the nobles would not submit to one of their own peers, and the people were still stricter legitimists than they had been under the Arsacids. In their view the royal majesty (*farahi kaydūtī*) was innate in the house of Ardashir, and none outside of it could be king. Bahram had to put down an insurrection in Ctesiphon itself, and Bindōe escaped and took up his nephew's cause. In the beginning of 591 a Roman host drew near, and Khosrau caused the gates of Martyropolis¹ and Dara to be opened to them. He was now joined by the Persian army of Nisibis, and Persian and some Armenian grandees came in to him day by day. The other armies took the same side. In Ātropatene Bistām, Bindōe's brother, gathered a host against Bahram, while the united Persian and Roman forces advanced along the left bank of the Tigris and smote him in a decisive battle near the Zab (summer 591). Selencia, Ctesiphon, and New Antioch had already been taken by troops sent through the Mesopotamian desert.

Khosrau II. Thus Khosrau was restored, and peace with Rome followed of course. The Romans ceased to pay tribute, but only recovered their old frontier, Nisibis still remaining Persian. Bahram fled to the Turks and was honourably received, but was murdered not long afterwards. Khosrau was still so insecure that he asked a bodyguard of 1000 Romans, and now he set himself to remove all dangerous persons, especially Bindōe and the other conspirators who had overthrown his father and set himself on the throne. Bistām was not so easily reached. When he saw himself condemned he made himself king in Media, and held out for almost six years with the help of the remnants of Bahram's forces and in alliance with Turks and Délamutes. He fell by treachery probably in 595 or 596.

To a land already weakened by long wars all these

¹ This town had been betrayed to the Persians, and the Romans had lain before it for some time.

disorders were ruinous. Nor was Khosrau II the king fit for such times. A weak coarse-minded man, at once boastful and timid, avaricious and fond of luxury and splendour, he was at best a very ordinary Oriental despot. He found the treasury empty and left it full, while the empire was impoverished by wars. And in these he won no glory, his victories were those of his generals. To the Christians he long extended protection and favour, and even built them churches; for he fancied that not only the Christian empire but St Sergius himself, the chief saint of the Roman Syrians and Arabs, had a share in his restoration, and he was much under the influence of a Christian wife, Shīrīn, and of some other Christians, such as his physician Gabriel.² But in later years his disposition toward the Christians was altogether reversed.

When Maurice fell by treason and the hideous tyrant Phocas seized the throne (November 602) Khosrau felt himself called to avenge his "father" and protect Maurice's supposed son, Theodosius, who had fled to the Persian court. Narses too, the commandant of Edessa, called for help against Phocas. Khosrau accordingly impuisoned the ambassadors who came to announce the new accession, and a war began, early in 604, which for twenty years laid the Roman lands open to such ravages as had never before been known, so helpless was the empire under the bad rule of Phocas and through the pressure of Avars and other barbarians. Khosrau was present at the taking of Dara (604),³ but had no personal share in the war after that event. After a few years the Persian armies were seen as far west as Chalcedon over against Constantinople. Yet the real weakness of the Sāsānian realm was strikingly exposed in these very years (604-610) in the battle of Dhī Kār, a small affair in itself, but very significant. Khosrau had abolished the kingdom of Hira and put King Nō'mān to death, thus ridding himself of a troublesome vassal, but at the same time losing a very useful means of influencing and checking the desert tribes. And soon after Nō'mān's fall the tribe of Bakr ibn Wail actually defeated a regular army at Dhī Kār near the Euphrates, but a few days' journey from Ctesiphon, and maintained themselves on the soil in spite of the Persians. Arabic vanity greatly exaggerated this success, and the result was a notable increase of self-confidence on the part of the Arabs, by which the Moslems ultimately benefited when they came to attack Persia.

The Romans still had the worst of the war when in October 610 Phocas gave place to the valiant Heraclius. The new emperor, laid pressed on all sides, vainly asked for peace. In 613 Damascus was taken, and the country round it, on which the Persians had never before set foot, was ravaged in a way of which countless runs bear witness to this day. In June 614 Jerusalem fell, and, to the horror of all Christendom, the "precious and life-giving cross" went into captivity. Next Egypt was conquered, and Asia Minor swept as far as Chalcedon. Heraclius was ^{Cam-} not able to strike a counter blow till 622, when an ex- ^{pagas of} pedition towards Armenia and the Pontine territories from ^{Hera-} the Gulf of Issus restored respect for the Roman arms. His great campaigns began in the following year and carried him deep into the Persian country, often quite cut off from his base, in a way that could not have succeeded with any leader who was not a great politician as well as a great general. In the first year of these campaigns he destroyed one of the holiest of Persian shrines, the fire-temple of Ganj'ak, near Lake Urmīyah, and so

² Shīrīn and the king even took part in the quarrels of Nestorians and Monophysites, and foolishly took the side of the latter, who were the minority and less Persian in sympathy. There are good contemporary Syriac records of all this which in part are still unused.

³ Land, *Anekd. Syr.* i. 15.

avenaged Jerusalem. Now we find him near the Caucasus, now in eastern Asia Minor, now again in Mesopotamia, never beaten, often victorious, but often perhaps unwitting superior forces by adroit movements. In 626 Khosrau attempted a diversion by sending his best general, Shahrbarāz, with a great force directly against Chalcedon. It was an anxious summer in Constantinople, with the Avars behind and the Persians in front, and the emperor almost lost in the depths of Asia. But in the beginning of August the Avars drew off, the Persians, who had no ships, having failed to cross the Bosphorus and effect a junction with them. Heraclius replied by drawing the *KHAZARS* (*qv*) down into Persian territory, and in 627 he ventured to strike a blow at the heart of the monarchy. The feast of 6th January 628 he celebrated in Dastagerd, which was but some three days' march from Ctesiphon, and had been Khosrau's usual residence for twenty-four years. Khosrau had died in terror, and did not deem himself safe till he and his harem were over the bridge of Ctesiphon. The capital was, of course, too strong to be carried by the small forces that the Roman had been able to lead by a rapid march from the Caucasus, and Heraclius turned swiftly before any great army could be gathered against him, and cut his way through the enemy's country back to Ganjak over the Kurdish Alps amid the snows of February and March,—an exploit almost unparalleled in the history of war.

Meantime there was revolution in Ctesiphon. Khosrau's tyranny and greed had offended high and low; his panic fight had made him contemptible, and, to crown all, his legitimate heir Kavādh and most of his brothers were pining in prison to leave the heirship open to Mardānshāh, son of Shihin, who, even in advanced years, had retained absolute command of her husband, in spite of his thousands of other wives. Certain nobles liberated Kavādh and proclaimed him king (25th February 628), and Khosrau, deserted by all, was dragged from his hiding-place and executed (29th February). Thus miserably perished a prince whose armies had covered almost the whole breadth of the Achaemenian empire. No hand was raised to help him, and the Christians, who had never forgiven the insult to the true cross, were the first to welcome the elevation of the parricide Kavādh, in which, indeed, one of their own number, Shamāz, son of the farmer-general Yazdin, had a leading part.

The first act of Kavādh II. Shérōe was to murder some eighteen brothers, his second to ask peace from the Romans. A truce was conceded, but Heraclius was too much master of the situation to agree to a final peace at once. Persian troops were recalled from Roman soil, but, when Heraclius, after a hasty reorganization of Mesopotamia, had gone on to Syria, he learned that the Persian king was already dead after a reign of but six months, in which the chief occurrence was a terrible pestilence.

Anarchy. Ardāshir III., son of Kavādh, was now crowned at the age of seven. An era of distress and trouble followed, in which children or women sat on the throne, and the nobles disputed with one another for the reality of power. The holy cross was sent back from Ctesiphon through the primate of the Nestorians, and the feast of the Elevation of the Cross still commemorates the joyful day (14th September 629) when Heraclius solemnly re-erected it in Jerusalem. The Government at Ctesiphon was powerless, the Khazars harried the empire; and it was perhaps at this time that Khosrau, son of Kavādh, and grandson of Hormizd IV., who had been brought up among the Turks, sought to make himself king in Khōrāsān, but was slain after a few months. A more dangerous pretendant was the victorious general Shahrbarāz, who met with Heraclius in June 629 at Arabissus in Cappadocia, and prob-

ably there obtained an approval of his enterprise from the 628-634. emperor, who naturally favoured the cause of disorder in Persia. Shahrbarāz took Ctesiphon with a small force aided by treason within, Ardāshir was put to death (27th April 630), and robbery, murder, and every terror raged in the royal city. But Shahrbarāz, too, fell on the 9th of June a victim to the envy of his peers and the spirit of legitimism. His body was dragged through the streets, and tradition speaks with grotesque irony of the man who sought to be king but could not, because he was not of the lawful house.

Bórān, daughter of Khosrau II., now sat for a time on the throne (till about autumn 631), and appears to have closed the treaty of peace with Heraclius. The conditions are not recorded, but were probably the same as in the peace with Maurice; at all events the Persians kept Nisibis. Bórān was followed in Ctesiphon by her sister Azarmidokht, probably after a short interval in which a certain Pátōz reigned. But in Nisibis the soldiery of the slain Shahrbarāz put forward Hormizd V., a grandson of Khosrau II., and he maintained himself in that quarter for a time (631-32). Azarmidokht was dethroned by Rustam, the powerful hereditary marshal of Khōrāsān, whose father's death she had procured. Our confused records of this age of disorder do not permit us to give a clear chronological or geographical view of all pretenders who arose in the capital and provinces; but in Ctesiphon, we know, there reigned for a time a certain Ferukhshādh (or Khorezādh) Khosrau, apparently a child.¹ But another child, Yazdegerd III., son of Shahrhyār, and so a grandson of Yazdegerd III., was put forward by certain nobles in Persia, and crowned in the fire-temple of Ardāshir (second half of 632 or first half of 633). Soon Khosrau was slain and Yazdegerd acknowledged in the capital, and without much resistance in the provinces also.

Fond hopes could now be entertained that the wounds of the monarchy might be healed under a legitimate prince unstained by descent from the parricide Shérōe, consecrated in the cradle of the monarchy, and upheld by the strong hand of Rustam. Some temporary recovery seems actually to have taken place, but a new foe more dangerous than Julian or Heraclius was already knocking at the gates of the monarchy. That Yemen and some tracts in north Arabia had already been lost by Persia to the Moslems had scarcely been observed at Ctesiphon amidst so many greater disasters. But now the Moslems already hovered on the frontier. Mothannā, one of the boldest leaders of those Bedouins who since Dhī Kār had made frequent forays on Persian soil, accepted Islām, and had his strength at his back. These attacks became bolder and bolder. Presently Khālid, in all the prestige of his victory Moslem over the revolt of the Arabs against Islām (see vol. xvi. p. invasion. 562), appeared with a small force on the lower Euphrates to take the lead of these Bedouins. Persian troops and their Arab allies were repeatedly beaten in small engagements, and soon a number of frontier-posts were in the hands of the Moslems.² The inhabitants of the western bank of the lower Euphrates, who were all Christians and had little attachment to Persia, submitted themselves and promised to supply the victors with intelligence. Soon the Arabs ventured to cross the river and plunder the villages west of the Tigris.³ In the early summer of 634, however, Khālid was called away to Syria; his successor, Abū 'Obaid of Tāif, though strengthened by reinforce-

¹ He appears baseless on his only known coin. By some accounts he was the only son of Khosrau II. who had escaped massacre.

² The history of the conquest is here given mainly after Baladhori, whose short notices stand examination much better than Tabari and the historians who follow him. The chronology is in many points uncertain.

³ Baghdād, then such a village, was plundered on a fair tide.

ments, was utterly defeated and slain on his first meeting with a regular Persian host in the hard-fought "battle of the bridge" at the Euphrates; and Mothamán had great difficulty in saving the remains of the army (26th November 634). Not without hesitation the caliph 'Omair resolved to send a greater force to Irak, calling on his Arabs to win for themselves the treasures of the Khosrans and parthians; and now for the first time a considerable Persian army was defeated at Bowab (635 or 636), with the loss of its general, a prince of the house of Mihrán. In Sa'd ibn Abi Waqqás the Moslems had now an energetic and cautious leader, and the Persian court began to see its danger, especially when the news arrived of the battle of Yarmúk, by which Syria was lost to Heraclius. Rustam in person placed himself at the head of a great army, over which, in sign of the gravity of the enterprise, was borne the venerable sacred banner of the empire (*Arash's lányán*). Sa'd fell back before the Persian advance and posted himself at Kádisiya on the edge of the desert south or south-west of Hira, where the armies lay facing each other for months. The Arab force must have been inferior in strength, for no great army could have long held such a barren post nourished only by forays and what the caliph could send from Medina. At length, towards the close of the year 636, or in 637, battle was joined and raged for several days, Sa'd giving orders to his men in spite of a sickness under which he laboured. The Persians were better armed, but the Arabs fought with desperate energy. The elephants, which formed part of every regular Persian army, greatly terrified them at first, but ultimately these huge beasts, getting out of command, only added the discomfiture of the Persians. Of the mass of a Persian host no great bravery was to be expected; yet it was only after a hard fight that the victory was decided, Rustam slain, and the sacred banner taken.

The battle of Kádisiya virtually decided the fate of the Tigris valley, but there was still some fighting on the plains of Babylonia, at Birs (Borsippa), and Seleucia was not taken without a lengthy siege. Then the Arabs crossed the Tigris and fell on Ctesiphon, Yazdegerd fleeing before them to Holwán on the Medo-Babylonian frontier. At Jalklá on the road to Holwán the Arabs gained a fresh victory over Rustam's brother, Khosroéddi, and Yazdegerd continued his flight. Meantime another body of Arabs had occupied Lower Irak and entered Susiana. A strong and wise leader might still perhaps have saved Irak proper, and 'Omair, as energetic as cautious, was in fact slow to allow his armies to assail the highlands. It was not till some time between 640 and 642 that the

"victory of victories," as the Arabs rightly call it, was gained at Nehávend (a little south of the old high road from Babylon to Ecbatana), and the last great army of the Persians was shattered by No'mán, who fell on the Overfield, and the Meccan Hódhafia. Even now many mid-throw of the empire
vidual provinces and cities did not yield without stubborn resistance, and in many places rebellion after rebellion had to be crushed, especially in the region around Istakhr, the cradle and sacred hearth of the fallen monarchy. Everywhere the great local barons and even the lesser nobility dealt with the Arabs as independent chiefs, and in many cases came to peaceful terms with them.

Yazdegerd fled from one to another of his lieutenants without venturing himself to strike a blow for his crown and his life. He still retained the forms of sovereignty, and coins were still struck in his name; but one host after another dismissed him as a burdensome guest, and at length he was miserably murdered in the remote district of Merv, not, it would appear, without the connivance of Máhóé, governor of that province (651 or 652).

The great similarity in the ends of the Achemenian and Sásánian empires is no mere accident, but significant of the internal resemblance between the two. Gracius which showed the reality of the danger, Issus which lost Darius his western provinces, Gaugamela which broke up the monarchy and yet did not at once give possession of the several lands of the realm, have then parallels a thousand years later at Bowab, Kádisiya, and Nehávend. The flight of Darius to the furthest north-east, and his death by the hand of traitors, not of the foe, are repeated in the fate of Yazdegerd, who resembles Darius also in his lack of heroism. The nobles showed more loyalty and patriotism against the tyrant than against Alexander, and indeed religious sympathy and the barbarism of the Arabs made it less easy in the later case for a Persian to accept the foreign yoke; yet even now there was too many traitors and deserters among the nobles high and low. Fully to subdue the Persian monarchy cost the Arabs a much longer time than it had cost the Macedonians, but the conquest went far deeper.—Hellenism never touched more than the surface of Persian life, but Irak was penetrated to the core by Arabic religion and Arabian ways. See MOHAMMEDANISM.

A fragment of the Sásánian empire lasted for a considerable time in the mountains of Tabaristán (Mázdandán), to which the hereditary generals (*Spáhpat, Spáhbedh*) of Khosráw, of the house of Káien, withdrew, and where they reigned for over a hundred years, though sometimes paying tribute to the caliphs. They remained faithful to Zoroastrianism, and apparently viewed themselves as direct successors of Yazdegerd, since the one employed on their coins seems to have his death as its epoch.

Literature.—G. Rawlinson, *The Seventh Great Oriental Monarchy* (London, 1876), is inadequate. Fuller but still inadequate use of Oriental sources is made by Spiegel, *Iranische Alterthümer*, vol. iii. (Leipzig, 1878). The documentary evidence is mostly collected in Noldeke's translation of Tabari (*Geschichte des Perser, &c.*, Leyden, 1879). For the relations of the Sásánians with Rome, Diocletian, *Iran, des Empereurs*, and Clinton, *Parsi Remains*, must be used, and Saint-Martin's notes to Le Beau, *Iran des Suptes* (Paris, 1828-30), are still useful. A great deal of miscellaneous material is to be found in Hoffmann's translation of excerpts from the Syriac Acts of Pagan Martyrs (*Syrische Akten Persischer Märtyrer*, Leipzig, 1880).

(THE N.)

PART II.—MODERN PERSIA.

SECTION I.—GEOGRAPHY AND STATISTICS.

Plate
VIII.

LONG prior to the Christian era the satrapies of Cyrus comprehended roughly an immense range of territory, from the Mediterranean to the Indus and from the Caucasian chain and Jaxartes to the Persian Gulf and Arabian Ocean. In the 17th and 18th centuries A.D. the conquests of 'Abbás and Nádir kept up these boundaries more or less on the east, but failed to secure them on the west, and were limited to the Caucasus and Oxus on the north. Persia of the present day is not only, in the matter of geographical definition, far from the vast empire of Sacred Writ and remote history, but it is not even the less extensive, though very expansive dominion of the Safawí kings and Nádir Sháh. It may be said, however, to comprise now quite as much settled and consolidated territory as at any period of its political existence of which we can speak with the authority of intimate acquaintance

If it has less extent of land than before its latest disastrous war with Russia, there is certainly within its recognized limits less rebellion and more allegiance. And, if the true interests of Persia, considered as a living power, were only understood by her kings and ministers, she might reasonably seek to attain a state of security which would amply compensate for the loss of precarious and profitless expanse.

Boundaries.—The region of Ararat presents a good starting-point for the definition of a western and northern boundary to the kingdom of Násrú'd-Din Sháh. East of the Greater Ararat a short oblique line from the Arras to the south-west divides it from Russia. Below this begins the Perso-Turkish frontier, for the settlement of Tula, which a mixed commission was appointed in 1843. The Persian outcome of the labours of this commission, which lasted more than twenty-five years, has been rather a careful delineation of the disputed tract than the delimitation of

frontier-line.

an exact boundary, while the cession of Kotur to Persia, though part of the general question, must, if carried out at all, be looked upon as a separate result, due only to later diplomacy. The territorial claims of Turkey and Persia bear chiefly upon Kurdistan and the respective tribes which inhabit the plains and valleys of that extensive mountain region. They are founded upon the treaty of Sultan Murâd IV with Shâh Süfi in 1639, a later one of Nâdir Shâh with Sultan Mahmûd I in 1736, and one more recent still between Fâth 'Alî Shâh and Mahmûd II. In 1823,—the last two maintaining the *status quo* established by the first. But, when the Anglo-Russian commission first met, the boundary of possession fell far short of Turkish pretensions. These would have extended the pashalik of Baiyazid (Bayazid) in the province of Arrzum (Erzeroum) to a line including Makû, chief place in the district, and situated on the bank of the river of that name.¹ Farther south, again, the sultan insisted on increasing the area of the province of Van by the forcible annexation of Kotur. Such an act, after the assembly of a commission for the demarcation of the disputed frontier, was neither justified by precedent nor could it enhance the merits of the Turkish claim, and the reason alleged, that Kotur was essential to the Ottoman Government for strategic reasons—in other words, that it gave the Turk free access into his neighbour's territory—could scarcely be taken to account in the estimation of their opponents. The question was submitted on behalf of Persia to the Berlin Conference in 1878, and a special Anglo-Russian commission appointed to consider it in July 1880. The proposed cession, if accepted, would substitute for the present curve eastwards a line more direct but with a westerly inclination, whereby the fort and station of Kotur become embodied in Persian territory. This section of frontier is overlooked on the north by the mountains Bêbi Kourgi, Guêrû Beranan, and Khidhr Baba, passes through Tépé Aristan on the west to the Turkish road to Kotur, follows this road to the west for half a mile, and then turns due south between Mount Kevlik and the river Shîva Rêsh to the sources of the latter, whence it zigzags to the eastward to rejoin the general boundary-line overlooked by the Kâra Hisâr, Mîr 'Omar, Guêré-Sourava, and Guêré-Berian Mountains. Sir Henry Rawlinson saw difficulty in defining a line of frontier from Ararat to Kotur, for the country was not only intersected by ranges running in every possible direction, but it wanted a fixed population, and was, moreover, liable to the incursions of wild Kurdish tribes, who would have no respect for boundary-marks. Below Kotur, and south-west of the important Persian town of Khoi, the old line of possession inclined considerably to the westward, but Turkey claimed a more advantageous line running nearly north and south to the passes between Sûk Bulak and Rowandiz, one of which was crossed in 1875 by Thielmann, who gives an interesting account of the surrounding country. The plain of Lâhiyan on the Persian side—some 20 miles long and 20 miles broad—he describes to be at an elevation of 5650 feet, "watered by the two sources of the Little Zab, which, several miles after their junction, traverses the mountain range through a deep rent and then flows towards the Tigris." On the west of this district is the "gigantic wall of the Zagros Mountains, the frontier-line between Turkey and Persia." Hence, to the latitude of Suhmaniya, or for more than 100 miles, the Turks claimed farther than the ancient limits assigned to them, and sought to include

within the Ottoman territory the border-*fort* of Sardasht, on the left bank of the Ak-su.

Continuing the line of disputed frontier to the southward, the same difficult country still presents itself to perplex the decisions of commissioners or arbitrators, but from the warmly-contested district of Zohâb in the province of Karmanshâh up to Dizful on the Diz river the mountains may be said generally to indicate Persian and the plains Turkish territory. Idristan and Khûzistan (with Arabistan) are the frontier provinces of the shâh, and the Hamrûn Hills, with Hawzâh, Muhammah, and the east bank of the Shattu 'l-'Arab, show the Persian possessions to the head of the gulf.

The want of a determined line of demarcation between the two countries for the 700 miles from Ararat to the Shatt, or outlet into the sea of the waters of the Tigris and Euphrates, may have political advantages, but is inconvenient to the geographer and most unfavourable to the cause of order and good government. Even without the evidence of open conflict, it may be assumed that there are few inhabited sections of the strip of disputed frontier (from 20 to 40 miles in breadth) where mutual ill feeling is not the rule, and where the Turkish Sunni does not abstain from friendly association with the Persian Shî'ah. More recently attempts have been made, and apparently with success, to reconcile differences by British and Russian mediation, and a renewal of the days need not be anticipated when telegraph-posts were torn up or destroyed, lands laid waste, and villages plundered, owing to the prevalence of the old spirit of hostility. A fixed boundary would, however, in a great measure facilitate settlements of dispute, because it would more clearly make known the actual transgressors.

From the already-adverted-to point on the Arras east of the Greater Arrat the river itself supplies a northern boundary to Persia up to the fortress of 'Abbasabad, where a cession of strategical works to Russia is noted by a loop on the southern bank. Thence the line is generally marked by the bed of the Arras for a distance of about 180 miles, descending as low as 38° 50' N. lat. and rising again to 39° 30' north-east of the steppe of Mogan. An oblique line running south-east to the Bulguru Châi makes that stream the southern boundary for 13 miles to the confluence of the Adina Bazâr and Sairkamish, the former of which then limits the Persian territory on the east. From the source of the Adina Bazâr the crest of the mountains towering over the more distant Russian ports on the western shores of the Caspian, and separating the Talish from the Arâha, marks the division of the two territories up to the river of Astara, the port of which name completes the demarcation on the sea-coast. Thus far the result of the treaty of Turk-mânchâi, dated 10 [22] February 1828, which involved Persia in a serious loss. To the southward all is Persian, and the two large maritime provinces of Gilân and Mazandaran, both laved by the waters of the Caspian, represent the northernmost parts of the shâh's dominions between the 49th and 54th meridians of E. long. In the south-eastern corner of the Caspian the island of Ashurâda in the Bay of Astrâbâd was appropriated by Russia in 1842 as a convenient post for overawing the Türkmen (Turkomans).

Eastward of the Caspian, from the Hasan Kûli Gulf, North the line of Persian territory cannot be indicated with absolute certainty, because the Russian maps do not correspond with those prepared by the war department in England; and it need hardly be added that the former give to Russia far more land than do the others. According to Colonel Stewart, an officer for some time resident in the vicinity of the Atak, or skirt of the mountains fronting the Black Sand Desert, the line follows the Atak (Atrek) from its mouth to Shatt, where it leaves the river

¹ Under the treaty of San Stefano (3d March 1878) the old Perso-Turkish became the Perso-Russian frontier as far south as to include the post-road below Baiyazid; but the territory so taken from the Turks was restored under the later treaty of Berlin.

and passes obliquely west of the Simlun to a point within 17 miles of Kizil Arvat,¹ and then turns towards the Tekko range to Darahgiz, which district it includes in an outer curve, passing on to the Tajand at Sarakhs. The Russian official map, however, brings the line south and east of the Simlun, and otherwise impoverishes Persia to the benefit of her powerful neighbour. But the first article of the Russo-Persian treaty signed in December 1881 at Tehran (Teheeran) thus describes the situation:—

"From Chat (Shatt) the frontier-line follows in a north-easterly direction the ridges of the Sonzog Daghi and Sagun ranges, thence extending northward to the Chanderi river, reaching its bed at Chakan Kala. From this point it runs in a northerly direction to the mountains dividing the Chanderi and Simlun valleys, and extends along the ridge of these in an easterly direction, descending into the bed of the Simlun at the spot where the Ak-Agayan stream falls into it. Hence, eastward, the bed of the Simlun marks the frontier as far as the ruins of Masjid Damanaah, where a local road forms the boundary to the ridge of the Kopet Daghi, along which the frontier extends, south-eastward, turning south among the mountain heights, which divide the valley of the Simlun from the source of the Gumbab. Taking a south-easterly course across the summit of the Misano and Chibest Mountains, it then strikes the road between Gumbab and Ribhat at a distance of less than a mile north of the latter, and, following a high ridge, proceeds in a north-easterly direction to the boundaries of Gink Khat. Hence, after crossing the gorge of the river Fuzai, it turns south-east till it reaches the summits of the mountain range, bounding the valley on the south, through which the road from the Russian station of Askabad to Fuzai passes, and pursues its course along the crest of these mountains to the most easterly part of the range. The frontier-line now crosses over to the northernmost summit of the Aselm range, whence it seeks out the junction of the mountains called Zui Kuh and Kizil Daghi, extending south-eastward along the summit of the former until it issues into the valley of the Baba Durmaz stream. It then takes a northerly direction and reaches the oasis at the road from Gavaras to Latifabad, leaving the fortress of Baba Durmaz to the east."

The distance from Baba Durmaz to Sarakhs is about 185 miles, and the intervening boundary is that of the Ataks of Darahgiz and Kelat, both of which districts belong to Persia. The word "atak," signifying "skirt," applies to the whole hill-country separating Persia from the Turkman desert, though these mountains and their passes and valleys are not all within the shah's present dominion. That they present a formidable barrier and remarkable geographical features may be inferred from the ascertained height of the loftier peaks, which, though inferior to those situated some 50 miles to the south, can still boast a figure varying from 5000 to 10,000 feet. In the Hazir Masjid range is one of 10,500. Adopting Rawlinson's divisions and distances, the whole Atak, or "Daman-i-Kuh," as the Persians call it, is divided into three districts: the Akhal Atak, extending for 160 miles, from Kizil Arvat to Darahgiz, the last Turkman camp (*obah*) in which is at Gawars; the Darahgiz Atak, 70 miles, to Abverd; and the Kelat Atak, 60 miles, to Mehna. Thence to Sarakhs another 70 miles may be reckoned, to accomplish which the traveller leaves the mountains on his right and the wonderful natural fortress of Kelat-i-Nadrin in his rear, to strike the Tajand at the crossing point between Merv and Mashhad (Meshed).

The subjection by Russia of the Turkman tribes and the planting of her standard in the hill-country on the western side of the Atak have immensely strengthened her power in the region east of the Caspian. These new Cosacks of the Black Sand Desert will be a great acquisition to her force, though their antecedents denote propensities rather aggressive than protective. In one respect the Persians should be gainers by the encroachment. It is hardly probable that under the new arrangements in the Atak the north-east frontier of Persia will be so frequently the scene of plunder and invasion as it has been of old, or that the marauders will be allowed by the Russian con-

querors to continue the unchecked exercise of their infamous profession in Khurasan (Khorasan).

Special mention of Sarakhs, the extreme outpost of Persia,

Persia in the north-east, appears to be appropriate, both on account of its geographical position and of its political importance. This place, situated on the plain of the same name,² was fifty years ago a mere outpost of Mazduran, the frontier hill-station on the shortest of three roads (and somewhat more than midway) between Mashhad the capital of Khurasan and Sarakhs. It was visited in 1860 by M. de Bloqueville, who found there a recently constructed Persian fort, with strong walls and protected by a ditch. Some of the towers contained as many as ten guns. He says nothing of the ruins of the old town on the east of the Tajand, though he forded the river, but Burnes, who in 1833 put up in a ruined tomb amid the Turkman tents or "khargahs" in that particular locality, had been equally silent regarding it. The last-named traveller speaks of the shrine of a Muhammadan saint, of a small weak fort, and of a few mud-houses only, and states that, at the third mile after leaving his encampment to enter Persia, he crossed the Tajand,—not supposing it, however, to be the Herat river. Sir Charles Macgregor was at Nov Sarakhs in 1879. He describes the fort as immense,—an irregular polygon, with eleven bastions, and citadel attached. It had a garrison of some 700 infantry, with a few horse-men, and eleven guns of more or less use. From its walls he reviewed the surrounding country. On the north stretched one vast plain almost unbroken by trees, bush, mound, or undulations, for the bed of the Tajand winding round to the north-west was too low to be visible. On the north-east lay the road to Merv stretched out beyond the dark tamarisk foliage of the river. To the east all was clear; south-east were undulating rounded ridges extending towards the Murgab; south was Mazduran; and north of west was a confused mass of rugged hills in the direction of Kelat-i-Nadrin. Lastly, we have the testimony of Lessar, the Russian engineer, who, visiting the place in 1882, found it extensively fortified and occupied by a battalion of Persian infantry, the armament of the fortification, however, consisted only of six old guns, which were never discharged, while the artillerymen were ignorant of their duties, and neither drilled nor exercised. Water was supplied from wells inside the walls and by canal from the Tajand.³

To define the eastern boundary of Persia, the lower Eastern course of the Hari Rud, under its name of Tajand, may be accepted generally up to Pul-i-Khatun, whence to Tuman. Agha the line is continued by the river in its own name. From this point it runs due south across the mountain range overtopped by the conical peak of the Sang-i-Dukhtar, and through the edge of the Salt Desert, leaving Kulsan and Zangi Suwar, villages near the Hari Rud, and the more important Ghurran in Afghan territory.⁴ Again crossing the ranges which intersect the desert from the north-east, the line, inclining somewhat to the west of south, is continued to Chah Sagak (the "dog's wall"), an elevated spot on the old caravan route between India and Persia, as far as which the Afghans have the right of pasturage. To the westward is the Persian province of Karyan. The surrounding country bears the significant name of Dashti-Na-Umaid, or "Waste of Hopelessness." For 8 miles south-east, 8 miles due east, and 24 miles south, in all about 40 miles, the line is carried to the

¹ West of the Tajand, called by Dr Wolff the "Darya" (or sea) of Sarakhs.

² Other modern travellers have written of Sarakhs, among them an intelligent Indian, Daddi Khan, but they give no information additional to that of the authorities quoted.

³ When Mr Forster was at Khaf in 1788, Timur Shah, the ruler in Afghanistan, had his boundary between that place and Tushuz.

⁴ Probably a plural or perversion of *rud*, a caravan-road.

Siyāh Kuh, or "Black Hill," on the border of the district of Nehbandan. Here begins the line of frontier determined by the Sīstān arbitration of 1872. The British commissioner (Sir F. Goldsmid) decided that an oblique line drawn from the Siyāh Kuh to the southern limit of the reedy marsh called "Nāzār," and prolonged to the main outlet of the Helmand, would fairly separate and distinguish the possessions of the two states respectively in the north of Sīstān. On the east the bed of the Helmand itself would be the boundary up to Kuhak, where was the large "band" or dam which diverted the waters of the river into the more fertile lands to the west. From Kuhak a line south-west to the Kuh Malik Siyāh completed the delimitation by leaving the two banks of the Helmand in the hands of the Afghans, and placing a large tract of partly desert and partly inundated country between the litigants. Subsequent surveys by Sir Charles Macgregor have thrown new light upon the large and little-populated tract to the far south of Sīstān, and are suggestive of an Afghan-Baluch as well as of a Perso-Afghan frontier.

In whatever light it is regarded, the line of Persian frontier from the Kuh Malik Siyāh to the sea rather concerns Baluchistan than Afghanistan, but, though roughly delineated by St John and Macgregor, it cannot be described with scientific accuracy until it reaches the district of Jalk, or after a south-easterly passage of 170 miles through the deserts of Pir Kassar and the Māshkel or Māshkid, — names used as the more likely to identify the region traversed. From Jalk the Perso-Kelat boundary begins, as determined by Major-General Goldsmid, the British commissioner in 1871, and verified in the subsequent year by Captain (now Sir Oliver) St John, R.E. The state of Kelat (Khelat), it should be explained, is now that of western Baluchistan, the western half of that country having become annexed to Persia by a process of gradual encroachment. It was this action of Persia, and the disquiet and mischief which it occasioned in Makran and other parts of Baluch and Brahui territory, that brought about the British mediation.

From Jalk to the sea is about 150 miles as the crow flies. By the line laid down it is very much farther, as the nature of the country and of the claims of the contending parties did not admit of other than a tortuous course. The small district of Kuhak, lying south-east of Jalk, should, in a geographical sense, have been included among the lands on the Persian side, but the evidence of right and possession was insufficient to warrant its separation from Kelat, and, whatever may have been its subsequent fate, it was not made over to the shāh's governors by the original decision, which was expressed in the following terms:—

"The territory of Kelat is bounded to the west by the large Persian district of Dizak, composed of many dells or minor districts, those on the frontier being Jalk and Kalagūn. Below these two last-named is Kuhak, including Kūnābasta and Isfandā. This small tract did not belong to the Māshkurāns, and as its chief pays no tribute, cannot be included among the conquests of Persia. It therefore remains as a tract of country within the Kelat frontier. Adjoining Kuhak to the east is the district of Pangūr, with Pūm and other dependencies, which are in the possession of Kelat; while on the Persian side Bāmpūsh is the frontier possession. Below Pangūr the frontier possessions of Kelat to the sea are Bulāid, including Zamrīn and other dependencies, Mand, and Daht. Within the Persian line of frontier are the villages or tracts belonging to Sabāb and Bahu Dahtār. The boundary of Dahtār is marked by a line drawn through the Drabul hill, situated between the rivers Bahu and Daht, to the sea, in the bay of Gwātār."

The boundaries of the frontier districts or village-lands named are well known, and may be distinguished by mountains, hills, hillocks, rivers, streams, or cultivation. In some places desert tracts occur which can offer no inducement for encroachment on either side, but through which a line may at any time be declared, if necessary, both by geographical computation and the erection of pillars.

The frontiers of Persia on the west, north, and east have now been described. The southern, or more strictly the south-western merging into the southern boundary, is the coast-line of the Persian Gulf and Arabian Ocean. This extends from the Khor Abūllūh west to the port of Gwātār east, and may be held to be composed between the meridians 49° and 61° 30' E. long. It will be observed that the Caspian Sea boundary, on the immediate north of Persia, is only two-fifths of this extent. On the Persian shores of the gulf are the ports of Bushahr (Bushire), Lūngah, and Bandar-Abbās, with the islands of Karag, Shaikh Sh'ab, Hindarāla, Kās, Kūshm, Hangām, Hōmūz (Ormuz), and Larāk, of which the last four are habitually held in lease by the imām of Maskāt (Muscat). On the Perso-Baluch coast are the telegraph stations of Jask and the quasi-ports of Chāh-bāi (or Chahbār) and Gwātār. In some parts of the generally dry and barren coast are ranges of rugged mountains, sometimes rising to a very considerable height.

Physical Geography—Major (now Sir Oliver) St John, R.E., is perhaps the latest recognized authority on the physical characteristics of the large extent of country comprised within the boundaries just described. He has himself surveyed or travelled over no insignificant portion, and has carefully studied the labours of his colleagues and predecessors in a similar field. In the following adaptation of that officer's account of its orography and hydrography attention has been given to the results of independent observation, as well as to those theories put forward by other travellers which seem to merit acceptance.

Persia—that is, modern Persia—occupies the western and larger half of the great Iranian plateau which, rising to a height of from 4000 to 8000 feet between the valleys of the Indus and Tigris, covers in round numbers more than a million square miles. Taking the Kuren Dagh and Kopet Dagh to form the northern scarp of this plateau east of the Caspian, we find a prolongation of it in the highlands north of the political frontier on the Arras, and even in the Caucasus itself. In St John's own words—"The Caucasian provinces of Russia are but an exerescence of the great elevated mass to the south-east, differing from it only in characteristics produced by the more bounteous rainfall which has scooped out the valleys to a greater depth." On the north-west Persia is united by the highlands of Armenia to the mountains of Asia Minor; on the north-east the Paropamisus and Hindu Kush connect it with the Himalayas of ancient India. The lines of boundary on the western and eastern faces are to be traced amid high ranges of mountains broken here and there by deserts and valleys. These ranges lie for the most part north-west and south-east, as do those in the interior, with a marked exception between Tehran (Teheran) and Būjīnūd, and in the more recently acquired territory of Baluchistan, where they lie rather north-east and south-west, or, in the latter case, sometimes east and west. The real lowlands are the tracts near the sea-coast belonging to the forested provinces of the Caspian in the north and the shores of the Persian Gulf below Basrah and elsewhere.

With regard to the elevation of the Persian mountains, Memoir of the Russian Caspian survey gives to the highest, Damāvand, 18,600 feet, and to Mount Savalan in Adarbaijan (Azerbaijan) 14,000. St John estimates the Kuh Hasār and summits of the Jamal Bāzīr in the province of Karman (Kirman) at a greater figure than the last, but he believes the chain of the Kuh Dīnār—snow-clad mountains in Fārs, visible from the sea at a distance of 190 miles, and over ranges known to be 10,000 feet high—to present the highest continuous range in Persia. To the Kūrt range, between Isfahan and Kashan, he gives an elevation of above 11,000 feet, and notes the absence of prominent spurs in all ranges

except the Alburz (Elburz), and to a lesser extent in the Khurāsān hills.

Plains.

The Khūzistan delta is cited as the only plain of extent and importance at sea-level. In the north-west, that part of the Moghan steppe which belongs to Persia and the delta of the Safid Rūd are large and fertile tracts. St John writes —

"Inland the long and narrow plains between the ridges rise gradually from 1000 feet to eight times that height in the valleys between the ridges on the east side of the western water-parting, and 4, 6, and 6000 father south and east. The plains of Isfahān, Shīrās, and Fāsepolā are about 5000 feet, that of Karmān somewhat higher. The valleys of Aīā-bayān present alluvial slopes favoured by torrents, and the only extensive tableland in Persia, that of Sultānah

"As they recede from the east and north, the intervals between the ridges are wider, and the rainfall smaller, till grassy valleys are replaced by gravelly deserts, which culminate in wastes of shifting sand. The valley between Abūkhā and Yazd, a prolongation of the Zāindān valley, contains the first of these sandy wastes, which, under the influence of the strong south-easterly winds, occasionally invade the neighbouring cultivated tracts. The original city of Khāges, south-east of Fēlādā, is said to have been abandoned on this account."

River drainage

Estimating the extent of Persia proper at 610,000 square miles, St John thus distributes the drainage. — (1) into the Arabian Sea and Persian Gulf, 130,000; (2) into the Caspian and Aral Seas, 100,000; (3) into the Sistan Lake, 40,000; (4) into the large lake of Ūrmiya or Ūrūmīyah, 30,000; (5) interior drainage, 320,000. No. (1) comprises the south-west provinces and the whole of the coast-region up to the small port of Gwatar in Baluchistan; (3) relates to the tracts south, south-west, and south-east of the Caspian; (3) is the tract adjudicated to Persia, including the Hāmān and part of the Helmand basin, (4) is a comparatively small area on the western frontier containing the basin of Lake Ūrmiya, shut off from the rest of the inland draining of Persia, (5) takes in Isfahan, Karman, and the province of Khurāsān, with the Dasht-i-Kavir, or "Great Salt Desert." He points out that the area draining into the ocean consists of a long strip nearly parallel to the Tigris and sea-coast without a single protrusion inland, but is uncertain whether an outlet exists from the Bampur plain in Persian Baluchistan to the sea. A later traveller, Floyer, mentions the names of two rivers debouching on the coast, namely the Sadaich and Gabrig, which might represent such outlets, but their courses have not been traced with sufficient completeness to supply a solution to the problem. If the native evidence taken by Major Goldsmid at Fanooh in 1866 can be relied on, the river entering the pass of that name from the highlands of Bampur, after undergoing two or three changes of nomenclature, passes out into the ocean as the Kābū.

Caspian basin.

According to St John, a narrow strip of land, not more than 30 to 50 miles wide, along the southern coast of the Caspian, drains into that sea. On the west it suddenly widens out to a depth of 250 miles, meeting the watershed of the Tigris on the one side and that of the Euphrates and Lake Van on the other, and embracing between the two the basin of Lake Ūrmiya, which forms with the basin of Lake Van what may be termed the supplementary plateau of Armenia, differing only from the Persian and Helmand basins in its superior altitude and smaller area. On the east the watershed of the Caspian gradually increases in breadth, the foot of the scarp extending considerably to the north of the south-east angle of that sea, three degrees east of which it turns to the south-east, parallel to the axis of the Kuren and Kopet ranges, which, as before stated, are a prolongation of the Caucasus. A little short of Herat the Caspian water-parting turns eastward, separating the valleys of the Hari Rūd and Hārīt rivers. West of Herat the desert plateau of Khāf divides the Caspian from the Helmand basin.

The three rivers belonging essentially to Persia, in reference to the Caspian watershed, are the Kizil Ūzan or Safid Rūd on the south-west, and the Atrak and Gurgan at the south-eastern corner of that inland sea. The first is stated by St John to drain about 25,000 square miles of country east and south of the Ūrmiya basin. According to Colonel Stewart, the Atrak has its source in the Hazār Masjīd range of mountains, a distance, probably, of 250 miles as the crow flies, from the river mouth. The Gurgan rises to the west of it and passes to the sea south of the Atrak. Observing that the Tajand, taking a sweep round Sarakhs, forms a swamp in the Atak about the 58th meridian, the same authority explains that as far south as 30° N. lat —

"the eastern slopes of the ranges which shut off the valley of the Helmand from the deserts of eastern Persia drain directly towards the Sistan Lake. South of that parallel the surplus water flows by several channels in a south-easterly direction, or away from the lake. About latitude 28°, the water-parting of the Baluchistan mountain-system, running east and west, changes the direction of these streams, and collects them into a single channel, which, under the name of the Mashkīd river, bursts through the northern scarp of the Baluch hills into the Khāfān desert. Here it takes a north-westerly course, thus reversing the original direction of its waters, which are lost in the desert not far from their most northern sources. It is very probable that these, finding a subterranean channel some distance farther to the north, aid to fill the Zereh swamp, the southern of the three depressions which, united by flood-waters, form the Hāmān or Sista Lake."

The great central area of Persia, included in the watersheds he has described, "forms a figure nearly triangular, with a base running south-west about 1000 miles long, and nearly equal sides north and east of 700 miles."

St John observes that the streams draining southern Streams and western Persia into the sea diminish regularly in im- of west and south. portance from north-west to south-east. He notes the Diyālāh and Karkhāh flowing into the Tigris from the mountains of Kurdistan; the Diz and Kārūn, which unite below Shīstār (Shuster), and reach the Shattū l-'Arab at Muhamrah; and the Jarāhi and Tāb, which with the Kārūn form "the delta of Persian Arabistan, the most extensive and fertile plain in Persia." After these he lays stress upon the fact that not a single stream unfordable at all seasons bars the passage of the traveller along the coast till he reaches the Indus. Those rising amid the high mountains north of Bushahr and Bandar-'Abbās are, with the exception of the Mīra, which debouches at 60 miles below Bushahr, nameless in the most trustworthy maps; and in Persian Baluchistan we have the Jagīn, Gabrig, Sadaich, Rābū, Kair, and Kāju.

The Kārūn merits especial notice as a navigable river for small steamers up to within a mile or two of Shīstār, though not favourably to the establishment of a regular service, owing to the existence of rapids at Ahvaz. By land there are perhaps somewhat more than 100 miles from Muhamrah to Shīstār; and Colonel Champain, an excellent authority, states that from Shīstār to Isfahan the distance is as nearly as possible the same as from Shīstār to Isfahan, the high road for ordinary travellers passing to and fro between Tehran and the sea-coast. Little need be said on the streams having no outlet to the sea, the water of which is utilized by cultivators both before they reach the alluvial plain between the ranges and afterwards in irrigating the banks. Referring to these St John notes the constant affluents which prevent the rapid exhaustion of water, and the salt swamps or lakes formed by the rivers at points far removed from their source. Six of these inland streams he mentions by name, viz, the Ājī Chāi and Jaghatū, flowing into the salt-lake of Ūrmiya; the Hamadan Rūd or Kāra Sū and the Shīstār, flowing eastwards to the Salt Desert; the Zāinda Rūd, a river of Isfahan, lost in an unexplored swamp; and the Kūr or Bandamir, which forms the salt-lake of Nīrā. He sees

cause for believing the lakes of Shīrāz and Kāzrūn to be fed mainly by springs.

St John writes further:—

Rainfall
and
winds.

"It will be readily believed that the rainfall on the Oceanic and Caspian watersheds is far in excess of that on the interior. Wherever the water-parting is formed, as it is in most parts, by a lofty mountain ridge, it intercepts the moisture-bearing clouds from the sea which are discharged from its outer slopes. The Alburz chain, which shuts off the plateau from the Caspian, may be taken as the typical instance of this. Its northern face is funneled into deep valleys by the constant and heavy showers which have clothed them in forests of almost tropical luxuriance, while the southern generally presents a single abrupt scarp, rising above long gravel slopes, unchanneled by anything worthy the name of a river, and bare of any vegetation rising to the dignity of a tree. At the most moderate estimate the rainfall of Gilān and Mazandārān may be taken as five times that of the adjoining districts across the ridges to the south.

"In other parts, however, we find the water-parting considerably below the level of the summits farther inland; and here the interior has a more piteous rainfall than the coast. This is particularly the case in south-eastern Persia, where the Khurāsān, Sarhad, and Dīzāk hills, far exceeding in altitude the ranges to the south, attract to themselves the major portion of the scanty supply of moisture borne inland from the sea. Again the rainfall differs very much in the parts of the country, under apparently similar conditions as regards mountains and distance from the sea; the east and south being far drier than the north and west, while the dampest parts of the Tigris valley have not half the rainfall of the southern and south-eastern shores of the Caspian.

"Two palpable causes unite to produce the prevailing winds throughout Persia and the Persian Gulf. These are, with an extraordinary uniformity, north-west or south-east. The first cause is the position of the Black Sea and Mediterranean on the north-west, and of the Arabian Sea on the south-east. The second is the bearing of the axes of the great mountain chains, which lie mainly in the same direction, and thus tend to guide the currents of air in a uniform course. The south-west, moreover, is not felt, except as moderating the temperature of the Makrān coast inside a line from Ras-al-Hadd, south of Muskat, to Karachi.

"The effect of the sun on the great Iranian plateau is to produce a heated stratum of air, which, when it rises, is succeeded by a current from the colder atmospheres above the seas to the south-east or north-west. Naturally the latter is the colder, and therefore, as might be expected, north-west winds are most prevalent. But in southern Persia and the gulf it often occurs that the two currents meet, and that a north-westerly gale is raging at Bushahr while a south-easter is blowing at Bandar-Abbas. This latter wind is the rain-bearer throughout the greater part of Persia, the exception being the north-west, where occasional rain-clouds from the Black Sea and the Caspian find their way across the Kurdish mountains or the Alburz. It is true that it often rains even on the gulf during a north-wester, but only when this has followed a succession of south-easterly gales, the moisture borne by which is returned from the opposite quarter."

There are no sufficient statistics available accurately to estimate the rainfall in Persia, but St John, himself a resident of some years in the country, was of opinion that in no part of it excepting the watersheds of the Caspian and Persian Gulf (north of 28° lat.) and their immediate reverse slopes, with perhaps the Urmīya basin, is there an average of 10 inches, taking mountain and hill together. He believed that throughout the greater part of central and south-eastern Persia and Baluchistan the annual rainfall could not be much more than five inches, and that, were it not for the snow stored on the lofty hills, nine-tenths of the country would be the arid desert which one-half was found to be when he wrote (1876). Cultivation is carried on mainly by artificial irrigation, the most approved arrangement being an underground tunnel called "kanāt," whereby wells are connected and supplies of water ensured.

Kavirs.

One remarkable feature in the plains of Persia which naturally engaged St John's attention was the salt-swamp called "kavir." He applied the term to those bogs of silty mud found in the lowest depressions of the alluvial soil, where the supply of water, though constant, was insufficient to form a lake. In winter they are covered with brine, and in summer with a thick crust of salt. The principal kavir is that in Khurāsān, and marked in the maps as the Great Salt Desert. St John describes

it as "the eastern part of what is probably the most extensive plain in Persia, that intercepted between the Alburz and its parallel ridges on the one hand and the heads of the ranges of the central plateau which run south-east on the other. Westward, it is divided into two valleys, originating, one in the Sultānīah plateau, and the other north of and near Hamadan. These are drained by rivers named respectively the Shīrāb and the Kāra Sū, which, with another considerable affluent from Tūrsīz, on the east, unite to form the great *kavir*." He was unable to determine the altitude of this extensive swamp further than that it might be below the level of the sea, but could not be much above it.

Other kavirs he finds in the Sarjan or Sayidābād plain west of Karman and in the neighbouring valley of Kūtrī. Among ordinary kavirs, which are "innumerable," he considers the largest to be on the south of Khāf, and the best known that north of Kūm.

It is clear, from the description given, that the range of these particular salt-swamps or kavirs is connected with the actual depression which has been directly affected by the passage of water, and that the term is not intended to apply to the surrounding wastes. But it seems to have been otherwise understood by the generality of travellers, and the better-known writers on Persia have seldom made the actual distinction here implied. Malcolm in 1800 crossed a "salt-desert" between Pul-i-Dallak and Hanz-i-Sultan, which, he says, was called *Dariya-i-Kabir*, or "the great sea." Mofer, nine years later, calls the place the "swamp of *kavir*," a part of the great desert which reaches unto Khurāsān, the soil of which is composed of a mixture (at least equal) of salt and earth. Colonel Johnson, passing over precisely the same road in 1817, describes it as leading "over a saline plain, leaving here and there hollows of considerable magnitude, white with salt; . . . eastward it stretches as far as the eye can see, and is said to reach to Manāsh, distant 40 miles." The writer would probably have been surprised to learn that it extended for at least ten times the distance named. He does not, however, use the word "kavir," which, while duly recorded as a Persian word in the dictionary, meaning salinus ground, is strangely like the Arabic adjective "kabīr," which Malcolm, as just mentioned, has coupled with "*dariya*" in his *Sketches of Persia*. St John states that in the south the salt-swamps are called "*kafsh*."

The last writer asserts that but one European, Dr Buhsh, a Russian, had seen the true kavir, having crossed it in about 84° lat., when going from Damghan to Yazd. Sir Charles Maegregor must have been close upon this traveller's track in 1875, for in the district of Biabānak (the "little desert"), which he visited, one of the eight villages, Jandak, is marked in St John's map as an oasis just above the parallel mentioned. Biabānak is, according to Maegregor, situated "south of the *kavir*, but it is joined to Semnan (on the Tehran-Mashhad highway) by a "regular road" which "crosses a bit of *kavir* of about 80 miles without water."

The drier deserts of Karman and Bampur cannot be included in the category of swamps; and the term "lūt," made use of by the Russian geographer Khanikoff in reference to the former, whatever its original derivation, must simply be accepted as the common local expression, in eastern Persia and western Baluchistan, for a waste waterless tract.

Geology.—Mr W. T. Blanford has given us an interest-geology. ing sketch of the geology of Persia. He found that by far the greater number of those who had treated the same subject before him had restricted their inquiries to the north-western provinces, and that few had penetrated east of Damāvand or south of Tehran. Mr Loftus had imparted a fair knowledge of western Persia, and Russian and German explorers had made students tolerably acquainted with Adarbāijān, Gilān, and Mazandārān. Khurāsān and eastern Persia generally were, however, in a geological sense unknown, and the south was almost equally a *terra incognita*, unless exception were made for certain stray observations on the shores of the Persian Gulf. The following passages are extracted from his paper.

"The most striking circumstance noticed during a journey in Persia is the great prevalence of formations, such as gravel, sand, and clay, of apparently recent origin; the whole of the great plains, covering at least one-half the surface of the country, consist either

of a fine, pale-coloured alluvial loam, which covers the lowest portion of the alluvial, or of gravel, fine or coarse, which usually forms a long gentle slope from the surrounding hills to the alluvial flat, and fills up with long slopes the broad valleys opening into the larger plains. All these deposits are more conspicuous than they are in most countries, in consequence of the paucity of vegetation and the absence of cultivation throughout the greater part of the surface. Nor is this prevalence of recent or sub-recent detrital accumulations confined to the plains, for the slopes of the hills up to a considerable elevation are in some cases composed of similar unconsolidated formations, from which only occasional peaks of solid rock emerge. This, however, is by no means universally the case, many ranges consisting entirely of rock. Again, the descent in Baluchistan from the plateau to the sea coast is over broad terraced-like flats of gravel and sand, separated from each other by ranges of hills running parallel to the coast-line.

"The mountains and hill-ranges of Persia comprise a considerable variety of geological formations, a few of which, however, prevail over large areas of country. So far as our knowledge at present extends, the great mass of the Zagros chain (the term being used in the widest sense for the whole mountain-range from Mount Ararat to Shiraz, together with the numerous parallel ranges north-east of the main chain) consists of cretaceous (luppuritic) and tertiary formations, the former constituting the north-east half of the range and its slope towards the central plain of Persia, whilst the nummulitic and later formations prevail almost exclusively on the south-west water-shed overlooking the Tigris valley. Older rocks occur, but they are not numerous, and it is not probable, I hold to Mr. Loftus and myself, that part at least of the altered rocks which form no inconsiderable portion of the range to the north-east is very probably of cretaceous origin. Old granite rocks, however, form a great band, extending from Lake Urmiah to a point nearly due west of Isfahan, and the same crystalline masses appear in the ranges between Isfahan and Káshán."

The general direction of the Persian mountains north-west to south-east has already been noted. Speaking of these, Blanford says that, so far as they have been examined, "they have the same geological features as the Zagros, and consist mainly in the main of cretaceous and nummulitic rocks, the former prevailing to the north-east towards the desert, the latter to the south-west near the sea. Here, again, metamorphic rocks occur, some of them granite, others but little altered, and closely resembling in places the cretaceous beds in the Zagros. Tertiary formations also occur, and also an extensive area, and whilst some appear of very late origin, others are possibly contemporaneous with the cretaceous epoch."

Of the southern border-land of the Persian plateau he writes—"Where crossed by Major St John and myself, between Gwádar and Jalk, it consisted of low ranges running east and west, and, except near the sea, was almost entirely composed of unfossiliferous sandstones and shales, associated with a few beds of nummulitic limestone. So far as could be ascertained, these ranges appear to belong entirely to the older tertiary epoch. Here and there a few isolated masses of basaltic igneous rock have been introduced through the strata, but their occurrence is exceptional. Along the sea-coast, however, from the frontier of Sind to the Persian Gulf, and probably throughout a large portion of the north-east shores of the gulf, a new series of rock rests upon the nummulitic. This new series is easily recognized by the presence of thick beds of hardened clay or mail, it is of great thickness, and abounds in fossils, a few of which appear to be living forms, whilst others are extinct. The exact age has not been ascertained; the mineral character is very different from that described by Loftus as characteristic of the gypsiferous series, and it is therefore premature to class these beds of the Persian coast as the same as those which I have proposed the name of Alakran group, more definitely than as new tertiary. It is highly probable that they represent a portion at least of the gypsiferous series. Along the coast itself are a few mud-volcanoes."

Remaining that luppuritic limestone had not been noticed on the eastern frontier, he turns to north-western Persia, a region "widely explored by various Russian and German travellers."

There would appear, both in Baluchistan and the Alburz range, to be a greater development of older Mesozoic and Palæozoic formations than in any other parts of western or in southern Persia. From the very brief visits I was enabled to pay to the Alburz and the small area examined, I can form but an imperfect conception of the range as a whole, but the impression produced by my visits is that the geological composition of this mountain-chain presents a striking contrast to that of all other parts of Persia which I had previously seen. It presents rather the appearance of a considerable portion of this range consists of carboniferous and Devonian beds, and that Jurassic or Liassic rocks are also extensively developed. The same formations extend to Adarbadjan, but here, as well as in the eastern parts of the Alburz, cretaceous and nummulitic rocks are also found. Metamorphic (granite, &c.) exist in several places.

¹ It has since been found extensively in southern Afghanistan and around Kwatta.

whilst volcanic outcrops occupy a considerable area, and the highest mountain in Persia, Damavand, in the Alburz chain, about 80 miles east-north-east of Teheran, is a volcano which, although dormant in the historical period, is of recent formation, and still gives vent to heated gases. The volcanic masses of Ararat, Salmas, south of Tabriz, and Savalan are also, in great part at least, of geologically recent origin."

Minerals, &c.—Of the value and extent of minerals in Persia Mineral, much still remains a matter of surmise. Iron and lead are to be found, copper and coal also, but gold and silver have not yet become substantial results, and the turquoise is perhaps the only product of high price and estimation. This gem, however, is not usually procured at Nishápur, its birthplace, but should rather be sought for at Teheran or Isfahan, where it comes into the market with other curiosities. The mines are situated at the base of the hill of Sulaimanyah, lying north of Zamánabád, a village on the high-road from Mashhad to Teheran. When the Sistan mission was at Nishápur in 1872 they were farmed by the Government for 8000 "tumans" per annum, or about £3200 in English money.

In Malakm's days, though copper was held to be a choice privilege of royalty, foreign pasties and ducts were in considerable vogue. Accounts are kept in "tumans," "kráns," and "sháhs," of which the value of the first has deteriorated to 8s, the second is barely the French franc, and the third is about a halfpenny. Less than the last is called "pul-saydi," or black money. The "sháhi" and the "panahat," a silver coin worth about 5d., have for long been in common circulation. In late years the manufacture of counterfeit coins and forging the royal seal, and some other practices, that the old tough hammer-struck coinage was called in, and medals in gold and silver with milled edges were substituted. But these also were counterfeited, and a head of police was called in from Austria to endeavor to check the evil.

The Yazd marble has a watery appearance with yellowish tinge. A handsome specimen is to be seen in the tomb of Háfiz at Shiraz. There is a quarry on the road from Yazd to Káshán. The petrifactions called *Tahiz* or *Marágha* marble are found on the road between those two places.

Eastwick describes the coal obtained from the pits at Hit, in the hill-country west of Teheran, as light, brittle, glittering, and with occasional red stains. There were no large blocks visible.

Though petroleum and naphtha appear indigenous to Persia, and Floyer visited an oil-spring in Dáshkavut, the produce of which was burnt by the king at Jámás near Bam, and 'Abbás, the produce of the oil-wells at Báki has found its way to Mashhad, and meets there with a ready sale. In connexion with this circumstance, Lovett states that a great number of lamps of the most tumpsey German manufacture are imported into Káshán and sold at large profits.

Dr. Bellew, referring to the twelve divisions of the district of Nishápur, and to its 1200 villages and hamlets, mentions the report that it possesses also twelve different mines, yielding turquoise, salt, lead, copper, antimony, iron, together with marble and soap-stones. The statement needs, however, verification.

Climate.—The climate of Persia varies much according to climate to locality. In the Caspian provinces, where rain is frequent, it is hot, humid, and unhealthy for the greater part of the year. In the tablelands it is intensely cold in winter, and, though it is hot in summer, its dry clear heat is temperate in comparison with that of Sind and the Punjab. The spring and autumn are the best seasons. In the south and south-west, towards the Persian Gulf and in Baluchistan, the heat is intense throughout the summer and often in the spring and autumn. The three regions of Nearchus and the old travellers—illustrated by parching heat, sand, and barrenness in the south, a temperate climate, pastures, and cultivation in the centre, and severe cold with bare or snow-clad mountains in the north—may best be accepted as conveying a fairly accurate description of the tracts lying generally between Bushahr and Teheran; but of course there are seasons and seasons, and it may be very hot as well as very cold in the north as elsewhere. In June the traveller, starting from the former place en route to the capital (Teheran), will for more than 50 miles, or up to the bridge of Dálaki, experience a fierce heat during the day, and not always find relief in a cool night. Reaching the plateau of Kunár Takhtá, 12 miles farther, at an elevation of 1800 feet, he will not then necessarily have escaped the influence of hot winds and a thermometer ranging to 100°. Some 50 miles farther he will have felt a most agreeable change at an altitude of 7000 feet; and in another 24 miles, at Khan-i-Zanian, he will

have had every cause to be grateful for a delightful temperature. Shiraz, though some 4750 feet above sea-level, and in respect of climate so belauded by the native poets, can be hot enough in the summer, and is subject to drought, scarcity, and other contingencies of Persia.

Moutrey considers May the finest month, when the plains are fresh and green, the gardens filled with roses and nightingales, the cherries ripe, and the green almonds in vogue. Running, writing from Isfahan on the 1st of July, had not seen the thermometer higher than 87° in his room, in the morning at sunrise it was generally 70°. Sleeping, as others, on the roof of his house, he described the air to be very dry, and the nights clear and bright, the little dew which fell being so pure as to be innocuous. He expected hotter weather towards the close of the month, but a long autumn would make amends for a little heat. Many years before Juning, Mr. Jones had recorded that, from the average of 27 days, including the end of May and beginning of June, the thermometer at Isfahan at sunrise was 56°, at 2 P.M. 87°, and at 9 P.M. 67°. Sir John Malcolm remarked that this city appeared to be placed "in the happiest temperature" that Persia could boast. Lady Shelley, whose experiences were chiefly gained in Tehran, laments the "gloious weather of Persia" from "the 1st of June" to "the 1st of March" in the middle of May, but most months would perhaps prefer the autumn in the highlands of the north, as in many other parts of the country. September and October are beautiful months. The blue sky, with its tempering haze, as it were a veil of reflected snow gathered from the highest peaks and ridges of continuous mountain chains, is too exquisite a sight to be readily forgotten, and the enjoyment is all the more complete when the temperature is that of October. To those who come from India direct, or to whom an Indian heat is habitual, the change to Persia is most grateful. In the late spring, fashion moves out a few miles from Tehran to the "yalaks of Shamiran," or cooler residences near the hills, and summer rendezvous of the various foreign legations, returning in the late autumn to the precincts of the capital, which, it may be noted, have been considerably extended of late years, and are designed for yet further extension. On the 5th of June 1871 the thermometer at Tehran was at 1 A.M. at 65° and at 2 P.M. at 75°. On the two following days it was at 6 A.M. at 65° and at 2 P.M. at 80°. In February the traveller across the plains of Sulimanya, on approaching the capital from Tabriz, will sometimes experience the most bitter cold.

Bushahr and the Caspian provinces have already been mentioned, but the heat of the former place is fairly shared by other parts on the seaboard to the south,—among them, Lingah, Bandar-Abbas, and Chiribár. When the Sistan mission was at Bandar-Abbas in December 1871, malarious fevers were prevalent, and enlarged spleen was a common complaint. The average maximum temperature was then only 72° and the minimum 52°; but the summer and winter heats are in this locality extreme. More than a month later the officers of the mission slept out on the desert plains south of Sistan, and woke in the morning to find their beds and bedding covered with frost and icicles.

With reference to the Caspian provinces the consular report to the English Foreign Office for 1881 is available. Major Lovett, remarking that the "minimum isotherms passing through the north of continental Europe are deflected considerably to the south on approaching the longitude of the Caspian," calls attention to the fact that, while during the winter the northern part of that large inland sea is frozen over, farther south, at only 10° distance, the climate of Astrábad (if there be no wind from the north and the sun shine) is like that of Madeira at the same time of the year. Though the preceding cold season had been unusually severe, and heavy snow had fallen at Báki and lower down, the lowest reading of the thermometer was 25° Fahr., and the maximum during the months of December, January, and February was 52° in the shade.

The following extract from the report is interesting, as it bears on the products as well as the climate of the north of Persia.

"It must be remembered, in connexion with the influence the Caspian Sea has on the climate of its shores, that its surface is 84 feet below the level of the ocean; and, consequently, the superincumbent strata of air being denser than, *ceteris paribus*, elsewhere, is also more capable of absorbing solar heat and moisture than the air at ocean-level. This partly accounts for the mildness as well

as for the dampness of the climate. I cannot give the amount of rainfall, having no gauge, but it rained, during the 245 days of recorded observations, forty-five times, and the sky was overcast seventy times besides. This tolerable proportion of rain and cloud is doubtless due to the action of cold not rarely blasts impinging on the warm and moisture-laden air shrouding the slopes of the Elburz, and hemmed in, as it were, between them and the sky northern wind. Outlets, therefore, are set up from the central region of the southern shores of the Caspian that blow to the east and to the west. The central region is a zone of much greater rainfall than the districts more remote. The westerly current, passing over this province, has its fertilizing influence expended on reaching the Golden hills, 100 miles from the sea. The breadth and intensity of this moisture-bearing current is well marked by the gradually proportionate denseness of the vegetation extending from the sands of the Atak steppe to the mountain summits. The action of these damp winds is distinctly traceable on all portions of the mountain-ranges exposed to the sea-breeze, even by the channels afforded by the valleys of the rivers that debouch on to the Caspian. Such are densely clothed with forest of a type similar to that found in southerly temperate climates. The flora is distinctly not tropical. In addition to the trees already mentioned, I should add that wild hops and plums are to be found. In the steppe, the valleys are covered with thick excellent pasture. In the gardens and orchards of Astrábad are to be found vine, fig tree, orange tree, pomegranate, and lemon trees, and the vegetables chiefly cultivated are melons, pumpkins, marrow, lettuce, aubergines, &c., that form at their seasons food-staples for the people. Tobacco, used for manufacturing cigarettes, is also grown here on a small scale.

"The Turkman steppe lying north of Astrábad is, as far as the Atak, a waste of exceeding fertility. Wheat reproduces itself more than a hundredfold without artificial irrigation or any trouble beyond sowing."

Soil and Products.—Where there is irrigation the productiveness of the soil in Persia is remarkable, but unfortunately there is too much truth in the notion that two-thirds of the tablelands of the country are sterile from want of water. The desert is the rule, fertility the exception, and generally in the form of an oasis. Yet Products, wheat, barley, and other cereals are grown in great perfection, there are the sugar-cane and rice also, especially in Mazandaran, where the soil is favourable and water procurable; opium, tobacco, and cotton, madder roots, henna, and other dyes, are as well-known exports as the woollen goods of Persia; and the first may become of importance in its bearing upon the Indian market.¹ In Gilan, famous for its mulberry plantations, silk has been one of the most valuable of products. Yazd and Mazandaran contribute also the same material, but of late years the worm has comparatively failed to do its office, and disease has destroyed crop after crop. According to Mr. Secretary Dickson's report of August 1882 the peasants of Gilan had turned their attention to the cultivation of rice, and, though a marked improvement was perceptible in the silk produce, they were not disposed to revert to this branch of culture on the former large scale. "Silk, once the staple produce of Persia, upon which it mainly depended for repaying the cost of its imports, is not likely," he fears, "to resume its former importance. In its flourishing days about 20,000 bales, or 1,400,000 lb, representing a value of £700,000, were annually exported. Now not more than a fourth of that quantity can be obtained." Rice was found to suit the cultivators better; it gave them less trouble and provided them with an article of daily food. The production of silk, on the other hand, profited the richer landed proprietors, and subjected the cultivators to oppression.

Consul Beresford Lovett, in his report before quoted, says that at Astrábad the soil is so productive, and subsistence is practicable on so small a piece of land and with so little labour and expense, that nearly poor emigrants come

¹ In 1881 the crop at Karmanshéh yielded over 12,500 lb; Isfahan claimed to have produced 8000 chests; in Khurassán it was reported that the cultivation of the poppy had increased tenfold, and so extended was the area that the opium realized was estimated at an eighth of the whole produce of the province, the yield for 1882 being reckoned at 38,750 lb. At Yazd it was largely cultivated, at Tehran to a small extent only.

there to settle from distant parts of Persia, Afghanistan, and the Indian border. "Rice," he writes, "is husked under tilt-hammers worked by a water-wheel apparatus, a rude and clumsy contrivance, but strong, simple, and cheap. Corn and barley are ground by water-mills of primitive construction; the best wheat-flour produced is inferior to English 'middlings.' They are careless as to the use of rusty coin; the effect of eating bread made with flour containing any of the noxious element is to render those unused to it very giddy."

Sir John Malcolm considered the shores of the Persian Gulf to be sandy and unproductive in comparison with the rich clayey soil on those of the Caspian. Yet at Bushahr, and elsewhere on the lowlands of the southern border, patches of luxuriant vegetation may be found and a soil producing wheat and barley.

Wines. Vines are abundant, and the Persian grapes are not only of a good flavour and kind, but the wines made from them by the Jews and Armenians have more than a mere local reputation. That of Shiráz is the most universally known and celebrated, but a description of port manufactured at Ispahan is equally palatable and less astringent. It might not, however, bear the vicissitudes of export. A light wine made at Hamadan, diluted with water, is found very drinkable by European visitors and residents. Other cities in Persia could be cited where the juice of the grape is turned to similar account. Samuel Gottlieb Gmelin, who explored the southern shores of the Caspian in 1771, observed that the wines of Gilan and Mazandaran were all made from the wild grape only.

Forests. *Flora*.—Eastwick refers to the trees in the low country of Gilan as "part of that great forest which extends some 400 miles from Astarabad to Talish." No longer do the sparse olive and occasional plantation of fruit-trees here meet the eye of the traveller descending from the Persian plateau, but his path will be through dense thickets of "jungle," amid which the bird and the fox and many familiar friends are recognized. There is an oak-forest in the vicinity of Shiráz, but no part of the country is so thickly wooded as the tract south of the Caspian. For the greater part of the province of Astrábad, Lovett surmises that nine-tenths of the surface is covered with forest. He excepts the pasture-lands of Sháh Kúh, a high mountain-range between Sháh Rúd and the sea. The trees are mostly deciduous. He had counted forty different kinds, including shrubs, but was unable to identify all. There were the oak, beech, elm, walnut, plane, sycamore, ash, yew, box, and juniper, but no pine, fir, or cedar,—though these last were said to exist in the dense forests of Fındekish and on the slopes of the Goklan Hills to the eastward. He applies to the oak, beech, and elm used in building the native names of "mázt," "nís," and "azad."

Fruits. Fruits and flowers are abundant, and are fully appreciated in Persia. Poets sing of them, and prince and peasant delight in them. Of fruits the variety is great, and the quality, though not always the best, is in some cases unrivalled. There is perhaps no melon in the world superior to that of Núsábad, a village between Káshan and Kúm. It was easier to name the few English fruits—such as the gooseberry, strawberry, raspberry, currant, and medlar—that are seldom, if at all seen, than the many that are commonly enjoyed by Persians. Apples and pears, filberts and walnuts, musk-melons and water-melons, grapes, peaches, plums, nectarines,—all these are to be had in profusion and so cheap as to be within reach of the poorest inhabitant.

Flowers. Among the flowers are roses of many kinds, the marigold, chrysanthemum, hollyhock, narcissus, tulip, tuberosa, convolvulus, aster, wallflower, dahlia, white lily (much valued), hyacinth, violet, larkspur, pink, and many

ornaments of the European pattern. Of the roses, Lady Shail observes that they are so profuse during the spring at Tehran that some are cultivated in fields as an object of trade to make rosewater. The double-coloured orange rose at Nishápur is exceptionally attractive and fragrant.

As with fruits and flowers, so also with vegetables for the table. If the parsnip be excepted, which is probably not found because not wanted, all those commonly used in England are to be had in Persia.

Fauna.—Mr W. T. Blanford has described with care and minuteness the zoology of Persia. In company with Major St John, R.E., he made a large collection of the vertebrate fauna in a journey from Gwatar to Tehran in 1872. Having added to this a previous collection made by the same officer with the assistance of a native from Calcutta, he had before him the principal materials for his work. Before commencing his analysis he adverted to his predecessors in the same field, i.e., Gmelin (whose travels were published in 1774-84), Olivier (1807), Pallas (1811), Ménetries (1832), Belanger (1834), Eichwald (1834-41), Aucher Eloy (1851), Loftus, Count Keyserling, Kotschy, Chesney, the Hon. C. Murray, De Filippi (1865), Hume (1873), and Professor Strauch of St Petersburg. All of these had, more or less, contributed something to the knowledge of the subject, whether as writers or as collectors, or in both capacities, and to all the due meed of credit was assigned. Blanford divided Persia into five zoological provinces: (1) the Persian plateau, or from Zoolog. the Kopet Dagh southwards to nearly 28° N lat., including all Khurásan to the Perso-Afghan border, its western limit being indicated by a long line to the north-west from near Shiráz, taking in the whole upper country to the Russian frontier and the Alburz; (2) the provinces south and south-west of the Caspian; (3) a narrow strip of wooded country south-west of the Zagros range, from the Diyáh river in Turkish Arabia to Shiráz; (4) the Persian side of the Shatt al-'Arab, and Khúzistán, east of the Tigris; and (5) the shores of the Persian Gulf and Baluchistan. The fauna of the Persian plateau he described as "Palearctic, with a great prevalence of desert forms; or, perhaps more correctly, as being of the desert type with Palearctic species in the more fertile regions." In the Caspian provinces he found the fauna, on the whole, Palearctic also, "most of the animals being identical with those of south-eastern Europe." But some were essentially indigenous, and he observed "a singular character given to the fauna by the presence of certain Eastern forms, unknown in other parts of Persia, such as the tiger, a remarkable deer of the Indo-Malayan group, allied to *Cervus amn*, and a pit viper (*Halys*)." Including the oak-forests of Shiráz with the wooded slopes of the Zagros, he found in his third division that, however little known was the tract, it appeared to contain, like the second, "a Palearctic fauna with a few peculiar species." As to Persian Mesopotamia, he considered its fauna to belong to the same Palearctic region as Syria, but could scarcely speak with confidence on its characteristic forms. The fifth and last division, Baluchistan and the shores of the Persian Gulf, presented, however, in the animals common to the Persian highlands "for the most part desert types, whilst the characteristic Palearctic species almost entirely disappear, their place being taken by Indian or Indo-African forms." Blanford adds: "Just as the fauna of the Persian plateau has been briefly characterized as of the desert type with a large admixture of Palearctic forms, that of Baluchistan and the shores of the Persian Gulf may be described as being desert with a small admixture of Indian species." Irrespective of scientific classification and detail, it may be stated that among the tame animals of Persia the horse, ass, mule, and camel occupy an important position, and, jointly

perhaps with oxen (used for tilling purposes), are first and foremost in usefulness to man. The Persian-Gulf Arab, though not equal to the pure Arabian, is a very serviceable animal, and has always a value in the Indian market. Among others, the Kashgurs, or those wandering semi-Turkish tribes brought down from Turkestan to the neighbourhood of Shiraz, have the credit of possessing good steeds. The Türkman horse of Khurdsan and the Atak is a large, bony, and clumsy-looking quadruped, with marvellous power and endurance. Colonel C. E. Stewart speaks of a "splendid breed of camels" in the north-eastern district, of which Radkan, a small town of 4000 inhabitants with a deputy-governor, is the capital. He also states that the Khurdsan camel is celebrated for its size and strength, that it has very long hair, and bears cold and exposure far better than the ordinary Arabian or Persian camel, and that, while the ordinary Persian camel only carries a load of some 320 lb and an Indian camel one of some 400 lb, the Khurdsan camel will carry from 600 to 700 lb. The best animals, he notes, are a cross between the Bactrian or two-humped and the Arabian or one-humped camel. Sheep, goats, dogs, and cats are good of their kind, but not all the last are the beautiful creatures which, bearing the name of the country, have arrived at such distinction in Europe. Nor are these to be obtained, as supposed, at Angora in Asia Minor. Lake Van or Isfahan is a more likely habitat. The cat at the first place, called by the Turks "Van kedisi," has a certain local reputation.

Wild animals.

Among the wild animals are the lion, tiger, leopard, lynx, wolf, jackal, fox, hare, wild ass, wild sheep, wild cat, mountain-goat, gazelle, and deer. The tiger is peculiar to the Caspian provinces. Lovett says they are plentiful in Astrabad; "they do not attack men, but badly a week passes but some cow belonging to this town is reported to have fallen a victim to the tiger's rapacity." He measured two specimens, one 10 feet 8 inches, the other 8 feet 10 inches from the tip of the nose to the end of the tail. Lynxes and bears were to be found in the same vicinity, and the wild pig was both numerous and destructive.

Avifauna.

Poultry is good and plentiful, and the game birds, if not of many varieties, have admirable representatives in the "durrâj" (black partridge) and the three kinds of partridge called respectively the "kabk," "kabk darâh," and "tûht." The "hubûra," a kind of bustard, is well known to the sportsman in northern India.

Com-
merce.

Commerce, &c.—The most direct and accurate information obtainable in England on the trade of Persia must be looked for in the reports of the secretary of H. M. Legation at Tehran, the resident at Bushahr (Bashahr), and the consul-general at Tabriz.

Mr. Secretary Dickson's report of the 30th August 1882 is hopeful as to the general prospects of trade and improvement of the condition of the people. There had been a good harvest, but money was scarce at the capital, cash sales were difficult operations, and considerable failures had occurred to render the native bankers cautious. Manchester goods, however, still sold well at Isfahan and elsewhere.

The comparative failure of silk had given an impetus to the cultivation of opium, the greater part of which, when prepared for the market, was shipped to China. Cuspeps had found new favour in Europe, and the value of these exports was estimated at ten times the amount of former days. But a fear was expressed that the introduction of European designs and dimensions, and deterioration in quality of the articles supplied, would eventually prove prejudicial to the trade.

Opium.

The larger traffic in opium effected both in 1880 and immediately preceding years is remarkable, and will be seen in the following table—

Year.	Number of Cases.	Value in Rupees.	Year.	Number of Cases.	Value in Rupees.
1871-72	870	606,000	1876-77	2870	2,514,000
1872-73	1400	1,120,000	1877-78	4780	4,780,000
1873-74	2000	1,600,000	1878-79	8200	5,800,000
1874-75	3080	1,625,000	1879-80	6100	6,100,000
1875-76	1890	1,701,000	1880-81	7700	6,470,000

Persian opium was, it appears, first exported from Isfahan in

1853. Since that period it has been grown in several parts of the country. The destination is usually China. In 1879, for instance, eighteen steamers took 49713 chests from Bushahr, of which all but 236—for London—went to Hong-Kong. Except in Isfahan, there is every probability of extended cultivation, and that the production will increase to an appreciable degree year by year. In the statement of a private firm, quoted by Mr. Harms in his report from Tehran in September 1881, is the following passage:—"The Persian drug has already succeeded in throwing out Turkish sorts from the China market, and, with due abstinence from adulteration, it can at any moment command a large outlet in Europe, America, and in the Dutch colonies." Mr. Harms himself says:—"Whether the Persian opium trade in its present extent by year constitutes a danger to the Indian revenue is, of course, a question to which I can furnish no reply. It depends upon circumstances respecting which I have no information. As matters at present stand, we have a trade that has been increasing steadily for several years past, and which the majority of persons think will continue to increase. The cultivation pays, and the hunt of land and labour has not yet been reached. There are so many reasons, in fact, why it should extend, so few why it should fall off."

Carriageable loads were still a desideratum, and the want of these Commodities obstructed the development of trade. On the other hand, it was mentioned that a fair road had been constructed between Kazvin and Tehran, a supply of carriages and carts had been obtained from Russia, and postal stations had been built at regular distances of 12 miles from each other. In the capital, the streets were kept in good repair, and the palace, square, and main streets lit with gas, and there was a greater number of private carriages. A concession had been granted for a railway from Isfahan to Tehran, Mr. Dickson, while approving of this line as a step in the right direction, was very strongly in favour of another to join Tehran to Baghdad. A branch from Kermanshah to Hamadan to Shīstār or Duzdū, whence goods could be exported by the Kāvin, would, in general, give Persia an independent outlet for her commerce, but he doubted whether Baghdad, with its prestige and advantages of climate, would not be accepted as the main commercial entrepôt. The navigability of the Kāvin river has been already noticed.

The Bushahr reports on the trade of the Persian Gulf for 1880 imports show that, as regards southern Persia, the year was unfavourable and on a commercial point of view. Large importations of sugar were expected to arrive, but the seed so provided for 1881 was not so good in time to allow full advantage being taken of an unusually good rainfall in autumn and winter. Increased imports in sugar from France and Java, the introduction of tea from Japan, and a decrease in exports of cotton and other ordinary produce owing to drought were all noticed.

The table showing the total estimated value of imports into Bushahr during the year 1882 gives a total of 10,183,980 rupees,—say something less than £2,000,000. Of this about four-fifths are from England and more than a third is from India. Of the exports, amounting to 6,566,220 rupees,—say £850,000—more than two-fifths are for China, not a fifth is for England, and more than a fifth is for India. The most valuable items of import are the piece-goods and barks,—the last from England and India only; and of export, opium, of which just three-fourths go to China, and wheat, of which more than two-thirds go to England.

As regards the trade of Lughah, the year 1882 showed a decrease. The total value of imports was 6,922,000 rupees, of which pearls formed the largest portion. These were brought chiefly from Bahman and the Arab coast, but some from the Persian Gulf and Makran and Aden. Rice, almost wholly from India, was the next most valuable item. The total value of exports was 5,800,000 rupees. In this also pearls formed by far the largest item. Next in value mother-of-pearl shells exemplified a traffic almost entirely carried on with England.

From Gez on the Caspian, Consul Lovett gives to the exports of 1881 a value of £26,320. These consisted of silk, cotton, wools, furs and skins, dried fruits, rice, corn, and miscellaneous articles. Silk represented nearly the half, and was valued at the quarter of the total figure. The imports he valued at £287,640, of which the amount for piece goods was entered at £266,000. The remaining articles specified were sugar, tea, iron, copper, steel, crockery, hardware, and brass utensils.

Manufactures, &c.—The handbook on Persia at published by Messrs. Colman and Co., Ltd., in 1876, with references to the collection of articles purchased and sent home by the South Kensington Museum, has an instructive account of the more common manufactures of the country. They are classified under the respective heads of "potcelain and earthenware," "tiles," "arms and armour," "textile fabrics," "needlework and embroidery," "metal-work," "wood carving and mosaic-painting," "manuscripts," "enamel," "jewellery," and "musical instruments." Specimens of the greater number are not only to be procured in England, but are almost everywhere to be seen in London. It need scarcely be said that the tiles have rather increased in value than deteriorated in the eyes of the connoisseur, that the ornamentation of metal-work, wood carving and inlaying,

trough it from other cities in the shah's territory, but it can boast also the tomb of the famous Hâim al-Rashidi and of Gauhar Shâh Agha, the favourite wife of Shâh Rûkh, and its canal and quays merit at least a passing remark from their rarity. It is divided into two towns, the sacred and the secular, each of which has its distinct government—the first called the "antarah," the second being also governor of the whole province of Khûzestân, and often a prince of the blood-royal. After Mashhad, among the chief towns of Khûzestân are Nishâpur and Sabzwâ on the highroad to Tehran, the first an ancient city within walls, the second notable for its flourishing cultivation, Bûyrdûd on the north, which in Burnes's time was "a rather large place standing in a spacious valley," Tâbat-e-Handâr, the chief town of a populous district with ten villages, visited by Goldsmid in 1830, by Khân in 1873, and by Stewart in 1880, Sultânabad, capital of the Turshûz district (in which there is no specific "Turshûz"), called by Colonel Stewart "a small and flourishing town of some 5000 inhabitants," Kâyan, once capital of the district of that name, and still a town of some importance, much frequented by "mullas" and "shayids," Tûn, which Macgregor describes as "decidedly a picturesque situated town, surrounded by a wall of irregular outline, which goes out to all the houses, and encloses besides a space—quite equal to that occupied by the houses—taken up with cultivation and gardens. This it is," he adds, "that Tûn may be said to be a town 4 miles in circumference, though, if only the space occupied by houses was calculated, it would divide to one-eighth of this. There are no buildings of any note in the place, but a few mosques and colleges are to be found, while most of the better houses, of which there is a total of about 1500, have a dignity." Coupled with Tûn is Tâbes, to which the same writer gives no importance, then come Bîrjûd, picturesque and clean, with a better class of mud buildings, well situated at the foot of hills, and having rather high mountains to the westward, the modern capital of the Kâyan district, and finally, Sîkûh, the true but somewhat insignificant chief town of Sîstân, here chosen in preference to Nasrâbâd, its military headquarters. Mr Rozario, medical attaché to the mission of 1872, described Sîkûh as composed of 200 archaic mud-built houses, connected with each other without any kind of woodwork about them, the land wanting in rice and timber, but producing wheat, barley, beans, and cotton in abundance.

Southern Persia. The fourth, Southern Persia, is a very extensive division, embracing not only the whole seaboard between 48° and 61° 30' E long but a great part of the country as far north as 32° 40', the parallel of Isfahan, and would thus include the greater part of the ancient and uncertain mode of parceling out a kingdom than the separation of natural and the combination of abnormal elements of unity to be found in this vast territory entrusted to the charge of the "zûl-sultân," or "shadow of the monarch," the title given to the shah's eldest son. That such an arrangement can work at all is one of many strange truths which are intelligible only to persons acquainted with the centralizing power exercised in Tehran. General Schumler, an officer of great local knowledge and experience, has guaranteed the correctness of the statement that the pince-governor or governor-general of Southern Persia—residing himself at Shîràz (or at Isfahan)—appoints governors to the following places—Kûrdstân, Karmanshâh, Lûristân, Bûyrdûd, Dûzûl, Shîstâr, Muhâmrah, Behbâhan, and Ram Hormuz in the west; the tactics occupied by the Bakhtiârs, Gulbâghâr, Khonsâr, Farûd, Chûshir Mahmûd, and with Nâm, Tâfi, and Shîrâz in the east; Fârs (with Yess, Darâb, Pâum, and Kâzâm) in the centre; Bûshahr and Langah on the coast; and Karmân (with Bam, Bampur, Rafsanjân, Khabis, Shiraz, Jurût, and Rudbâr) in the east. Among the more prominent cities or towns within this range are:—Isfahan, a fine city, still worthy from its site, buildings, gardens, river, and surroundings to be the royal residence; Shîràz, happily situated with pleasant neighbouring resorts and the ordinary requirements of the place—possessing, moreover, not only a special national prestige for high and low, yet not a general residence for strangers, who can accomplish its lions in a couple of days, Yazd, a large and fairly populated city, with one remarkable mosque and a handsome new bazar, but somewhat gloomy in character and dearly situated on a flat plain in an amphitheatre of hills, Karmân, a place of pleasant recollection to those English travellers who experienced the genuine kindness and hospitality of the wâkîl 'I-mulk, Muhâmmed 'I-mull Khân, its governor in 1865-68, and not wanting in material attractions of its own, Isfah, Bam and Bampur, visited by Lieutenant Pottinger in 1810, more than half a century afterwards by Colonel Goldsmid, and later still by Majors St John and Lovett—the one a frontier town with associations of border warfare, the other a mere Paiso-Baluch rantonment with a fort and mud buildings, round the residence of Ibrahim Khân, a chief of notoriety serving the interests of Persia. Muhâmrah, Bûshahr, Langah, and Bender-'Abbâs are ports, but there is no real harbour between Yâd at the mouth of the Shattû 'l-'Arab and Kûdâhî (Kurrachee) in British India.

¹ Literally "wind-catchers,"—towers so called on the roofs of houses for purposes of ventilation.

Ashtâdî is a town and district near the entrance of the bay of Minor the same name on the Caspian. In 1884 it was governed by governor Habib Ullah Khân, the "shâh 'I-daulah," or "aim of the state" means.

Mazandârân and Gilân are the Caspian provinces, *par excellence*, of Persia. General Schumler makes them distinct governments, but they appear to have once formed part of the northern division under the pince-governor.

Khannash, a district on the high road between Tabriz and Tehran, of which the chief town, Zanjan, is a place of some importance. The governor's name in 1884 was Nûsâ Kulî Khân, the "amîd 'I-mulk," or "prop of the kingdom."

Kazvin, a considerable town, with surrounding district, in the plains south of the Alburz, and not a hundred miles from Tehran, was governed in 1884 by Mirza Rza, the "mirzâ 'I-sultânâh," or "helper of the kingdom."

Genius is a district on the south of Khamash.

Population.—Although the present section deals with statistics only, the following well-considered remarks of Mr Robert Grant Watson, formerly a secretary in the Persian legation, form an appropriate preface to the record of population.

"Persia is peopled by men of various races. A very great portion of the population is composed of wandering tribes, that is, of a large number of families who pass a portion of the year on the hills. It is in this sense only that they can be considered wanderers. They invariably occupy the same pasture-grounds one year after another. Their chiefs are possessed of great authority over the tribesmen, and all dealings between the Government and the tribes are carried on through the heads of these divisions. Through the chief the taxes, whether in money or in kind, are paid, and though him the regiments which his tribe may furnish are recruited. The office of chief is hereditary. The tents in which the tribesmen dwell are for the most part composed of a light framework of the shape of a beehive. This is covered with a coating of reeds, and above it is placed a thick black felt. It has but one door, and no window or chimney. This is the Turkman tent, which is used by the Shahwârân and other tribes, but the Kurds in central Persia make use of tents of another construction, with flat or slightly-sloping roofs.

"The provinces near the Persian Gulf contain many Arabs and men of Asiatic extraction. Such are for the most part the inhabitants of Lûristân and of the country lying to the left of the Shattû 'l-'Arab and of the lower part of the Tigris. The Bakhtiâr mountains, between the valley of the lower Tigris and the plain of Isfahan, are the dwelling-place of tribes of Arab origin, the names of which their country very little is known. The mountains of Kurdistan give birth to a warlike people, who are attached to their own tribe-chiefs, and who never go far from the borders of Turkey and of Persia, sometimes proclaiming themselves subjects to the Porte, and sometimes owing allegiance to the Shah. At the foot of one part of these mountains, on the borders of the lake of Urmîa, there is a plain on which dwell many Christian families who hold the tenets of Nestorius. At Isfahan, at Tehran, at Tâbriz, and in other parts of Persia, there is a more or less considerable population of Armenians. At Hamadân, at Isfahan, at Tehran, at Mashhad, at the town of Dâmâvâd, and elsewhere in Persia, Jews are found in considerable numbers. The province of Gilân is inhabited by a race of men peculiar to itself, the descendants of the ancient Gêls. The people of Mazandârân speak, as do the Gilaks, a dialect of their own. The province of Ashtâdî is partly inhabited by Turkmen, and in the districts claimed by Persia, which border on Afghanistan and Baluchistan, the Afghan and Baluch elements are prominent in the population. At Karmân a few Hindus reside, and at Yazd there are about 2000 families of the original fire-worshippers of Iran.² But the two principal races to be met with in Persia are the Turks and the Persians or Mongols. The former are, as a general rule, spread over the northern portion of the empire, and later over the southern. The Persians, on the other hand, for the most part speak only the Persian language, while those of Turkish race speak the Turkish language in preference to Persian.

"The inhabitants of Persia may be divided into two classes,—those who inhabit the towns and villages, and those who dwell exclusively in tents. The former class remain stationary during the greater part of the year, the richer orders only leaving the towns for two months during the summer heats, when it is possible to obtain cool air in the hills or upper grounds close by. The tribes who dwell in tents move from place to place with the varying seasons of the year. In the springtime they drive their flocks and herds to their accustomed pasture-grounds, and if they have a right to the pasture of mountains which are inaccessible in spring, they move up to summer quarters as soon as the snow disappears. Winter finds them on the plains, prepared, in their black tents, to brave its utmost rigour. Thus the tribes saye each a separate chief. For the Kurds of Persia there is a hereditary chief called the Ilkhân, to whom they all owe allegiance, from whom they receive the laws that rule their conduct, and to whom they pay the revenue imposed upon them. They contribute a certain number

² Since greatly reduced in numbers.

of soldiers to the Shah's army. Very little is known as to the numbers and the peculiarities of these nomads. The Ilak tribes of Turkish descent have an Ilkhan appointed by the Shah. Besides these tribes there are wanderers, who are less numerous, and who occupy a less prominent position,—the gypsies common to so many countries.

It is difficult to form an estimate of the population of Persian towns or districts. In the first place, opinion is divided upon the approximate figure to be accepted for the kingdom at large. According to St John, the discrepancy is between ten and four millions, and if the smaller one be made a basis there could be left a scanty number indeed for partition among the cities and principal centres. The figure of 1870 was, moreover, severe and fatal enough to allow a considerable number in the totals calculated prior to its occurrence. When returning through Mashhad in the spring of 1873 the British commissioner for the Sistan boundary settlement was informed that no less than 100,000 persons had been carried off within the limits of the prince-governor's rule, of whom 24,000 were from the city itself, where, exclusive of passing pilgrims, reckoned by thousands, a population of 70,000 might well be supposed. In Yezd and Isfahan the losses were also very great, and must have sensibly affected the figures.

Statistics of population. The official estimate for 1881 is rendered as follows:—inhabitants of cities, 1,963,800, wandering tribes, 1,909,800, inhabitants of villages and country, 2,780,000; total, 7,653,600. It is probable that 8,000,000 would be a fair estimate in round numbers, and this should include the comparatively new accessions of territory in Sistan and western Baluchistan.

The population of Persian cities may be recorded as follows. Those figures marked with an asterisk are from the official returns given in the *Sutestanian's Year Book*, for 1884. Tehran, *100,000, Ashkhabad (city), 8000—*in the province*, 26,000 (Lovett, 1881), Tabriz, *120,000, Urmia, *40,000, Hamadan, *30,000, Kermanshah, 25,000, Rasht, 20,000, Kavin, 25,000, Zanjan or Zangabad, 20,000, Astrak, 1800, Ktin, 20,000 (Eman Smith said in 1871 that out of 20,000 he thought it actually possessed only 4000 were then inhabitable); Isfahan, 60,000, Shiraz, 50,000, Bushahr, 11,000, Yazd, *40,000; Kerman, 40,000, Bujaud, 12,000 (Sistan mission, 1872); Ardakan (Khuzistan desert), 20,000 (Colonel Stewart, 1880), Bam, 6000 (Goldsmid, 1868-72).

With regard to these interesting places in eastern Persia visited by Macgregor in 1876, this active explorer gives no clue to the population of Tabriz, but the fact that it is well known to be about half a mile in length by a quarter in breadth, with an "ark" or citadel, but no bazars, or, of Tin, his 1500 "better houses" may imply about 6000 well-to-do people only, and Bushuyah, between Tabas and Tinn, he calls a village of some 600 houses, equivalent to a population of between 3000 and 4000.

Administration. *Government.*—The Shah is regarded as viseregent of the Prophet, and, as such, demands implicit obedience so long as his commands do not go against the Koran and the sacred law. The executive government is carried on by a ministry of which the personnel is subject to constant change, and the distribution of duties depends much upon the standing in royal favour of individual ministers. It may be said, as a rule, that those who fill the more important functions and do the most real work are better known by their family names than the official titles accorded them. The somewhat common prefix "mirza" is usually taken by high functionaries of state,—a word which invariably denotes a member of the royal house when used as an affix.¹

The division of the country for administrative purposes has been mentioned above, p. 626. Provinces are further subdivided into districts under "hikims," or chiefs, who collect the revenue as well as exercise a general superintendence. In villages the "kathkhal," or magistrate, administers justice.

Of the 48 provinces under Persian rule there are said to be 43,000, chiefly in Julfa near Isfahan, and of Nestorians and Chaldeans 23,000, chiefly in Urmia and Salmas. There are probably 70,000 Christians of every denomination. The number of Jews given is 19,000, and of Gabaus (Gabaurs) or Parsi, 8000. Perhaps the Nestorians have been under-estimated; but the Parsis have greatly diminished in recent years. However tolerant the doctrinal principles of the Government under Persian rule there is no doubt that much could yet be done to improve the condition of the Shah's non-Moslem subjects in respect of taxation, civil and social rights, and general treatment by local authorities. Efforts on behalf of the Nestorians have from time to time been made in late years, with the support of the British Government, and special agents have been deputed to Urmia to report upon supposed grievances.

¹ In 1881 the following were among the more prominent ministers:—*Mirza*—Nabiz-Saltanah, Kerman Khan.

Interior and Finance—Mortofin-1-Mandali, Mirza Yusuf Khan.

Foreign Affairs—Nizam-1-Daula, Mirza Mahmud Khan.

Justice—Mirza-1-Daula, Mirza Abdul Wahid.

War and Telegraphs—Makhan-1-Daula, 'Ali Khali Khan.

Of these, Mirza Mahmud Khan, the "new" family, had been minister in London. His predecessor in the cabinet had been always known as simply Mirza Sa'id Khan.

with a view to their alleviation or removal. The temporary appointment of a Christian governor was an indication of the Shah's good wishes, but can hardly be said to have attained the desired end. It is just possible that the desire awakened in England in the second half of the 19th century to know more of the Persian churches may result in the exercise of a beneficial influence over the fortunes of a people who have suffered various forms of oppression for five centuries or more. See *Nestorians*, vol. xvi p. 387 ff., where statistics, &c. are given.

Army.—Military service is not popular, and could not be pro-Army, vided for at all but by compulsory enlistment. Pay is always kept in arrears, generally for two or three years; and, as issued, it is issued from its legitimate amount by the exactions of distributing officers, from the "sarhang," or lieutenant-colonel, downwards. The native officers are, as a rule, incapable and ignorant of military affairs, and the European drill-instructors, whatever their local rank, have no actual command in the native army. The common "sarbaz," or Persian infantry soldier, might with good officers and good training be made very efficient. In the performance of his long marches—24 or even 40 miles a day—he has very often a companion, his donkey, without which adjunct no picture of a Persian infantry soldier would be complete. Setting such aside, the marching and endurance of the sarbaz are wonderful, and, though better food might in some respects improve his physique, his fugacity is such as to account in some measure for his bodily strength. If wanting in the discipline that is considered in England essential to the well-being of the service, the fault is that of his superiors, from whom he is ill-combined. The "sarbaz" is often accused with an evil example. In fact, the moral value of the soldier deteriorates as the social grade rises. It is much the same in Turkey, where the state of things is perhaps Oriental rather than national. The post of "wakil," or non-commissioned officer, becomes thus the first step to demoralization. Above this person is the "naib," or lieutenant, corresponding to the Turkish "mudrakim," then comes the "sardar," or captain, the Turkish "yuzbashi," or major, the Turkish "kimbashi," "sarhang," or lieutenant-colonel, the Turkish "kdim-makim," and the "sartap," or colonel, the Turkish "mir-alai"; such as roughly the respective grades which represent the commissioned ranks.

The most business-like cavalry the present writer can recall in the Shah's dominions were the stay horsemen met with in the Kerman province. There these, known from top to toe, with the exception of the halos and the calumet, were the most experienced and soldier-like, and nothing but headstaying aptitude could make the horseman so fitted to the horse. Both in 1868 and in 1871 the governor of Bam, in Baluchistan, had good stuff to discipline into regular cavalry in his mounted Daluhs as well as Persians, and the same remark applies to the Persian governor of Sistan in 1872. The "istikbal," or motley troop of cavaliers, sent out to meet the writer by ethnic chief, presented a singular specimen of rough but efficiently formidable fighting men, men who had, clearly, fighting propensities, and might be moulded, without much effort, into very serviceable soldiers. Colonel (now Sir Charles) Macgregor found the few irregular cavalry incidentally brought under his observation in Khuzistan very fairly mounted in a working sense. Over the saddle and behind it they seemed to carry all that belonged to them. With less than £3 a year in pay, over and above a grain allowance, he says truly of these cavaliers, that, "it is not the best light horsemen in the world, but they are the very cheapest." At Mashhad he saw several Persian regiments encamped outside the city. They were composed of men generally of fine physique, hardy and muscular, but their small pay of seven "tumans" (not £2, 18s) per annum was seldom realized up to half the amount, and they had to subsist chiefly on their rations. Their uniform consisted of a black lamb's-wool bushy, with a lion and sun in brass on the front, a dark-blue tunic, or long European mould, with white bands across the breast, blue trousers with red stripe, and shoes (if they like to wear them). They had clumsy percussion, smooth-bore muskets and bayonets, with jacks of French manufacture, but they did not clean them, and it was probable that more than half were unfit for actual use. The artillery he states to be probably the most efficient branch of the service, not smart, but tough and ready.

Although there were no English soldiers employed in training the Persian troops during any of the present writer's visits to Tehran, there were two Englishmen connected with the arsenal to whom the local Government was indebted for useful service. The chief control of the arsenal, however, and indeed the direction of the whole Persian artillery, was in the hands of an Armenian, the two principal drill-instructors were Italians, a Florentine and a Neapolitan, while that vital part of the public works department comprising roads and bridges was under an Austrian officer holding the rank of general. There were, besides, two or three other Europeans holding quasi-military posts.

St Henry Rawlinson, who was for five years in the Shah's army, believes that, "if the Persian material were placed at the disposal of a European power who would encourage and take care of the

men, and develop their military instincts, a fine working army, very superior to anything that Turkey could produce, might be obtained in a very short period of time."

It is difficult to rely on statistics in the present case, but the following are found in the latest and most trustworthy records.¹ "The Persian army, according to official returns of the minister of war, numbers 105,500 men, of whom 5000 form the artillery, 53,900 the infantry, 31,000 the cavalry, regular and irregular, and 7200 militia. Of these troops, however, only one-third are employed in active service, the standing army of Persia consisting, on the peace footing, of a total of 30,000 men. By a decree of the Shah, issued in July 1875, it was ordered that the army should for the future be raised by conscription, instead of by irregular levies, and that a term of service of twelve years should be substituted for the old system, under which the mass of the soldiers were retained for life, but the decree has not been enforced to any extent. The organization of the army is by provinces, tribes, and districts. A province furnishes several regiments, a tribe gives one, and sometimes two, and a district contributes one battalion to the army. The commanding officers are almost invariably selected from the chiefs of the tribe or district from which the regiment is raised. The Christians, Jews, and Guebans in Persia are exempt from all military service. In recent years the army has been under the training and organization of European officers."

Revenue. *Revenue.*—According to the *Statesman's Year Book* for 1884 the revenue and expenditure of the Government are known only from estimates. If we accept these as based on consular reports, the total receipts of the Government amounted, on the average of the years 1872 to 1876, to £1,600,000 per annum, while the expenditure during the same period was at the rate of £1,756,000 per annum. The receipts of the year 1882 amounted to £1,600,000 in money, besides £280,000 in kind, consisting of barley, wheat, rice, and silk, making the total revenue equal to £1,880,000, and of this sum £1,520,000 came from direct taxes and £358,000 from customs. The expenditure amounted to £1,800,000, of which £780,000 was for the army; £380,000 for the regular count, the post-office, &c.; £240,000 for other affairs; £138,000 other departments, £60,000, education, £12,000. The surplus is paid into the Shah's treasury. About one-fourth of the receipts are constituted by payments in kind, mostly reserved for the use of the army and the Shah's own household. The whole revenue is raised by assessments upon towns, villages, and districts, each of which has to contribute a fixed sum, the amount of which is changed from time to time by tax-assessors appointed by the Government. The almost entire burden of taxation falls upon the labouring classes, and among these upon the Muhammadan subjects of the Shah. The amount of revenue collected from the Christian population, the Jews, and the Guebans is reported to be very small. The Government has no public debt. *The Almanach de Göttinge* adds to the above items of expenditure in 1882 the sum of £80,000 for the priesthood, &c.

In 1868 the revenue demanded from each province, under the divisions then made, was—Adiabayan, £248,000; Gilan, £178,000; Isfahan, £168,000; Fais, £159,000; Khuristan, &c., £88,000; Ahalstan, £86,000; Tehran, &c., £84,000; Kerman, £84,000; Kermanshah, &c., £80,000; Khamsah, £72,000; Yazd, £68,000; Mazandaran, £44,000; Karvin, £28,000; Kashan, £28,000; Bardsir, £24,000; Gulistan, £24,000; Kurdistan, £20,000; Hamadan, £12,000; Astrabad, £10,000; Kilm, £6000; total, £1,508,000. The customs were £214,664, and the value of income received in kind was £230,886, making a total revenue of £1,937,000, or something less than two millions.

A prince-royal appointed to a province is often little more than a nominal ruler. On the other hand, some governors, such as Muhammad Isma'il Khan, the late wakil of Kerman, appeal to even the minute details of administration, and pay especial attention to the collection of revenue. It is not always an easy matter to be a ruler in Persia, and the sum paid out, or even voluntarily offered for the government of a province.

National Character.—Malcolm's *Sketches and Memoirs of Hagg Baba* are still, after more than half a century, unsurpassed as standard records of accurate information on the manners and customs of an Oriental people. A clever volume* published in 1838, which is also with quoting, contains, among many other faithful delineations, the following:

"The character of the Persian is that of an easy-going man with a wish to make things pleasant generally. He is hospitable, obliging, and specially well disposed to the stranger. His home virtues are many. He is very kind and indulgent to his children, and, as a son, his respect for both parents is excessive, developed in a greater degree to his father, in whose presence he will rarely sit, and whom he is in the habit of addressing and speaking of as 'father.' The full stream of his love and reverence is reserved for his mother, he never leaves her to starve, and her wishes are laws to him. The mother is always the most important member of the household, and the grandmother is treated with veneration. The

presence of the mother-in-law is coveted by their sons-in-law, who look on them as the guardians of the virtue of their wives. The paternal uncle is a much nearer tie than with us, while men look on their first cousins on the father's side as their most natural wives.

"Black slaves and men-servants or 'hulaks' are much respected, the 'dakh' or wet nurse is looked on as a second mother, and usually provided for for life. Persians are very kind to their servants, a master will often be addressed by his servant as his father, and the servant will protect his master's property as he would his own. A servant is invariably spoken to as 'bacha' (child). The servant expects that their master will never allow them to be wronged. The slaves in Persia have a good time, well fed, well clothed, treated as spoiled children, given the highest wages, and often given in marriage to a favourite son or taken as 'sagah' or concubine by the master himself, slaves have the certainty of a well-earned old age. They are looked on as confidential servants, are entrusted with large sums of money, and the conduct of the most important affairs, and seldom abuse their trust. The greatest punishment to an untrustworthy slave is to give him his liberty and let him earn his living. They vary in colour and value. The 'Habshi' or Abyssinian is the most valued; the Shidhi or Somali next in blackness, is next in price, the Bonlassa, or cool-black negro of the interior, being of much less price, and usually only used as a cook. The prices of slaves in Shiraz are, a good Habshi girl of twelve to fourteen £40, a good Somali same age, half as much, while a Bonlassa is to be got for £14, being chosen merely for physical strength. They are never sold, save on invitation, and they are so scarce that they are never sold. A Persian unkind to his own horse or his slave, and when overtaken by poverty he will first sell his shirt, then his slave.

"In commercial morality, a Persian merchant will compare not unfavourably with the European generally. . . . To the poor, Persians are unostentatiously generous, most of the rich have regular pensioners, old servants, or poor relations who live on their bounty, and though there are no workhouses, there are in ordinary times no deaths from starvation, and charity, though not organized, is general. Procrastination is the attribute of all Persians, 'to-morrow' being ever the answer to any proposition, and the 'to-morrow' means indefinitely delay. A good dialist is shown generally to a written contract binding the parties to a fixed date, and, as a rule, on breaking it the Persian always appeals for aid and expects delay and indefinite days of grace. . . .

"Persians are clean in their persons, washing themselves and their garments frequently. The Persian always makes the best of his appearance; he is very neat in his dress, and is particular as to the cut of his hat and the cut of his coat. All Persians are fond of animals, and do not treat them badly when their own property.

"Cruelty is not a Persian vice, torture and punishments of an unusual and painful nature being part of their judicial system. There are reductive punishments, such as solitary confinement, penal servitude for long terms of years, &c. Solitary, indeed, is a man imprisoned more than twelve months, the rule being that there is a general jail delivery at the New Year. Royal clemency is frequently shown, often, perhaps, with want of judgment."

The close adherence to ceremony and etiquette, the ready adaptation to foreign habits, together with the capacity for using and of recovering the grossest forms of flattery—which in the days of Herodotus were found to be notable features of the national character—are still to be seen in the 19th century.

Momer, in his *Second Journey through Persia*, relates how on arrival at Bombay his fellow-traveller, the Persian ambassador, returning from a mission to the court of St. James's, would not call at Government House until the governor had visited him, on the plea that, when in London, the chairman and deputy-chairman, whom he styled the father and grandfather, of the East India Company, as well as the "viceroy" and "grand vizier," himself (Mr. Spencer Perceval), had made the first call upon him,—clothed, moreover, in the very dress they had worn before their own sovereign! The present writer, when discussing the necessary conduct of British diplomatists accredited to Persia, said: "In some courts . . . there is a meaning in ridiculous minutiae, the comprehension of which is of vital importance to the envoy and the cause he advocates. . . . A chair pushed up, such as two forward or backward, so as to transgress the border of a particular carpet marked for his limit, may cause serious offence; a cup of tea, or a tobacco pipe missing from the conventional number offered to a guest, may awake hostile feelings, there may be hidden mischief in a misplaced word of welcome or farewell, in a clumsy gesture, in a new-fashioned article of wearing apparel. Trifles could hardly go further in the way of publicity, but it is a part of common-sense diplomacy to acknowledge with gravity things which are at all seeming the most opposed to common-sense."

Forms of compliment and adulation are in such constant requisition with him that a Persian is never at fault in need occasion for their use. If the following example be too characteristic to be

¹ *Statesman's Year Book*, 1884, pp. 708, 707.

² *Wills, in the Land of the Lion and the Sheik*, 1889.

³ Lecture at the Royal United Service Institution, 26th May 1876.

admitted, he it understood that it indicates a grosser kind of procedure than that which, at the present day, is known to the higher classes. It is a common custom on the arrival at the gate of a town of a distinguished traveller for some duly appointed official to strike off the head of a sheep, and toll it, with the blood dripping, across the path of the new-comer. Moine gives a revolting illustration of the custom, to which this ceremony was carried on the arrival of the shah at the halting place of Moushka. The head man of the village went so far as to strip his own son naked from the waist upwards, and, having tied the lad's hands behind his back, to lift his knees as though to cut the victim's throat. The conclusion of the story is not told, but it is to be hoped that the shah evaded his prerogative of preventing any evil results.

Costume.

Costume.—The costume of the Persians may be shortly described as fitted to their active habits. The men generally wear an unstarched shirt of cotton, sewn with white silk, often, particularly in the south of Persia, elaborately embroidered about the neck. It fastens in front by a flap, having two small buttons or knots at the left shoulder, and seldom comes below the hips. It has no collar, and the sleeves are loose. The lower orders often have it dyed blue, but the servant and upper classes always prefer a white shirt. Silk shirts are now seldom seen on men. Among the very religious during the mourning month ("Muharram") the shirt is at times dyed black. The "dir-jamah," or trowsers, are of cloth among the higher classes, particularly those of the military order, who affect a garment of a tightness approaching that worn by Europeans. The ordinary "zhi-jamah" is of white, blue, or red cotton, very loose, and are exactly similar to the "pajama" worn by Europeans in India. They are fastened by a draw cord, and of green silk or cotton round the waist, and the following classes, when engaged in heavy or dirty work, or when running, generally tuck the end of these garments under the cord, which leaves their legs bare and free to the middle of the thigh. The amplitude of this part of his attire enables the Persian to sit without discomfort on his heels, chairs or as only used by the rich, great or Europeanized. Over the shirt and trowsers, the Persians wear a "kamarband," generally of quilted cloth or silk, a closely-fitting garment, collared, with tight sleeves to the elbow, whence, to the wrist, are a number of little metal buttons, fastened in winter, but not in summer. Above this is the "kamarchin," a tunic of coloured calico, cloth, Kashmir or Kaman shawl, silk, satin, or velvet (gold embroidered, or otherwise), according to the time of year and the purse and position of the wearer. Thus, the "akshah" is open in front, and shows the shirt. It is sometimes of a single piece, and is double-breasted. It has a pocket-hole on either side, giving access to the pockets which are always in the "akshah," where also is the breast-pocket in which watch, money, jewels, and seals are kept. The length of the "kamarchin" denotes the class of the wearer. The military and official classes and the various servants wear it short, to the knee, while fops and sharpens wear it even shorter. Priests, merchants, villagers, especially about Shiraz, townsmen, shopkeepers, doctors, and lawyers wear it very long, often nearly to the heels. Over the "kamarchin" is worn the "kudjah," or coat. This is, as a rule, cast off in summer, save on formal occasions, and is often borne by a servant, or carried over the shoulder by the owner. It is of cloth, shawl, or camel-hair cloth, and is lined with silk or cloth, flannel or fur. It has, like the Turkish frockcoat, a very loose sleeve, with many plaits behind. It has lapels, as with us. It is trimmed with gold lace, shawl, or fur, or is worn quite plain. It has a roll collar and false pockets.

Besides these garments there are others, the long "juba," or cloth cloak, worn by "mirzas" (secretaries), Government employes of high rank, as ministers, farmers of taxes, courtiers, physicians, priests, the "abba," or camel-hair cloak of the Arab, worn by travellers, priests, and hermits; and the "pustik," or Afghan skin-cloak, used by travellers and the sick or aged, the "sawtan" or common sheepskin jacket, with short sleeves, used by shopkeepers and the lower class of servants, grooms, &c., in winter, the "yapanjah," or woollen Kurdish cloak, a kind of felt, having a shaggy side, of immense thickness, worn generally by shepherds, who use it as greatcoat, bed, and bedding. There is also the felt coat of the village, very warm and inexpensive, the coat being from 5 to 15 kama (a kama is a hand), and the "gavah," a shawl, a characteristic of class. It is made of muslin, wool, or cotton cloth among the priests, merchants, bazaar people, the secretary class, and the more aged Government employes. In it are carried, by literate and merchants, the pen-case and a roll of paper, its voluminous folds are used as pockets, by the bazaar people and villagers, porters and merchants' servants, a small sheath knife is stuck in it, while by "farmahs," the carpet-spreader class, a large "Khanjar," or curved dagger, with a heavy iron handle, is carried. The head-gear is very distinctive. The turban worn by priests is generally white, consisting of many yards of muslin. When the wearers are "sayid" of the Prophet, a green turban is worn, also a "kamarband" of green muslin, or shawl or cotton cloth. Merchants generally wear a turban of muslin embroidered in colours, or of a yellow pattern on straw-

coloured muslin, or of calico, or shawl. The distinctive mark of the courtier, military, and upper servant class is the belt, generally of black varnished leather with a brass clasp, pincies and courtiers often replace this clasp by a huge round ornament of cut stones. The "kudjah," or hat, is of cloth or sheepskin on a frame of paste-board. The fashions in hats change yearly. The Afghan turban and the Armenian at times wear the hat very tall. The vast of the Persian is generally small, and he is very proud of his fine figure and broad shoulders.)

The hair is generally shaved at the crown, or the entire head is shaved, a "kakul," or long thin lock, being sometimes left, often 2 feet long, from the middle of the crown. This is to enable the prophet Muhammad to draw up the hair over the temporal bone long, and brought in two long locks turning backwards behind the ear, termed "zulf," the beaus and youths are constantly twisting and combing these. The rest of the head is shaven. Long hair, however, is going out of fashion in Persia, and the more civilized affect the cropped hair worn by Europeans, and even have a parting in it. The chin is never shaved, save by "beauty men," or "hashangs," though often clipped, while the mouth-whiskers are usually left long. At forty a man generally lets his beard grow its full length, and cherishes it much. Part of a Persian's religious exercises is the combing of his beard. Socks, knitted principally at Isfahan, are worn, they are only about 2 inches long in the leg. The rich, however, wear them longer. They are of white cotton in summer and coloured worsted in winter. Villagers only wear socks on state occasions. Shoes are of many patterns. The "chiriz," or Russian moccasins, are the most common, and are made of leather, a sort of kash. The heel is folded down and remains so. The priests wear a peculiar heavy shoe, with an ivory or wooden lining at the heel. Green shoes of shagreen are common at Isfahan. Blacking is unknown to Persians generally. Boots are only used by horsemen, and are then worn in much too large for ease. Those worn by courtiers often come up to the thigh. With boots are worn "shabwads," or baggy riding breeches, very loose, and fast by a strap, often the side, a sort of belt is worn by courtiers. Pocket-handkerchiefs are seldom used, save by the rich or the Tehrans. Most Persians wear a "shab kudjah," or night hat, a loose jacket of shawl or quilted material, often embroidered by the ladies.

Arms are usually carried only by tribesmen. The natives of the south of Persia and servants carry a "kammali," or dirk. The soldier, on or off duty, always carries one of these or then endeavours to carry two. These are both "kammali" and must with them. On the road the carrying of weapons is necessary.

The costume of the women has undergone considerable change in the last century. It is now, when carried to the extreme of fashion, highly indecent and must be very uncomfortable. The garment doing duty as a chemise is called a "pijahan," it is, with the lower order, of white or blue calico, and comes down to the middle of the thigh, leaving the arms bare. Among the upper class it is frequently of silk. At Shiraz it is often of fine cotton, and elaborately ornamented with black embroidery. With the rich it is often of gauze, and much embroidered with gold thread, pearls, &c. The head is usually covered with a "chir-kudjah," or large square of embroidered silk or cotton, folded so as to display the corners, and fastened under the chin by a brooch. It is often of considerable value, being of Kashmir shawl, embroidered gauze, &c. A "kudjah" is a small, feather-like ornament, worn on the top of the head, while the front hair, cut to a level with the mouth, is brought up in love-locks on either cheek. Beneath the "chir-kudjah" is generally a small kerchief of dark material, only the edge of which is visible. The ends of the "chir-kudjah" cover the shoulders, but the gauze "pijahan" is quite transparent. A profusion of jewellery is worn of the most solid description, none hollow; silver is only worn by the very poor, worn only by negroes. Necklaces and bracelets are much affected, and chains with scent-caskets attached, while the arms are covered with clanking glass bangles called "alangi," some twenty even of these being on one arm. Jewelled "bazarbands," containing talismans, are often worn on the upper arm, while among the lower orders and south Persians or Arab women nose-rings are not uncommon, and bangles or anklets of beads.

The face on important occasions is usually much painted, save by young ladies in the heyday of beauty, who are content very freely applied, the cheeks being as much reddened as a clown's, and the neck smeared with white, while the eyelashes are marked round with "kohl." This is supposed to be beneficial to the eyes, and almost every woman uses it. The eyebrows are widened and painted till they appear to meet, while sham moles or stains are painted on the chin and cheek, even spangles are stuck at times on the chin and forehead. Tattooing is common among the poor and in villages, and is seen among the upper classes. The hair, though generally hidden by the "chir-kudjah," is at times exposed and plaited into unnumberable little tails of great length, while a comestible little skull-cap of embroidery, or shawl, or coloured silk is worn. False hair is common. The Persian ladies' hair is very luxuriant, and never cut, it is nearly always dyed red with henna, or with indigo

1 Dr. Wills's instructive volume again supplies this information.

to a blue-black tinge, it is naturally a glossy black. Fair hair is not esteemed. Blue eyes are not uncommon, but brown ones are the rule. A full-moon face is much admired, and a dark complexion termed "namak" (salt) is the highest native idea of beauty. Most Persian women are small, with tiny feet and hands. The figure is always lost after maturity, and no support of any kind is worn. A very short jacket, of grey colour, quite open in front, having tight sleeves with many metal buttons, is usually worn in summer, and a lined outer coat in cold weather. In winter a pair of very short white cotton socks are used, and tiny slippers with a high heel, in summer in the house ladies go often barefoot. The rest of the costume is composed of the "chubbin" or "shah-dā," short skirts of great width, held by a running string—the outer one being usually of silk, velvet, or Kashmir shawl, often trimmed with gold lace, or, among the poor, of local-patterned chintz or print. Beneath are unnumerable other garments of the same shape, varying in texture from silk and satin to print. The whole is very short, among the women of fashion extending only to the thigh. In winter an over-mantle like the "kuljāh," or coat of the man, with short sleeves, lined and trimmed with fur, is worn. Leg-coverings are now being introduced. In ancient days the Persian ladies always wore thins, as may be seen by the pictures in the South Kensington Museum. Then the two enormous legs, now so fashionable as Persian embroideries ("nakoh"), occupied a girl from childhood to marriage in making; they are all enveloped in elaborate patterns of great beauty, worked on muslin or silk. The outdoor costume of the Persian women is quite another thing. Enveloped in a huge blue sheet, with a yard of linen as a veil perforated for two inches square with minute holes, the feet thrust into two huge bags of coloured stuff, a wife is perfectly unrecognizable, even by her husband, when out of doors. The dress of all is the same, and, save in quality or coarseness, the effect is similar.

As for the children, they are always when infants swaddled, when they can walk they are dressed as little men and women, and with the dress they generally ape the manners. It is a strange custom with the Persian ladies to dress little girls as boys, and little boys as girls, till they reach the age of seven or eight years, this is often done for fun, or on account of some vow,—often, to avert the evil eye.

Geographical summary.

A summary of personal impressions of Persia may serve to convey a tolerably correct idea of the country, without the necessity of serious study or the aid of science and statistics. The reader is asked to suppose a tableland dropping to the Caspian Sea for nearly one-third of its northern frontier, and to the Persian Gulf for its southern limit. The lowlands, naturally, are the coast-tracts. In the north these are covered with forest, and the climate there is damp, feverish, relaxing, in the south they are dry and barren, and the winds are hot and violent, yet a relief to the scorching summer atmosphere. In the central highlands (that is, Persia generally) there are few rivers, and the country is either composed of parallel mountain-ranges and broad intervening plains, or of irregular mountain-masses with fertile valleys, basins, and ravines. One plain on the last is of exceptionally large extent, and is called the Salt Desert of Khurāsān. The theory that this was once a sea is supported by the circumstance that at one of its extreme edges is the village of Yūnst, so called because the prophet Jonah (Yūnās) is locally believed to have been cast up there by the whale. For irrigation the plains and valleys depend on the mountains, and at the base of these are "kanāts," or underground canals, with watercourses on the surface. Yet where rain and snow fall during the year there is scarcity of water, and where both are wanting there is always distress and sometimes famine. The valleys and ravines are more fertile than the plains, affording often bright, picturesque, and grateful prospects, while the latter are for the most part barren and sandy wastes, scored or streaked, as it were, rather than ornamented with patches of green oases. Forests are rare and, except in Gilān, not dense, numerous gardens are commonly found in the neighbourhood of large towns, not cared for as in Europe, yet pleasant in their wildness; and there are many beautiful trees usually also near the centres of population. Persian cities are not like cities in Europe. The passing stranger sees no street or house in any of them at all comparable to a respectable street or building, as

England, France, or Germany rate structural respectability. Blank mud-walls and narrow ill-paved thoroughfares are the rule, the windowed or terraced front of a Persian house is for the inner court or inner precincts of the abode, and not for the world without. Some mosques are handsome, some caravanserais solid, some bazaars highly creditable to the designer and builder, but everything is irregular, nothing is permanent, and architectural ruin blends with architectural revival in the midst of dirt, discomfort, and a total disregard of municipal method. Even Constantinople and Cairo cannot bear the ordeal of close inspection. Beautiful and attractive as they may be from without—and the first has a charm beyond description, while the second is always interesting in spite of her barbarous boulevard—they are palpably deficient in completeness within, and yet Tehran, Bagdad, Isfahan, Tabriz, Mashad, Shirāz are far behind them in civilized construction and order.

Sources.—Independently of original sources, information has been obtained from official and private journals, to which access was kindly facilitated under authority, from *Eastern Persia*, 2 vols. (1876), and various books of travel by authors already named. The writer has also to express his thanks to General Schumler, in the service of the shāh, to Mirza Hasan 'Alī Khān, attaché to the Russo-Afghan boundary commission; to Colonel Bateman-Champain, R.E., Mr W. T. Blanford, Mr Andrews (of the Indo-European telegraph), and others, who have more or less favoured him with special information, written or oral.

SECTION II.—HISTORY.

Oriental history, as told by Oriental historians, is for the majority of readers in Europe a study of little attraction. Its genealogies and oft-repeated names are wearisome; its stories of battle, murder, and rapine are monotonous and cast in one mould, the mind cannot readily impart life to the dry bones of the more prominent *dramatis personæ* by conceiving for them any flesh-and-blood individuality. The court-chronicler of an Eastern potentate writes to order, and in accordance with a precedent which fetters style and expression, and even the painter of state-portraits strives rather to turn out a conventional and model monarch than the likeness of an original human being. In the place of Kūnich, near Tehran, is a picture of Fāth 'Alī Shāh and his sons. There may be a certain waxwork beauty in some of the faces, but they give no more signs of innate character or mental idiosyncrasy than do the kings and knaves of a pack of cards.

The Timurids in these respects were exceptionally fortunate. Timur himself, their great progenitor, though not the distinct figure of an English king as delineated by Macaulay, has been handed down to us in some kind of personality in the history called *Zafarnāma*,¹ in his *Madhāt* or utterances, and in the *Tuḥfat* or institutes.² There are, moreover, portraits of him in existence which are professed likenesses. Bābar, Akbar, and Jahāngīr were either their own chroniclers or had comparatively competent men to write for them; and, to illustrate the period in which they lived, we obtain—in addition to records of events—biography, memoirs, and something also of the current sayings, writings, and doings. But the reigns of these three monarchs rather concern the annals of India than of Persia, whereas Timur has so much to do with the latter that a brief retrospect of the career of that conqueror and his immediate descendants as it affected the countries generally south of the Caspian will be an appropriate opening to the present history.

¹ Unfortunately, perhaps, there are two histories bearing this title. In the one, as Sir William Jones explains, "the Tatarian conqueror is represented as a liberal, benevolent, and illustrious prince"; in the other he is "as deformed as impenious, of a low but and detestable principles." The authenticity of the *Madhāt* is disputed.

² Both these last terms, however, are indifferently applied to the writings of Timur. *Tuḥfat* is the passive participle of *tūmah*, "to arrange," hence *tuḥfat*, "arrangement."

1405-1506. *The Timurids and Tükhmans* (1405-1499)—Timür died in 1405, when in the seventeenth year of his age and about to enter upon a new war,—an invasion of China. Besides exercising sovereignty over Transoxiana and those vast regions more or less absorbed in Asiatic Russia of the 19th century, inclusive of the Caucasus, Ashkhanan, and the lower Volga, and overrunning Mesopotamia, Syria, Asia Minor, Afghanistan, and India, he had at this time left his indelible mark upon the chief cities and provinces of Persia. Khurāsān and Mazandāran had submitted to him in 1381. Adarbāyan had shortly after followed their example, and Isfahān was seized in 1387. If the chronicles are to be trusted, the occupation of this place was accompanied by the slaughter of 70,000 inhabitants,—a number in excess of its whole population as officially estimated in 1868. From Isfahān he passed on to Shirāz, and thence returned in triumph to his own capital of Samarkand. Five years later his cruel hand was stretched out to subdue a formidable resistance in Mazandāran, and later still he was again at Shirāz, having effected the subjugation of Lüristan and other provinces in the west. It may be said that from north to south, or from Astrābād to Hormuz, the whole country had been brought within his dominion.

Timür's
success-
ors

The third son of Timür, Miran Shāh, had ruled over part of Persia in his father's lifetime; but he was said to be insane, and his incapacity for government had caused the loss of Baghidd and revolt in other provinces. His claim to succession had been put aside by Timür in favour of Pir Muhammad, the son of a deceased son, but Khalil Shāh, a son of the discarded prince, entered the lists against the nominee and won the day. The reign of this chief, however, was not of any duration. His lavish waste of time and treasure upon a fascinating mistress named Shādu'l-Mulk, the "delight of the kingdom," soon brought about his ruin and deposition, and in 1408 he gave way to Shāh Rukh, who, with the exception of Miran Shāh, was the only surviving son of Timür. In fact the uncle and nephew changed places,—the one quitting his government of Khurāsān to take possession of the Central-Asian throne, the other consenting to become governor of the empire at Samarkand. In the following year Khalil Shāh died, and the story goes that on his death Shādu'l-Mulk stabbed herself and was buried in the same tomb with her royal lover at Rhé, one of the towns which his grandfather had passed through and partly destroyed.

Shāh Rukh, the fourth son of Timür, reigned for thirty-eight years, and appears to have been a brave, generous, and enlightened monarch. He removed his capital from Samarkand to Herat, of which place he rebuilt the citadel, restoring and improving the town. Merv also profited from his attention to its material interests. Sir John Malcolm speaks of the splendour of his court and of his encouragement of men of science and learning. He sent an embassy to China, and an English version of the travels to India of one of his emissaries, 'Abdu'r-Razzāk, is to be found in the volumes of the Hakluyt Society. As regards his Persian possessions, he had some trouble in the north-west, where the Tükhmans of Asia Minor, known as the Kāra Koyrūn,¹ or "Black Sheep," led by Kāra Yūsuf² and his sons Iskandar and Jahan Shāh, had advanced upon Tabriz, the capital of Adarbāyan, a province in which they had supplanted the settlers of Halaqu, called, after him, Tikhāni. The distance from Herat—supposing that city to represent

the centre of imperial power—was favourable to intrigue and revolt in these parts. On the death of Shāh Rukh in 1446 he was succeeded by his son Ulugh Bey, whose taste for scientific pursuits and active patronage of scientific men are practically demonstrated in the astronomical tables bearing his name, quoted by European writers when determining the latitude of places in Persia. He was, moreover, himself a poet and patron of polite literature, and built a college as well as an observatory at Samarkand. On the other hand, there is no evidence to show that he did much to consolidate his grandfather's conquests south of the Caspian. Ulugh Bey was put to death by his son 'Abdu'l-Latif, who, six months later, was in his turn slain by his own soldiers. Bābar—not the illustrious founder of the Mughal dynasty in India, but an elder member of the same house—next obtained possession of the sovereign power, and established himself in the government of Khurāsān and the neighbouring countries. He did not, however, achieve any special reputation, and died after a short rule, from habitual indulgence in intemperate habits,—an abuse which he had vainly striven to check by the registry of a solemn vow. After him Abū Sa'īd, grandson of Miran Shāh, and once governor of Fārs, became a candidate for empire, and was to a great extent successful. This prince allied himself with the Uzbek Tatars, seized upon Bükhārā, entered Khurāsān, and waged war upon the Türkman tribe aforesaid, which, since the invasion of Adarbāyan, had, under Jahan Shāh, overrun Trak, Fārs, and Kerman, and pillaged Herat. But he was eventually taken prisoner by Uzun Hasan, and killed in 1468.

It is difficult to assign dates to the few events recorded in Persian history for the eighteen years following the death of 'Abdu'l-Latif, and, were it not for the happy intervention of chance European missions, the same difficulty would be felt in dealing with the period after the death of Abū Sa'īd up to the accession of Isma'il Süfi in 1499. Nor can the chain of events within the range of Persia proper be connected with certainty for the period specified by the aid of native annals or histories. Sultan Ahmad, eldest son of Abū Sa'īd, reigned in Bükhārā, his brother, Umar Shaikh, in Farghāna, but the son of the latter, the great Bābar, was driven by the Uzbeks to Kabul (Cabul) and India. More to the purpose is it that Sultan Husain Mirza, great-grandson of 'Umar Shaikh, son of Timür, reigned in Herat from 1487 to 1506. His Mirza. siege and capture of the fort of that city are incidentally told in Bābar's *Commentaries*, where he is described as an old and experienced soldier. He was a patron of learned men, and as such his reign is remarkable for many brilliant names inscribed as visitors to his court. Among others are those of the historians Mikhund and Khundamir, and the poets Jāmi and Hatifi. But at no time could the control exercised by this scion of a far-famed stock have extended over central and western Persia. The nearest approach to a sovereignty on those parts on the death of Abū Sa'īd is that of Uzun Hasan just mentioned, who achieved his greatness by individual prowess and the force of circumstances. He was the leader of the Ak Koyrūn, or "White Sheep," Türkmen, and conqueror of the "Black Sheep," whose chief, Jahan Shāh, he defeated and slew. Between the two tribes there had long been a deadly feud. Both were composed of Uzun settlers in Asia Minor, the "Black Sheep" having consolidated their power at Van, the "White" at Diarbekir.

Sir John Malcolm states that at the death of Abū Sa'īd, Sultan Husain Mirza "made himself master of the empire," and, a little later, that "Uzun Hasan, after he had made himself master of Persia, turned his arms in the direction of Turkey", but the reader is left to infer

¹ They were commonly called Kāra Koyrūn-Id and the "White Sheep." Türkmen Ak Koyrūn-Id, the affix "Id" signifying possession, i.e., possession of a standard bearing the image of a black or white sheep.

² According to Biskane, this chief killed Miran Shāh, whose dwelling-place was Tabriz.

for himself what was the real "empire" of Husain Murza, and what the limit of the "Persia" of Uzun Hasan. The second could not well be included in the first, because the Türkmans were in possession of the greater part of the Persian plateau, as understood in modern geography, while the "sultan" was luxuriating in Herat, to which Khurāsān belonged. It may be assumed as a broad fact that an empire like that acquired by Timur could not long be maintained by his descendants in its integrity, even though separate kingdoms or sovereignties were formed in its more important divisions. The retention of particular provinces, or groups of provinces, must have depended not only on the loyalty but on the capability of particular rulers and their subordinate governors; and it was manifestly impossible for an emperor at Samarkand or Herat to know what revolutions were taking effect at Baghdad, Tabriz, or similarly remote places, inland or on the seaboard, which passed away from the original "empire" through the weakness or treachery of unit agents, even when these were lineal descendants of its distinguished founder.

The Turkish adjective *uzun*, *ارزون*, "long," applied to Hasan, the Türkman monarch of Persia (called also by the Arabs *Hasanu 'l-Tawil*), is precisely the qualifying Persian word *دراز* used in the compound designation of *Aitaxerxes Longimanus*; and Malcolm quotes the statement of a Venetian envoy in evidence that Uzun Hasan was "a tall thin man, of a very open and engaging countenance." This reference, and a further notice in Markham's more recent history, supply the clue to a store of valuable information on the place and period made generally available by the publications of the Hakluyt Society. The narratives of Caterino Zeno, Barbaro, and Contarini, envoys from Venice to the court of Uzun Hasan, are in this respect especially interesting, and throw much light on the personality of one who was a genuine shāh of Iran. Zeno was sent in 1471 to incite this warlike ruler against the Ottoman sultan, and succeeded so far in his mission as to bring the two powers into open warfare. That the result was disastrous to the shāh is not surprising, but the whole affair seems to hold a comparatively unimportant place in the annals of Turkey.

Uzun Hasan had married Despina (Gr. *Δέσποινα*), daughter of the emperor of Trebizond, Calo Johannes of the house of the Comneni, and Zeno's wife was niece to this Christian princess. The relationship naturally strengthened the envoy's position at the court, and he was permitted to visit the queen in the name of the republic which he represented. Barbaro and Contarini met at Ispahan in 1474, and there paid their respects to the shāh together. The description of the royal residence—"in the middle of a field, through which a river flowed, in a very delightful locality"—recalls the palaces in that city, such as the Haft Dast, where strangers of distinction are lodged in the present day. Moreover, the continual and excessive instalments of "good confections" brought to satisfy the travellers' appetites show that the lavish hospitality of the local authorities is a time-honoured institution. Kūm and Tauris or Tabriz (then the capital) were also visited by the Italian envoys following in the royal suite, and the incidental notice of these cities, added to Contarini's formal statement that "the extensive country of Ussuncassan [*sic*] is bounded by the Ottoman empire and by Caramania," and that Siras (Shirāz) is comprehended in it, proves that at least Adarbayjan, Irāk, and the main part of the provinces to the south, inclusive of Fārs, were within the dominions of the reigning monarch.

There is good reason to suppose that Jahan Shāh, the Black Sheep Türkman, before his defeat by Uzun Hasan, had set up the standard of royalty, and Zeno, at the

outset of his travels, calls him "king of Persia"¹ in 1450 1468-149 Chardin alludes to him in the same sense, but, even admitting the validity of his precarious tenure, the limits of his sovereignty were too confined to warrant more than casual mention of his name in an historical summary.

Hasan the Long is a far more prominent figure, and has hardly received justice at the hands of the historian. Indeed, his identity seems to have been lost in the various modes of spelling his name adopted by the older chroniclers, who call him indiscriminately² *Alymbens*, *Asembeins*, *Asemboe*, *Assimbeo*, or *Ussan Cassano*. He is said to have earned the character of a wise and valiant monarch, to have reigned eleven years, to have lived to the age of seventy, and, on his death in 1477 or (according to Kiususki and Zeno) 1478, to have been succeeded on the throne of Persia by his son Ya'kūb. This prince, who had slain an elder brother, died by poison, after a reign of seven years. The dose was offered to him by his wife, who had been unfaithful to him and sought to set her paramour on his throne. Kiususki thus tells the story.

"Notwithstanding the assurance she put on at the very moment she was acting the crime, the king, her husband, fancying he saw an air of confusion in her countenance, had a suspicion of her, and required her to drink first. As she could not get off of it without condemning herself, she swallowed the poison with an affected intemperity, which deceived the king, and so encouraged him that after he had drunk of it himself, he commended it to the lips of the prince his son, then with him, who was eight years of age. The poison was so quick, that all three died of it that night in the year 1485."

Writers differ as to the succession to Ya'kūb. Zeno's account is that a son named Alamur (called also Alamut, Alvante, El-wand, and Alvung Bey) was the next king, who, "besides Persia, possessed Diarbekir and part of greater Armenia near the Euphrates." On the other hand, Kiususki states that, Ya'kūb dying childless, his relative Julaver, one of the grandees of the kingdom, seized the throne and held possession of it for three years. Basinger, it is added, succeeded him in 1488 and reigned till 1490, when a young nobleman named Rustan (Rustam) obtained the sovereign power and exercised it for seven years. This account is confirmed by Angeliello, a traveller who followed his countrymen Barbaro and Contarini to Persia, and from the two authorities combined may be gathered the further narration of the murder of Rustam and usurpation of the throne by a certain Ahmad, whose death, under torture, six months afterwards, made way for Alamut, the young son of Hasan. These discrepancies can be reconciled on reference to yet another record bound up with the narratives of the four Italians aforesaid, and of much the same period. In the *Travels of a Merchant in Persia* the story of Ya'kūb's death is supplemented by the statement that "the great lords, hearing of their king's decease, had quarrels among themselves, so that for five or six years all Persia was in a state of civil war, first one and then another of the nobles becoming sultan. At last a youth named Alamut, aged fourteen years, was raised to the throne, which he held till the succession of Shaikh Ismail." Who this young man was, is not specified, but other writers call Alamut and his brother Murād the sons of Ya'kūb, as though the relationship were unquestioned.

Now little is known, save incidentally, of Julaver or Rustam; but Basinger is the name of a nephew of Umar Shaikh, king of Fārgāna (Ferghana) and contemporary of Uzun Hasan. There was no doubt much anarchy and confusion in the interval between the death of Ya'kūb and the restoration, for two years, of the dynasty of the White Sheep. But the tender age of Alamut would, even in civilized countries, have necessitated a regency; and it may be assumed that he was the next legitimate and more

² Knolles, Purchas, Zeno.

1480-1499 generally recognized sovereign Maikham, in designating this prince the last of his house, states that he was de-throned by the renowned founder of the Safawi dynasty. This event brings us to one of the most interesting periods of Persian history, any account of which must be defective without a preliminary sketch of Isma'il Sâfi.

Shaikh
Sâfi.

The Sifti or Safawi Dynasty (1499-1736)—Shaikh Saifu 'al-Din Izhâk¹—initially de-scended from Mûsâ, the seventh mânan, was a resident at Arâdâb, south-west of the Caspian, some time during the 14th century. It is said that his reputation for sanctity attracted the attention of Timû, who sought him out in his abode, and was so charmed by the visit that he released, at the holy man's request, a number of captives of Turkish origin, or, as some affirm, Georgians, taken in the wars with Baiyazîl, who had been probably reserved for some more cruel end. The act ensured to the shaikh the constant devotion and gratitude of these men,—a feeling which was loyally maintained by their descendants for the members of his family in successive generations. Morier's description of the mausoleum erected to the memory of Shaikh Sifti in Arâdâb enables the reader to form some idea of the extraordinary veneration in which he was held. Among the offerings on the tomb,² which was covered with brocades and shawls, bunches of feathers, ostrich eggs, and other ornaments, was a golden ewer set with precious stones, said to have been presented by the Indian emperor Humâiyûn.

Shaikh
Haider

His son Sadru 'al-Din and grandson Kwâjah 'Alî (who visited Mecca and died at Jerusalem) retained the high reputation of their pious predecessor. Junaid, a grandson of the last, and not a whit less prominent in the pages of history, married a sister of Uzun Hasan, and by her had a son named Shaikh Haider, who married his cousin Martha, daughter of Uzun Hasan and Queen Despina. Three sons were the issue of this marriage, Sultan 'Alî, Ibrâhim Mirza, and the youngest, Isma'il, the date of whose birth is put down as 1480 for reasons which will appear hereafter. So great was the influence of Shaikh Haider, and so earnestly did he carry out the principles of conduct which had characterized his family for five generations, that his name has become, as it were, inseparable from the dynasty of his son Isma'il, and the term "Haideri" (leonine) is applied by many persons to indicate generally the Safawis of Persia. As to the nature of his teaching, and the peculiar tenets professed, this is hardly the place for their discussion, but it may be broadly stated that the outcome was a division of Muhammadanism vitally momentous to the world of Islam. The Persian mind was peculiarly adapted to receive the form of religion prepared for it by the philosophers of Arâdâb.

The doctrines presented were dreamy and mystic, they rejected the infallibility of human wisdom, and threw suspicion on the order and arrangement of human orthodoxy. They breathed in harmony with the feelings of a people who, partly in the Athenian spirit and wholly with Athenian perversity, were ever ready "to tell or to hear some new thing." There was free scope given for the indulgence of that poetical imagination which revels in revolution and chafes at prescriptive bondage. As Malcolm truly and happily remarks, "the natives of Persia are enthusiastically devoted to poetry, the meanest artisan of the principal cities of that kingdom can read or repeat some of the finest passages from their most admired

writers; and even the rude and unlettered soldier leaves his tent to listen with rapture to the strain of the minstrel who sings a mystic song of divine love, or recites the tale of a battle of his forefathers." And he adds, "the very essence of Sifti-ism is poetry . . . the Masnavi . . . the works of the celebrated Jâmî . . . the book of moral lessons of the eloquent Sa'ûl, and the lyric and mystic odes of Hafiz . . . to them they (the Siftis) continually refer, and the gravest writers who have defended their doctrine take their proofs from the pages of these and other poets whom they deem to have been inspired by their holy theme."

Those authorities who maintain that Ya'kûb Shâh left no son to succeed him consider valid the claim to the vacant throne of Shaikh Haider Sifti. At any rate, he could not be otherwise than formidable to a usurper such as Rustam, both from relationship to the deceased monarch and position as one of the most noted of Sifti teachers. Purchas says that Ya'kûb himself, "jealous of the multitude of Aidar's disciples and the greatness of his fame, caused him to be secretly murdered", but Kruzinski attributes the act to Rustam a few years later. Zeno, the anonymous merchant, and Angiolello affirm that the devotee was defeated and killed in battle,—the first making his conqueror to be Alamut, the second a general of Alamut's, and the third an officer sent by Rustam named Sulaiman Dey. Malcolm, following the *Zuhdatu 't-tawârikh*, relates that Shaikh Haider was vanquished and slain by the governor of Shirwan. The subsequent statement that his son, Sultan 'Alî, was seized, in company with two younger brothers, by Ya'kûb, "one of the descendants of their grandfather Uzun Hasan, who, *jealous of the numerous disciples that resorted to Arâdâb*, confined them to the hill fort of Istakhr in Fars," seems to indicate a second interpretation of the passage just extracted from Purchas, and that there is confusion of persons and incident somewhere. One of the sons here alluded to was Isma'il, whom Malcolm makes to have been only seven years of age when he fled to Gilan in 1492. Zeno states that he was then thirteen, which is much more probable,³ and the several data available for reference are in favour of this supposition.

The life of the young Sifti from this period to his assumption of royalty in 1499 was full of stirring adventure; and his career as Isma'il I. was a brilliant one for the annals of Persia. According to Zeno, who seems to have carefully recorded the events of the time, he left his temporary home on an island of Lake Van before he was eighteen, and, passing into Karabagh,⁴ between the Arras and Kur, turned in a south-easterly direction into Gilan. Here he was enabled, through the assistance of a friend of his father, to raise a small force, with which to take possession of Bâkd on the Caspian, and thence to march upon Shumakhi in Shirwan, a town abandoned to him without a struggle. Hearing, however, that Alamut was advancing to meet him, he was compelled to seek new levies from among the Jengian Christians and others. In this he was quite successful. Finding himself at the head of an army of 16,000 men, he thoroughly routed his opponents, and, having cleared the way before him, marched straight upon Tabriz, which at once surrendered. He was soon after proclaimed shâh of Persia (1499), under the designation which marked the family school of thought.

Alamut had taken refuge at Diarbekir, but his brother Murâd, at the head of an army strengthened by Turkish auxiliaries, was still in the field with the object of contesting the paternal crown. Isma'il lost no time in moving against him, and won a new victory on the plains of Tabriz. Murâd fled with a small remnant of his soldiers to Diar-

¹ So thinks the editor and annotator of the *Italian Travels in Persia*, Mr. Charles Grey.

² Possibly Kârâ-dâgh, as being the more direct road.

¹ According to Langbe, the minstrel of Chardin, his real designation was Abû 'l-Fath Izhâk, the Shaikh Saifu 'l-Hakk wa 'l-Dîn or "pure one of truth and religion."

² Langbe finds 1834 to be the year of his death. This is impossible if he was contemporary with Timû, who was born in 1336. Malcolm's opinion, derived from the *Zuhdatu 't-tawârikh*, that the conqueror's visit was paid to Sadru 'al-Dîn, is, however, the more credible theory.

bekir, the rallying-point of the White Sheep Türkmans. One authority (Zeno) states that in the following year Isma'î entered upon a new campaign in Kurdistan and Asia Minor, but that he returned to Tabriz without accomplishing his object, having been harassed by the tactics of Ala'ud-Daulah, a beylerbey, or governor in Armenia and parts of Syria. Another, ignoring these movements, says that he marched against Murâd Khân in Irak-Ajmi ('Irak-Âdjemî) and Shîrâz. This last account is extremely probable, and would show that the young Türkman had wished to make one grand effort to save Ispahan and Shîrâz (with Kâzvin and the neighbouring country), these being, after the capital Tabriz, the most important cities of Uzun Hasan's Persia. His men, however, apparently dismayed at the growing prestige of the enemy, did not support him, and he was defeated and put to flight. One writer says that he was slain in battle; and, since he appears to have made no further attempt on Persia, the statement is perhaps correct. There is similar evidence of the death of Alamut, who, it is alleged, was treacherously handed over to be killed by the shâh's own hands.

Contest
with
Shahabâd

Isma'î returned again to Tabriz (1501) "and caused great rejoicings to be made on account of his victory." In 1503 he had added to his conquests Baghdâd, Mosul, and Jazirah on the Tigris. The next year he was called to the province of Gilan to chastise a refractory ruler. Having accomplished his end, he came back to his capital and remained there in comparative quiet till 1507.¹ Malcolm's dates are somewhat at variance with the above, for he infers that Baghdâd was subdued in that particular year, but the facts remain. All writers seem to agree that in 1508 the king's attention was drawn to an invasion of Khurâsan by Shahbâd, or Shâhi Beg, the Uzbek, a descendant of Jenghiz and the most formidable opponent of Bâbar, from whom he had, seven years before, wrested the city of Samarkand, and whom he had driven from Turkestan to Kabul. Since these exploits he had obtained great successes in Tashkand, Farghâna, Hissar, Kunduz, and Khwârazm (Kharezm), and, at the time referred to, had left Samarkand intent upon mischief south and west of the Oxus, had passed the Mîrghâb, and had reached Sarakhs Isma'î encamped on this occasion at Ispahan, and there concentrated the bulk of his army,—strengthening his northern (and probably north-eastern) frontier with large bodies of cavalry. Zeno's statement that the royal troops were kept for the whole year in a state of suspense and preparation for encountering their powerful adversaries derives a colour of truth from the circumstance that, before the Uzbek army of invasion could have quite overrun the Khurâsan of Husain Mirza, it found occupation to the eastward in Herat and Kandahar; and it must have been represented, even in Mashhad, Nishâpûr, Astrâbâd, and Turshîz—all named as the scenes of conflict—rather by lieutenants than by the leader in person. Such diversion from any direct invasion of his own territories may have caused the shâh to maintain an attitude of simple watchfulness. In 1510, when Shahbâd had invaded Khurâsan the second time, and in person, and had entered the fine province of Mazandaran—then in the possession of an independent chief—it was discovered that his troops, in the wantonness of success, had ravaged the Persian province of Kerman. Shâh Isma'î had asked for redress, referring to the land encroached on as "hereditary"; and Shahbâd had replied that he did not understand on what was founded the claim "to inherit." Mutual taunt and recrimination followed; and eventually the Persian troops were put in movement, and the Uzbeks, having been divided into small detachments scattered over the country, fell back and retreated to Herat. Their leader, however,

not being in a position to oppose the shâh in the field, 1499-1514, repaired to Meiv, where he could obtain sufficient reinforcements, or whence he could, if hard pushed, retire across the Oxus. Isma'î quickly followed him there, and enticed him out to battle by the use of taunt and reproach at his remaining within walls. Shahbâd was defeated and fled, but was overtaken in his flight, surrounded, and put to the sword, together with numerous relatives and companions (see Mozsover, vol. xvi p. 749).

The next remarkable event in Isma'î's reign is his war ^{with} Sar with Sultan Salm I. Its origin may be traced to the Ottoman emperor's hatred and persecution of all heretical Moslems in his dominions, and the shâh's anger at the fanaticism which had urged him to the slaughter of 40,000 Turks suspected to have thrown off the orthodox Sunni doctrines. The declaration of war sent by Salm in the form of a letter is one of the most singular of documents, and breathes the true spirit of the age. "I, the glorious Sultan . . . address myself to thee, Amir Isma'î, chief of the Persian troops, who art like in thyname to Zohak and Ahasiab, and art destined to perish like the last Dara." Words such as these might well provoke a less haughty potentate than the Shîfî, and, when to them was added the accusation of iniquity, perjury, blasphemy, impiety, heresy, and schism, it is not surprising that the response was a ready resort to arms.² As a preliminary, however, to this decisive step Isma'î replied to the sultan in a calm and dignified letter, denying the existence of a *casus belli*, expressing willingness to resume peaceful relations, and regretting the mode of address it had been thought fit to adopt towards himself, but he nullified the conciliatory passages by the ironical conclusion that the sultan's communication must have emanated from the brain of a secretary who had taken an overdose of narcotics,—a remark the significance of which was aggravated by the accompaniment of a box of opium, and the popular belief that Salm was addicted to the use of the drug.

The sultan's army advanced into Adarbaijan and western Persia through Tokat and Arznjan. Isma'î had at this time the greater number of his soldiers employed in his newly-conquered province of Khurâsan, and was driven to raise new levies in Kurdistan to obtain a sufficient force to resist the invasion. It is asserted by some that his frontier then extended westward to Sivas, a city situated in a large high plain watered by the Kizil Irmak, and that thence to Khoi, 90 miles west of Tabriz, he followed the approved and often successful tactics of ravaging and retreating, so as to deprive his advancing enemy of supplies. There is good evidence to show that the Turkish janissaries were within an ace of open revolt, and that but for extraordinary firmness in dealing with them they would have abandoned their leader in his intended march upon Tabriz. In fine, at or near Khoi, the frontier-town of Adarbaijan, the battle (1514) was fought between the two rival monarchs, ending in the defeat of the Persians and the triumphant entry of Salm into their capital.

There are stirring accounts of that action and of the gallant deeds performed by Salm and Isma'î, both personally engaged in it, as well as by their generals.³ Others maintain that Isma'î was not present at all.⁴ It is tolerably

¹ Cressy's *History of the Ottoman Turks*.

² Knolles, Malcolm, Cressy, Markham, &c.

³ Zeno. Angeliello says that "the Sophi monarch had left for Tauris [Tabriz] in order to assemble more troops." Kruasnik infers much to the same effect, for he notes that "Salm came in person and took Tauris from Isma'î, but at the noise of his approach was obliged to retreat with precipitation." The battle must thus have been fought and the victory gained when the shâh was himself absent. Yet Markham quotes a journal which thus records his feats of prowess: "It was in vain that the brave Shâh, with a blow of his scure, severed a chain with which the Turkish guns were fastened together to resist the shock of the Persian cavalry."

⁴ Angeliello.

1514-1561. certain that the Turks won the day by a better organization of the arms of the military service, superiority of numbers, and more especially the use of artillery. On the side of the Persians the force consisted of little more than cavalry.

Salm remained at Tabriz no more than eight days. Levying a contribution at that city of a large number of its skilled artisans, whom he sent off to Constantinople, he marched thence towards Karalah with intent to fix his winter quarters in those parts and newly invade Persia in the spring, but the insubordination of his troops rendered necessary his speedy return to Turkey. His expedition, if not very glorious, had not been unproductive of visible fruits. Besides humbling the power of an arrogant enemy, he had conquered and annexed to his dominions the provinces of Diarbekir and Kurdistan.

From 1514 to 1524, although the hostile feeling between the two countries was very strong, there was no serious nor open warfare. Salm's attention was diverted from Persia to Egypt, Isma'il took advantage of the sultan's death in 1519 to overrun and subdue unfortunate Georgia, as Jahan Shah of the "Black Sheep" had done before him, but Sulaiman had not won without cause his attribute of "great," and was too strong a successor to the imperial throne to admit of retaliatory invasion being carried out with impunity at the cost of Turkey.

Isma'il's
character:

In 1524 Isma'il died¹ at Ardabil when on a pilgrimage to the tomb of his father "The Persians dwell with rapture on his character," writes Sir John Malcolm, for they deem him "not only the founder of a great dynasty, but the person to whom that faith in which they glory owes its establishment as a national religion. He is styled in their histories Shah Shian, or 'king of the Shahs,' an appellation which marks the affection with which his memory is regarded. Though he may not be entitled to their extravagant praises, he certainly was an able and valiant monarch." And he quotes a note handed down by Purchas from a contemporary European traveller which reports of him thus. "His subjects deemed him a saint, and made use of his name in their prayers. Many disdained to wear armour when they fought under Isma'il, and so enthusiastic were his soldiers in their new faith that they used to bare their breasts to their enemies and court death, exclaiming, 'Shah! Shah!' to make the holy cause for which they fought."

The proposition has been already laid down that Oriental celebrities, whether heroes or tyrants, as depicted by native painters, bear commonly so strong a family resemblance one with another that the European reader is unable to discriminate between the 'Abbases and Akbars, the Timurs and the Nâdurs; and it cannot be pleaded that Isma'il Shah Sîfî is an exception to the rule. He is belauded and reviled according to the lights or prejudices of his historian. "Reputed one of the greatest and most famous kings that ever ruled in the East,"² he is at the same time charged with acts of the greatest cruelty and most flagrant vice.³ Purchas, apparently guided by the "Italian merchant" and Angolello, has described him as "of fawre countenance, of reasonable stature, thicke and large in the shoulder, shauen al but the mustaches, left-handed, and stronger than any of his nobles."

Shah
Tahmasp

Shah Tahmasp, the eldest of the four sons of Isma'il,

¹ Malcolm says 1523, Krummke 1525, Angolello heard of his death at Ouzo in August 1524. Krummke adds that he was forty-five years of age.

² Krummke.

³ See chaps. xiv and xxii. of *Travels of a Merchant on Persia*, Hakluyt reprint, 1873.

⁴ Angolello calls him "Shiathemes." As an instance of the absurd transliterating current in France as in England the word "Achi-tacon" may be mentioned. It is explained in Chardin's text to mean "les hôpitaux à Tauris c'est-à-dire ceux où l'on fait grâces de vies." Chardin's editor remarks, "La dernière partie de ce mot

succeeded to the throne on the death of his father.⁵ The principal occurrences in his reign, placed as nearly as possible in chronological order, were a renewal of war with the Uzbeks, who had again invaded Khurāsān, and the overthrow of their army (1527), the recovery of Baghaddād from a Kurdish usurper (1528), the settlement of an internal feud between Kizil-bāsh tribes (Shāmlu and Tukūlu), contending for the custody of the royal person, by the slaughter of the more unruly of the disputants (1529), the rescue of Khurāsān from a fresh irruption, and of Heiat from a besieging army of Uzbeks (1530); a new invasion of the Ottomans, from which Persia was saved rather by the severity of her climate than by the prowess of her warriors (1533), the wresting of Baghaddād from Persia by the emperor Sulaiman (1534), the king's youngest brother's rebellion and the actual seizure of Herat, necessitating the recovery of that city and a march to Kandahar (1536); the temporary loss of Kandahar in the following year (1537), when the governor ceded it to Prince Kamran, son of Bābar, the hospitable reception accorded to the Indian emperor Humāyūn (1543), the rebellion of the shāh's brother next in age, Ilkhāsh, who, by his alliance with the sultan, brought on a war with Turkey (1548),⁶ and finally a fresh expedition to Georgia, followed by a revengeful incursion which resulted in the enforced bondage of thousands of the inhabitants (1552).

Bayazid, a son of the Turkish emperor, rebelled, and War his army was beaten in 1559 by the imperial troops at with Konah in Asia Minor. He fled to Persia and took refuge with Shah Tahmasp, who pledged himself to give him a permanent asylum. Sulaiman's demand, however, for extradition or execution was too stern and peremptory for refusal, the pledge was broken, and the prince was delivered up to the messengers sent to take him. Another account ignores the pledge and makes the surrender of the guest to have been caused by his own bad conduct. Whatever the motive, the act itself was highly appreciated by Sulaiman, and became the means of cementing a recently-concluded peace between the two monarchs, which theretofore, perhaps, had been more formal than real. Perhaps the domestic affliction of the emperor and the anarchy which in his later years had spread in his dominions had, however, more to do with the maintenance of tranquillity than any mere personal feeling. It is to be feared that at this time not only was there religious fanaticism at work to stir up the mutual hatred ever existing between Sunni and Shī'ah, but the intrigue of European courts was probably directed towards the maintenance of an hostility which deterred the sultan from aggressive operations north and west of Constantinople. "His only the Persian stands between us and ruin" is the reported saying of Busbecq, ambassador at Sulaiman's court on the part of Ferdinand of Austria, "the Turk would fain be upon us, but he keeps him back."

In 1561 Anthony Jenkinson arrived in Persia with

est méconnaissable, et je ne pus deviner quel mot Persan signifiait profusion a pu donner naissance à la corruption qu'on voit ici." In other words, the first syllable "ach" (Auclicie *ach*) was understood in its common acceptance for "food" or "victuals"; but "tacon" was naturally a puzzler. The solution of the whole difficulty is, however,

to be found in the Turco-Persian *خانه* *khānah* *khānah*, pronounced by Turks *hasta* *homa*, and more vulgarly *asta* *khon*, and even to a French ear *ach-tacon*, a hospital, literally a sick-house. This word is undoubtedly current at Tabriz and throughout northern Persia.

⁵ The other brothers were Ilkhāsh, Behlīm, and Sām Muzā, each having had his particular appanage assigned him.

⁶ Professor Cressy says that "Sulaiman led his armies against the Persians in several campaigns (1558, 1559, 1564, 1565, 1566), during which the Turks often suffered severely through the difficult nature of the countries traversed, as well as through the bravery and activity of the enemy." All the years given were in the reign of Tahmasp I.

a letter from Queen Elizabeth to the sháh He was to treat with his majesty of "Trafique and Commerce for our English Marchants,"¹ but his reception was not encouraging, and led to no result of importance.

Tahmâsp died in 1576, after a reign of about fifty-two years He must have been some sixty-six years of age, having come to the throne at fourteen Writers describe him as a robust man, of middle stature, wide-hipped, and of tawny complexion. His long reign was hardly a profitable or glorious one to Persia, especially in respect of the losses to Turkey He was not wanting in soldierly qualities, but his virtues were rather negative than decided While one writer acquits him of any remarkable vices, and even calls him prudent and generous, another taxes him with love of ease, avarice, and injustice If it be true that he abandoned his old capital, Tabriz, for Kazvin because the former was too close to Ardabil, his birthplace, and reminded him too keenly of the mean condition of his grandfather, Shaikh Haider, his *morale* must have been low indeed.²

The deceased sháh had a numerous progeny, and on his death his fifth son, Haider Mirza, proclaimed himself king, supported in his pretensions by the Kizil-bâsh tribe of Ustajulâ. Another tribe, the Afshâr, insisted on the succession of the fourth son, Isma'îl. Had it not been that there were two candidates in the field, the contention would have resembled that which arose shortly after Tahmâsp's accession. As it was, the claim to guardianship of the royal person was put forward, but each tribe declared for its own particular nominee. Finally Isma'îl, profiting from his brother's weak character and the intrigues set on foot against him, obtained his object, and was brought from a prison to receive the crown.

The reign of Isma'îl II. was a short one,—less than two years He was found dead in the house of a confectioner in Kazvin, having left the world either drunk, drugged, or poisoned. No steps were taken to verify the circumstances, for the event itself was a cause of general relief and joy. He has been represented as a tyrant of the worst type, but it is only right to observe that his youth and part of his manhood had been embittered by injustice and ill-treatment. A prisoner in a dreary fort for years, if his accession to power was marked by cruelties such as disgraced the name of Tiberius, he had, like Tiberius, been brutalized by a hard and continuous provocation.

He was succeeded by his eldest brother, Muhammad Mirza, otherwise called Muhammad Khudâbanda, whose claim to sovereignty had been originally put aside on the ground of physical infirmity. A few words will dispose of this prince's career as a sovereign of Persia. Historians are divided as to his qualities, though he certainly failed to prove, in any shape, equal to the opportunity opened to him. He had the good sense to trust his state affairs almost wholly to an able minister; but he was cowardly enough to deliver up that minister into the hands of his enemies. His kingdom was distracted by intestine divisions and rebellion, and the foe appeared also from without. On the east his youngest son, 'Abbâs, held possession of Khurâsan; on the west the sultan's troops again entered Adarbâyan and took Tabriz. His eldest son, Hamza Mirza, nobly upheld his fortunes to the utmost of his power, reduced the rebel chieftains, and forced the Turks to make peace and retire, but he was stabbed to death by an assassin. On the news of his death reaching Khurâsan, Murshid Kûlî Khân, leader of the Ustajulâ Kizil-bâsh, who had made good in fight his claims to the guardianship of 'Abbâs, at once conducted the young prince from that province to Kazvin, and occupied the royal city. The object was evident, and in accordance with the popular feeling. 'Abbâs,

who had been proclaimed king by the nobles at Nishâpûr 1561-1609, some two or three years before this occurrence, may be said to have now undertaken in earnest the cares of sovereignty. His ill-starred father, at no time more than a nominal ruler, was at Shîráz, apparently deserted by soldiers and people. Malcolm infers that he died a natural death, but when³ or where is not stated. Alluding to him at this period, he writes, "He was never afterwards mentioned." The stories originated by Olearius that Hamza and a second son, Isma'îl, each reigned a few months may refer to attempts on the part of the Kizil-bâsh chiefs to assert, for one or the other, a share of sovereign power, but do not seem to merit particular consideration.

Shâh 'Abbâs, the Great, commenced his long and glorious 'Abbâs reign (1586) by retracing his steps towards Khurâsan, which had been reinvaded by the Uzbeks almost immediately after his departure thence with the Kizil-bâsh chief. They had besieged and taken Herat, killed the governor, plundered the town, and laid waste the surrounding country. 'Abbâs advanced to Mashhad, the provincial capital and great resort of Persian pilgrims as the burial-place of Imâm Riza, but owing to internal troubles he was compelled to return to Kazvin without going farther east. In his absence 'Abdul Mumîn Khân, the Uzbek commander, attacked the sacred city, obtained possession of it while the shâh lay helplessly ill at Tehran, and allowed his savage soldiers full licence to kill and plunder. The whole kingdom was perplexed, and 'Abbâs had much work to restore confidence and tranquillity. But circumstances rendered impossible his immediate renewal of the Khurâsan warfare. He was summoned to Shîráz to put down rebellion in Fârs, and, that being over, before he could give his individual attention to drive out the Uzbeks, he had to devise the best means of securing himself against Turkish invasions threatening from the west. He had been engaged in a war with Murâd III. in Georgia. Peace was concluded between the two sovereigns in 1590, but the terms were unfavourable to Persia, who lost thereby Tabriz and one or more of the Caspian ports. A somewhat offensive stipulation was included in the treaty to the effect that Persians were not to cause any longer the first three khahfs, —a sort of privilege previously enjoyed by Shî'ahs as part and parcel of their religious faith.

In 1597 'Abbâs renewed operations against the Uzbeks, and succeeded in recovering on them Herat and Khurâsan. Eastward he extended his dominions to Balkh, and in the south his generals made the conquest of Bahraïn (Bahrein), on the Arabian side of the Persian Gulf, and the territory and islands of the Persian seaboard, inclusive of the mountainous provinces of Lar. He strengthened his position in Khurâsan by planting colonies of Kurdish horsemen on the frontier, or along what is called the "stak" or skirt of the Turkman mountains north of Persia. In 1601 the war with the Ottoman empire, which had been partially renewed prior to the death of Sultan Murâd in 1595, with little success on the Turkish side, was now entered upon by 'Abbâs with more vigour. Taking advantage of the weakness of his ancient enemy in the days of the poor voluptuary Muhammad III., he began rapidly to recover the provinces which Persia had lost in preceding reigns, and continued to reap his advantages in succeeding campaigns under Ahmad I., until under Othman II. a peace was signed restoring to Persia the boundaries which she had obtained under the first Isma'îl. On the other side Kandahar, which Tahmâsp's lieutenant had yielded to the Great Moghal, was recovered from that potentate in 1609. The following slightly abridged extract from Clements Markham's history of Persia, relating to distinguished Englishmen of the period, will be an appro-

Isma'îl II.

Muhammad Khudâbanda

¹ Purchas.

² Kruzinski.

³ Kruzinski says in 1586.

1598-1641. private conclusion of the narrative of events as above summarized

European envoy's "In 1598 Sir Anthony and Robert Shirley, two English gentlemen, arrived at the Shāh's court at Kāzin with a numerous retinue. They were well received, and after some months Sir Anthony returned to Europe with credentials to several Christian princes. Robert, with five Englishmen, remained at the court of the Shāh. He married a Caucasian lady named Teresa, and in 1607 was sent by 'Abbās as his ambassador to James I. of England after travelling through Europe and remaining a long time at Madrid. Sir Robert Shirley and his Caucasian wife landed in his native country in 1611, and was received by James I. with every respect, as the ambassador of a powerful sovereign. His object was to open a trade between England and Persia, but he did not meet with success, owing to the opposition of the Levant merchants. He sailed from Dover with his wife in 1613, and after visiting the court of the Great Mogul, reached Isfahan in 1615. He was soon afterwards sent as ambassador to Spain, where he remained until 1622. In 1618, while Shirley was residing at Madrid, the government of Philip III. of Spain sent an embassy to Persia, at the head of which was Don García de Silva y Figueroa, an able and learned diplomatist, who made good use of his time in collecting information, and in writing a detailed account of his mission and of Persia, including a Life of Tīmūr. García de Silva landed at Ormuz, and proceeded thence to Shirāz, where he was most hospitably entertained. The ambassador was forwarded to Kāzin in June, and had an audience of the Shāh, who received him very graciously. Many conversations afterwards took place between 'Abbās and the stately Spaniard, touching Spanish victories over the Turks, and other matters of state. But the main object of the embassy, namely, security for Ormuz, which was now, through the absorption of Portugal, a Spanish possession, was not obtained. García de Silva returned home by way of Aleppo, and embarked at Tybriat for France, 12th November 1616, devoutly praying that his friend the Shāh might be victorious over the Great Turk.

"In the meanwhile Shāh 'Abbās was occupied in establishing and regulating the important trade of the Persian Gulf. Lar had previously been completely subdued, and Fars was ruled by one of the Shāh's most trusty and faithful servants. In 1622 the Shāh determined on the expulsion of the Portuguese from the Persian Gulf. They had seized upon the Isle of Ormuz in 1507, under the famous name of the 'Abbāsids, and in their hands it had attained great prosperity, and become the emporium of all the commodities of the gulf. But they were quite independent of the Shāh of Persia, whose jealousy and resentment they excited. Assisted by the English East India Company, 'Abbās collected a fleet at Gombroon, and embarked a Persian force under Imām Kāfī Khān. They laid siege to Ormuz, and the Portuguese, having no hope of success, were forced to surrender. The island is now covered with desolate heaps of ruins. The port of Gombroon, on the mainland, and sheltered by the islands of Kishm and Ormuz, rose on the fall of the Portuguese city. It received the name of *Bandar 'Abbās*, and both the English and Dutch were allowed to establish factories there.

"In 1623 Sir Robert Shirley again arrived in England on an embassy from the Shāh, and in 1627 sailed for Persia, in company with Sir Doumer Cotton, who was sent as envoy from Charles I. of England to the Shāh of Persia. They landed at Gombroon in 1628, and Sir Doumer obtained a very gracious reception from 'Abbās, at Kāzin, where he soon afterwards died. Sir Robert Shirley had now grown old in the service of Persia. On his return he was lighted by the Shāh and his favourite, Muhammad 'Alī Beg, and he died at Kāzin in July 1628. Of all the brave and gallant adventures of the glorious age of Elizabeth, Sir Robert Shirley was by far the greatest traveller, with the exception, perhaps, of Anthony Jenkinson."

Character and power of 'Abbās.

"At the age of seventy, after a reign of forty-two years, 'Abbās died at his favourite palace of Farahabad, on the coast of Mazandaran, on the night of the 27th January 1628. Perhaps the most distinguished of all Persian kings, his fame was not merely local but world-wide. Isfahan was his capital, and he did much for its embellishment and enlargement. At his court were ambassadors from England, Russia, Spain, Portugal, Holland, and India. To his Christian subjects he was a kind and tolerant ruler. His conquests have been already mentioned; but there are few sovereigns of an age so closely following the mediæval who have done such real good to their country by material improvement and development of resources. The establishment of internal tranquillity, the expulsion of interlopers and marauders like Turks and Uzbeks, the introduction of salutary laws, and the promotion of public works of utility—

these alone would render remarkable his two-score years of enlightened government. Even in the last quarter of the 19th century the gratified traveller admires the magnificent caravanserais which afford him rest and shelter, and the solid bridges which facilitate his "chapan" (posting), and of which, if he ask particulars, he invariably hears that they were constructed by Shāh 'Abbās.¹ With a fine face, "of which the most remarkable features were a high nose and a keen and piercing eye,"² he is said to have been below the middle height, robust, active, a sportsman, and capable of much endurance. It is, however, to be regretted that this monarch's memory is tarnished by more than one dark deed. The murder of his eldest son, Sūfi Mirza, and the cruel treatment of the two younger brothers, were stains which could not be obliterated from the page of history by an after-repentance. All that can be now said or done in the matter is to repeat the testimony of historians that his grief for the loss of Sūfi Mirza was profound, and that, on his death-bed, he nominated that prince's son (his own grandson) his successor. Krusinski adds that, on being told at that time by his confidential officers of a prophecy which some astrologers had made to the effect that the new king would reign but three months at most, he replied, "Let him reign as long as he can, though it be but three days. I shall be glad of the assurance that one day, at least, he will have that crown upon his head which was due to the prince, his father."

Sām Mirza was seventeen years of age when the nobles, Shāh in fulfilment of the charge committed to them, took him Sūfi from the "haram" and proclaimed him king under the title of Shāh Sūfi. He reigned fourteen years, and his reign was a succession of barbarities, which can only be attributed to an evil disposition acted upon by an education not only wanting the *ingenue artes* but void of all civilizing elements and influences. Taught to read and write, his diversions were to shoot with the bow and ride upon an ass. There was a rumour, moreover, that his father, to stunt the possible growth of wit, ordered him a daily supply of opium. When left to his own devices, he became a drunkard and a murderer, and is accused of the death of his mother, sister, and favourite queen. Among many other sufferers Imām Kāfī Khān, conqueror of Lar and Ormuz, the son of one of 'Abbās's most famous generals, founder of a college at Shirāz, and otherwise a public benefactor, fell a victim to his savage cruelty. During his reign the Uzbeks were driven back from Khurāsān, and a rebellion was suppressed in Gilān; but Kandahar was again handed over to the Mughals of Delhi (Delhi), and Bagdad retaken from Persia by Sultan Murād,—both serious national losses. Tavernier, without charging the Shāh with injustice to Christians, mentions the circumstance that "the first and only European ever publicly executed in Persia was in his reign." He was a watchmaker named Rodolph Stadler, who had slain a Persian on suspicion of intrigue with his wife. Offered his life if he became a Moslem, he resolutely declined the proposal, and was decapitated. His tomb is to be recognized at Isfahan by the words "Cygit Rodolphus" on a long wide slab. Shāh Sūfi died (1641) at Kashan and was buried at Kūm.

His son, 'Abbās II., who succeeded him, appears to 'Abbās have possessed some good qualities, and to have been^{II} actuated by liberal sentiments, but his accession to the throne in extreme youth, and the restraint put upon him by his advisers, were fatal to healthy development, and on arriving at an age which should have been that

¹ It would be unfair, however, to forget that these are, in parts of Persia, especially Kāzin, some fine caravanserais whose construction is due to the munificence of governors or private individuals. 'Abbās seems certainly to have set the example, and to have furnished the best specimens. ² Malacolin.

of discretion he became wilfully indiscreet. Beyond the credit of regaining Kandahar, an operation which he is said to have directed in person when barely sixteen, there is not much to mark the period of his life to the outer world. As to foreign relations, he received embassies from Europe and a deputation from the French East India Company; he sought to conciliate the Uzbeks by treating their refugee chiefs with unusual honour and sumptuous hospitality; he kept on good terms with Turkey; he forgave the hostility of a Georgian prince when brought to him a captive; and he was tolerant to all religions,—always regarding Christians with especial favour. But he was a drunkard and a debaucher, and chroniclers are divided in opinion as to whether he died from the effects of drink or licentious living. That he changed the system of blinding his relatives from passing a hot metal over the open eye to an extraction of the whole pupil is indicative of gross brutality. 'Abbās II. died (1668) at the age of thirty-eight, after a reign of twenty-seven years, and was buried at Kūm in the same mosque as his father.

Sulaiman.

'Abbās was succeeded by his son, Shāh Šūfi II., crowned a second time under the name of Shāh Sulaiman.

Sir John Malcolm remarks that from the middle of the reign of 'Abbās II. till the elevation of Nādir Shāh, or for about eighty years, there are but few Persian histories which give particular or authentic accounts of current events; and he attributes this circumstance to the absence for nearly a century of any one political event of magnitude. "And yet," he writes—

"this extraordinary calm was productive of no advantage to Persia. The princes, nobles, and high officers of that kingdom, were, it is true, exempt from the dangers of foreign or internal war; but their property and their lives were the sport of a succession of weak, cruel, and debauched monarchs. The lower orders were exposed to more evils than the higher, but they became every day more unwarlike; and what they gained by that tranquillity which the state enjoyed, lost almost all its value when they ceased to be able to defend it. This period was distinguished by no glorious achievements. No characters arose on which the historian could dwell with delight. The nation may be said to have existed upon the reputation which it had before acquired till all it possessed was gone, and till it became, from the slow but certain progress of a gradual and vicious decay, incapable of one effort to avert that dreadful misery and ruin in which it was involved by the invasion of a few Afghan tribes, whose conquest of Persia effected so indelible a disgrace upon that country, that we cannot be surprised that its historians have shrunk from the painful and degrading narration."

Though weak, dissolute, and cruel, Sulaiman is not without his penegrists. Chardin, whose testimony is all the more valuable from the fact that he was contemporary with him, relates many stories characteristic of his temper and habits. The statement that on one occasion he compelled his grand wazir to drink to intoxication, and on another to have his hair cut by a barber after the unorthodox fashion of the day, contrary to the old man's religious prejudices, belongs to the record of unworthy and disgraceful acts. He kept up a court at Isfahan which surprised and delighted his foreign visitors, among whom were ambassadors from European states; and one learned writer, Kaempfer, credits him with wisdom and good policy. *Au reste*, during his reign Khurāsān was invaded by the ever-encroaching Uzbeks, the Kapchak Tatars plundered the shores of the Caspian, and the island of Kiahm was taken by the Dutch; but the kingdom suffered otherwise no material loss. He died in 1694, in the forty-ninth year of his age and twenty-sixth of his reign.

About a year before his death he is described by Sanson,¹ a missionary from the French king Louis XIV., as tall, strong, and active, "a fine prince, a little too effeminate for a monarch," with "a Roman nose very well proportioned to other parts," very large blue eyes, and "a middling mouth, a beard painted black, shav'd round, and

well turn'd, even to his ears." His air was "affable, 1641-1715. but nevertheless majestic"; he had a masculine and agreeable voice, and sweet manner of speaking, and was "so very engaging that when you but bow'd to him he seem'd in some measure to return it by a courteous inclining of his head, and which he always did smiling." The same writer greatly praises him for his kindness to Christian missionaries.

Krusinaki's memoir is full of particulars regarding Shāh Husān.

Husān, the successor of Sulaiman. He had an elder and a younger brother, sons of the same mother, but the eldest had been put to death by his father's orders, and the youngest secreted by maternal precaution lest a similar fate should overtake him. There was, however, a second candidate for power in the person of a half-brother, 'Abbās. The latter prince was the worthier of the throne, but the other better suited the policy of the eunuchs and those noblemen who had the right of election. Indeed Sulaiman himself is reported to have told the grandees around him, in his last days, that "if they were for a martial king that would always keep his foot in the stirrup they ought to choose Mirza 'Abbās, but that if they wished for a peaceable reign and a pacific king they ought to fix their eyes upon Husān." But he himself made no definite choice.

Husān was selected, as might have been anticipated. On his accession (1694) he displayed his attachment to religious observances by prohibiting the use of wine,—causing all wine-vessels to be brought out of the royal cellars and destroyed, and forbidding the Armenians to sell any more of their stock in Isfahan. The shāh's grandmother, by feigning herself sick and dependent upon wine only for cure, obtained reversal of the edict; and the process by which the venerable lady made her son, in pure regard to herself, drink the first glass with her (and thereby become a confirmed tippler) is woven into a story good enough to attract a writer of vaudevilles. For the following account of Shāh Husān and his successors to the accession of Nādir Shāh, Markham's abstract history has been mainly utilized.

The new king soon fell under the influence of mullas, and was led so far to forget his own origin as to persecute the Šūfīs. Though good-hearted, he was weak and licentious; and once out of the hands of the fanatical party he became ensnared by women and entangled in harem intrigues. For twenty years a profound peace prevailed throughout the empire, but it was the precursor of a terrible storm destined to destroy the Safawī dynasty and scatter calamity broadcast over Persia. In the mountainous districts of Kandahar and Kabul the hardy tribes of Afghans had for centuries led a wild and almost independent life. They were divided into two great branches—the Ghilzīs of Ghazni and Kabul, and the Šāduzīs of Kandahar and Herat. More than one fanciful explanation is given of the etymology of the first name; the most probable one is perhaps that which connects them with a Turki tribe of Khalji or Khilaji, a word not improbably derived from the Turkish *Kılıç*, "a sword," the affix "ch" or "ji" always denoting possession. The second take their name from Šādu, their leader in the time of Shāh 'Abbās. In 1702 a newly-appointed governor, one Shāh Nawīs, called Gūrji Khān from having been "wall" or ruler of Georgia, arrived at Kandahar with a tolerably large force. He was a clever and energetic man, and had been instructed to take severe measures with the Afghans, some of whom were suspected of intriguing to restore the city to the Delhi emperor. At this time Kandahar had been for sixty years uninterruptedly in the shāh's possession. The governor appears to have given great offence by the harshness of his proceedings, and a Ghilzī chief named Mir Wāz, who had complained of his tyranny, was sent a prisoner to Isfahan. This person had much ability and no little cunning. He was permitted to go on a pilgrimage to Mecca, and on his return in 1708 he so gained upon the confidence of the Persian court that he was allowed to go back to his country. At Kandahar he planned a conspiracy against the Government, slew Gūrji Khān and his retinue, seized the city, defeated two Persian armies sent against him, and died a natural death in 1715. His brother, Mir 'Abdallāh, succeeded him in the government of the Afghans, but after a few months, Mahmūd, a son of Mir Wāz, a very young man, murdered his uncle and assumed the title of a sovereign prince.

In the meanwhile dark clouds were rising all round the horizon

¹ *Present State of Persia*, London, 1695.

1715-1738 ready to overthrow the doomed Safawi dynasty. The Saluzai tribe revolted at Herat, and declared itself independent in 1717; the Kurds overran the country round Hamadan, the Uzbeks desolated Khuzistan, and the Arabs of Maskat seized the island of Al-Bahrein and threatened Basrah. 'Abbas thus surrounded by dangers on all sides, the wretched shah was benighted. He made one vain attempt to regain his possessions in the Persian Gulf, but the Portuguese fleet which had promised to transport his troops to Al-Bahrein was defeated by the union of Maskat and forced to retreat to Goa.

Afghan
invasion

The court of Isfahan had no sooner received tidings of this disaster than Mahmud, with a large army of Afghans, invaded Persia in the year 1721, and Kázar, the chief of the Afghans, advanced to within four days' march from the city of Isfahan. The shah offered him a sum of money to return to Kandahar, but the Afghan answered by advancing to a place called Gulnabad, within 9 miles of the capital. The effeminate and luxurious courtiers were taken completely by surprise, no preparation had been made, and the capital was unprovided with either provisions or ammunition. The ill-disciplined Persian army, hastily collected, advanced to attack the rebels. Its centre was led by Shahrí 'Ali Khán, covered by twenty-four field-pieces. The wálí of Arábia commanded the right, and the 'imámsháh d-danish, or prime minister, the left wing. The whole force amounted to 50,000 men, while the Afghans could not count half that number.

On 8th March 1722 the richly-dressed hosts of Persia appeared before the little band of the Afghans, who were scorched and disfigured by their long sun, and the wálí of Arábia commenced the battle by attacking the left wing of the Afghans with great fury, routing it, and plundering their camp. The prime minister immediately afterwards attacked the enemy's right wing, but was routed, and the Afghans, taking advantage of the confusion, captured the Persian guns and turned them on the Persian centre, who fled in confusion without striking a blow. The wálí of Arábia escaped into Isfahan, and Mahmud the Afghan gained a complete victory. Fifteen thousand Persians remained dead on the field. A name now seized on the surrounding inhabitants, thousands of country people fled into the city, and the squares and streets were filled with a helpless multitude. Isfahan was then one of the most magnificent cities in Asia, containing more than 600,000 inhabitants. After his victory Mahmud seized on the Armenian suburb of Julfa, and invaded the domed city, but Tahmasp, son of the shah, had previously escaped into the mountains of Elam, where the Persian soon began to stir his heart upon the besieged, and in September Sháh Husáin offered to capitulate. He agreed to abdicate in favour of Mahmud, and to deliver himself up as a prisoner. Having been conducted to the Afghan camp, he fixed the royal plume of feathers on the young rebel's turban with his own hand, and 4000 Afghans were ordered to occupy the palace and gates of the city. Mahmud entered Isfahan in triumph, with the captive shah on his left hand, and seating himself on the throne in the royal palace, he was saluted as sovereign of Persia by the unfortunate Husáin. When Tahmasp, the fugitive prince, received tidings of the abdication of his father he at once assumed the title of shah at Kazvin.

Mah-
mud's
suc-
cession.

Turkey and Russia were not slow to take advantage of the calamities of Persia. The Turks seized on Tiflis, Tabriz, and Hamadan, while Peter the Great, whose aid had been sought by the friendless Tahmasp, fitted out a fleet on the Caspian. The Russians occupied Shirvan, and the province of Gilan on the south-west corner of the Caspian¹, and Peter made a treaty with Tahmasp II in July 1722, by which he agreed to drive the Afghans out of Persia on condition that Derband (Derbend), Báká, Gilan, Mazandaran, and Ashkhabad were ceded to Russia in perpetuity. These were all the richest and most important northern provinces of Persia.

Meanwhile the cruel and cruel king was deluging Isfahan with the blood of its citizens. Dreading rebellion, in 1723 he invited three hundred of the principal Persian nobility to a banquet and massacred them. To prevent then children rising up in vengeance they were all murdered also. Then he proceeded to slaughter vast numbers of the citizens of Isfahan, until the place was nearly depopulated. Not content with this, in February 1725 he assembled all the captives of the royal family, except the shah, in the courtyard of the palace, and caused them all to be murdered, commencing the massacre with his own hand. The wretched Husáin,

famished with grief, rushed to this scene of horror, and was himself wounded in endeavouring vainly to save his infant son, only five years of age. All the males of the royal family, except Husáin himself, Tahmasp, and two children, are said to have perished. At length the inhuman massacre terminated, at the only age of twenty-seven, on 23d April 1725. With scarcely any nook, he had round shoulders, a broad face with a flat nose, a thin head, and squinting eyes, which were generally downcast.

Mahmud was succeeded in his usurpation by his first cousin Ashraf, the son of 'Alí 'Abdalláh. He was a brave but cruel Afghan. He gave the dethroned shah a handsome allowance, and stove, by a mild policy, to acquire popularity. In 1727, after a short reign, he signed a treaty with the Turks, acknowledging the sultan as chief of the Moslems. But the fortunate state of Tahmasp II. was now beginning to rise, and the days of Afghan usurpation were numbered. He had collected a small army in Mazandaran, and was supported by Fath 'Ali Khán, the powerful chief of the Kárái tribe. In 1737 the fugitive shah was joined by Nádir Kúli, a robber chief, who was already famous for his undaunted valour, and who was destined to become the mightiest conqueror of the age. He married Rati 'Ali, and, having easily appeased the shah, received the command of the royal army. In 1729 Ashraf-Espul, became alarmed at these formidable preparations in the north, and son of led an Afghan army into Khuzistan, where he was defeated by Afghans, Nádir at Damghan, and forced to retreat. The Persian general followed close in his rear, and again entirely defeated him outside Isfahan in November of the same year. The Afghans fled through the town, and Ashraf, murdering the poor old shah, Hassan, on his way, hurried with the wreck of his army towards Shiráz. On 16th November the victorious Nádir entered Isfahan, and was soon followed by his master, the young shah Tahmasp II., who burst into tears when he beheld the ruined and defaced walls of the palace of his ancestors. His mother, who had escaped the numerous massacres by disguising herself as a slave, and performing the most degrading offices, now came forth and threw herself into his arms. Nádir did not give his enemies time to recover from their defeat. He followed them up, and again utterly routed them in January 1730. Ashraf tried to escape to Kandahar almost alone, but was murdered by a party of Baluch robbers; and thus, by the genius of Nádir, his native land was delivered from the terrible Afghan invader.

The ambition of Nádir, however, was far greater than his loyalty to the pretext of necessity. He dethroned Tahmasp II. in 1732, and sent him a prisoner into Khuristan, where he was murdered some years afterwards by Nádir's son, while the conqueror was absent on his Indian expedition. For a short time the wily usurper placed Tahmasp's son on the throne, a little child, with the title of 'Abbas III., while he contented himself with the office of regent. Poor little 'Abbas died at a very convenient time, in Fall of the year 1756, and Nádir then threw off the mask. He was proclaimed shah of Persia by a vast assemblage on the plain of Moghan.

By the fall of the Safawi dynasty Persia lost, as it were, her race of national monarchs, considered not only in respect of origin and birthplace but in essence and in spirit. The Persians have never been governed by more truly representative kings than Isma'íl, Tahmasp, and 'Abbas; and, whatever their faults and failings, they were Persian and peculiar to Persians. Thoroughly to realize this truth we must endeavour for a moment to change our own for the Oriental standpoint, and accept even the murders and excesses committed as an outcome of the age, place, and circumstances, and as natural as are the freaks of unrestrained childhood. Regarded in a sober English spirit, the reign of the great 'Abbas is rendered mythical by crime. No sovereign could be great in the estimation of civilized Europe who acted as he did on certain occasions.

No victory or healthy legislation could compensate for moments of madness, which, under Western orthodoxy, must mar a whole career. But something liberal in the philosophy of their progenitors threw an attractiveness over the earlier Safawi kings which was wanting in those who came after them. In course of time the old philosophical element disappeared; and one of Shah Husáin's immediate predecessors not only disavowed all sympathy with Sáfáism but threatened to crush it where detected. The fact is that, two centuries after Sháh Isma'íl's accession to the throne, the Safawi race of kings was effete; and it became necessary to make room for a more vigorous if not a more lasting rule. Nádir was the strong man for

¹ We have an account of the Afghan invasion and sack of Isfahan from an eye-witness, Fathir Krasinski, procurator of the Jesuits at that place, whose interesting work was translated into English in the last century.

² In 1722 Sultan Husáin sent an embassy to the Russians, seeking aid against the Afghans. In May 1723 a flotilla descended the Volga, commanded by Czar Peter, and on 13th July the Russian flag first waved over the Caspian. Gilan was occupied by 6000 men under General Matsechkin.

³ The Russians remained in Gilan until 1734, when they were obliged to evacuate it, owing to the unhealthiness of the climate.

the hour and occasion. He has been designated a "robber chief"; but his antecedents, like those of many others who have filled the position, have redeeming points of melodramatic interest. He was driven to this mode of life by injustice, and raised to consideration above ordinary banditti by ability as much as by physical force. It was the reputation he had thus obtained which caused Saifu 'd-Din Beg, a general of Shāh Tahmāsp, and chief of a tribe, to unite his fortunes to Nādir's, and so enable him to rise on the ladder of his ambition. That Nādir misused his advantages by acts of treachery is not to be denied. Such was, unfortunately, one of the visible roads to success in those barbarous times.

Persia in 1738 A map attached to Krusinski's volumes (see Plate VIII.) illustrates the extent of Persian territory in 1738, or one year before Ashraf was finally defeated by Nādir, and some eight years prior to the date on which Nādir was himself proclaimed king. It shows, during the reign of the Safawis, Tiflis, Erivan, Khoi, and Baghdād to have been within the limits of Persia on the west, and in like manner Balkh and Kandahar to have been included within the eastern border. There is, however, also shown, as a result of the Afghan intrusion and the impotency of the later Safawī kings, a long broad strip of country to the west, including Tabriz and Hamadan, marked "conquests of the Turks," and the whole west shore of the Caspian from Astrakhan to Mazandaran marked "conquests of the czar of Muscovy"; Makran, written Meccan, is designated "a warlike independent nation." If further allowance be made for the district held by the Afghan invaders as part of their own country, it will be seen how greatly the extent of Persia proper was reduced, and what a work Nādir had before him to restore the kingdom to its former proportions.

But the former proportions had been partly reverted to, and would doubtless have been in some respects exceeded, both in Afghanistan and the Ottoman dominions and on the shores of the Caspian, by the action of this indefatigable general, had not his sovereign master, Tahmāsp II, acting on his own account, been led into a premature treaty with the Turks. Nādir's anger and indignation had been great at this weak proceeding; indeed, he had made it the ostensible cause of the shah's deposition. He had addressed letters to all the military chiefs of the country, calling upon them for support; he had sent an envoy to Constantinople insisting upon the sultan's restoration of the Persian provinces still in his possession—that is, Georgia and part of Adarbāijān,—and he had threatened Baghdād with assault. As regent, he had failed twice in taking the city of the Khalifs, but on the second occasion he had defeated and killed its gallant defender, Topal 'Othman, and he had succeeded in regaining Tiflis, Kara, and Erivan.¹

Russia and Turkey, naturally hostile to one another, had taken occasion of the weakness of Persia to forget their mutual quarrels and unite to plunder the tottering kingdom of the Safawī kings. A partition treaty had been signed between these two powers in 1723, by which the czar was to take Astrābād, Mazandaran, Gilān, part of Shirvan and Daghestan, while the acquisitions of the Porte were to be traced out by a line drawn from the junction of the Aras and Kur rivers, and passing along by Ardabil, Tabriz, and Hamadan, and thence to Karman-shāh. Tahmāsp was to retain the rest of his paternal kingdom on condition of his recognizing the treaty. The ingenious diplomacy of Russia in this transaction was manifested in the fact that she had already acquired the greater part of the territory allotted to her, while Turkey had to obtain her share by further conquest. But the combination to despoil a feeble neighbour was outwitted

by the energy of a military commander of remarkable type.

Nādir Shāh.—Nādir, it has been said, was proclaimed Nādir-shāh in the plains of Moghan in 1736. Mirza Mahdi relates how this event was brought about by his address to the assembled nobles and officers on the morning of the 'Nāu-rūz,' or Persian New-Year's Day, the response to that appeal being the offer of the crown. In the spirit of the third English Richard, he refused to accept the high dignity, but eventually suffered his petitioners, on certain conditions, to "buckle fortune on his back." The conditions were that the crown should be hereditary in his family, that the claim of the Safawis was to be held for ever extinct, and that measures should be taken to bring the Shī'ahs to accept uniformity of worship with the Sunnis. The mulla bāshī (or high priest) objecting to the last, Nādir ordered him to be strangled, a command which was carried out on the spot. On the day following, the agreement having been ratified between sovereign and people, he was proclaimed emperor of Persia. At Kazvin the ceremony of inauguration took place. Having girt on the royal semitar and put the crown on his head, he took the accustomed oath. The edict expressing the royal will on the religious question is dated in June, but the date of coronation is uncertain. From Kazvin Nādir moved to Isfahan, where he organized an army for a proposed expedition against Kandahar, then in the possession of a brother of Mahmūd, the conqueror of Shāh Husain. But before setting out for Afghanistan he took measures to secure the internal quiet of Persia, attacking and seizing in his stronghold the chief of the marauding Bakhtiāris, whom he put to death, retaining many of his men for service as soldiers. With an army of 80,000 men he marched through Khurāsān and Sīstān to Kandahar, which city he blockaded ineffectually for a year, but it finally capitulated on the loss of the citadel. Balkh fell to Rūzā Kūli, the king's son, who, moreover, crossed the Oxus and defeated the Uzbeks in battle. Besides tracing out the lines of Nadirabad, a town since merged in modern Kandahar, Nādir had taken advantage of the time available and of opportunities presented to enlist a large number of men from the Abdālī and Ghilzī tribes. It is said that as many as 16,000 were at his disposal. His rejection of the Shī'ah tenets as a state religion seems to have propitiated the Sunni Afghans, and it is not to be otherwise wondered at that a man of his warlike habits should have succeeded in attaching many of the rough mountaineers to his person. Such a force, in addition to his own army, rendered him a truly formidable foe, and the prospect which now opened out before him must have fired his heart and the hearts of his warriors with restless exultation.

He had sent an ambassador into Hindustan requesting the Mughal emperor to order the surrender of certain unruly Afghans who had taken refuge within Indian territory, but no satisfactory reply was given, and obstacles were thrown in the way of the return of the embassy. The Persian monarch, not sorry perhaps to find a plausible pretext for encroachment in a quarter so full of promise to booty-seeking soldiers, pursued some of the fugitives through Ghazni to Kabul, which city was then under the immediate control of Nāsar Khān, governor of eastern Afghanistan, for Muhammad Shāh of Delhi. This functionary, alarmed at the near approach of the Persians, fled to Peshāwar. Kabul had long been considered not only an integral part but also one of the main gates of the Indian empire; notwithstanding a stout resistance on the part of its commandant, Shīr or Shīrāz Khān, the place was stormed and carried (1738) by Nādir, who, after slaughtering the greater part of the garrison, took possession of it and moved on to the eastward. Mirza Mahdi relates

¹ Malacoin

1738-1747 that from the Kabul plain he addressed a new reconnaissance to the Delhi court, but that his envoy was arrested and killed, and his escort compelled to return by the governor of Jalalabad. The same authority notes the occupation of the latter place by Persian troops and the march thither from Gandamak. There are some doubts as to the exact route now taken, but it was probably through the Khair (Khyber) Pass that he passed into the Peshawar plain, for it was there that he first defeated the imperial forces.

The invasion of India had now fairly commenced, and its successful progress and consummation were mere questions of time. It will not do to cite a triumphal march of an irresistible hoard in example of what may still be achieved by an inroad upon modern Hindustan. The prestige of this Eastern Napoleon was immense. It had not only reached but had been very keenly felt at Delhi before the conquering army had arrived. There was no actual religious war, all sectarian distinction had been disavowed, the contest was between vigorous Muhammadans and effete Muhammadans. Nâdir had not, like Cæsar, come, and seen, and conquered. His way had been prepared by circumstances, and as he progressed from day to day his army of invaders increased. There must have been larger accessions by voluntary recruits than losses by death or desertion. The victory on the plain of Karnal, whether accomplished by sheer fighting or the intervention of treachery, was the natural outcome of the previous situation, it was the shifting of the scene as anticipated and prepared, and the submission of the emperor followed as a matter of course. But the coming and going of Nâdir are studies quite as interesting and instructive as the coming and going of Alexander, and belong to comparatively recent days.

Delhi must have experienced a sense of relief at the departure of its conqueror, whose residence there had been rendered painfully memorable by carnage and riot. The marriage of his son to the grand-daughter of Aurangzib and the formal restoration of the crown to the dethroned emperor, both prominent parts of the first pageant, were doubtless politic, and his parting counsels to the wretched Muhammad Shah were, it is probable, good and appropriate, but the descendant of Bâbur could not easily forget how humiliating a chapter in history would remain to be written against him. The return march of Nâdir to Persia is not recorded with precision. On the 5th May 1739 he left the gardens of Shalimar, north of Delhi, to proceed, by Lahore and Peshawar, through the passes to Kabul. Thence he seems to have returned to Kandahar and, either in person or by his lieutenants, to have recrossed the Indus into Sind. But the subjection of Nûr Muhammad, the Kalbora chief then ruling in that province, would hardly have been a sufficient inducement to bring back the great Nâdir Kûli so far as 'Umakot, and in May 1740—just one year after his departure from Delhi—he was in Herat displaying the imperial throne and other costly trophies to the gaze of the admiring inhabitants. Sind was certainly included in the cession to him by Muhammad Shah of "all the territories westward of the river Attok," but only that portion of it, such as Thattah (Tatta), situated on the right bank of the Indus.

North-
ern con-
quests.

From Herat he moved upon Balkh and Bûkhara, and at a short distance from the latter city received the submission of Abd'ul-Fâiz Khân, the Uzbek ruler, whom he restored to his throne on condition that the Oxus should be the acknowledged boundary between the two empires. The khân of Khwârizm was his next opponent; and, as this chief rejected conciliation, and had given serious cause of offence by repeated depredations in Persian territory, he was made prisoner and doomed, with some of his officers, to execution. Nâdir then visited the strong

fortress of Kelat, a place which now bears his name and to which he was greatly attached as the scene of his boyish exploits, and Mashhad, which he constituted the capital of his empire. Here he spent three months in festivity, and if extension of dominion be a cause for gratulation, he could well justify the demonstration, for he had extended his boundary on the east to the Indus, and to the Oxus on the north.

On the south he was restricted by the Arabian Ocean Wars and Persian Gulf, but the west remained open to his further progress. He had in the first place to revenge the death of his brother Ilâûm Khân, slain by the Leaghians, and a campaign against the Tuiks might follow in due course. The first movement was unsuccessful, and indirectly attended with disastrous consequences. Nâdir, when hastening to the support of some Afghan levies who were doing good service, was fired at and wounded by a stray assailant, suspecting his son, Riza Kûli, of complicity, he commanded the unfortunate prince to be seized and deprived of sight. From that time the heroism of the monarch appeared to die out. He became moose, tyrannical, and suspicious. An easy victory over the Turks gave him but little additional glory, and he readily concluded a peace with the sultan which brought but insignificant gain to Persia.¹ Another battle won from the Ottoman troops near Diarbekû by Nâsîr Ullah Muza, the young prince who had married a princess of Delhi, left matters much the same as before. "It was agreed that prisoners on both sides should be released, that Persian pilgrims going to the holy cities of Mecca and Medina should be protected, and that the whole of the provinces of Iak and Adarbayjan should remain with Persia, except an inconsiderable territory that had belonged to the Turkish Government in the time of Shah Ismail, the first of the Suffavi kings."²

The last years of Nâdir's life were full of internal trouble. On the part of the sovereign, murders and executions, on that of his subjects, revolt and conspiracy,—these were the ordinary topics of common interest throughout the country. Such a state of things could not last, and certain proserbed persons plotted together for the destruction of a sovereign who had now become a half-demented tyrant. He was despatched by Salah Bey, captain of his guards, to whom, with three others, was committed the work of his assassination (1747). He was some sixty years of age, and had reigned eleven years. About the time of setting out on his Indian expedition he was described as a most comely man, upwards of 6 feet high, well-proportioned, of robust make and constitution, inclined to be fat, but prevented by the fatigue he underwent, with fine, large black eyes and eyebrows; of sanguine complexion, made more manly by the influence of sun and weather; a loud, strong voice; a moderate wine-drinker, fond of simple diet, such as pillos and plain dishes, but often neglectful of meals altogether, and satisfied, if occasion required, with parched peas and water, always to be procured.³

Malcolm winds up a long account of his idiosyncrasies with the following

"The character of this wonderful man is, perhaps, exhibited in its truest colours in those impressions which the memory of his actions has left upon the minds of his countrymen. They speak of him as a deliverer and a destroyer, but while they expatiate with pride upon his deeds of glory, they dwell with more pity than horror upon the cruel enormities which disgraced the latter years of his reign; and neither his crimes, nor the attempt he made to abolish their religion, have subdued their gratitude and veneration for the hero, who served in the breasts of his degraded countrymen

¹ Professor Cressy says the war broke out in 1743, but was terminated in 1746 by a treaty which made little change in the old arrangements fixed under Murâd IV.

² Malcolm ³ Fraser's *History of Nâdir Shah* (1742).

a sense of their former fame, and restored Persia to her independence as a nation."

During the reign of Nâdir an attempt was made to establish a British Caspian trade with Persia. The names of Jonas Hanway and John Elton were honourably connected with this undertaking; and the former has left most valuable records of the time and country.

Period of anarchy.

From Nâdir Shâh to the Kajâr Dynasty.—After the death of Nâdir Shâh something like anarchy prevailed for thirteen years in the greater part of Persia as it existed under Shâh 'Abbâs. No sooner had the crime become known than Ahmad Khân, chief of the Abdâlî Afghans, marched off rapidly with his men to Kandahar and took possession of that city and a certain amount of treasure. The chief of the Bakhtiâris, Raslud, also with treasure, fled to the mountains, from which his people had been drawn prior to the Indian expedition; and the conspirators who had done the murderous deed invited 'Alî, a nephew of the deceased monarch, to ascend the vacant throne. By the action of Ahmad Abdâlî, Afghanistan was at once lost to the Persian crown, for this leader was strong enough to found an independent kingdom. The Bakhtiâri encouraged his brother, 'Alî Mardân, to compete for the succession to Nâdir; and the nominee of the disaffected party hastened from Sîstân to Mashhad to take advantage of his nomination. The prince was welcomed by his subjects, he told them that the murder of his uncle was due to his own instigation, and, in order to conciliate them towards him in a practical manner, remitted the revenues of the current year and all extraordinary taxes for the two years following.

Taking the title of 'Adil Shâh, or the "just" king, he commenced his reign by putting to death the two princes Rûza Kûlî and Nâsr Ullâh, as well as all relatives who could, in his estimation, be considered his competitors, with the exception of Shâh Rukh, son of Rûza Kûlî, whom he spared in case a lineal descendant of Nâdir should at any time be required by the people. His calculations proved, however, no wiser than beneficent. He had not removed all dangerous members of the royal house, nor had he gauged the temper of the times or people. 'Adil Shâh was soon dethroned by his own brother, Ibrahim, and he in his turn was defeated by the adherents of Shâh Rukh, who made their leader king.

Shah Rukh.

This young prince had a better and more legitimate title than that of the grandson of Nâdir, whose usurpation was too recent an occurrence to have eradicated and supplanted a comparatively ancient dynasty of national kings. He was also grandson, on the mother's side, of the Safawî Shâh Husain. Amiable, generous, and liberal-minded, and of prepossessing exterior, he proved to be a popular prince. But his friends and supporters had done well to have left him in honourable obscurity, for he was neither of an age nor character to rule over a people led hither and thither by turbulent and disaffected chiefs, ever divided by the conflicting interests of personal ambition. No sooner had his claim to succession been admitted than his authority was subverted. Sa'îd Muhammad, son of Mirza Dâûd, a chief mulla at Mashhad, whose mother was the reputed daughter of Sulaiman, collecting a body of men, and assuming the name of his maternal grandfather, declared himself king, and imprisoned and blinded Shâh Rukh. Yûsuf 'Alî, the general commanding the royal troops, came to the rescue, defeated and slew Sulaiman, and replaced his master on the throne, reserving to himself the protectorship or regency. A new combination of chiefs, of which J'âfir the Kurd and Mir 'Alam the Arabian are the principal names handed down, brought about the death of Yûsuf 'Alî and the second imprisonment of Shâh Rukh. These events were followed by a quarrel terminating in the supremacy of the Arab. At this juncture

Ahmad Shâh Abdâlî reappeared in Persian Khurâsen from Herat; he attacked and took possession of Mashhad, slew Mir 'Alam, and, pledging the local chiefs to support the blinded prince in retaining the kingdom of his grandfather, he returned to Afghanistan. But thenceforward this unfortunate young man was a mere shadow of royalty, and his purely local power and prestige had no further influence whatever on Persia as a country.

The land was partitioned among several distinguished persons, who had of old been biding their opportunities, or were born of the occasion. Foremost among these was Muhammad Hasan Khân, hereditary chief of those Kajârs who were established in the south-east corner of the Caspian. His father, Fath 'Alî Khân, after sheltering Shâh Tahmasp II. at his home in Astrâbâd, and long acting as one of his most loyal supporters, had been put to death by Nâdir, who had appointed a successor to his chiefdom from the "Yukhî" or "upper" Kajârs, instead of from his own, the "Ashgha," or "lower." Muhammad, with his brother, had fled to the Tûrkman, by whose aid he had attempted the recovery of Astrâbâd, but had not succeeded in regaining a permanent footing there until Nâdir had been removed. On the murder of the tyrant he had raised the standard of independence, successfully resisted Ahmad Shâh and his Afghans, who sought to check his progress in the interests of Shâh Rukh, and eventually brought under his own sway the valuable provinces of Gilân, Mazandaran, and Astrâbâd,—quite a little kingdom in itself. In the large important province of Adarbâyan, Azad Khân, one of Nâdir's generals, had established a separate government, and 'Alî Mardân, brother of the Bakhtiâri chief, took forcible possession of Isfahan, empowering Shâh Rukh's governor, Abd 'l-Fath Khân, to act for the new master instead of the old.

Had 'Alî Mardân declared himself an independent ruler he would have been by far the most important of the three persons named. But such usurpation at the old Safawî capital would have been too flagrant an act for general assent, so he put forward Isma'îl, a nephew of Shâh Husain, as the representative of sovereignty, and himself as one of his two ministers,—the other being Kâim Khân, a young chief of the Zend Kurds. Shâh Isma'îl, it need scarcely be said, was a mere nominal king, and possessed no real authority, but the ministers were strong men in their way, and the Zend especially promised to be useful in his generation, for he had many high and excellent qualities. After a time 'Alî Mardân was assassinated, and Karim Khân became the sole living power at Isfahan. The story of the period is thus told by Watson.

"The three rivals, Karim, Azad, and Muhammad Hasan, professed to settle by means of the sword, the question as to which of them was to be the sole master of Persia. A three-sided war then ensued, in the course of which each of the combatants in turn prevailed, seemed at one time sure to be the final conqueror. Karim, when he had arranged matters at Isfahan, marched to the borders of Mazandaran, where the governor of that province was ready to meet him. After a closely-contested battle victory remained with Muhammad Hasan, who, however, was unable to follow up the foe, as he had to return in order to encounter Azad. That leader had invaded Gilân, but, on the news reaching him of the victory which the governor of Mazandaran had gained, he thought it prudent to retrace his steps to Sulaimaniyeh. Karim summoned the scattered forces at Tehran, and retired to Isfahan to prepare for a second campaign. When he again took the field it was not to measure himself once more with the Kajâr chief, but to put down the pretensions of Azad. The wary Afghan, however, shut himself up in Kasvin, a position from which he was enabled to inflict much injury on the army of Karim, while his own troops remained unharmed.

¹ There were three branches of the Kajâr tribe, i. e., the Suldis, Tingkidî, and Jakâyzer. The last, according to Watson, became settled in Irm and Turan, and seem at first to have given their name to all the tribe.

² Watson. Maloolim says that Gilân was under one of its own chiefs, Huda'yât Khân.

1752-1753 behind the walls of the town. Karīm returned a second time to Isfahan, and in the following spring advanced again to meet Ādā. A pitched battle took place between them, in which the army of Karīm was defeated. He retreated to the capital, closely pressed by the foe. Thence he continued his way to Shirāz, but Ādā was still upon his traces. He then threw himself upon the mercy of the Ālābs of the Gaur, or hot country, near the Persian Gulf, to whom the name of the Afghans was hateful, and who rose in a body to fight upon Ādā. Karīm, by their aid, once more repaired his losses and advanced on Isfahan, while Muhammad Hasan with fifty thousand men was coming from the opposite direction, ready to encounter either the Afghan or the Zand. The Afghan did not await his coming, but retired to his government of Tabriz.

"The Zand issued from Isfahan, and was a second time defeated in a pitched battle by the Karīm. Karīm took refuge behind the walls of Shirāz, and all the efforts of the enemy to dislodge him were ineffectual. Muhammad Hasan Khan in the following year turned his attention to Ādā-bāqān. Ādā was no longer in a position to oppose him in the field, and he in turn became master of every place of importance in the province, while Ādā had to seek assistance in vain—from the Pasha of Baghdad, and then from his former enemy, the Tsar of Georgia. Next year the conquering Karīm returned to Shirāz to make himself the only rival who now stood in his way. On his side were 80,000 men, commanded by a general who had twice defeated the Zand chief on an equal field. Karīm was still obliged to take shelter in Shirāz, and to employ artifice in order to supply the place of the force in which he was deficient. Nor were his efforts in this respect unattended with success: seduced by his gold, many of the troops of the Karīm began to desert; then judges came to meet him, the neighbourhood of Shirāz was laid waste, so as to destroy the sources from which Muhammad Hasan drew his provisions, by degrees his army vanished, and he had finally to retreat with ignominy to Isfahan with the few men that remained to him. Finding his position there to be untenable, he retreated still further to the country of his own tribe, while his rival advanced to Isfahan, where he received the submission of nearly all the chief cities of Persia. The ablest of Karīm's generals, Shakhsh 'Alī, was sent in pursuit of the Karīm chief. The fidelity of the commander to whom that chieftain had confided the care of the pass leading into Mazandān, was corrupted, and, as no further retreat was open to him, he found himself under the necessity of fighting. The combat which ensued resulted in his complete defeat, although he presented to his followers an example of the most determined valour. While attempting to effect his escape he was recognised by the chief of the other branch of the Karīm tribe, who had deserted his cause, and who had a blood-feud with him, in pursuance of which he now put him to death.

Karīm Khan. "For nineteen years after this event Karīm Khan ruled with the title of wakīl, or regent, over the whole of Persia, excepting the province of Khurāsān. He made Shirāz the seat of his government, and by means of his brothers put down every attempt which was made to subvert his authority. The rule of the great Zand chief was just and mild, and he is on the whole, considering his education and the circumstances under which he was placed, one of the most faultless characters to be met with in Persian history."

Karīm Khan died at his capital and favourite residence in 1779 in the twentieth year of his reign, and, it is said, in the eightieth of his age. He built the great bazaar of Shirāz, otherwise embellishing and improving the city, had a tomb constructed over the remains of Háfiz, and repaired the "tūrbāt" at the grave of Sa'ād, outside the walls. He encouraged commerce and agriculture, gave much attention to the state of affairs along the shores of the Persian Gulf, and carefully studied the welfare of the Armenian community settled in his dominions. In his time the British factory was removed from Gombroon to Bushahr (Bushhe). It would be pleasant, if space allowed, to repeat the anecdotes creditable to his memory; for it is unusual to find so worthy a figure in Oriental annals.

Zakī. On Karīm's death a new period of anarchy supervened. His brother, Zakī, a cruel and vindictive chief, and withal a pardoned rebel—for, when governor of Isfahan, he had revolted against Karīm—assumed the government. At the same time he proclaimed Abū'l-Fath Khān, second son of the deceased monarch, and his brother Muhammad 'Alī, joint-successors to the throne. The seizure of the citadel at Shirāz by the adherents of the former, among whom were the more influential of the Zends, may have induced him to

adopt this measure as one of prudent conciliation. But the garrison held out, and, to avoid a protracted siege, he had recourse to treachery. The suspicious nobles were solemnly adjured to trust themselves to his keeping, under promise of forgiveness. They believed his professions, tendered their submission, and were cruelly butchered. Zakī did not long enjoy the fruits of his perfidious dealing. The death of Karīm Khān had raised two formidable adversaries to mar his peace, who could not fail to bring on a dénouement of some kind seriously affecting his interests.

Agha Muhammad, son of Muhammad Hasan, the Kājār chief of Astrākhād, a prisoner at large in Shirāz, was in the environs of that city awaiting intelligence of the old king's decease, and, hearing it, instantly escaped to Mazandaran, there to gather his tribesmen together and put himself in a condition to compete for the crown of Persia. Taken prisoner by Nādir and barbarously mutilated by 'Ādil Shāh, he had afterwards found means to rejoin his people, but had surrendered himself to Karīm Khān when his father was killed in battle. On the other hand, Sādik, brother to Zakī, who had won considerable and deserved repute by the capture of Basrah from the Turkish governor, abandoned his hold of the conquered town on hearing of the death of Karīm, and appeared with his army before Shirāz. To provide against the intended action of the first, Zakī detached his nephew, 'Alī Murād, at the head of his best troops to proceed with all speed to the north; and, as to the second, the seizure of such families of Sādik's followers as were then within the walls of the town, and other violent measures, struck such dismay into the hearts of the besieging soldiers that they dispersed and abandoned their leader to his fate. From Karman, however, where he found an asylum, the latter addressed an urgent appeal for assistance to 'Alī Murād. This chief, encamped at Tehran when the communication reached him, submitted the matter to his men, who decided against Zakī, but put forward their own captain as the only master they would acknowledge. 'Alī Murād, leaving the pursuit of Agha Muhammad, then returned to Isfahan, where he was received with satisfaction, on the declaration that his one object was to restore to his lawful inheritance the eldest son of Karīm Khān, whom Zakī had set aside in favour of a younger brother. The sequel is full of dramatic interest. Zakī, enraged at his nephew's desertion, marched out of Shirāz towards Isfahan. On his way he came to the town of Yazdikhast,—a singular place, steep and rugged, something like a section, or three upper stories, of the old town of Edinburgh set upon a natural foundation of crumbling stone. It comes upon the traveller as an abrupt elevation in a dreary vale, and the surrounding scenery savours of the weird and romantic. Here he demanded a sum of money from the inhabitants, claiming it as part of secreted revenue; the demand was refused, and eighteen of the head men were thrown down the precipice beneath his window; a "sayyid," or holy man, was the next victim, and his wife and daughter were to be given over to the soldiery, when a suddenly-formed conspiracy took effect, and Zakī's own life was taken in retribution for his guilt (1779).

When intelligence of these events reached Karman, Sādik Khān hastened to Shirāz, proclaimed himself king in place of Abū'l-Fath Khān, whom he declared incompetent to reign owing to dissipation and indolence, and put out the eyes of the young prince. He despatched his son J'i'āfir to assume the government of Isfahan, and watch the movements of 'Alī Murād, who appears to have been then absent from that city; and he gave a younger son, 'Alī Naki, command of an army in the field. A campaign ensued with success from time to time on either side, but ending in the capture of Shirāz and assumption of sovereignty by 'Alī 'Alī Murād, who caused Sādik Khān to be put to death.

From this period up to the accession of Agha Muhammad Khán the summarized history of Markham will supply the principal facts required.

'AH Murád reigned over Persia until 1785, and carried on a successful war with Agha Muhammad in Mazandaran, defeating him in several engagements, and occupying Tehran and Sari. He died on his way from the former place to Isfahan, and was succeeded by J'afar, son of Sâdik,¹ who reigned at Shíráz, assisted in the government by an able but unprincipled "kalántar," or head magistrate, named Hajj Ibrahim. This ruler was poisoned by the agency of conspirators, one of whom, Sâdyul Murád, succeeded to the throne. Hajj Ibrahim, however, contriving to maintain the loyalty of the citizens towards the Zend reigning family, the

Latif 'Ali
Khán.

usurper was killed, and Latif 'Ali Khán, son of J'afar, proclaimed king. He had hastened to Shíráz on hearing of his father's death and received a warm welcome from the inhabitants. Hajj Ibrahim became his chief adviser, and a new minister was found for him in Mirza Husain Shírázi. At the time of his accession Latif 'Ali Khán was only in his twentieth year, very handsome, tall, graceful, and an excellent horseman. To his fearless bravery and indomitable perseverance he united the nobler virtues of generosity and magnanimity. He formed many enduring friendships, and, though false-hearted traitors flocked him in the hour of adversity, others loyally stood by him to the last. While diffusing widely in character, he was a worthy successor of Kaím Khán, the great founder of the Zend dynasty. Latif 'Ali Khán had not been many months on the throne when Agha Muhammad advanced to attack him, and invested the city of Shíráz, but retreated soon afterwards to Tehran, which he had made the capital of his dominions. The young king then enjoyed a short period of peace. Afterwards, in the year 1790, he collected his forces and marched against the Kajás, in the direction of Isfahan. But Hajj Ibrahim had been intriguing against his kind young sovereign, to whose family he owed everything, not only with his officers and soldiers but also with Agha Muhammad, the chief of the Kajás, and arch-enemy of the Zends. Latif 'Ali Khán was suddenly deserted by the whole of his army, except seventy faithful followers, and when he retreated to Shíráz he found the gates closed against him by Hajj Ibrahim, who held the city for the Kajár chief. Thence falling back upon Bushahr, he found that the shahk of that town had also betrayed him. Surrounded by treason on every side, basely deserted alike by his dearest friends and by those who had been raised from the dust by his family, yet still undaunted by the black clouds that gathered round him, with his little band he boldly attacked and routed the chief of Bushahr and blockaded the city of Shíráz. His unconquerable valour gained him many followers, and he defeated an army sent against him by the Kajárs in 1792.

Agha Muhammad then advanced in person against his gallant young rival. He encountered with an army of 60,000 men on the plain of Mazandaran, where Latif 'Ali Khán, in the dead of night, suddenly attacked the camp of his enemy with only a few hundred followers. The Kajárs were completely routed and thrown into confusion; but Agha Muhammad, with extraordinary presence of mind, remained in his tent, and at the first appearance of dawn his "muazzin," or public crier, was ordered to call the faithful to morning prayer as usual. Astonished at this, the few Zend cavaliers, thinking that the whole army of Kajárs had returned, fled with precipitation, leaving the Shírázi Latif 'Ali Khán in possession of Mazandaran. The successful Kajár then entered Shíráz, and promoted the traitor Hajj Ibrahim to be his wazir. Latif 'Ali Khán took refuge with the hospitable chief of Tabas in the heart of Khúdsán, where he succeeded in collecting a few followers, but, advancing into Fárs, he was again defeated, and forced to take refuge at Kandahar.

In 1794, however, the undaunted prince once more crossed the Persian frontier, determined to make a last effort, and seize again his throne or die in the attempt. He occupied the city of Kerman, then a flourishing commercial town, half-way between the Persian Gulf and the province of Khúrsán. It had a very fine bazaar and was well fortified. Agha Muhammad besieged it with a large army in 1795, and, after a stout resistance, the gates were opened through treachery. For three hours the gallant young warrior fought in the streets with determined valour, but in vain. When he saw that all hope was gone he spun a last faithful home against the ranks of the enemy and, with only three followers, fought his way through the Kajár host and escaped to Bam-Narmashir, the most eastern district of the province of Kerman on the borders of Sístán.

Finally at the escape of his rival, the savage conqueror ordered a general massacre, 20,000 women and children were sold into slavery, and 70,000 eyes of the inhabitants of Kerman were brought to Agha Muhammad on a platter. The monster counted them with the point of his dagger, then, turning to his minister, he exclaimed, "If one had been wanting I would have made up the

number with your own eyes." Káman has never fully recovered 1779-1788, from the effects of this fiend's atrocities.

Latif 'Ali Khán took refuge in the town of Bam, but the governor of Námashir, anxious to propitiate the conqueror, basely surrounded him as he was mounting his faithful horse Khán to seek a more secure asylum. The young prince fought heavily, but, being badly wounded and overpowered by numbers, he was seized and sent to the camp of the Kajár chief. The spot where he was seized at Bam, when morning his horse, was marked by a pyramid, formed, by order of his revengeful enemy, of the skulls of the most faithful of his adherents. The most heinous indignities and atrocities were committed upon his person by the cruel Kajár, in whose breast not one spark of generous or humane feeling had ever found a place. Finally, the last reigning prince of the house of Zends was sent to Tehran and murdered, when only in his twenty-sixth year. Every member of his family and every friend was ordered to be massacred by Agha Muhammad, and the successful but guilty assassin thus founded the dynasty of the Kajárs at the price of all the best and noblest blood of Iran.

The Zend is said to be a branch of the Lak tribe, dating from the time of the Kámanian kings, and claims to have been charged with the care of the *Zend-Avesta*, by Zoroaster himself.² The tree attached to Markham's chapter on the dynasty contains the names of eight members of the family only, *i.e.*, four brothers, one of whom had a son, grandson, and great-grandson, and one a son. Four of the eight were murdered, one was blinded, and one cruelly mutilated. In one case a brother murdered a brother, in another an uncle blinded his nephew.

Kajár Dynasty.—Agha Muhammad was undoubtedly Agha one of the most cruel and vindictive despots that ever Muhammad disgraced a throne. But he was not without care for the honour of his empire in the eyes of Europe and the outer world, and his early career in Mazandaran gave him a deeply-rooted mistrust of Russia, with the officers of which power he was in constant contact. The following story, told by Forster,³ and varied by a later writer, is characteristic. A party of Russians having obtained permission to build a "counting-house" at Ashraf, in the bay of that name, erected instead a fort with eighteen guns. Agha Muhammad, learning the particulars, visited the spot, expressed great pleasure at the work done, invited the officers to dine with him, imprisoned them, and only spared their lives when they had removed the whole of the cannon and razed the fort to the ground. As this occurrence must have taken place about 1789, when he was engaged in family feuds, and the sovereign power was vested in the hands of 'Ali Murád, it may be received as an illustration not only of his patriotism but of the independent action he was ever ready to exercise when opportunity offered.

Forster was travelling homeward by the southern shores of the Caspian in January 1784, and from him we gather many interesting details of the locality and period. He calls Agha Muhammad chief of Mazandaran, as also of Astrábad and "some districts situate in Khúrsán," and describes his tribe, the Kajár, to be, like the Indian Rajpút, usually devoted to the profession of arms. Whatever hold his father may have had on Gílan, it is certain that this province was not then in the son's possession, for his brother, J'afar Kúli, governor of Balfrush (Balfrush), had made a recent incursion into it and driven Haidiyet Khán, its ruler, from Rasht to Enzali, and Agha Muhammad was himself meditating another attack on the same quarter. The latter's palace was at Sari, then a small and partly fortified town, thickly inhabited, and with a plentifully-supplied market. As "the most powerful chief in Persia" since the death of Karím Khán, the Russians were seeking to put their yoke upon him, and he was naturally averse to the infliction. It is not clear, however, from the context

² Markham. Muller says of Kaím Khán's family, "it was a low branch of an obscure tribe in Khúdsán."

what Forster means when he writes that Agha Muhammad is "the only Persian chief biding on the Caspian Sea whom the empire of Russia has yet made tributary, or rendered sub-*servient* to its policy."

As Agha Muhammad's power increased, his dislike and jealousy of the Muscovite assumed a more practical shape. His victory over Luti 'Ali was immediately followed by an expedition into Georgia. After the death of Nâdir the wild or pume ruler of that country had looked around him for the safest and surest means of shaking off the offensive yoke of Persia, and in course of time an opportunity had offered of a promising kind. In 1788, when the strength of the Persian monarchy was concentrated upon Isfahan and Shirâz, the Georgian czar Heraclius entered into an agreement with the empress Catherine by which all connection with the shah was disavowed, and a quasi-vassalage to Russia substituted,—the said empire extending her rights of protection over her new ally. Agha Muhammad now demanded that Heraclius should return to his position of tributary and vassal to Persia, and, as his demand was rejected, prepared for war. Dividing an army of 60,000 men into three corps, he sent one of those into Daghestan, another was to attack Erivan, and with the third he himself laid siege to Shushah in the province of Karabagh. The stubborn resistance offered at the last-named place caused him to leave there a small investing force only, and to move on with the remainder of his soldiers to join the corps *d'armée* at Erivan. Here, again, the difficulties presented caused him to repeat the same process and to effect a junction with his first corps at Ganja, the modern Elisabethpol. At this place he encountered the Georgian army under Heraclius, defeated it, and marched upon Tiflis, which he pillaged, massacring and enslaving the inhabitants. Then he returned triumphant to Tehran, where (on at Ardabil on the way) he was publicly crowned shah of Persia. Erivan surrendered, but Shushah continued to hold out. These proceedings caused Russia to enter the field. Darband was taken possession of by Imhoff, Bakr and Shumakhi were occupied, and Gilan was threatened. The death of the empress, however, caused the issue of an order to retire, and Darband and Bakr remained the only trophies of the campaign.

Opera-
tions in
Khur-
asan

In the meantime Agha Muhammad's attention had been called away to the east. Khurâsan could hardly be called an integral part of the shah's kingdom so long as it was under even the nominal rule of the blind grandson of Nâdir. But the eastern division of the province and its outlying parts were actually in the hands of the Afghans, and Mashhad was not Persian in 1796 in the sense that Delhi was British at the outbreak of the Indian mutiny. Shâh Rukh held his position, such as it was, rather under Ahmad Shâh and his successors in Afghanistan than under any other sovereign power. Agha Muhammad determined to restore the whole province to Persia, and, after a brief residence in Tehran on his return from the Georgian expedition, he set out for Mashhad. It is important to note that on the occasion of his coronation he had girded on the sabre consecrated at the tomb of the founder of the Safawis,—thus openly pledging himself to support the Shâfah faith.

But there had been continual dissatisfaction in the capital of Khurâsan, and there had been constant inroads upon it from without, which the powerless royal puppet was unable to prevent. His popularity was real, but wholly wanting in political vigour. It never seemed to have effect outside the limited sphere of personal sympathy and regard. Owing to the frequent revolutions in the

¹ Lady Shelley says (1849) : "I saw a few of these unhappy captives, who all had to embrace Mahomedanism, and many of whom had risen to the highest stations, just as the Cretan slaves in Constantinople."

holy city the generals of Timûr Shâh, king of the Afghans, had made three expeditions on Shâh Rukh's behalf. Mashhad had been taken and retaken as though he were not a resident in it, much less its *de jure* king. Moreover, his two sons Nâdir Mirza and Wâli N'amat had been long waging, one with the other, a predatory war, and the former was practically in 1796 the actual ruler of the place. Three years before Timûr had died, and his third son, Zaman Shâh, by the intrigues of an influential sardâr, Fayyanda Khân, had been proclaimed his successor at Kabul.

Agha Muhammad's entry into Mashhad was effected without a struggle on the part of those in possession. The Kayâr shâh walked on foot to the tomb of Imâm Riza, before which he knelt and kissed the ground in token of devotion, and was recognized as a Shâfah of Shâfahs. Shâh Rukh submissively followed in his train. Then began the last act of the local tragedy. The blind king's gradual revelation, under horrible torture, of the place of concealment of his several jewels and treasures, and his deportation and death (of the injuries thus received, at Damaghan, *en route* to Mazandaran), must be classed among the darkest records of Oriental history.

From Mashhad Agha Muhammad sent an envoy to Zaman Shâh, asking for the cession of Balch, and explaining his invasion of Khurâsan; but the Afghan monarch was too perplexed with the troubles in his own country and his own insecure position to do more than send an unmeaning reply. It is not shown what was the understood boundary between the two countries at this particular period, but Watson states that on the shah's departure he had received the submission of the whole of Khurâsan, and left in Mashhad a garrison of 12,000 men.

Agha Muhammad had now fairly established his capital at Tehran. On his return thither in September 1796 he dismissed his troops for the winter, directing their re-assembly in the following spring. The re-invasion of Russia of the provinces and districts he had recently mad-
wasted from her west of the Caspian had made great progress, but the circumstance does not seem to have changed his plans for the army. Olivier, who had in those days come to the Persian court on a commercial and political mission from the French republic, and whose book is quoted by Watson, expressed his surprise to the prime minister that, while his majesty thought it necessary to strangle some twenty-seven Russian sailors sent in as prisoners, he took no immediate measures to check the Muscovite forces in the field. The reply was that there was no hurry in the matter. Although, when the spring arrived and the shah led his forces to the Arras, the Russians had, it is true, retreated, yet territory had been regained by them as far south as the Talish. Agha Muhammad had now arrived at the close of his career. He was enabled, with some difficulty, to get his troops across the river, and take possession of Shushah, which had given them so much trouble a year or two before. There, in camp, he was murdered (1797) by his own personal attendants,—men who, singularly enough, were under sentence of death, but allowed to be at large. He was then fifty-seven years of age, and had ruled over part of Persia for more than eighteen years,—over the kingdom generally for about three years, and from his coronation for about one year only.

The brutal treatment he had experienced in boyhood under the orders of 'Adil Shâh, Nâdir's wretched nephew, and the opprobrious name of "eunuch" which attached to him, and with which he was taunted by his enemies, no doubt contributed to embitter his nature. His vindictiveness and inhumanity were notorious, and exemplified at almost every period of his life. On the other hand, his contempt of luxury and frugality of diet, his avoidance

of hyperbole and dislike of excessive ceremony, his protection to commerce and consideration for his soldiers, the reluctance with which he assumed the crown almost at the close of his reign, his positive refusal to wear any royal headgear but the small circular pearl-adorned diadem in which he is commonly represented by the native painter,—all these would have been praiseworthy in another man; but the fearful weight of evil on the other side of the scales made them of comparatively small consideration, and on his death the memory of his atrocious tyranny alone survived. Those who have seen his portrait once will recognize the face wherever presented. "Beardless and shrivelled," writes Sir John Malcolm, "it resembled that of an aged and wrinkled woman, and the expression of his countenance, at no time pleasant, was horrible when clouded, as it very often was, with indignation. He was sensible of this, and could not bear that any one should look at him."

Path
'Alī
Shāh.

Agha Muhammad had made up his mind that he should be succeeded by his nephew Fath 'Alī Shāh, son of his full brother, Husain Kuli Khān, and governor of Fārs, a young prince with whom he had always been on good terms, and to whom he had proved himself exceptionally well disposed. There was a short interval of confusion after the murder. The remains of the sovereign were exposed to insult, the army was disturbed, the recently-captured fort on the left bank of the Arras was abandoned; but the wisdom and resolution of the minister, Hajji Ibrahim, and of Mirza Muhammad Khān Kajār, a high functionary, prevailed to secure order and acceptance of the duly-appointed heir. The first, proclaiming his own allegiance, put himself at the head of a large body of troops and marched towards the capital. The second closed the gates of Tehran to all comers until Fath 'Alī Shāh came himself from Shirāz. Though instantly proclaimed on arrival, the new monarch was not crowned until the spring of the following year (1798).

Rebel-
lions.

The so-called rebellions which followed were many, but not of any magnitude. Such as belong to local history are three in number, *viz.*, that of Sādik Khān Shakāki, the general whose possession of the crown jewels enabled him, after the defeat of his army at Kāzvin, to secure his personal safety and obtain a government; of Husain Kuli Khān, the shāh's brother, which was compromised by the mother's intervention; and of Muhammad, son of Zakī Khān, Zand, who was defeated on more than one occasion in battle, and fled into Turkish territory. There may have been other names mixed up with these, but of aiders and abettors rather than principals. Later, Sādik Khān, having again incurred the royal displeasure, was seized, confined, and mercilessly broken up in his dungeon to die of starvation.

Another adversary presented himself in the person of Nadir Mirza, son of Shāh Rukh, who, when Agha Muhammad appeared before Mashhad, had taken refuge with the Afghans. This prince, hearing of the death of his father's destroyer, gathered around him a military force and made a show of independence. Fath 'Alī sent to warn him of the consequences of his act, but without the desired effect. Finally, he advanced into Khurāsān with an army which appears to have met with no opposition save at Nishāpūr and Tūrbāt, both of which places were taken, and when it reached Mashhad Nadir Mirza tendered his submission, which was accepted. Peace having been further cemented by an alliance between a Kajār general and the prince's daughter, the shāh returned to Tehran.

Now that the narrative of Persian kings has been brought up to the period of the consolidation of the Kajār dynasty and commencement of the 19th century, there remains but to summarize the principal events in the reigns of Fath 'Alī Shāh and his immediate successors, Muhammad Shāh and Nāgā 'D-Dīn Shāh.

Fath 'Alī Shāh came to the throne at about thirty-two years

of age, and died at sixty-eight, after a reign of thirty-six years, 1797-1809. The period was an eventful one. It was that of George III., George IV., and William IV. in England, of Napoleon I. from first consul to emperor, of the restoration of the Bourbon kings and the interposition of the house of Orleans, in France. The sons of Paul, Alexander and Nicholas, were emperors of Russia; and, except for the last few years of Salim II., the second Mahmūd ruled over the Turkish dominions. No other European nations had any direct concern with Persia. In Afghanistan it was the epoch of the revolution which broke up its short-lived unity as a kingdom. The struggles of Mahmūd Shāh and Shīr'au 'l-Mulk enabled them to be quasi-sovereigns for a time; but Kāshān was divided from Kandahar, and Kandahar from Herāt, and the work of Ahmad Abdālī was all undone. Among the governors-general of India in those days are the distinguished names of Wellesley, Cornwallis, Hastings, and William Bentinck.

Persia's great aim was to recover in the north-west, as in the north-east of her empire, the geographical limits obtained for her by the Safawī kings; and this was no easy matter when she had to contend with a strong European power whose territorial limits touched her own. Fath 'Alī Shāh undertook, at the outset of his reign, a contest with Russia on the western side of the Caspian, which became with constant and harassing warfare. Georgia was, clearly, not to revert Russia to a Muhammadan suzerain. In 1800 its czar, George, son and successor of Heracles, notwithstanding his former professions of allegiance to the shāh, renounced his crown in favour of the Russian emperor. His brother Alexander indignantly repudiated the act and resisted its fulfilment, but he was defeated by General Lermoff on the banks of the Lora. Persia then re-entered the field. Among the more notable occurrences which followed were a three days' battle, fought near Etchmiadzin near Erivan, between the crown prince, 'Abbās Mirza, and General Zizianoff, in which the Persians suffered much from the enemy's artillery, but would not admit they were defeated; unsuccessful attempts on the part of the Russian commander to get possession of Erivan; and a surprise, in camp, of the shāh's force, which caused them to disperse, and necessitated the king's own presence with reinforcements. On the latter occasion the shāh is credited with gallantly swimming his horse across the Arras, and setting an example of energy and valour. In the following year 'Abbās Mirza advanced upon Shīshāh, the chief of which place and of the Karabagh, though an old foe to Agha Muhammad, had declared for Russia; much fighting ensued, and Erivan was formally taken possession of in the name of the shāh. The Russians, moreover, made a futile attempt on Gölbad, sending troops at Enzeli, which returned to Bākī, where Zizianoff fell a victim to the treachery of the Persian governor. Somewhat later Ibrahim Khān of Shīshāh, repenting of his Russophilism, determined to deliver up the Muscovite garrison at that place, but his plans were betrayed, and he and his relatives put to death. Reprisals and engagements followed with varied success; and the crown prince of Persia, after a demonstration in Shirvān, returned to Tabriz. He had practically made no progress; yet Russia, in securing possession of Derbānd, Bākī, Shirvān, Sheki, Ganja, the Talish, and Moghan, was probably indebted to gold as well as to the force of arms. At the same time Persia would not listen to the overtures of peace made to her by the governor-general who had succeeded Zizianoff.

Relations had now commenced with England and British India. A certain Mahd 'Alī Khān had landed at Bushahr, entrusted by the governor of Bombay with a letter to the shāh. His mission, England, had reference to the politics of Afghanistan, and appears to have ended, been fairly successful; but he was followed shortly by an English and envoy from the governor-general, Captain Malcolm of the Madras Force army. He had not only to talk about the Afghans but about the French also, and the trade of the Persian Gulf. The results were a political and commercial treaty, and a return mission to India from Fath 'Alī Shāh. To him France next sent her message. In 1801 an American merchant from Baghdad had appeared as the bearer of credentials from Napoleon, but his mission was mistrusted and came to nothing. Some five years afterwards Jambert, after detention and imprisonment on the road, arrived at Tehran and went back to Europe with a duly-accredited Persian ambassador, who concluded a treaty with the French emperor at Finkenstein. On the return of the Persian diplomatist, a mission of many officers under General Gardanne to instruct and drill the local army was sent from France to Persia. Hence arose the counter-claim of Sir Harford Jones from the British Government, which, on arrival at Bombay in April 1803, found that it had been anticipated by a previously-sent mission from the governor-general of India, under Malcolm again, then holding the rank of brigadier-general.

The home mission, however, proceeded to Bushahr, and Malcolm's return thence to India, from pressure of circumstances, enabled Sir Harford to move on and reach the capital in February 1806. A few days before his entry General Gardanne had been dismissed, as the peace of Tilsit deferred France from aiding the shāh against Russia. However open to criticism may have been the after-conduct of the British diplomatist, his diplomacy was so far successful that he

1809-1880, concluded a treaty with Persia the month after his arrival at the capital, but the Government of India were not content to leave matters in his hands notwithstanding the anomaly of a double mission. Malcolm was in 1810 again despatched as his own particular envoy. He had dealt with him Girdan, Lindsay and Christie to assist the Persians in the war, and presented the shah with some valuable field-pieces, but there was little occasion for the exercise of his diplomatic ability save in his non-official intercourse with the people, and here he availed himself of it to the great advantage of himself and his country. He was welcomed by the shah in camp at Ujan, and took leave a month afterwards to return via Baghdad and Basrah to India. The next year Sir Hafrad Jones was relieved as envoy by Sir Gore Ouseley.

Renewal of Russo-Persian war. Meanwhile hostilities had been resumed with Russia. The crown prince vainly attempted to penetrate Georgia, and one or two engagements ensued with more or less assertion of success on either side. In 1819 the British envoy used his good offices for the restoration of peace between the belligerents, and a Russian officer of high rank was sent to the Persian camp to propose the appointment of deputies. But there was no possibility of agreement, and the endeavour failed. To add to the Persian difficulty, it so happened that in July of this year a treaty was concluded between England and Russia "for re-establishing the relations of amity and good understanding between the two kingdoms respectively", and this circumstance caused the envoy to direct that British officers should take no further part in Russo-Persian military operations. Christie and Lindsay, however, refused to accept of this on their own risk, and advanced with the Persian army to the Aras. On the 31st October the force was surprised by an attack of the enemy, and retreated, the next night they were again attacked and routed at Asalandiz. Christie fell bravely fighting at the head of his brigade, Lindsay saved two of his nine guns; but neither of the two Englishmen was responsible for the want of proper disposition of the troops which mainly caused the disaster. Lankuan was taken by Persia, but retaken by Russia during the next three months, and on the 13th October 1819, through Sir Gore Ouseley's intervention, the treaty of Gulistan put an end to the war. Persia formally ceded Georgia and the seven provinces before named, with Kaitabagh.

On the death of the emperor Alexander in December 1825 Prince Menschikoff was sent to Tehran to settle a dispute which had arisen between the two Governments regarding the prescribed frontier. But, as the claim of Persia on a particular district then occupied by Russia could not be admitted, the general envoy was recalled, his *congé* and war was recommenced. The chief of Talish struck the first blow, and drove the enemy from Lankuan. The Persians then carried all before them, and the hereditary chiefs of Simvan, Sheki, and Bakri returned from exile to co-operate with the shah's general in the south. In the course of these weeks the only advanced post held by the governor-general of the Caucasus was the obsolete little town of Shush. But before long all was again changed. Hearing that a Russian force of some 9000 men was concentrated at Teheran, Muhammad Mirza, son of the crown prince, advanced to meet them on the banks of the Zezam. He was defeated, and his father, seeking to repair the loss, was routed more seriously still at Ganja. The shah made great efforts to renew the war, but divisions took place in his son's camp, not conducive to successful operations, and new proposals of peace were made to the Afghans, and even Tabriz had been threatened, the presence of threat had been rather significant than expressed, the presence of Russian troops south of the Aras was calculated to strike terror in Adabkayan. But Russia demanded Erivan and Nakhichevan (Nakhichevan) as well as the cost of the war, and in 1827 the campaign was reopened. Briefly, after successive gains and losses, not only Erivan was taken from Persia but Tabriz also, and finally, through the intervention of Sir John Macdonald, the English envoy, a new treaty was concluded at Turkmenchah, laying down the boundary between Russia and Persia very much as it has been formed in 1884. Among the hard conditions for the latter country were the cession in perpetuity of the khanates of Erivan and Nakhichevan, the inability to have an armed vessel in the Caspian, and the payment of a war indemnity of some £3,000,000.

War with Turkey. After Russia, the neighbouring state next in importance to the wellbeing of Persia was Turkey, with whom she was united on the west by a common line of frontier. Fath 'Ali Shah was not at all having had but one war with the sultan during his whole reign, and that one of no duration. Salm had not scrupled, it is true, in 1804 and 1805, to allow the Russians to make free use of the south-eastern coasts of the Black Sea, to facilitate operations against the shah's troops, and there had been a passage of arms between the king's oldest son, Muhammad 'Ali Mirza, and Sultan Mahmud Pasha, son-in-law of the governor-general of Baghdad, which was locally credited as a battle won by the former. But there was no open rupture between the two sovereigns until 1821, when the frontier dispute and com-

¹ The "wāhid-i-mulk" governor of Kermān, told Colonel Goldsmid, when he went in 1856, that "his father had been Sir John Malcolm's *Armanzadar*. There never was any *Armanzadar* of Kermān, and Malcolm Sahib" not only was he generous on the part of his government, but with his own money also." (Telegraph and Travel, p. 185)

plants of Persian travellers, merchants, and pilgrims culminated in a declaration of war. This made Abbas Mirza at once seize upon the fortified places of Toprak Kafa and Ak Sasa within the limits of the Ottoman empire, and, overcoming the insufficient force sent against him, he was further enabled to extend his incursions to Mush, Bitlis, and other known localities. The Turkish Government retaliated by a counter-invasion of the Persian frontier on the south. At that time the pasha of Baghdad was in command of the troops. He was defeated by Muhammad 'Ali Mirza, then prince-governor of Kermānshāh, who drove his adversary back towards his capital and advanced to its immediate environs. Being attacked with cholera, however, the Persian commander recrossed the frontier, but only to succumb to the disease in the pass of Kirind. In the sequel a kind of desultory warfare appears to have been prosecuted on the Persian side of Kurdistan, and the shah himself came down with an army to Hamadan. Cholera broke out in the royal camp and caused the troops to disperse.

In the north the progress of Abbas Mirza was stopped at Bayazid by a like deadly visitation, and a suspension of hostilities was agreed upon for the winter season. At the expiration of four months the sardar of Erivan took possession of a Turkish military station on the road to Arrum (Ezrum), and the crown prince marched upon that city at the head of 30,000 men. The Ottoman army which met him is said to have numbered some 52,000, but victory was on the side of then opponents. Whether the result was owing to the defection of 15,000 Kurds or not the evidence adduced is insufficient to decide. In the English records of the period it is stated that "the defeat of the Turks was complete, the greater part of their army died in disorder from the field, abandoning the tents and baggage, and fourteen pieces of artillery." It is added: "the prince royal followed up his successes, and advanced within two days' march of Arrum, but the cholera morbus is said to have again broken out in his army, and in such a manner as effectually to arrest its further advance."

Profiting from this victory, Abbas Mirza repeated an offer of peace before made without avail to the pasha of Arrum, and, in order to conclude him more effectually, he retired within the old limits of the dominions of the shah, his father. But more troubles arose at Baghdad, and other reasons intervened to protect negotiations for a year and a half. At length, in July 1829, the treaty of Arrum closed the war between Turkey and Persia. It may be remarked that this document is sensible and business-like, and provides especially against a sequence of the proved causes of war, such as interference in one another's frontier districts, stopping taxes from Persian travellers or pilgrims, disrespect to the ladies of the royal harem, and other ladies of rank proceeding to Mecca or Karbala (Kerbla), irregular levies of custom-duties, non-punishment of Kurdish degraded transgressors the boundary, and the like. Fath 'Ali Shah in it is styled "King of kings, the Sultan son of a Sultan—the Conqueror," and Mahmud II is "Protector of the Faith, Guardian of the Holy Cities, Ruler by Sea and Land, the Sultan son of a Sultan—the Conqueror."

With respect to the eastern boundaries of his kingdom, Fath 'Ali Shah was fortunate in having to deal with a less dangerous neighbour than the Muscovite of persistent policy and the Turk of questionable precarious friendship. The Afghan was neither a contemptible foe nor a sure ally, but he was not tainted with that fictitious civilization of semi-Oriental people which makes duplicity the essence of diplomatic intercourse. He had seen too little of Europeans to imitate them in their worst and weakest points, and, though equal to the Persian in physical force and prowess, he was his inferior in worldly knowledge and experience. Quite as dishonest as his neighbours and more treacherous than most, he had not the polished ingenuity to conceal his dishonesty and double-dealing. Moreover, the family divisions among the ruling houses of Afghanistan grew from day to day more destructive to that patriotism and sense of nationality which Ahmad Shah had held out to his countrymen as the sole specific for becoming a strong people.

The revolt of Nadir Mirza had, as before explained, drawn the shah's attention to Khuisan in the early part of his reign; but, although quiet had for the moment been restored at Mashhad by the presence of the royal camp, fresh grounds of complaint were urged against the shah but powerless prince, and recourse was had to extreme measures. Charged with the murder of a holy sayid, his hands were cut off and his tongue was plucked out, as part of the horrible punishment inflicted on him.

It does not appear that Nadir Mirza's cause was ever seriously espoused by the Afghans, nor that Fath 'Ali Shah's claim to Mashhad, as belonging to the Persian crown, was actively resisted. But the large province of Khuisan, of which Mashhad was the capital, and which included Darabagh and Kelat-i-Nadiri in the north and Kāyan in the south, had never been other than a nominal dependency of the crown since the death of Nadir, and in the autumn of 1830

² *Annual Register*, for "History of Europe" (1829). This is a note in connection with the text from which these extracts are taken, on the state of Anglo-Persian relations and the predominance of Russian influence at Tehran, well worthy the reader's perusal.

the shah, under Russian advice, assembled a large force to bring into subjection all turbulent and refractory chiefs on the east of his kingdom. Yazli and Karman were the first points of attack, Khuridan was afterwards entered by Semnan, on the main road from Tehran. The expedition, led by 'Abbas Mirza, involved some hard fighting and much loss of life. A considerable number of towns was traversed, several forts and places were captured, among them Kabushan and Sarakhs, and it may be concluded that the objects contemplated were more or less attained. An English officer, Colonel Shee, commanded what was called the "British detachment" which accompanied the prince. Thus far as regards Yazli, Karman, and Khuridan. The latter was otherwise without heat.

Hayr Furkan 'd-Din, the son of 'Alim Shih, was mustered in that city from 1800 to 1816. Since Path 'Al Shih's accession he and his brother Mahmud had been, as it were, under Persian protection, and, when the king retreated his steps homeward after his expedition to Mashhad, at the commencement of the century, it is supposed that he did so at the request of an ambassador from Zaman Shih of Kabul. Persia claimed the principality of Herat as part of the empire of Nadir, but her pretensions had been satisfied by payments of tribute or evasive replies. Now, however, that she marched her army against the place, Furkan 'd-Din called in the aid of his brother Mahmud Shih of Kabul, who sent to him the famous wazir, Path Khan Barakzai. The latter, intrusting on his own account, got possession of the town and citadel, he then sallied forth, engaged and defeated the Persian forces, and forced them to retire into their own country. There are various accounts of this action, and the Persian story is that the Persians were routed, but no one disputes the result, i. e., the retreat of the invading army. In 1824, on a solicitation from Mustafa Khan, who had got temporary hold of Herat, more troops were despatched thither, but, by the use of money or bribes, their departure was purchased. Some eight or nine years afterwards 'Abbas Mirza, when at the head of his army in Mashhad, invited Yr Muhammad Khan of Herat to discuss a settlement of his long and deep quarrel with Persia. The meeting was unproductive of good. Again the Persian troops advanced to Herat itself under the command of Muhammad Mirza, son of 'Abbas; but the news of his father's death caused the commander to break up his camp and return to Mashhad.

Sir Gore Ouseley returned to England in 1814, in which year Mr Ellis, assisted by Mr Morier—whose "Hayr Raba" is the unflattering proof of his deep knowledge of Persian character—negotiated on the part of Great Britain the treaty of Tehran. England was to provide troops or a subsidy in the event of unprovoked invasion, while Persia was to attack the Afghans should they invade India. Captain Willock succeeded Mr Morier as chargé d'affaires in 1815, and since that period Great Britain has always been represented at the Persian court. It was in Path 'Al Shih's reign that Sir Martin was in Persia, and completed his able translation of the New Testament into the language of that country. He had met Malcolm and Macartney at Bombay, and Sir John had recommended him to Sir Gore Ouseley, to whose mission he officiated as chaplain prior to departure from Shiraz in 1812. Martyr died at Toket in Asia Minor, on his homeward journey. Little more remains to be here narrated of the days of Path 'Al Shih. Among the remarkable occurrences may be noted the murder at Tehran in 1808 of M. Grelbyssoff, the Russian envoy, whose conduct in forcibly retaining two women of Erivan provoked the interference of the nullas and people. To repair the evil consequences of this act a conciliatory embassy, consisting of a young son of the crown prince and some high officers of the state, was despatched to St Petersburg. Shortly afterwards the alliance with Russia was strengthened, and that with England slackened in proportion. There were two reasons why the latter was the outcome of the previous situation, some of which will be self-evident to the reader of blue-books, while others will remain mere matters of opinion.

As an Oriental despot Path 'Al Shih was neither cruel nor unjust, but acts of cruelty and injustice were committed under his sanction. The treatment of Nadir Mirza has been mentioned. That of the old matriarch, Hayr Khudim, was perhaps more barbarous still. His fortress for years, and his libidinous tastes gave him the capacity of sating his conversation to victors of different kinds; but the love of money was a drawback to the exercise of his sympathies, and the loss of territory to Russia, involving as it did loss of revenue, was not calculated to arouse any strong sentiment of friendship towards the czar's European allies. The description of the king's person was thus given in 1809.

"He is a man of pleasing manners and of agreeable conversation, with an aquiline nose, large eyes, and very arched eyebrows. His face is obscured by an immense beard and mustachios, which are kept very black; and it is only when he talks and smiles that his mouth is discovered. His voice has once been fine, and is still harmonious, though now hollow, and obviously that of a man who has led a free life. He was seated on a species of throne called the *salik-dada*, or the throne of the peacock, which is raised 8 feet from the ground, and supports an oblong screen of felt, lined and 12 long. We could see the bust only of his majesty; as the rest of his body was hidden by an elevated railing, the upper work of the throne, at the corners of which were placed several ornaments of vases and toys. The back was thus raised, on

each side are two square pillars, on which are perched birds, probably intended for peacocks, studded with precious stones of every description, and holding each a ruby in their beak. The highest part of the throne is composed of an oval ornament of jewelry, from which emanate a great number of diamond rays."

One passage may be added as not only significant of the individual monarch extent of the nation, but of the national character.

"When the audience was finished, the king drew one of his ministers to measure from *d'fau* 'Al Khan (the English Agent) what the foreman said of him, and whether they passed and admired his appearance." Path 'Al Shih had a numerous family. Agreeably to the Persian custom, asserted by his predecessors, of nominating the heir-apparent from the sons of the sovereign without restriction to seniority, he had passed over the eldest, Muhammad 'Al, in favour of a junior, 'Abbas, but, as the nominee died in the lifetime of his father, the old king had proclaimed Muhammad Mirza, the son of 'Abbas, and his own grandson, to be his successor. Why a younger son had been originally selected, to the prejudice of his elder brother, is differently stated by different writers. The true reason was probably the superior rank of his mother. Maikhan's estimate of the character of the crown prince, based upon conflicting evidence, but apparently correct, is that "he possessed enlightened views," was zealous of improving the condition of his country, yet "was deficient in talent, rather weak-minded, and loved idleness."

It is worthy of remark that the selection of Muhammad Mirza was made with the express concurrence of the British and Russian Governments, communicated to their respective representatives at the shah's court, and the British minister at St Petersburg was instructed to express to the Government of the czar the gratification of his own Government at finding that the two powers were "acting with regard to the affairs of Persia in the same spirit," and was "equally animated by a sincere desire to maintain not only the internal tranquillity but also the independence and integrity of Persia."

Muhammad Shih was twenty-eight years old when he came to Muhammad the throne in 1834. He died at the age of forty-two, after a reign of about thirteen and a half years. His accession was not publicly shah.

For several months after his accession he was in the hands of the necessary to clear the way of all competitors, and there were two on this occasion,—one 'Al Mirza, governor of Tehran, who actually assumed a royal title, and one Hasan 'Al Mirza, governor of Shiraz. Owing to the steps taken by the British envoy, Sir John Campbell, assisted by Colonel Behrune, at the head of a considerable force, supplied with artillery, the opposition of the first was neutralized, and Muhammad Shih, entering Tehran on the 21st of May, was proclaimed king on the 31st of the same month. It cost much time and trouble to bring the second to book. Hasan 'Al, "farmân-farmâ," or commander-in-chief, and his brother and abettor, had an army at their disposal in Fais. Sir Henry Lindsay Behrune marched his soldiers to Isfahan to be ready to meet them. An engagement which took place near Kumsalâh, on the road between Isfahan and Shiraz, having been successful, the British commander pushed on to the latter town, where two rebel princes were seized and imprisoned. Forwarded under escort to Tehran, they were, according to Watson, ordered to be sent on thence as state prisoners to Auidah, but the farmân-farmâ died on the way, and his brother was blinded before incarceration. Maikhan, however, states that both 'Al Mirza and Hasan 'Al were allowed to retire with a small pension, and that no atrocities stained the beginning of the reign of Muhammad Shih. It is presumed that the fate of the prime minister, or "khâm-makâm," who was strangled in prison, was no more than an ordinary execution of the law. This event, and the prevalence of plague and cholera at Tehran, marked somewhat gloomily the new monarch's first year.

The selection of a premier was one of the first weighty questions for solution. A member of the royal family, the *saifi* 'd-Dinshah, governor of Khuridan, left his government to urge his candidature for the post. The king's choice, however, fell on Hayr Mirza Aghaie, a native of Erivan, who in former years, as tutor to the sons of 'Abbas Mirza, had gained a certain reputation for learning and a smattering of the occult sciences, but whose qualifications for statesmanship were craftiness and suspicion. Such a counsellor was hardly fitted for Muhammad Shih, whose natural bigotry could scarcely be said to accept the short-sighted policy of his minister, who would be sure to advocate. As might have been anticipated, the layn fell into the hands of Russia, represented by Count Simonich, who urged him to a fresh expedition into Khuridan and the siege of Herat. There was no doubt a plausible pretext for both Expeditions. The chiefs, reduced to temporary submission by 'Abbas Mirza, had again revolted, and Shah Karman, supported by his agent wazir, Yr Muhammad, had taken these expeditions and plundered Herat on the 15th of July. Path 'Al Shih had withdrawn his troops. In addition to these causes of offence he had appropriated the province of Sistan, over which Persia had long professed to hold the rights of suzerainty. But the king's ambition was to go farther than retaliation or chastisement. He refused to acknowledge any right to separate government whatever on the part of the Afghans.

1836-1838, and Kandahar and Ghazni were to be recovered, as belonging to the empire of the Safawid dynasty. The advice of the British envoy was dissuasive in this respect, and therefore distasteful.

Sir John Campbell, in less than a year after the sovereign's installation, went home, and was succeeded as British envoy by Mr Henry Ellis. The change in *personae* suggested also a transfer of supreme power to the Persian legation, which passed from the Legation in India to the authorities in England. In 1836, on the return home of Mr Ellis, Mr McNeill became chargé d'affaires.

About this time the arrangements for the expedition were matured. It was to commence with a campaign against the Tukhmans, — Herat being its later destination. The king would command in person, and the army would be formidable in numbers and in material. Such count-proposals as Mr Ellis had suggested for consideration in his earliest mission, to divert the shah from his purpose, had been politely put aside, and the counsels of the war-party had prevailed. Should the main operations designed be successful, and Herat fall to Persia, it was impossible to foretell the result, and the case was now more than ever complicated by the action of the British chiefs of Kandahar, who had sent a mission to Tehran to offer assistance against their Shikhi rival at Herat. Fresh proposals had, moreover, been given to the shah's Government by the rash and unrepentant Karman.

About the close of the summer the force moved from Tehran. The royal camp was near Astāshād in November 1836. Food was scarce, barley sold for ten times the usual price, and what was not procurable for any money. The troops were dissatisfied, and, being kept without pay and on short rations, took to plundering. There had been operations on the banks of the Helmand, and the Tukhmans had been driven from one of their strongholds, but little or no progress had been made in the subjection of these marauders, and the Heratis had sent word that all they could do was to pay tribute, and, if that was insufficient, the shah had better march to Herat. A military council was held at Shahrūd, when it was decided to return to the capital and set out again in the spring. Accordingly the troops, dispersed, and the sovereign's presence at Tehran was taken advantage of by the British minister to renew his attempts, in the name of peace, that remonstrance was vain, and, although on the present occasion Count Simounch ostensibly aided Mr McNeill, no argument was of any avail to divert the monarch from his purpose. He again set out in the summer, and, invading the Herat territory in November 1837, began the siege on the 23d of that month.

Sege of
Herat

Not until September in the following year did the Persian army withdraw from before the walls of the city, and then the movement only took place on the action of the British Government. Ordinary pressure and argument had failed. It had become necessary to use strong language, and to resort to strong measures, the import of which could not be mistaken. Mr McNeill, who had joined the Persian camp on 6th April, left it again on 7th June. He had in this interval done all in his power to effect a reasonable agreement between the contending parties by personal communication with Aghas in Herat as well as with the shah and his minister, but both in this respect and in the matter of a commercial treaty with England, then under negotiation, his efforts had been met with evasion and latent hostility, and this last feeling had been notably evinced in the seizure and violent treatment of a messenger bearing an official communication from a foreign Government to the British minister at Tehran. The Russian envoy, who had appeared among the tents of the besieging army almost simultaneously with his English colleague, no sooner found himself alone in his diplomacy than he resumed his aggressive counsels, and little more than a fortnight had elapsed since Mr McNeill's departure when a vigorous assault, planned, it is asserted, by Count Simounch himself, was made upon Herat. The Persians attacked at five points, at one of which they would in all likelihood have been successful had not the English aid, by Elzied Fortington, a young Englishman, who, with the services of an artillery officer, combined a courage and determination which meritably influenced his subordinates. Though his exertions the assailants were beaten back, as they were also independently at the other points noted. Still the garrison was disheartened, and, had not Colonel Stoddart's arrival on 11th August to threaten the shah with British intervention put a stop to further action, there is no knowing what might have resulted from the increasing array of intrigues of Karman and his advisers. As it happened, Colonel Stoddart's firm attitude and refusal to allow any but British mediators to decide the pending dispute won the day, and that officer was able to report that on 9th September Muhammad Shah had "mounted his horse" and gone forth from before the walls of the beleaguered city.

The sege of Herat was the great event in the reign of Muhammad Shah. It lasted for nearly ten months; and the story of its progress is a strange record of a desultory campaign, in which intrigues and conspiracy were the continuously working agencies, while military action was spasmodic. The British expedition in support of Shah Shuyā, which may be called its natural consequence, involves a question foreign to the present narrative. Persia's con-

nexion with Afghanistan can only be partial, and confined to Herat, Kabul, Kandahar, or one section of the country only. A united Afghanistan would always be distasteful to her.

The remembrance of the king's reign was marked by new difficulties with the British Government, — the rebellion of Agha Khan Makhdo, otherwise known as the chief of the Assassins, a new rupture with Turkey, the banishment of the asafu 'd-danial, governor of Khurasan, followed by the insurrection and defeat of his son, and the rise of the sect of the Babis. The first of these only calls for any detailed account.

In the demands of the British Government was included the Diffusion by Persia of places such as Ghazni, Farah, and Sabzavār, only which had been taken during the rule of the Afghans, and in which preparation for the violence offered to the count of the British legation. The shah, in all-humour at his fruitless expedition to Herat, defied compliance with these requisitions, and indeed sought to evade them altogether. Mr McNeill gave a certain time for decision, at the end of which, no satisfactory reply having reached him, he broke off diplomatic relations, ordered the British officers sent to the shah to proceed towards Baghdad *en route* to India, and ordered to Aram with the members of his mission. On the Persian side, charges were made against Mr McNeill, and a special envoy, sent to England to support them, was instructed to represent the so-called injuries which British diplomatic action had inflicted on the shah. An endeavour was at the same time made to interest the cabinets of Europe in influencing the British Government on behalf of Persia.

The envoy managed to obtain an interview with the minister of foreign affairs in London, who, in July 1838, supplied him with a statement, fuller than before, of all English demands upon his country. Considerable delay ensued, but the outcome of the whole proceedings was not only acceptance but fulfilment of all the engagements contracted. In the meantime the island of Karak had been taken possession of by an expedition from India. On 11th October 1841 a new mission arrived at Tehran from London, under Mr (now Sir) John McNeill, to renew diplomatic relations. It was most cordially received by the shah, and it need scarcely be added that, as one of its immediate results, Karak was evacuated by the British-Indian troops.

There had been a long diplomatic correspondence in Europe on the proceedings of Count Simounch and other Russian officers at Herat. Among the papers is a very important letter from Count Nesselrode to Count Pozzo di Borgo in which Russia declares herself to be the first to countenance the shah to acquiesce in the demand made upon him, because she found "justice on the side of England" and "wrong on the side of Persia." She withdrew her agent from Kandahar and would "not have with the Afghans any relations but those of commerce, and in no way any political interests."

She recalled to the English cabinet her wishes before expressed "to establish by treaty the relations of friendship between the empires of London and of Tehran, to put an end to the disturbances in the Persian Gulf, to abstain from disturbing the tranquillity of the people of the centre of Asia by nourishing their animosities, to be contented with competing in military in those vast countries, but not to engage there in a struggle for political influence, to respect the independence of the intermediate countries which separate her from British territory, that, it was emphatically stated, was "the system which England and Russia have a common interest mutually to pursue, in order to prevent the possibility of a conflict between these two great powers, which they may continue friendly, require to remain each within its own limits, and not to advance against each other in the centre of Asia."

Agha Khan's rebellion was fostered by the defection to his cause of a large portion of the force sent against him; but he yielded at last to the local authorities of Karman and fled the province and country. He afterwards resided many years at Bombay, where, while maintaining among natives a dangerous influence, he is better known among Europeans for his doings on the turf.

The quarrel with Turkey, though specific in the case of individual actors, was generally about frontier relations and transgressions of the border. Eventually the matter was referred to an Anglo-Russian commission, of which Colonel Williams (since Sir Fenwick Williams of Kais) was president. A massacre of Persians at Karabala might have seriously complicated the dispute, but, after a first burst of indignation and call for vengeance, an expression of the regret of the Ottoman Government was accepted as a sufficient apology for the occurrence.

The rebellion of the asafu 'd-danial, maternal uncle of the shah, was punished by exile, while his son, after giving trouble to his opponents, and once gaining a victory over them, took shelter with the Tukhmans.

Sayyid Muhammad 'Ali, founder of the Bábí, was born at Tábris Shíráz about 1810. Adopting a life of asceticism, and practicing Bábí, a kind of exaggerated Sufism, he followed for some time the calling of a dervish, and when at Káizman near Baghdad he openly asserted his pretensions as a prophet. The Turkish authorities

¹ Correspondence relating to Persia and Afghanistan, London, 1839. The annexation of Sind and the Punjab will, it is presumed, be a desultory cause for the partial absorption of Turkestan. But the cases are in no way analogous. The occupation by Russia of the Persian island of Ashkhará in the south-east corner of the Caspian followed the British reverses in Kabul of 1841.

² Lady Elgin's Gleanings says 1834.

would have put him to death, but the Persian consuls, claiming him as a subject, saved his life, and sent him to his native place. Thereafterward his career is strange and adventurous, and even when he himself had been committed to prison his agents were employed in procuring his decline, with valiant success to occasion the issue of a decree making it a capital crime to profess the tenets of Bábism. None will be said on the subject shortly.

Before closing the reign of Muhammad Sháh, note should be taken of a prohibition to import African slaves into Persia, and a commercial treaty with England,—recorded by Watson as gratifying achievements of the period by British diplomats. The French missions in which occur the names of M. de Lavelette and de Salgues were notable in them, way, not somewhat taint of results. In the autumn of 1848 the shah was seized with the malady of combination of maladies, which caused his death. Gout and erysipelas had, it is said, ruined his constitution, and he died at his palace in Sháman on 4th September. He was buried at Kím, where is situated the shrine of Fátima, daughter of Imám Riza, by the side of his grandfather, Fath 'Alí, and other kings of Persia. In person he is described as short and fat, with an aquiline nose and agreeable countenance.

Náru
'd-Din
Sháh

On the accession of his father's death, Náru 'd-Din Mirza, who had been proclaimed wá'í, or heir-apparent, some years before, was absent at Tabriz, the headquarters of his province of Adárbáyan. Colonel Fábiant, then chargé d'affaires on the part of the British Government, in the absence of Colonel Shéh, had succeeded Sir John M'Neill, had, in anticipation of the shah's decease and consequent trouble, sent a messenger to summon him instantly to Teherán. The British officer, moreover, associated himself with Prince Dolgoukoff, the representative of Russia, to secure the young prince's accession, and there was no doubt in the minds of the wiser lookers-on that, if the two diplomatists were really of one mind in the matter, they would attain then and in spite of all obstacles.

They did so after a time, and with the aid of the queen-mother, a who, as president of the council, showed much judgment and capacity in consulting adverse parties. But the six or seven weeks which passed between the death of the one king and the coronation of the other proved a disturbed interval, and full of stirring incident. The old minister, Hají Muza Afghá, incurred the displeasure of the influential part of the community by shutting himself up in the royal palace with 1200 followers, and had to take refuge in the sanctuary of Sháh 'Abdu'l-'Azíz near Teherán. On the other hand Mirza Afghá Khán, a partisan of the late 'd-Daulah, and himself an ex-minister of the emperor, who had caused to be banished, was welcomed back to the capital. At Isfahan, Shiráz, and Kármán serious riots took place, which were with difficulty suppressed. While revolution prevailed in the city, robbery was rife in the province of Yazd, and from Kávin the son of 'Alí Mirza, otherwise called the "rúlu 's-sultan," the prince-governor of Teherán, who disputed the succession of Muhammad Sháh, came forth to contest the crown with his cousin, the heir-apparent. The last-named incident soon came to an inglorious termination for its hero. But a more serious revolt was in full force at Mashhad when, on the 20th of October 1848, the young sháh entered his capital and was crowned at midnight king of Persia.

The chief events in the long reign of the present sháh, Náru 'd-Din, may be reviewed under four heads, (1) the insurrection in Khúisán, (2) the insurrection of the Bábís, (3) the fall of the amín 'n-nizam, and (4) the revolution of 1851.

Insurrec-
tion in
Khúisán

It has been stated that the asafí 'd-Daulah was a competitor with Hají Muza Afghá for the post of premier in the cabinet of Muhammad Sháh, that he was afterwards, in the same reign, exiled for rising in rebellion, and that his son, the sháh, took shelter with the Türkmen. Some four months prior to the late king's decease the latter chafed at his imprisonment against his authority, he had gained possession of Mashhad itself, drove the prince-governor Hánuz Mirza into the citadel, and so firm was his attitude that Yar Muhammad of Herat, who had come to help the Government officials, had retired after a fruitless co-operation, drawing away the prince-governor also. The sháh now defied Mímá Mirza, Náru 'd-Din's uncle, who was besieging the city, he found secret means of obtaining money and supplies, and, by occasionally repelling an assault or effecting a skilful sortie, he kept up a prestige of power, which, added to his personal popularity, commanded the sympathy and good wishes of the multitude. In April 1850, after a siege of more than eighteen months, fortune turned against the bold insurgent, and negotiations were opened between the citizens and besiegers for the surrender of the town and citadel. Treachery may have had to do with the result, for when the sháh's troops entered the holy city the sháh sought refuge in the mosque of Imám Raza, and was forcibly expelled. He and his brother were seized and put to death, the instrument used being, according to Watson, "a bowstring of Eastern steel." The conqueror of Mashhad, Mímá Mirza, became afterwards himself the prince-governor of Khúisán.

² Khásham

Lady Shéh has written a graphic account of the death of Sa'id 1848-1851. Muhammad 'Alí. After repeated arrests and warnings, to be supposed the spread of his doctrines had become so rapid among all classes that it was thought necessary to remove him by the severest punishment of the law. He was conveyed to Tabriz, and brought out in the quiet stage for execution.

A company of soldiers was ordered to begeth Bahá in a valley. When the smoke had cleared away Bah had disappeared from sight. It was not without a hypothesis that one of the balls had touched him, and, prompted by an impulse to preserve his life, he leaped from the spot. Bahá leaped without the presence of mind to have led to the lava. He would in all probability have succeeded in effecting his escape. A musket palpable to all told would have been pelleted, and a new onset would have been established. But he turned in the opposite direction, and hid himself in the grassy sward, where he was immediately detected, brought out, and shot. His body was thrown into the ditch of the town, where it was devoured by the half wild dogs which abounded outside a Persian city. Bah possessed a mild and benignant countenance, his manners were composed and dignified, his eloquence was impressive, and he wrote rapidly and well.

Later on she wrote—

"This year (1850) seven Bahás were executed at Teherán for an alleged conspiracy against the life of the prince minister. Then late events gained publicity, for every one knew that no criminal had been committed, and suspected the accusation to be a pretence. Previously to decapitation they received an order of pardon, on the condition of reciting the *Litham* (for Muhammadan creed). It was recited, and these victims died in silence in their fate."

In Zanjan the inhabitants, on the religious movement, as the Bábíes termed it, broke out with violence. This city is only 300 miles from Teherán, and lay to Tabriz. At its head was a Bábí, Sháh 'Abdu'l-'Azíz, who, with his associates, uttered into an angle of the city, which they strengthened in best they could. For several months they defended themselves with unexampled resolution against a large force sent to suppress the movement against them. They were then *reduced* to mere death, that made the Bábíes so formidable to their assailants. From street to street, from house to house, from cellar to cellar, they fought their way, and at length, at their post, excepting a few who were afterwards hanged by the troops in cold blood.

In the summer of 1852 his majesty was attacked, while riding in the vicinity of Teherán, by four men, one of whom fired a pistol and slightly wounded him. This man was killed, and two others were captured by the royal attendants, the fourth jumped down a wall. The existence of a conspiracy was then discovered, in which some forty persons were implicated, and ten of the conspirators (one a young woman) were put to death,—some under cruel tortures. A short report of these then ensued which is well illustrated in the following extract from Watson's *History*.

"The prime minister, so fearful of drawing down upon himself and his family the vengeance of the followers of the Báb, and in order that others might be implicated in these events, he hit upon the device of assigning a culprit to each department of the state, the several ministers of the Sháh being thus compelled to act as executioners. The minister for foreign affairs, the minister of finance, the son of the prime minister, the administrator of the army, and the minister of the mint, each received a list of names, and first met with a share of the charges assigned to their several departments, respectively. The artillery, the ministry, the canal-officers, and the cavalry, each had its victim." But the result of all this was that the Bábíes have been expected, to create a feeling of sympathy for the Bábí, whose crime was but slight of the punishment which had overtaken them. They met their fate with unflinching intrepidity, and without a murmur. The Sháh was moved by the chief magistrate of Teherán to execute the Bábí and his wife, which was offered to them on the simple condition of seeing the Bábí crucified. While the highest capital was being the first of one follower of the Báb, he was tried by the chief magistrate of Teherán to execute the Báb and his wife. He would not renounce the Báb, but he cursed the magistrate who tempted him to do so, he cursed the Sháh, and even cursed the prophet Muhammad, his spirit rising superior to the agency of his tortures.

The movement, however, was not only felt in Teherán and Zanjan but also in Mazandaran, Fás, Hamán, and Tabriz, and in spite of the fearful punishments with which the professors of the doctrine have been visited, the complete extinction of Bábism by fire and sword is a consummation hardly to be set within the range of human probability.

Mírza Taki, the amín 'n-nizam (vulgarily amín-nizam), or com-fall of master-in-chief, was a good specimen of the self-made man of Persia. He was the son of a cook of Bahá Mirza, Muhammad Taki. Sháh's brother, and he had filled high and important offices of state and amassed much wealth when he was made by the young sháh Náru 'd-Din, on his accession, both his brother-in-law and his prime minister. The choice was an admirable one, he was honest, hard-working, and liberal according to his lights, and the services of a loyal and capable adviser were secured for the new régime. For the rebellion in Khúisán and all emergencies that occurred during his three years' tenure of office, he was the same active and intelligent mentor that he had been when associated with the prince in his government of Adárbáyan. Unfortunately, he did not boast the confidence of the queen-mother, and this circumstance greatly strengthened the hands of those enemies which in honest manner were wise around him. A corrupt Oriental state. For a time the sháh closed his eyes to the seditious and insinuations breathed against him, but at last he fell under the evil influence of designing counsellors, and acts which should have rebounded to the minister's credit became the charges on which he lost his office and his life. He was credited with an intention to grasp by his own hands the royal power, his influence over the army was

³ Even the Sháh's admirable French physician, the late lamented Dr Clouquet, was invited to show his loyalty by following the example of the rest of the court. He excused himself, and pleasantly said that he killed too many men professionally to permit him to increase their number by any voluntary homicide on his part." (Lady Shéh)

1851-1872, cited as a cause of danger, and on the night of 18th November 1851 he was summoned to the palace and informed that he was no longer permitted. Mirza Agha Khan, the "timidid d-daulah," was named to succeed him, and had been accordingly raised to the dignity of "sah' aam." As the hostile faction pressed the necessity of the ex-minister's removal from the capital, he was offered the choice of the governorship of Fars, Ispahan, or Kirm. He declined all, but, through the mediation of Colonel Shiel, he was afterwards offered and accepted Kaskan. It is not probable that Mirza Taki, once fallen from his high estate, would have long survived, or rather would have been long sufficed by his rivals or foes to survive, this crisis in his career. For intrigues and chancellations he was too real a character to be harmless, and means would have doubtless been devised to get rid of him altogether. As it happened, opportunity was taken of an ill-timed if well-meant interference on his behalf of the Russian legation, and the shah's ire was aroused more than even against him.

"Once having got him out of the way," writes Major Euan Smith from information gathered on the scene of the tragedy he is recounting, "his enemies had full play, and, fairly days after his banishment, prevailed upon the king to issue orders for his execution. The executioners arrived at Fin, and, seeing the ex-minister, told him that they had been sent by the shah to ask after his health. Mirza Taki Khan at once said that he felt no need, he merely asked that, instead of having his throat cut, he might be allowed to die in his own way. The request was granted, he went into the harem, where the king ordered the principal attendants in each arm, and he quietly sat there and died, to death."

Rapture with England. When England was engaged in the Crimean War of 1854-55 her alliance with a Muhammadan power in no way aided her popularity or strengthened her position in Persia. The Shum Turk was almost a greater enemy to his neighbour the Shiah than the formidable Muscovite, who had entailed him of so large a section of his territory west of the Caspian. Hence during the war Persia coquetted with Russia as to a possible secret alliance, rather than with France or England. Moreover, since Sir John McNeill's arrival in Tehran in 1841, formally to repair the breach with Muhammad Shih, there had been little difference, demands, and explanations, which were pointions of a storm in the future, and these symptoms had culminated in 1855, the year of the peace with Russia. As to Afghanistan, after Mirza Muhammad had in 1843, when the British troops were pushing in the passes, or otherwise in the midst of dangers, caused Kaman to be suffocated in his prison. Since that event he had himself regained supremacy in Herat, and, dying in 1851, was succeeded by his son Sa'ad Muhammad. This chief soon entered upon a series of intrigues in the Persian interests, and among other acts offensive to Great Britain, suffered one 'Abbas Kuli who had, with the aid of the Hon. Mr. Murray, been fulfilling a sala at Mashhad, to corrupt the atalaf of Herat, and again place a detachment of the shah's troops in Ghuman. Colonel Shiel remonstrated, and obtained a new engagement of non-interference with Herat from the Persian Government, as well as the recall of 'Abbas Kuli. In September 1855 Muhammad Yusuf Saduzi seized upon Herat, putting Sa'ad Muhammad to death with some of his followers who were supposed accomplices in the murder of his uncle Kaman.

About this time Kohan Dil Khan, one of the chiefs of Kandahar, died, and Dost Muhammad of Kabul annexed the city to his territory. Some relations of the deceased chief made their escape to Tehran, and the shah, listening to their complaint, directed the prince-governor of Mashhad to march across to the eastern frontier and occupy Herat, declaring that an invasion of Persia was imminent. Such was the state of things when the Hon. Mr. Murray was fulfilling his second year of duty at the legation in Tehran. He had relieved Mr. Taylor Thomson, Colonel Shiel's *locum tenens*, at a time when relations were somewhat strained, and coolness and want of confidence were daily becoming more apparent between the British representative and the court to which he was accredited. The following passage is from a recently-published work treating of the place and period.

"At the end of 1855, our relations with the court of Tehran were anything but satisfactory. Even the outward semblance of civility towards the English representative was disregarded, and, in like manner, the veneer of courtesy was wanting in the official communications bearing the signature of the shah or his responsible ministers. So great was the ferment of ill-feeling occasioned, that our envoy withdrew to Baghdad, declining to resume the functions of his office until ample apology had been made by the Persian government. In such an offence charged, after a matter detailed by himself. A crisis such as this may, it is true, be brought about in Persia by ourselves, through defective diplomacy and ignorance of the native character, vices, prejudices, and, to some extent, language, but it may also arise from many other causes—among others, a willful pique determination on the part of the local government. Once instructed to give offence to strangers and provoke a rupture, the Persian is a wonderful adept in fulfilling his instructions, and will more as capable in bandying insult and innuendo as in the more complex and refined game of compliment and civility. In the present instance, there was in the attitude of Persia evidence of violence and an air of more than ordinary temper, for not only were the Shah's own words full of insult, but his expressions were supplemented by deeds. Finally, by sending a large military expedition under his royal uncle, Prince Mirza Mirza, to take possession of Herat, he showed his complete change of tactics, and aimed a blow at England's Eastern policy in the most sensitive part

"This occurred in December, the same month in which the British envoy quoted Tehran. In the first week of 1856, negotiations were opened at Constantinople when the Persian charge d'affaires, who in the meantime had been of the quality to our well-known ambassador there. Discussion was prolonged for some months in 1856, during which an 'ultimatum' from Lord Clarendon had been put forward without avail, and in October, a plenipotentiary named Farukh Khan arrived at the Porte with the Shah's instructions to settle the whole matter in dispute. But although this passage went so far as to sign a declaration that Herat should immediately be evacuated by the troops of his sovereign, other engagements were required from him which he could not undertake, and the attempt at a settlement failed. Lord Clarendon presented a new 'ultimatum' on November 1856, and on the 20th of the same month the Shah broke. The news that Herat had been captured on October 20th, and that three proclamations declaring war against Persia had been issued by the governor-general of India on November 1856, at Constantinople, and Farukh Khan's completion was, for the moment, gone."

In less than three weeks after issue by the governor-general of India of the proclamation of war with Persia the 8th division of the field force left Karachi (Kuneshes) on 18th January following the Bombay Government officials notified the formation of a second division under Lieutenant-General Sir James Outram. Before the general arrived the island of Kasak and part of Bushahr had both been occupied, and the fort of Rishar had been attacked and captured. After the general's arrival the march upon Bushahr and the engagement at Kishnah—two places on the road to Shiraz—and the operations at Muhammrah and the Khatm river decided the campaign in favour of England. On 5th April, at Muhammrah, Sir James Outram received the news that the treaty of peace had been signed in Paris, where Lord Cowley and Farukh Khan had conducted the negotiations. The stipulations regarding Herat were much as before; but there was to be apologies made to the mission for past violence and rudeness, and the slave trade was to be suppressed in the Persian Gulf.

With the exception of a small force retained at Bushahr under General John Jacob for the three months assigned in execution of the ratifications and giving effect to certain stipulations of the treaty with regard to Afghanistan, the British troops returned to India, where their presence was greatly needed, owing to the outbreak of the mutiny. The envoy realised his steps from Baghdad to Tehran, to receive the excuses of the shah's minister. Before Mr. Murray's arrival, however, an act of so-called retaliation, but avowing rather of their revenge, had been perpetrated, which could not have commended itself to the mind of an English diplomat on the spot. One of the articles of the treaty of peace provided for the release of all prisoners taken by the Persians at Herat. Among these was the ex-vice Muhammad Yusuf, who, having resisted the besieging army, had been brought captive to Tehran. The payment of money was made to secure his release, and, after a year of savage death, for the relatives of Sa'ad Muhammad (whom he had slain in return for the murder of his uncle Shih Kaman) awarded his release literally to leave him to pieces in front of the Kasbi Kayar, a royal palace about 5 miles from the walls of the capital. When Colonel Taylor and the officers deputed with him to certify the evacuation of Herat by the Persian soldiers reached their destination, they were received by a newly-appointed governor, Sultan Ahmad Khan, better known as Sultan Jan, nephew and son-in-law of the amir Dost Muhammad. It is unnecessary to refer to other than the political reasons of the war. They soon ceased to interest the minds of even European residents in Persia; and the war became a thing of the past. Mr. Murray was succeeded in 1859 by Sir Henry Rawlinson as British envoy. No more popular nomination could have been made than that of this justly-distinguished and able statesman, but his tenure of office was brief at the work. Returning at his own request, he was succeeded by Mr. Charles Alison, whose marvellous acquaintance with Turkish and Persian language had rendered him an invaluable secretary at Constantinople.

It now only remains to mention those incidents which have engaged the attention of the British Government, or in which British troops have had to play a part. Such are the establishment of a telegraph, the settlement of the Perso-Baluch frontier, and the intervention on the Perso-Afghan frontier. The proceedings of Russia in the countries east of the Caspian and bolder on the Oxus have, moreover, a bearing more or less direct on the interests of Great Britain, with especial reference to her Indian empire.

The question of constructing a telegraph in Persia is a link in Anglo-the overland line to connect England with India was broached in Indian Tehran by Colonel Patrick Stewart and Captain Channay, officers attached to the British mission, and an agreement on the subject was concluded by Mr. Edward Esquivel, when charged d'affaires, at the close of that year. Three years later a more formal convention, including a second vice, was signed by Mr. Alison and the Persian foreign minister, meantime the work had been actively carried on, and communication opened on the one side between Bushahr and Karachi and the Makran coast by cable, and on the other between Bushahr and Baghdad by telegraph. The trustworthy character of the line through Amasia Turkey caused a subsequent change of direction; and an alternative line—the Indo-European—from London to Tehran, through Russia and along the eastern shores of the Black Sea, was constructed, and has worked well since 1872,

¹ Eastern Period, vol. 1 p. 156. The palace of Fin, near Kaskan, was the residence of the amir namak.

² James Outram: a Biography, vol. 1, London, 1880.

in conjunction with the Persian land telegraph system and the Bushahr-Karachi line.¹

Sistan mission. The Sistan mission, under Major-General (afterwards Sir Frederick) Goldsied, left England in August 1870, and reached Tehran on 24 October. Thence it proceeded to Isfahan, from which city it moved to Baluchistan, instead of seeking its original destination. Difficulties had arisen both in arranging the preliminaries to arbitration and owing to the disordered state of Afghanistan, and it was therefore deemed advisable to commence operations by settling a frontier dispute between Persia and the Kalat state. Unfortunately, the obstructions thrown in the way of this settlement by the Persian commissioner, the untoward appearance of a band of an unexpected body of Kalatis, and the absence of definite instructions marred the fulfilment of the programme sketched out; but a line of boundary was proposed, which has since been accepted by the litigants, and which, except perhaps in the case of a small district on the north, has, it is believed, been generally respected. In the following year the same mission, accompanied by the same Persian commissioner, proceeded to Sistan, where it remained for more than five weeks, prosecuting its inquiries, until joined by another mission from India, under Major-General (afterwards Sir Richard) Pollock, accompanying the Afghan commissioner. Complications then ensued by the determined refusal of the two native officials to meet in conference; and the arbitrator had no course available but to take advantage of the notes already obtained on the spot, and return with them to Tehran, there to deliver his decision. This was done on 19th August 1872. The contending parties appealed to the British secretary of state, but the decision held good, and was eventually accepted on both sides (see above, p. 619).

The Russo-Persian boundary question of 1851 might have been considered to belong to history, but has been treated elsewhere. It is, however, a strictly pacific arrangement, and has nothing in common with the treaties of Gulistan or Turkmenchâh.

Englishmen in Persia. Mr Allison died at Tehran in April 1872. Mr Ranald Thomson, whose experience of Persia is of thirty-five years' duration, then

became chargé d'affaires, and held the post until relieved by his brother, Mr (since Sir) Teylour Thomson from Ghili. On the retirement of the latter in April 1876, Mr (since Sir Ranald) Thomson succeeded in the post. During the last years of the reign of Nâser 'i-Dîn several Englishmen have distinguished themselves as explorers in the north-east. Among them the names of O'Donovan, Napier, Baker, Gill, Clayton, and Stewart will be readily remembered. Colonels Bateman-Champain, Murdoch Smith, Sir Oliver St John, Beresford Lovett, and the late Major Pierson, all engineer officers connected with the telegraph, have made their mark in the country. Nâser 'i-Dîn Shâh, unlike his predecessors, has paid two visits to Europe,—one in 1873 and another in 1876. On the latter occasion only he extended his journey to England, and was then attended by his "sadr 'azim," or prime minister, the late Mirza Husain Khân, an able and enlightened adviser, with a Grand Cross of the Star of India. His second visit was to Russia, Germany, France, and Austria, but he did not cross the Channel. Among the shâh's latest projects are the possession of a little fleet in the Persian Gulf, and of some vessels on the Kârtûn. In 1864 it was stated that a thousand-ton steamer (the "Parsopolis") and a smaller one for river navigation were actually in course of construction. The route by the Kârtûn was to be opened, and a carriageable road constructed from Shûstâr to Tehran, *via* Dîrlû, Khramabad, Bûrjird, Sulatnabad, and Kûm. Orders had been given for building two tugs to pull native craft up the Kârtûn. The arrangements for the road, transport, and administration from Mûhamrah to Tehran were confided to General Hotum Schindler, the inspector-general of Persian telegraphs.

The works which have been mainly followed and quoted in the above historical sketch are Sir John Malcolm's *History of Persia*; the more modern histories by Robert Grant Watson and Clements Markham; the *Travels of Persepolis* in Persia, edited by Lord Stanley of Alderley, printed for the Hakluyt Society (1879); and the *History of the Late Pashas of Persia*, taken from the memoirs of Father Krusinski, procurator of the Jesuits at Isfahan (1789). Those which have contributed information in a minor degree are Lady Stanbury's *Diary in Persia*; Brinkley's *Persian Travels*; and the *Annals of Langkies*; Professor Crassey's *History of the Ottoman Turks*; Ferriar's *History of the Afghans*; *Telegraph and Travel* (1874); and others mentioned in the footnotes. (F. J. G.)

PART III.—LANGUAGE AND LITERATURE.

SECTION I.—PERSIAN (IRANIAN) LANGUAGES.

Under the name of Persian is included the whole of that great family of languages occupying a field nearly coincident with the modern Iran, or which true Persian is simply the western division. It is therefore common and more correct to speak of the Iranian family. The original native name of the race which spoke these tongues was Arian. King Darius is called on an inscription "a Persian, son of a Persian, an Arian of Arian race"; and the followers of the Zoroastrian faith in their earliest records never give themselves any other title but *Aryansd dâghardh*, that is to say, "Arian races." The province of the Iranian language is bounded on the west by the Semite, on the north and north-east by the Ural-altaic or Turanian, and on the south-east by the kindred language of India.

Iranian languages. The Iranian family of languages is one of the seven great branches of the Indo-European stem, and was first recognized as such by Sir William Jones and Friedrich Schlegel. Whatever uncertainty still remains as to the exact relationship between all the several branches of the Indo-European family, it is at least certain that Indian and Persian belong together more closely than the rest, and that they continued to develop side by side for a long period after the other branches had been already severed from the parent stem.

The common characteristics of all Iranian languages, which distinguish them especially from Sanskrit, are as follows.

(1) Change of the original *s* into the spirant *h*. Thus—

Sanskrit.	Zend.	Old Persian.	New Persian.
asraha (Indus)	hinda	hinda	hind
hasra (all)	hastra	hasra	has
hasna (white)	hasna	hasna	has
asht (eight)	asht	asht	asht

(2) Change of the original aspirate *gh*, *dh*, *bh* (= *gh*, *dh*, *bh*) into the corresponding medials—

Sanskrit.	Zend.	Old Persian.	New Persian.
bhumi (earth)	bûmi	bûmi	bûm
dhita (verte)	dhita	dhita	dhita
gharma (heat)	garma	garma	garma

(3) *h*, *t*, *p* before a consonant are changed into the spirants *zh*, *th*, *f*—

Sanskrit.	Zend.	Old Persian.	New Persian.
grathama (first)	grathama	grathama	grathama
kratu (sight)	kratu	kratu	kratu

(4) The development of soft sibilants—

¹ The Indo-European Telegraph Company have now (1884), on rather more than 450 miles of wire, from Jûla on the Arras to Tehran, in what is called the "Maintenance Department," six stations with fifteen employes; the "Commercial" stations, with twenty employes, are at Tâhrî and Tehran only. The Persian telegraph system, under British officers, has fourteen stations in all, the chief being at Tehran, Isfahan, Shîraz, and Bushahr. The official telegraph numbers between the stations are forty. The number of paid words passing through these lines has steadily increased from 806,466 in 1877 to 1,177,412 in 1883. The average time taken by a message from London to Calcutta via Tehran varies from one and a half to two and a half hours.

Sanskrit.	Zend.	Old Persian.	New Persian.
Asura Medhas	Asura Medhas	Asura Medhas	Asura Medhas
hama (arm)	hama	hama	hama
hima (horns)	hima	hima	hima

Our knowledge of the Iranian languages in older periods is too fragmentary to allow of our giving a complete account of this family and of its special historical development. It will be sufficient here to distinguish the main types of the older languages, the more recent periods. From antiquity we have sufficient knowledge of two dialects, the first belonging to eastern Iran, the second to western.

1. *Zend*, or *Old Avestan*.—Neither of these two titles is well Zend.

chosen. The name Old Avestan suggests that the language was limited to the small district of Bactria, or at least that it was spoken there,—which is, at the most, only an hypothesis. *Zend*, again (originally *destind*), is not the name of a language, as Anquetil Duperron supposed, but means "interpretation" or "explanation," and is specially applied to the mediæval Pahlavi translation of the *Avesta*. Our "*Zend-Avesta*" does not mean the *Avesta* in the *Zend* language, but is an incorrect transcription of the original expression "Avestak va zend," i.e., "the holy text (*Avesta*) together with the translation." But, since we still lack sure data to fix the home of this language with any certainty, the convenient name of *Zend* has become generally established, and may be provisionally retained. But the home of the *Zend* language was certainly in eastern Iran; all attempts to seek it farther west—e.g., in Media—must be regarded as failures.

Zend is the language of the so-called *Avesta*, the holy book of the Persians, containing the oldest documents of the religion of Zoroaster. Besides this important monument, which is about twice as large as the *Rig* and *Yajurved* put together, we only possess very scanty relics of the *Zend* language in mediæval glosses and scattered quotations in Pahlavi books. These remain, however, suffice to give a complete insight into the structure of the language. Not only amongst Iranian languages but amongst all the languages of the Indo-European group, *Zend* takes one of the very highest places in

¹ In the transcription of proper names in Part II. an endeavour to render the pronunciation current in Persia has caused the modification of the conventional, and perhaps the more strictly correct, mode elsewhere followed in this work. On this principle it is that the *s* is replaced by *z* and *q*, and the *h* by *z* as in *Mazra* for *Makra*, *Rig* for *Raga*, *Kamshar* for *Khorshar*, &c. In Arabic words, however, the *s* is not exchanged for *z*, nor is the *y* necessarily used for the *z*, except where the repetition of *z* would be confusing, as in *azidat*. As a general rule the system of spelling Indian words, accepted for their correspondence, has been applied to the transliteration of Persian. When a final *z* or *s* is not accented it represents *zh* or *th* for *z* and *s*, and so forth.

² Name of the supreme god of the Persians.
³ Op. I. Darmesteter, *Revue Indienne*, 1. 10 (Paris, 1880).
⁴ As it was said above, *Zend*, and not *destind*, is the correct title for the original text of the Persian Bible. The origin of the word is doubtful, and we cannot point to it before the time of the Sassanians. Perhaps it means "announcement," "revelation."

bhagas. The differences in declension between Old Persian and Zend are unimportant.

Old Persian inscriptions are written in the cuneiform character of the simplest form, known as the "first class." Most of the inscriptions have besides two translations into the more complicated kinds of cuneiform character of two other languages of the Persian empire. One of these is the Assyrian; the real nature of the second is still a mystery. The interpretation of the Persian cuneiform, the character and dialect of which were equally unknown, was begun by Grotefend, who was followed by Burnouf, Rawlinson, and Oppert. The ancient Persian inscriptions have been collected in a Latin translation with grammar and glosses by Spiegel (Leipzig, 1832). The other ancient tongues and dialects of this family are known only by name; we read of peculiar idioms in Sogdiana, Zabulistan, Herat, &c. It is doubtful whether the languages of the Scythians, the Lycians, and the Lydians, of which hardly anything remains, were Iranian or not.

After the fall of the Achæmenians there is a period of five centuries, for which no document of the Persian language has come down to us.

Under the Arsacids Persian nationality rapidly declined; all that remains to us from that period—namely, the inscriptions on coins—is in the Greek tongue. Only towards the end of the Parthian dynasty and after the rise of the Sassanians, under whom the national traditions were again cultivated in Persia, do we recover the lost traces of the Persian language in the Pahlavi inscriptions and literature.

3. *Middle Persian*.—The singular phenomena presented by Pahlavi writing have been discussed in a separate article (see Pahlavi). The language which it disguises rather than expresses—Middle Persian, as we may call it—presents many changes as compared with the Old Persian of the Achæmenians. The abundant grammatical forms of the ancient language are much reduced in number; the case-ending is lost; the noun has only two inflections, the singular and the plural; the cases are expressed by prepositions, e.g., *rôdân* (the soul), nom. and acc. sing., plur. *rôdânân*; dat. *-û* or *on* *rôdân*, abl. *mita* or *on* *rôdân*. Even distinctive forms for gender are entirely abandoned, e.g., the pronoun *am* signifies "he," "she," "it." In the verb compound forms predominate. In this respect Middle Persian is almost exactly similar to New Persian.

4. *New Persian*.—The last step in the development of the language is New Persian, represented in its oldest form by Firdausi. In grammatical forms it is still poorer than Middle Persian; except English, no Indo-European language has so few inflections, but this is made up for by the subtle development of the syntax. The structure of New Persian has hardly altered at all since the *Shâhnâmâ*; but the original purism of Firdausi, who made every effort to keep the language free from Semitic admixture, could not long be maintained. Arabic literature and speech exercised so powerful an influence on New Persian, especially on the written language, that it could not withstand the admission of an immense number of Semitic words. There is no Arabic word which would be refused acceptance in good Persian. But, nevertheless, New Persian has remained a language of genuine Iranian stock.

Among the changes of the sound system in New Persian, as contrasted with earlier periods, especially with Old Persian, the first that claims mention is the change of the tenses *k*, *t*, *g*, *c*, into *g*, *â*, *b*, *z*. Thus we have—

Old Persian or Zend.	Pahlavi.	New Persian.
<i>mairia</i> (death)	<i>mar</i>	<i>mari</i>
<i>θrâstâna</i>	<i>Frâstân</i>	<i>Frâstân</i>
<i>âp</i> (water)	<i>âp</i>	<i>âb</i>
<i>âvâto</i> (sail)	<i>âvât</i>	<i>âvât</i>
<i>râncâh</i> (day)	<i>râj</i>	<i>rûz</i>
<i>haca</i>	<i>hâc</i>	<i>âc</i>

A series of consonants often disappear in the spirant; thus—

Old Persian or Zend.	Pahlavi.	New Persian.
<i>hacû</i> (mountain)	<i>hâc</i>	<i>kâ</i>
<i>gâthû</i> (place), <i>Z. gâthû</i>	<i>gis</i>	<i>gâh</i>
<i>cûthware</i> (four)	<i>cûth</i>	<i>cûth</i>
<i>hâkâta</i> (divine)	<i>hâkâk</i>	<i>bandâk</i>
<i>spâda</i> (army)	<i>spâd</i>	<i>spâh</i>
<i>dâsâmî</i> (I give)	<i>dâsâm</i>	<i>dâham</i>

Old *s* and *dh* frequently become *y*—

Old Persian or Zend.	Pahlavi.	New Persian.
<i>machû</i> (wine)	<i>may</i>	<i>mai</i>
<i>baodhû</i> (consciousness)	<i>bôd</i>	<i>bâi</i>
<i>pâthâ</i> (foot)	<i>pâ</i>	<i>pâi</i>
<i>saitha</i> (wheat)	<i>sâi</i>	<i>sâi</i>

Old *y* often appears as *j*; Zend *yâma* (glance), New Persian *yâm*; *yavem* (a youth), New Persian *yâvan*. Two consonants are not allowed to stand together at the beginning of a word; hence vowels are frequently inserted or prefixed, e.g., New Persian *siddan* or *seddan* (to stand), *rot* *stâ*; *brâddar* (brother), Zend and Pahlavi *brâdar*.¹

¹ Grammar of New Persian, by Lumsden (Calcutta, 1820), Choix des Perses, 1852, Vulliamy (Glasgow, 1870). For the New Persian dialects see Fr. Müller, in the *Sitzungsber. der Wien. Akad.*, vol. lxxvii, lxxviii.

Amongst modern languages and dialects other than Persian which Modern must be also assigned to the Iranian family may be mentioned—dialects.

1. *Kurdish*, a language nearly akin to New Persian, with which it has important characteristics in common. It is chiefly distinguished from it by a marked tendency to shorten words at all costs, e.g., Kurd. *brâd* (brother) = New Persian *brâdar*; Kurd. *dâm* (give) = New Persian *dihâm*; Kurd. *epî* (white) = New Persian *spîd*.
2. *Baluch*, the language of Baluchistan, also very closely akin to New Persian, but especially distinguished from it in that all the old spirants are changed into explosives, e.g., Baluch *âd* (sleep) = Zend *haefra*; Baluch *kup* (slime) = Zend *kafra*, New Persian *kuf*; Baluch *hapt* (seven) = New Persian *haft*.
3. *Ossetic*, true Iranian, in spite of its resemblance in sound to the Georgian.²

4. *Afghan*, which has certainly been increasingly influenced by the neighbouring Indian languages in inflexion, syntax, and vocabulary, but is still at bottom a pure Iranian language, not merely intermediate between Iranian and Indian.

The position of *Armenian* also remains doubtful. Some scholars attribute it to the Iranian family; others prefer to regard it as a separate and independent member of the Indo-European group. Many words that at first sight seem to prove its Iranian origin are only adopted from the Persian.³ (K. G.)

SECTION II.—MODERN PERSIAN LITERATURE.

Persian historians are greatly at variance about the origin of their national poetry. Most of them go back to the 5th Christian century and ascribe to one of the Sassanian kings, Bâhrâmîr or Bâhrâm V. (420-439), the invention of metre and rhyme; others mention as author of the first Persian poem a certain Abulhâsh of Soghd, near Samarkand. In point of fact, there is no doubt that the later Sassanian rulers fostered the literary spirit of their nation (see Pahlavi). Pahlavi books, however, fall outside of the present subject, which is the literature of the idiom which shaped itself out of the older Persian speech by slight modifications and a steadily increasing mixture of Arabic words and phrases in the 9th and 10th centuries of our era, and which in all essential respects has remained the same for the last thousand years. The national spirit of Iran, although smothered and stifled by the Arab conquest, could not be entirely annihilated. The system of centralization was at no time very strong in the extensive dominions of the Omayyad and 'Abbâsid dynasties; and the more their power and influence decayed the more they lost their hold on Persia, especially since the native element began to aspire to governorships and to take the political management into its own hand. The death of Hârun al-Rashîd in the beginning of the 9th century, which marks the commencement of the decline of the caliphate, was at the same time the starting-point of movements for national independence and a national literature in the Iranian dominion, and the common cradle of the two was in the province of Khorâsân, between the Oxus and Jaxartes. In Merv, a Khorâsânian town, a certain 'Abbâs composed in 809 A.D. (193 A.H.), according to the oldest biographical writer of Persia, Mohammed 'Aufi, the first real poem in modern Persian, in honour of the 'Abbâsid prince Ma'mûn, Hârun al-Rashîd's son, who had himself a strong predilection for Persia, his mother's native country, and was, moreover, thoroughly imbued with the freethinking spirit of his age. Soon after this, in 820 (205 A.H.), Tâhir, who aided Ma'mûn to wrest the caliphate from his brother Amin, succeeded in establishing the first semi-independent Persian dynasty in Khorâsân, which was overthrown in 872 (259 A.H.) by the family of the Sa'fîdî, founded by Ya'qûb b. Laith, originally a brazier in Sistân or Zabulistan.

The development of Persian poetry under these first native dynasties was slow. Arabic language and literature had gained too firm a footing to be supplanted at once

Earliest modern Persian poet.

by a new literary idiom still in its infancy, nevertheless the few poets who arose under the Tāhids and Saffārids show already the germs of the characteristic tendency of all later Persian literature, which aims at amalgamating the enforced spirit of Islamism with their own Aryan feelings, and reconciling the strict deism of the Mohammedan religion with their inborn loftier and more or less pantheistic ideas, and we can easily trace in the few fragmentary verses of men like Hanzalah, Hakīm Fīrūz, and Abū Salīk those principal forms of poetry now used in common by all Mohammedan nations—the forms of the *kasīda* (the encomiastic, elegiac, or satirical poem), the *ghazal* or ode (a love-ditty, wine-song, or religious hymn), the *rubāʿī* or quatrain (our epigram, for which the Persians invented a new metre in addition to those adopted from the Arabs), and the *mathnawī* or double-rhymed poem (the legitimate form for epic and didactic poetry). The first who wrote such a *mathnawī* was Abū Shukr of Balkh, the oldest literary representative of the third dynasty of Khorāsān, the Sāmānids, who had been able in the course of time to dethrone the Saffārids, and to secure the government of Persia, nominally still under the supremacy of the caliphs in Baghdād, but in fact with full sovereignty. The undisputed reign of this family dates from the accession of Amīr Nasr II. (913-942, 301-331 A.H.), who more than any of his predecessors, patronized arts

century.

and sciences in his dominions. The most accomplished minstrels of his time were Mohammed Farāldī, Abū ʿAbbās of Bokhārā, a writer of very tender verses; Abū ʿMuzaffar Naṣr of Nishāpūr; Abū ʿAbdallāh Mohammed of Jūnāid, equally renowned for his Arabic and Persian poetry, Maḥawī, full of original thoughts and spiritual subtleties; Khusravānī, from whom even Firdausi condescended to borrow quotations; Abū ʿḤasan Shāhid of Balkh, the first who made a *diwān* or alphabetical collection of his lyrics, and Master Rūdāgī, the first classic genius of Persia, who impressed upon every form of lyric and didactic poetry its peculiar stamp and individual character (see Rūdāgī). His graceful and captivating style was imitated by Hakīm Khābbāz, a great baker, poet, and quack; Abū Shuʿaib Sālih of Herāt, who left a spirited little song in honour of a young Christian maiden, Raṣmākī of Bokhārā, Abū ʿI-Fath of Bust, who was also a good Arabic poet, the amir Abū ʿḤasan ʿAlī Alagātehi, who handled the pen as skillfully as the sword, ʿUmīrah of Merv, a famous astronomer; and Kisāʾī, a native of the same town, a man of stern and ascetic manners, who sang in melodious rhythm the praise of ʿAlī and the twelve Imāms. All these poets flourished under the patronage of the Sāmānid princes, who also fostered the growing desire of their nation for historical and antiquarian researches, for exegetical and medical studies. Mansūr I., the grandson of Rūdāgī's patron, ordered (963; 352 A.H.) his waṣīr Balʿam to translate the famous universal history of Tabarī (224-310 A.H.) from Arabic into Persian; and thus *Tarīkh-i-Tabarī*, the oldest prose work in modern Persian, is not merely remarkable from a philological point of view, it is also the classic model of an easy and simple style. The same prince employed the most learned among the ulemā of Transoxiana for a translation of Tabarī's second great work, the *Tafṣīr*, or commentary on the Koran, and accepted the dedication of the first Persian book on medicine, a pharmacopoeia by the physician Abū Mansūr Muwaffak b. ʿAlī of Herāt (edited by Seligmann, Vienna, 1859), which forms a kind of connecting link between Greek and Indian medicine. It was soon after further developed by the great Avicenna (died 1037; 428 A.H.), himself a Persian by birth, and author of pretty wine-songs, moral maxims, psychological tracts, and a manual of philosophic science, the *Dāmešnāma-i-ʿAlāʾī*, in his native tongue.

Tabarī

A still greater impulse was given, both to the patriotic feelings and the national poetry of the Persians, by Mansūr's son and successor, Prince Nūh II., who ascended the throne in 976 (365 A.H.). Full of enthusiasm for the glorious past of the old Iranian kingdom, he charged his court poet Dakīkī, who openly professed in his *ghazals* the Zoroastrian Dākīkī creed, to turn the Fārsī collection of the venerable legends and traditions of the heroic ages of Iran, the *Khodāʾndāma*, or "Book of Kings" (which had been translated from the Pahlavī under the Saffārid Yaʿqūb b. Laith), into Persian verse. Shortly after commencing this work Dakīkī was murdered in the prime of life, and the fall of the minstrel was soon followed by that of the Sāmānid dynasty itself, which was supplanted by the younger and more vigorous house of Sabuktāgīn, the founder of the Ghaznawids, who had rapidly risen from the rank of a common Turkish soldier to that of an independent ruler of Ghazna (Ghazni, Ghuznee) and all the surrounding countries, including a considerable portion of India. But Dakīkī's great enterprise was not abandoned; a stronger hand, a higher genius, was to continue and to complete it, and this genius was found in Firdausi (940-1020, 328-411 A.H.), Firdausi with whom we enter the golden age of the national epopee in Persia (see Firdausi). In 1011, after thirty-five years of unremitting labour, he accomplished his gigantic task, and wrote the last distichs of the immortal *Shāhnāma*, that "glorious monument of Eastern genius and learning," as Sir W. Jones calls it, "which, if ever it should be generally understood in its original language, will contest the merit of invention with Homer itself." And, although it was not he, the unrivalled master of epic art, but his old friend and patron, the less-renowned ʿUnsurī, who officiated as "king of poets" in the court of Mahmūd of Ghazna (998-1030; 388-421 A.H.), who had continued his father Sabuktāgīn's conquests, and founded an empire extending from the Caucasus to Bengal and from Bokhārā and Kashgar to the Indian Ocean, he was nevertheless the central sun round which all the minor stars revolved, those four hundred poets who formed the famous "Round Table" in the sultan's magnificent palace. Firdausi's fame eclipsed that of all his contemporaries (however well founded that claim upon literary renown),—men like ʿUnsurī, Farrukhī, Aṣḡadī, Ghadrī, Mīnūtchehrī, and others, whose eloquent praises of Mahmūd have come down to us in very scarce copies, and even that of his own teacher Aṣadī, who survived his great pupil, and established a reputation of his own by introducing into Persian literature the novel form of the *mundasrah* or strife-poem, the equivalent of the Provençal *tenson* and the English *strif* or *joust*. The *Shāhnāma*, imitations from the very moment of its appearance, exercised such an irresistible fascination upon all minds that there was soon a keen competition among the younger poets as to who should produce the most successful imitation of that classic model; and this competition has gone on under different forms through all the following centuries, even to the most recent times. First of all, the old popular traditions, so far as they had not yet been exhausted by Firdausi, were ransacked for new epic themes, and a regular cycle of national epopees gathered round the *Book of Kings*, drawn almost exclusively from the archives of the princes of Sīstān, the family of Firdausi's greatest hero, Rustam. The first and most ambitious of these competitors seems to have been Aṣadī's own son, ʿAlī b. Ahmad al-Aṣadī, the author of the oldest Persian glossary, who completed in 1066 (458 A.H.), in upwards of 9000 distichs, the *Garshāspnāma*, or marvellous story of the warlike feats and love-adventures of Garshāsp, one of Rustam's ancestors. The heroic deeds of Rustam's grandfather were celebrated in the *Sāmāna*, which almost equals the *Shāhnāma* in length; those of Rustam's two sons, in the *Tahangīrnāma* and the *Farā-*

Imitations

Shāhnāma.

murnāma; those of his daughter, an amazon, in the Brunhild style of the German Nibelunge, in the *Bānū Gushaspnāma*; those of his grandson, in the *Barsnāma*; those of his great-grandson, in the *Shahriyār-nāma* (ascribed to Mukhtār and dedicated to Mas'ūd Shah, who is probably identical with Mas'ūd b. Ibrahim, Sultan Mahmūd's great-grandson, 1088-1114; 481-508 A.H.); and the wonderful exploits of a son of Isfandiār, another hero of the *Shāhnāma*, in the *Bahnānāma*.

When at last these old Iranian sources were almost entirely exhausted, the difficulty was met in various but equally ingenious ways. Where some slight historical records of the heroic age—no matter how doubtful their authenticity—were still obtainable, poetical imagination seized upon them at once, and filled the wide gaps by its own powerful invention; where no traditions at all were forthcoming, fiction pure and simple asserted its indisputable right; and thus the national epopee gave way to the epic story, and—substituting prose for verse—to the novel and the fairy tale. Models of the former class are the various *Iskandarnāmas*, or "Books of Alexander the Great," the oldest and most original of which is that of Nizāmī (completed about 1202; 599 A.H.); the latter begins with the *Kutb-i-Samak 'Iyār*, a novel in three volumes (about 1189; 585 A.H.), and reaches its climax in the *Bāstām-i-Khayāl*, or "Garden of Imagination," a prose romance of fifteen large volumes, by Mohammed Taqi Khayāl, written between 1742 and 1756 (1155 and 1169 A.H.). Many aspirants to poetical fame, however, were not satisfied with either of these expedients: they boldly struck out a new path and explored hitherto unknown regions, and here again a twofold tendency manifested itself. Some writers, both in prose and verse, turned from the exhausted fields of the national glory of Persia to the comparatively original soil of Arabian traditions, and chose their subjects from the chivalrous times of their own Bedouin conquerors, or even from the Jewish legends of the Koran. Of this description are the *Amiriyānāma*, or history of the pre-Mohammedan prophets, by Hasan Shabistari 'A'yān (before the 8th century of the Hijra); Ibn Husām's *Khawarnāma* (1427; 850 A.H.), or the deeds of 'Alī; Bādhlī's *Hamīd-i-Haidari*, which was completed by Najaf (1725; 1135 A.H.), or the life of Mohammed and the first four caliphs; Kāzīm's *Farahnāma-i-Fātima*, the book of joy of Fātima, Mohammed's daughter (1737; 1150 A.H.),—all four in the epic metre of the *Shāhnāma*; and the prose stories of *Hātim Tā'i*, the famous model of liberality and generosity in pre-Islamic times; of *Amir Hamzah*, the uncle of Mohammed; and of the *Mu'jizāt-i-Muhammad*, or the miraculous deeds of Moses, by Mu'n-al-ma'akhi (died about 1501; 907 A.H.).

Quite a different turn was taken by the ambition of another class of imitators of Firdausi, especially during the last four centuries of the Hijra, who tried to create a new heroic epopee by celebrating in rhythm and rhyme stirring events of recent date. The gigantic figure of Timur inspired Hāfīf (died 1521; 927 A.H.) with his *Timurnāma*; the stormy epoch of the first Safawi rulers, who succeeded at last in reuniting for some time the various provinces of the old Persian realm into one great monarchy, furnished Kāsimī (died about 1560; 967 A.H.) with the materials of his *Shāhnāma*, a poetical history of Shāh Isma'īl and Shāh Tahmasp. Another *Shāhnāma*, celebrating Shāh 'Abbās the Great, was written by Kamālī of Sabawār; and even the cruelties of Nādir Shāh were duly chronicled in a pompous epic style in 'Izzat's *Shāhnāma-i-Nādirī* (1749; 1162 A.H.). But all these poems are surpassed in length by the 33,000 distichs of the *Shāhshāhnāma* by the poet-laureate of the late Feth 'Alī Shāh of Persia, and the 40,000 distichs of the *Georgenāma*, a poetical history of India from its discovery by the Portuguese to the conquest

of Poonah by the English in 1817. In India especially this kind of epic versification has flourished since the beginning of Humāyūn's reign (1530-1586); the court-poets of the great Mogul emperors of Delhi, as well as of all the minor dynasties, vied with one another in glorifying the exploits of their respective sovereigns, and is sufficiently proved by the *Zafarnāma-i-Shahshāhī* by Kudsī (died 1646; 1056 A.H.); the *Shāhshāhnāma* by Tālib Kalīm (died 1651; 1061 A.H.), another panegyrist of Shāh Jahān; Atash's *'Adībāna*, in honour of Shāh Mohammed 'Adil of Bijāpūr, who ascended the throne in 1629 (1039 A.H.); the *Pandir-kh-i-Kutb Kuybehāh*, a metrical history of the Kutb shāhs of Golkonda; and many more, down to the *Pathnāma-i-Tipū Sulṭān* by Ghulam Hasan (1784; 1189 A.H.).

But the national epopee, with both its legitimate and its illegitimate offspring, was not the only bequest the great Firdausi left to his nation. This rich genius gave also the first impulse to the higher development of those other branches of poetical art which were to flourish in the following ages—particularly to *romantic*, *didactic*, and *mystic poetry*; and even his own age produced powerful co-operators in these three most conspicuous departments of Persian literature. *Romantic fiction*, which achieved its Romantic highest triumph in Nizāmī of Ganja's (1141-1203; 535-599 section. A.H.) brilliant pictures of the struggles and passions in the human heart (see NIZĀMĪ, vol. xvii. pp. 521, 522), sent forth its first tender shoots in the numerous love-stories of the *Shāhnāma*, the most fascinating of which is that of Zāl and Rūdābeh, and developed almost into full bloom in Firdausi's second great mathnawī *Yūsuf u Zalikha*, which the aged poet wrote after his flight from Ghazna, and dedicated to the reigning caliph of Baghdād, Alkādīr-billāh. It represents the oldest poetical treatment of the Biblical story of Joseph, which has proved so attractive to the epic poets of Persia, among others to 'Amak of Bokhārā (died 1149), who was the first after Firdausi to write a *Yūsuf u Zalikha* (which can be read in two different metres), to Jāmī (died 1499), Manjī Kāsim Khān, Humāyūn's amir (died 1871), Nāzīm of Herāt (died 1670), and Shaukat, the governor of Shirāz under Feth 'Alī Shāh. Perhaps prior in date to Firdausi's *Yūsuf* was his patron 'Ungur's romance *Wāmiq u Adhrā*, a popular Iranian legend of great antiquity, which had been first written in verse under the Tāhirid dynasty. This favourite story was treated again by Fāsihi Jurjāni (in the course of the same 5th century of the Hijra), and by many modern poets,—as Dāmīr, who died under the Safawi Shāh Mohammed (1577-1586; 985-994 A.H.), Nāmī, the historiographer of the Zand dynasty, and Husain of Shirāz under Feth 'Alī Shāh, the last two flourishing towards the beginning of the present century. Another love-story of similar antiquity, which had originally been written in Pahlavi, formed the basis of Fakhr-uddīn As'ad Jurjān's *Wīs u Rāstin*, which was composed in Isfāhān (Isfahān) about 1048 (440 A.H.),—a poem remarkable not only for its high artistic value but also for its close resemblance to one of the epic masterpieces of mediæval German literature, Gottfried von Strassburg's *Tristan und Isolde*.

The last-named Persian poet was apparently one of the earliest eulogists of the Seljūks, and it was under this Turkish dynasty, which soon became a formidable rival both of the Ghaznawids and of the Arabian caliphs of Baghdād, that lyrical romanticism—that is, panegyrical *romantic* and satirical poetry—rose to the highest pitch. What *acts and* Firdausi, in his exalted descriptions of royal power and *satirists* dignity, and the court-poets of Sultan Mahmūd, in their unbounded praise of the great sovereign and protector of arts, had commenced, what other encomiasts under Mahmūd's successors—for instance, Abū 'l-Faraj Rūmī of Lahore and Mas'ūd b. Sa'd b. Salman—under Sultan

XVIII. — 83

1040-1085)—had successfully continued, reached its perfection in the famous group of panegyrists who gathered in the first half of the 6th century of the Hijra round the throne of Sultan Sanjar, and partly also round that of his great antagonist, Atsiz, shah of Khwārizm. This group included Adib Sabir, who was drowned by order of the prince in the Orus about 1145 (540 A.H.), and his pupil Janhar, the goldsmith of Bokhārā; Amīr Mu'izzī, the king of poets at Sanjar's court, killed by a stray arrow in 1147 (542 A.H.); Rashid Watwāt (the Swallow), who died in 1172 (568 A.H.), and left, besides his kasidas, a valuable treatise on poetry (*Ilwāḍ-ḥ-esshr*) and a metrical translation of the sentences of 'Alī, 'Abd-al-wāsiṭ Jabālī, who sang at first, like his contemporary Hasan Ghaznawī (died 1160, 565 A.H.), the praise of the Ghaznawid shah Bahram, but afterwards bestowed his eulogies upon Sanjar, the conqueror of Ghazna, and Aḥmad-uddīn Anwarī, the most celebrated kasida-writer of the whole Persian literature. Anwarī (died between 1191 and 1196; 587 and 592 A.H.), who in early life had pursued scientific studies in the madrasah of Tish and who ranked among the foremost astronomers of his time, owes his renown as much to the inexhaustible store of poetical similes and epithets onanistic which he showered upon Sanjar and other royal and princely personages as to his cutting sarcasms, which he was careful enough to direct, not against special individuals, but against whole classes of society and the cruel wrongs worked by an inexorable fate,—thus disregarding the more manly example of Firdausi, whose bold attack upon Sultan Mahmūd for having cheated him out of the well-earned reward for his epopee is the oldest and, at the same time, most finished specimen of personal satire. This legitimate branch of high art, however, soon degenerated either into the lower forms of parody and travesty—for which, for instance, a whole group of Transoxanian writers, Sūzani of Samarqand (died 1174, 569 A.H.) and his contemporaries, Abū 'Alī Shatrānī of the same town, Lāmī of Bokhārā, and others gained a certain literary reputation—or into mere comic pieces and jocular poems like the "Pleasantries" (*Uṭṭiyāt*) and the humorous stories of the "Mouse and Cat" and the "Stone-cutter" (*Sangtarash*) by 'Ubad Zakānī (died 1370, 772 A.H.) Anwarī's greatest rival was Khakānī (died 1199, 595 A.H.), the son of a carpenter in Shirwān, and panegyrist of the shahs of Shirwān, usually called the Firdas of the East on account of the difficult and enigmatic style of his verses. Oriental critics, of course, greatly admire the obscure allusions, far-fetched puns, and other eccentricities with which the otherwise energetic and harmonious language, both of his laudatory odes and of his satires, is loaded; to European taste only the shorter epigrams and the double-rhymed poem *Tuṭṭ-ut-tirṭān*, in which Khakānī describes his journey to Mecca and back, give full satisfaction. Among his numerous contemporaries and followers may be noticed Muḥy-uddīn Balaḥkānī (died 1198, 594 A.H.), Zahir Fāryābī (died 1202; 598 A.H.), and Athir Akhsikānī (died 1211, 608 A.H.),—all three panegyrists of the atabegs of Adharbaijān (Azerbaijan), and especially of Sultan Kizil Arslan—Kamāl-uddīn Isfahānī, tortured to death by the Moguls in 1237 (635 A.H.) who sang, like his father Jamāl-uddīn, the praise of the governors of Isfahan, and gained, on account of his fertile imagination, the honorary epithet of the "creator of fine thoughts" (Khallāk-ulma'ānī), and Saif-uddīn Isfaraḡī (died 1287, 686 A.H.), a favourite of the shahs of Khwārizm.

Fruitful as the 6th and 7th centuries of the Hijra were in panegyrics, their literary fame did not rest upon these alone; they attained an equally high standard in two other branches of poetry, the didactic and the mystic, which after a short period of separate existence entered into a close and henceforth indissoluble union. The origin of

both can again be traced to Firdausi and his time. In the ethical reflexions, wise maxims, and moral exhortations scattered throughout the *Shāhnāma* the didactic element is plainly visible, and equally plain in it are the traces of that mystical tendency which was soon to pervade almost all the literary productions of Persian genius. Sūfī pantheism, which tends to reconcile philosophy with revealed religion, and centres in the doctrine of the universality and absolute unity of God, who is diffused through every particle of the visible and invisible world, and to whom the human soul during her temporary exile in the prison-house of the body strives to get back through progressive stages till she is purified enough to be again absorbed in Him, is already hinted at in the numerous verses of the "Book of Kings" in which the poet cries out against the vanity of all earthly joys and pleasures, and expresses a passionate desire for a better home, for a reunion with the Godhead. But the most characteristic passage of the epopee is the mysterious disappearance of Shah Kaikobad, who suddenly, when at the height of earthly fame and splendour, renounces the world in utter disgust, and, carried away by his fervent longing for an abode of everlasting tranquillity, vanishes for ever from the midst of his companions. The first Persian who devoted poetry exclusively to the illustration of Sūfī doctrine was Firdausi's contemporary, the renowned poet Sheikh Abū Sa'īd b. Abū 'l-Khair of Mahna in Khorāsān (968-1049; 357-440 A.H.), the founder of that specific form of the rubā'ī which gives the most concise expression to religious and philosophic aphorisms,—a form which was further developed by the great freethinker 'OMAR b. KHAYYAM (q.v.), and Aḥmad-uddīn Kāshī (died 1307; 707 A.H.). The year of Abū Sa'īd's death is most likely the same which gave to the world the first great didactic mathnawī, the *Rishawānīdama*, or "Book of Enlightenment," by Nāṣir b. KROBAT (q.v.), a poem full of sound moral and ethical maxims with slightly mystical tendencies. About twenty-five years later the first theoretical handbook of Sūfism in Persian was composed by 'Alī b. 'Uthmān al-jullabī al-hujwiri in the *Kashf-ulmaḥabb*, which treats of the various schools of Sūfīs, their teachings and observances. A great saint of the same period, Sheikh 'Abdallāh Ansārī of Herāt (1006-1089; 396-481 A.H.), assisted in spreading the pantheistic movement by his *Munāṣṣat* or invocations to God, by several prose tracts, and by an important collection of biographies of eminent Sūfīs, based on an older Arabic compilation, and serving in its turn as groundwork for Jāmī's excellent *Nafahāt-uluns* (completed in 1478; 883 A.H.). He thus paved the way for the publication of one of the earliest text-books of the whole sect, the *Madkhal-ulkhatat*, or "Garden of Truth" (1130; 525 A.H.), by Hakim Sanā'ī of Ghazna, to whom all the later Sūfī poets refer as their unrivalled master in spiritual knowledge. In this extensive mathnawī in ten cantos, as well as in his smaller poetical productions, he skilfully blended the purely didactic element, which is enhanced by pleasant stories and anecdotes, with the chief tenets of higher theosophy,—an example which has been strictly adhered to by all the following Sūfī poets, who only differ in so far as they give preponderance either to the ethical or to the mystical side of their writings. As the most uncompromising Sūfīs appear the greatest pantheistic writer of all ages, Jalāl-uddīn Rūmī (1207-1273; 604-672 A.H.; see RŪMĪ), and his scarcely less renowned predecessor Farīd-uddīn 'Attār, who was slain by the Moguls at the age of 114 lunar years in 1230 (627 A.H.). This prolific writer, originally a druggist (ṭabīb) in Nishāpūr, after having renounced all worldly affairs and performed the pilgrimage to Mecca, devoted himself to a stern ascetic life, and to the composition of Sūfī works, partly in prose, as in his valuable "Biography of eminent Mystic Divines," but mostly in the form of math-

navis (upwards of twenty in number), among which the *Pandāma*, or "Book of Counsels," and the *Manik-ut-tavar*, or the "Speeches of Birds," occupy the first rank. In the latter, an allegorical poem, interspersed with moral tales and pious contemplations, the final absorption of the Sāfi in the deity is most ingeniously illustrated, and the seven valleys through which the birds travel on their way to the fabulous phoenix or smurg (literally thirty birds), and in which all except thirty succumb, are the seven stations of the mystic road that leads from earthly troubles into the much-coveted Fanā or Nirvāna.

In strong contrast to these advanced Sāfis stands the greatest moral teacher of Persia, Sheikh Sa'di of Shirāz (died about 110 lunar years old in 1292; 691 A.H., see Sa'di), whose two best known works, the *Bistān*, or "Fruit-garden," and the *Gulistan*, or "Rose-garden," owe their great popularity both in the East and the West to the purity of their spiritual thoughts, their sparkling wit, charming style, and the very moderate use of mystic theories. However, both have found comparatively few imitations,—the former in the *Dustārnāma* of Nizāmī of Kohistān (died 1390, 720 A.H.), in the *Dak Bāb*, or "Ten Letters," of Kātibī (died 1434, 838 A.H.), and in the *Gulabr* of Haratī (murdered 1554; 961 A.H.); the latter in Mu'in-uddin Juwainī's *Nigārīstān* (1335, 735 A.H.) and Jāmī's *Bahārīstān*, or "Spring-garden" (1487; 892 A.H.), whereas an innumerable host of purely Sūfic compositions followed in the wake of Sanā'ī's, 'Attār's, and Jelāl-uddin Rūmī's mathnawīs. They consist partly of mere expositions of doctrines with or without illustrations by tales and anecdotes, partly of complete Sūfic allegories, often disguised by the wildest eccentricities. It will suffice to name a few of the most conspicuous in each class. To the former belong the *Lamā'āt*, or "Sparks," of 'Irāki (died between 1287 and 1309; 686 and 709 A.H.), the *Zād-ul-muwāḍḍir*, or "Store of the Wayfarers," by Husainī (died 1318, 718 A.H.), the *Gulshan-i-Rās*, or "Rose-bed of Mystery," by Mahmūd Shabastārī (died 1320; 720 A.H.), the *Jām-i-Jam*, or "Cup of Jamshīd," by Anḥādī (died 1338; 738 A.H.), the *Anīs-ul-'Arīfīn*, or "Friend of the Mystics," by Kāsim-i-Anḥārī (died 1434; 837 A.H.), and others; to the latter 'Assā's *Mubr u Muḥṭār*, or "Sun and Jupiter" (1376, 778 A.H.), 'Arīf's *Gūs u Chayḡar*, or "The Ball and the Bat" (1438; 842 A.H.), *Husn u Dil*, or "Beauty and Heart," by Fattāḥī of Nishāpūr (died 1448, 852 A.H.), *Sham u Parvāna*, or "The Candle and the Moth," by Ahlī of Shirāz (1489; 894 A.H.), *Shāh u Gadā*, or "King and Dervish," by Hīlālī (put to death 1532; 939 A.H.), Bahā-uddin 'Amīlī's (died 1621, 1030 A.H.) *Nān u Havāḍ*, or "Bread and Sweeties," *Shār u Shakar*, or "Milk and Sugar," and many more.

works.

Lyric
poetry.

During all these periods of literary activity, lyric poetry, pure and simple—i.e., the ghazal, in its legitimate form—had by no means been neglected; almost all the renowned poets since the time of Rūdāgi had sung in endless strains the pleasures of love and wine, the beauties of nature, and the almighty power of the Creator; but, however rich the ghazals of Sa'di in lofty thoughts and pious feelings, however sublime the hymns of Jelāl-uddin Rūmī, it was left to the incomparable genius of Ḥafīz (died 1389; 791 A.H.; see Ḥafīz) to give to the world the most perfect models of lyric composition; and the lines he had laid down were more or less strictly followed by all the ghazal-writers of the 9th and 10th centuries of the Hīra,—by Salmān of Sāva (died about 1377, 779 A.H.), who excelled besides in ḡasida and mathnawī, Kamāl Khujandī, Ḥafīz's friend, and protégé of Sultan Husain (776-784 A.H.), Mohammed Shīrīn Maghrībī (died at Tabriz in 1406, 809 A.H.), an intimate friend of Kamāl; Nīmat-ullāh Walī (died 1431; 834 A.H.), the founder of a special religious order; Kāsim-i-

Ghazal-
writers

Anḥārī (see above); Amīn Shāhī (died 1453; 857 A.H.), of the princely family of the Sarbadars of Sabzawār, Bannā'ī (died 1512, 918 A.H.), who also wrote a romantic poem, *Bukhrām u Bukhrā*, Bābā Fighānī of Shirāz (died 1519, 925 A.H.), usually called the "Little Ḥafīz"; Nargis (died 1531, 938 A.H.), Lisānī (died 1534; 941 A.H.), who himself was imitated by Damīnī of Isfahān, Muḥtasham Kāshī, and Wahshī Bāfīkī (all three died in the last decade of the 10th century of the Hīra), Ahlī of Shirāz (died 1535, 942 A.H.), author of the *Subḥ-i-Hadd*, or "Lawful Witchcraft," which, like Kātibī's (died 1434, 838 A.H.) *Mayma-ul-baharān*, or the "Confluence of the Two Seas," can be read in two different metres, Nan'ī (died 1610, 1019 A.H.), who wrote the charming romance of a Hindu princess who burned herself in Akbar's reign with her deceased husband on the funeral pile, styled *Sās u Qadās*, or "Burning and Maltreating," &c. Among the immediate predecessors of Ḥafīz in the 8th century of the Hīra, in which also Ibn Yamin, the great kut'ah-writer,¹ flourished, the highest fame was gained by the two poets of Delhi, Amīr Hasan and Amīr Khosrau. The latter, who died in 1325 (725 A.H.), two years before his friend Hasan, occupies the foremost place among all the Persian poets of India by the richness of his imagination, his graphic style, and the historical interest attached to his writings. Five extensive dīwāns testify to his versatility in all branches of lyric poetry, and nine large mathnawīs to his mastery in the epic line. Four of the latter are poetical accounts of contemporary events during the reigns of the emperors of Delhi, 'Alā-uddin Mohammad Shāh Khiljī (1296-1311), his predecessor Firūz Shāh, and his successor Kutb-uddin Muḥarrak Shāh,—the *Miftāḥ-ul-futūḥ*, or "Key of Mysteries," the *Kirān-us-sādān*, or "The Conjunction of the Two Lucky Planets," the *Nuh Sūph*, or "Nine Spheres," and the love-story of *Khulīkhdn u Duvāl ānī*. His other five mathnawīs formed the first attempt ever made to imitate Nizāmī's famous *Khamasah*, or five romantic epopees, and thus attempt turned out so well that henceforth almost all epic poets wrote quintuples of a similar description. Khwāḡ Kirmānī (died 1352; 753 A.H.) was the next aspirant to Nizāmī's fame, with five mathnawīs, among which *Humayd u Humaydāt* is the most popular, but he had to yield the palm to 'Abd-urrahmān Jāmī (1414-1492; 817-898 A.H.), Jāmī the last classic poet of Persia, in whose genius were summed and later up, as it were, all the best qualities of his great predecessors, and who combined, in a manner, the moral tone of Sa'di with the lofty aspirations of Jelāl-uddin Rūmī, and the graceful ease of Ḥafīz's style with the deep pathos of Nizāmī, to whose *Khamasah* he wrote the most successful counterpart (see his *Yūsuf u Zalikhdn* mentioned above). Equally renowned are his numerous prose works, mostly on Sūfic topics, and his three dīwāns. Many poets followed in Jāmī's footsteps, first of all his nephew Ḥafīfī (see above), and either wrote whole *khamasahs* or imitated at least one or other of Nizāmī's epopees, thus we have a *Lailā u Maymān*, for instance, by Maktabī (1490), Hīlālī (see above), and Rūḥ-ulamīn (died 1637). But their efforts could not stop the growing corruption of taste, and it was only at the court of the Mogul emperors, particularly of the great Akbar (1556-1605), who revived Sultan Mahmūd's "round table," that Persian literature still enjoyed some kind of "Indian summer" in poets like Ghazālī of Mashhad and Meḥdī (died 1572); 'Urī of Shirāz (died 1591), who wrote spirited ḡasidas, and, like his contemporaries Wahshī and Kanṭharī, a mathnawī, *Farḡad u Shīrīn*; and Faldī (died 1595), the author of the romantic poem, *Nad u Damān*, who also imparted new life into the rubā'ī. In Persia proper

¹ A kut'ah or mukatta'ah is a poem containing moral reflexions and differs from the ḡasida and ghazal only by the absence of a metrical distich.

PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUC DE (1808-1872), the most devoted servant of Napoleon III., who with the duc de Morny and Marshal Saint-Arnaud formed the triumvirate which established the second empire, was born at Saint-Germain Lespinasse (Loire) on 11th January 1808. He came of a good family, but not a noble one, and, as his father had been killed at the battle of Salamanca in 1812, he was brought up by an uncle, who sent him to be educated at the college of Lumoges. He entered the 3d Hussars in 1825, the cavalry school at Saumur in 1826, and became *maréchal des logis* in the 4th Hussars in 1828. He was at this time a Legitimist, but was soon made a Republican by his captain, and he helped to persuade his regiment to assist in the insurrection of 1830. For this service he expected great rewards, but got none, and was eventually dismissed from the army for insubordination in 1831. Finding himself without resources, he took to journalism, and assisted in editing the *Temps*, and in 1833, by which time he had become a profound Bonapartist, he issued a solitary number of a new journal, the *Occident français*, in which he proclaimed his political creed. This number was sent to Queen Hortense at Arenenberg, and when M. Fialin followed it in person, calling himself the *vicomte de Persigny*, he met with a warm reception, and soon became indispensable to Louis Napoleon. He had two qualities which gave him ascendancy over the young prince, fidelity and audacity. He it was who planned the attempt on Strasburg in 1836, and that on Boulogne in 1840. For his share in the last escapade he was sentenced to imprisonment in a fortress for twenty years, which was commuted into detention at Versailles, where he wrote a curious book to prove that the Pyramids were built to keep the Nile from silting up. When the Revolution of 1848 broke out he laboured indefatigably for the Bonapartist cause, securing the election of Louis Napoleon to the Constituent Assembly in June and in September 1848, and to the presidency in December 1848. His own prosperity was now secured, he was made *aide-de-camp* to the prince president, and elected to the Legislative Assembly in May 1849 for the department of the Loire. He then became one of the secret plotters of the coup d'état, and was at first designed for the office of minister of the interior, but a man of more capacity, De Morny, was chosen for this post, and Persigny only accompanied Colonel Espinasse to take possession of the hall of the assembly. On securing the throne Napoleon III. hastened to reward his most faithful personal adherent. Persigny became minister of the interior in the place of De Morny in January 1852, and a senator in December 1852. He resigned office in 1854 and became ambassador in London, with but one short interval (1858-59), from May 1855 to November 1860, when he again became minister of the interior. His second tenure of office lasted till June 1863, when he resigned in disgust at the influence which M. Rouher was attaining over the mind of the emperor, and was made duc de Persigny in September 1863. As a minister he showed very little capacity, and throughout the years of his political influence he never seemed to understand, like De Morny, the real bases of the existence of the second empire. He, however, from dislike of Rouher, supported Olivier in 1869, and defended the *plébiscite*, and when the empire fell in 1870 escaped to England. He did not long survive the overthrow of the idea which he had so strenuously supported, and died at Nice on 11th January 1872. Fialin de Persigny was certainly only an adventurer, but he had one merit, which the other founders of the second empire did not possess, fidelity to his master.

For Persigny's life, see a most eulogistic biography by Delacroix (*Le duc de Persigny et les doctrines de l'empire*, 1866); a short biography in Mircourt's *Portraits contemporains* (1858), and Cas-

telle's *Portraits politiques et historiques* (1859). His own curious book, *De la destination et de l'utilité permanente des Pyramides d'Égypte et de Nubie*, was published in 1845, and he wrote various political pamphlets, of which the most interesting relates to the Strasburg attempt, *Rélaton de l'entreprise du prince Napoléon Louis* (Lond. 1837). For his political career under the empire, see Taxile Delord's *Histoire du second empire* (1893-75).

PERSIMMON, the name given to the fruits of *Diospyros virginiana* in the United States. The tree which bears them belongs to the order *Ebenaceæ*, and has oval entire leaves, and monoecious flowers on short stalks. In the male flowers, which are numerous, the stamens are sixteen in number, arranged in pairs, and with the anthers opening by slits. The female flowers are solitary, with traces of stamens, and have a glabrous ovary with one ovule in each of the eight cells,—the ovary being surmounted by four styles, which are hairy at the base. The fruit-stalk is very short, bearing a subglobose fruit an inch or rather more in diameter, of an orange-yellow colour, and with a sweetish astringent pulp. It is surrounded at the base by the persistent calyx-lobes, which increase in size as the fruit ripens. The astringency renders the fruit somewhat unpalatable, but, after it has been subjected to the action of frost, or has become partially rotted or "bletted" like a medlar, its flavour is improved. In some of the southern States the fruit is said to be kneaded with bran, made into cakes, and baked. From the cakes a fermented liquor is made with the aid of yeast. The tree is cultivated in England, but rarely if ever ripens its fruit, and in the States it is said not to ripen north of New Jersey.

The Chinese and Japanese cultivate another species, the *Diospyros Kaké*, of which there exist numerous ill-defined varieties, which, according to M. Huen in his exhaustive monograph of the *Ebenaceæ*, all belong to one species. The fruits are larger than those of the American kind, variable in shape, but have similar properties. Some varieties have been introduced into Great Britain, and have produced their fruits in orchard-houses. The fruit is in appearance something like that of the apricot, but very astringent to the taste. After "bletting," however, it becomes sweet and agreeable. Some specimens analyzed by Dr Voelcker for the scientific committee of the Royal Horticultural Society contained, roughly, 84 per cent of water, 21 per cent of tannic acid, and 8.5 of sugar, pectin, &c., with small quantities of woody, albuminous, and mineral matters.

PERSIUS (A. PERSIUS FLACCUS) stands third in order of time of those recognized by the Romans as their four greatest satirists. These represent four distinct periods of the national development,—the revolutionary era of the Gracchi, the years immediately preceding the establishment of the monarchy, the first years of the reign of Nero, the age of Domitian and the dawning of the better era which followed on the accession of Nerva. Their relative value consists in the truth, freedom, and power with which they expressed the better spirit of their time, commented on its vices and follies, and described the actual personages, the prevailing types of character, and the fashions and pursuits—the "*quicquid agunt homines*"—by which it was marked. Of these four representatives of the most distinctly national branch of Roman literature—Lucilius, Horace, Persius, and Juvenal—Persius is the least important. He is indeed inferior to none of them in the purity and sincerity with which he expresses the best spirit of his age; but he was inferior in literary originality and vigour to Lucilius, in literary art to Horace and Juvenal,—less powerful in his denunciation of evil than Lucilius and Juvenal, less searching in his criticism than Horace,—less true to life in his delineation of men and manners than the two earlier satirists, less powerful in his effects than the latest among them. This inferiority is to be ascribed partly to the circumstances of his age. His literature was more artificial, and also more opposed to the true principles of art, than that of any other stage in the development of Roman letters. The generation which succeeded the Augustan age—the generation which lived

under Tiberius, Gaius, and Claudius—had not the genius to originate a literature of its own nor the sense of security which would enable it to perpetuate the literary accomplishment of the preceding age. No period between the Ciceronian era and the reign of Hadrian was so unproductive. The accession of the young emperor, in whom were ultimately realized the worst vices of the tyrant along with the most despicable weaknesses of the *litterateur* and *artiste*—"scenicus ille" is the term of contempt applied to him in Tacitus—gave a fresh impulse to that fashion of verse-making which Horace remarked as almost universal among his educated contemporaries, and which was stimulated by the rhetorical education of the day. But the writers of the Neronian age had neither the genius nor the true sense of art which distinguished the Ciceronian and Augustan ages, nor had they acquired the cultivated appreciation and good taste of the later Flavian era, nor were they animated by that sense of recovered freedom of speech and thought which gave to Roman literature its two last great representatives. The writing of the Neronian age was, for the most part, a crude and ambitious effort to produce sensational effects by rhetorical emphasis. Of its representatives four can still be read with a certain though by no means an unmixed pleasure,—Seneca, Lucan, Petronius, and Persius. Of these Persius had least of the true literary gift. He had neither the smooth and fluent elegance of Seneca, the "ingenium amicum et aurbus illius temporis accommodatum" attributed to him by Tacitus, nor the rhetorical passion of Lucan, nor the cynical realism and power of representation which enabled Petronius to originate a new form of literature. Persius could not have become a satirist of the type of Petronius or of Martial. He could not have treated human degradation in a spirit of cynical sympathy or of amused tolerance. On the other hand earnest satire directed against its legitimate objects, the emperor and his favourites, could not at such a time express itself openly. "Pone Tigellinum" is an expressive reminder that it was safer to write sickly sentimentalism about "Phyllis and Hypsipyle" than to assume the rôle of Lucilius.

But apart from the influence of his time and the natural limitations of his genius, the personal circumstances of Persius were unfavourable to success in the branch of literature to which he devoted himself. The shortness of his life and the retirement in which it was spent, his studious tastes, his delicate health, and that which is most admirable in him, his exceptional moral purity, all contributed to keep him ignorant of that world which it is the business of a satirist to know. Lucilius, Horace, Petronius, Martial, Juvenal, were all men of the world, who knew the life of their day by close personal contact with it, and had no need to imagine it through the medium of impressions received from literature, or situations invented as themes for rhetorical exercises. Some aspects of his time, such as the outward signs of literary affectation and effeminacy, did come within the range of Persius's observation, and these he describes with no want of the pungency, "Italum acetum," characteristic of his race. But from any intimate knowledge, even through the medium of conversation, of the vices and vulgarities from which Petronius lifts the curtain he was debarred by the purity alike of his moral instincts and of his taste. Thus his satire, while able to lash "the sickly morals" of his time ("pallentes radere mores") in fervid generalities, cannot perform the more important function of probing them through living examples.

But Roman satire had another function besides the representation and criticism of men and manners. More than any other branch of literature it was the expression of the writer's own nature and convictions. The frank sincerity with which these were expressed was a great cause

of the personal hold which Lucilius had on his readers; it is still one of the secrets of the personal charm of Horace. The sympathy with which Persius was read in the early days of Christianity and the enthusiasm which many readers have felt for him in modern times are mainly due to the impression of character which he produces. But he is to be regarded further, not as an isolated specimen of purity in an impure age, but as an important witness of that undercurrent of moral and spiritual sentiment which gathered force as a protest against the corruption and tyranny of the first century of the empire. The consciousness of moral evil which became intensified during that period is very apparent when we compare the spirit of Cicero and Horace, men in their own day seriously concerned with questions of conduct, with that of Tacitus and Juvenal. This great inward change was stimulated and directed by the teaching of Stoicism; and it was in the reign of Nero that Stoicism gained its chief ascendancy over educated men, and supplanted among the adherents of the republic the fashionable Epicureanism of the days of Lucretius and Horace. Of the Stoical spirit of that time, represented also by Seneca and Lucan, Persius is the purest representative. His chief claim to consideration is, not that he is a great poet, satirist, or humorist, or even an agreeable writer, but that he is one of the earliest, and, amongst classical writers, one of the most sincere preachers of a pure personal morality based on a spiritual conception of religion.

The impression of him produced by his writings is confirmed by the accounts transmitted of his life, for which we are indebted to the contemporary grammarian, Valerius Probus of Berytus. Written when the impression left by him was fresh on the memory of his friends, it may be accepted as trustworthy in regard both of outward facts and of the sentiments which he inspired.

Well born and well connected, and the inheritor of a good estate, Persius lived the uneventful life of a student, and was chiefly remarkable for his affection for his friends, his teachers, and his family. He was a native of Etruria, a district which contributed less than any other in Italy to the literary distinction of Rome. And it is noticeable that, while Persius has all the characteristic moral fervour of the more serious Roman writers, he shows less, compared with those who have an important place in the national literature, of that sensuous vivacity and susceptibility to beauty in art and nature with which the purely Italian race was pre-eminently endowed. He was born at Volaterræ in the year 34 A.D., and received his early education there. His father died when he was six years of age, and his mother, Fulvia Sisenna, whose latter name by its termination is indicative of an Etruscan stock, married a second time and was soon again left a widow. In one of the satires he speaks of the eagerness with which his father used to bring his friends to listen to his recitation of the dying speech of Cato. It is not likely that at the age of six he could have been so far advanced in his rhetorical education, and perhaps, though he uses the word "pater," this reminiscence, which is told not without satirical colouring, may be a testimony to the interest which his stepfather took in watching his progress. The nature of the lesson—"mortem verba Catonis"—is suggestive of an early direction towards Stoicism given in his teaching, but by what he tells us of his way of shirking his lessons and of his healthy preference of play to work, he seems to have done what he could to escape the doom of becoming a precocious prodigy. He was taken at the age of twelve to Rome, and continued his education under the two most famous grammarians and rhetoricians of the day, Remmius Palaemon and Virginius Flavius. The decisive influence of his life was his friendship with the Stoic philosopher, Annaeus Cornutus, whose

pupil he became on assuming the "toga virilis" at the age of sixteen. To the charm of this man's conversation and teaching Persius attributes his escape from the temptations to a life of pleasure, to which youths of good position and fortune were exposed at Rome. Besides his friendship with Cornutus, he enjoyed during ten years of his life the intimate friendship of Thrasea Patus, the noblest specimen of Stoicism which the Roman world produced in the first century of the empire. This intimacy was probably due, in the first place, to the relationship of Persius to the younger Arria, the wife of Thrasea. Though a much younger man, he gained so completely the affection of Thrasea that he often went with him as the companion of his travels. The knowledge that he was an intimate member of the circle of Thrasea and Helvidius gives an additional interest to the opinions of Persius on literature and conduct, and also to the indications of his attitude towards the reigning power. He was introduced also to Seneca, but was not much attracted by his genius. The influence of Thrasea may have had something to do with this want of sympathy. The true Stoic, who "kept as holidays the birthdays of the two Brutuses and of Cassius," was not likely to have been among the admirers of the apologist for paricide.¹

He was also intimate with some of the younger poets of the time, especially with Cæsius Bassus, to whom he addresses his sixth satire. He was acquainted with his younger and more famous contemporary, Lucan, who is said, with the generous impulses which seemed to have been mixed with the fatal weaknesses of his character, to have been carried away by great enthusiasm when he first heard Persius reciting some of his verses. His biographer tells us that the impulse to writing satire was derived from reading a book of Lucilius. He was evidently a diligent student both of him and of Horace. He himself justifies his adoption of this mode of writing by his natural tendency to satiric criticism,—"sum petulantis splene cachinno." But his satire shows as little of the humorous amusement in contemplating the comedy of life, which is one of the motives of the satire of Horace, as of the fierce indignation which the tragic spectacle of its crimes produced in Juvenal. We should rather be inclined to conclude that, as his Stoicism was a protest against the vices and tyranny of the time, so his adoption of that masculine national form of literature which took its subjects from the actual experience of Roman life was a protest against the effeminate style and exotic themes which were then fashionable with the social class to which he belonged.

There is no trace in his writings of any participation in the active interests of public or professional life. More than any other Roman writer, except perhaps Lucretius, he chose the "secretum iter et fallentis semita vias" (the flowery path that winds by stealth). But his life, if apparently much happier, was not enriched by the fulness of contemplative interest and of delight in nature which lightened up the gloom of the older poet. His latest satire, addressed to his friend Cæsius Bassus, is written from the port of Luna on the Gulf of Genoa; but, while celebrating the mildness of its winter climate, grateful to him as an invalid, he is silent about the charm of its natural beauty. He died at the age of twenty-eight, on one of his own estates on the Via Appia, within eight miles of Rome. His satires were revised by Cornutus and edited at his own request by Cæsius Bassus. The former is said to have altered into a vague generality an expression reflecting on the poetical gifts of Nero, a subject as dangerous to deal with as his vices and tyranny. Dying in the

year 62 A.D., Persius did not witness the worst crimes of that reign, and escaped the fate which awaited Seneca, Lucan, and Thrasea.

His character is thus summed up by his biographer: "He was of a most gentle disposition, of maidenly modesty, handsome in person, and marked by exemplary affection towards his mother, sister, and aunt. He lived soberly and chastely." The characteristic of "virginalis pudicitia" it is natural to associate with the pure family atmosphere in which he lived, and the existence of cultivated women who could exercise such an influence is a warning not to judge Roman society, even in its worst time, altogether from the representation of Juvenal. The letters of Pliny amply confirm the belief that the world was not all so bad as it appears in that representation. The tone of the biographer as well as his explicit statements attest the warm affection which Persius inspired in his lifetime. Mere asceticism unaccompanied by other graces of character cannot account for this sentiment of affection, and the Roman world had a keen eye to detect insincere professions of austerity. But, while there are many signs of inexperience of life and much forced and artificial writing in Persius, there is in the expression of his deepest convictions an unmistakable ring of genuineness. He seems to love virtue without effort, because his nature finds in the love and practice of virtue the secret of happiness. There is also in the personal addresses to his friends, as in that to Macrinus, a tone of genial sympathy with the innocent enjoyments of life. In the expression of affection for those whom he loved no ancient writer is so cordial and single-minded, except one, as much separated from him by the licence of his life as by the force of his genius, who also died in early youth, the ardent true-hearted poet of Verona.

Persius is said to have written slowly and seldom, and, though he seems to have composed, probably before he devoted himself to satire, a tragedy on a Roman subject, it is accounted for by some of his travels, and some lines on the elder Anna (none of which were ever given to the world), the only result of his literary activity is the short book of six satires which we now possess. The contrast between the small amount of his contributions to literature and the reputation which he enjoyed is noticed by two ancient writers, who indicate their appreciation of his value, Quintilian and Martial. The satires are not only fewer in number than those of Horace and Juvenal, but they are for the most part shorter. Only one of them, the first, fulfils the proper function of satire by representing any phase of the life of the time and pointing its moral. It exposes by personal sketches and representative imitations the fashionable taste in poetry, and marks its connexion with the luxury and effeminacy of the age. The satire was believed in ancient times to be aimed at the emperor; and this is confirmed, not only by the tradition of the substitution by Cornutus of the vague generality "quis non" for the pointed "Mida rex," but also by the parody "Torva Mimalones implerunt cornua bonis," &c., which is in keeping with the account we have in Tacitus and other writers of the style of the emperor's compositions. In an age abounding in informers it would have been dangerous to have published or even to have read before a circle of friends a more direct comment; but the attitude of Persius towards the absolute ruler of the day may be inferred from other references in the satires, as from the passage in 35, beginning "Magne pater divum"; and again at 20, in the words, "Ast ego Diomachas," we may suspect a protest against the degradation of the Roman world in submitting to be governed by the son of Agrippina. Even in the abstinence from one single word of compliment to the ruling power we enjoy an agreeable contrast to the time-serving of Seneca and the adulation of Lucan.

While the sixth satire is, like the rest of the satires, of Horace, and Juvenal, essentially representative, and has its motive in the desire to paint in satiric colours a prevailing fashion and some of the actual personages or types of character of the day, all the rest are essentially didactic and have their motive in the desire to enforce and illustrate some lesson of morality or tenet of Stoicism. The second is an admirable sermon on prayer, and illustrates by examples that union of worldliness and conservatism with religious faith and practice which has not been absolutely confined to Paganism. The third is aimed at the exposure and correction of the weakness of character which, in spite of good resolutions, succumbs to the attacks of sloth and pleasure. The fourth, suggested by the first *Alibiades* of Plato, though perhaps also written with covert reference to one whose "Greek levity" may have prompted him to

¹ Cf. "Ergo non iam Nero, cuius immittas omnium questus antebat, sed Seneca adverso rumore atri, quod oratione tali confessionem scripisset" (Tac., *Ann.*, xiv. 11).

pose as a Roman Alcibiades, is directed against the arrogant claims of a sensual youth to deal, on the ground of his hereditary distinction, with affairs of state and to govern men. The fifth, the most elaborate of all, illustrates the Stoical doctrine of the difference between true and false freedom, and shows the power of avarice, luxury, the passion of love, ambition, and superstition to make men slaves. It is the same subject as that which Horace treats in the third satire of the second book; but it is treated with neither the irony nor the direct knowledge of life which Horace applies to it. The last satire is chiefly devoted to a subject which played a large part in the satire of Horace and Lucilius,—the proper use of money. In all these latter pieces the subjects are the common-places of satire and moral disquisition, illustrated rather by new versions of old characters than by pictures of the living men and women of the day. Though he expresses admiration for the spirit of Lucilius and the old comedy, he seems to keep clear of all personality and detraction. He professes "ingenuo culpam deliquere Iudo," and, whatever may be thought of his humour, he at least always writes in the spirit of a gentleman. So far as there is real contact with life in his satires, it is with the vanity and weakness of the class to which he himself belonged that he shows familiarity. Other sketches, however, show original observation, as that of the provincial squire, of the bawny commoner who laughs at all philosophers, and, the most elaborate of all, that of the man torn asunder by his avarice and his love of luxury, who slunks from the hard roughing of a sea-voyage, to which he is prompted by his cupidity (i. 129, ii. 76-87, v. 141-150).

In point of form he aims at reproducing the dialogue of the old "saturni," to which he alludes in the dramatic vivacity of ordinary speech; he substitutes the cut questions and answers of Stoical disquisition. This is a great source of the obscurity of his writing. Some of his satires take the form of a familiar epistle, but in them also there is a large intermixture of dialogue. In style, while he protests against other modes of affectation, he cannot escape the perverse fashion of forced and exaggerated expression. While disclaiming religious inspiration, and avoiding poetical ornament, he falls into the opposite extreme of excessive realism, and disguises his plain meaning under contortions of metaphor, taken from the forge, the potter's wheel, the carpenter's rule, the baker's oven, &c. He is fond, too, of the realism of physical expression to denote states of mind and feeling, such as "fibra," "pulpæ," "glutis," &c., and this tendency, combined perhaps with the wish to imitate Lucilius, has led him occasionally to disguise the purity of his style by the use of unpoetical words. It is only rarely, and when he is at his best, that we are not conscious of a constant strain to express his meaning with unnecessary emphasis. Though single phrases of forcible condensation can be quoted from him, yet almost every period and paragraph seems to have been made harsh and obscure with the purpose of attracting attention. In the pictures which he draws from life, as in that of the seething poet in the first satire, he strives by minuteness and exaggeration of detail to produce a strong sensational impression; and this is still more observable in those numerous cases where he distorts and caricatures the temperate and truthful effects of Horace's sketches. No Latin writer is less natural. His works have engaged the industry of many commentators both in ancient and modern times. None could claim less the praise which Martial claims for his own, of "pleasing grammarians without needing the aid of their interpretation."

It is not, accordingly, among writers but among moralists that he holds a high place. Among the professors of Stoicism some were better writers, others were greater men; no one was purer in all his instincts, more sincere in all his nature, or inspired with a more genuine enthusiasm for virtue. It is when he gives expression to this enthusiasm and to his single-hearted affection for his friends that he is able for a few lines to write with simple force and with impassioned earnestness. Such lines as these—

"Comprobatum hunc fœvæ animæ, mondogue recensens
Mentis, et incoctum genitoris pectus horrore" (i. 78, 74);

"Quid sumus et quidnam victui gregamus

quem tu deus esse
Jussit et humana quæ parte locutus es in te" (ii. 60-72), &c.,

are in a strain more in accordance with the best modern ideas of man's highest duty and his true position in the world than anything to be found in the other satirists of Rome. The aim of Lucilius was to make men good citizens. He judged their life by the standard of public virtue and utility. The aim of Horace's satire was to make men happier in themselves and more agreeable in their intercourse with one another. He judged them by the standard of good sense, good feeling, and good manners. The aim of Juvenal was to make men sincere in their nature, free from the degradation into which it had fallen. The standard by which he judged the men of his day was that of the manliness and dignity realized in the best ages of the republic. The aim of Persius was to make men live in accordance with the dictates of a pure conscience. His standard was that ideal of human conduct which has arisen out of the aspirations and convictions of an enlightened times.

The best recent editions of Persius are those of O. Jahn and of Professor Conington. The edition of Mr. Peck is also to be named. All of these contain, in their introductions, important contributions to the critical estimate of Persius. An excellent account of his life, character, and writings is to be found in Matthes's *Les Maitres Romains*, and an interesting, though somewhat disparaging, criticism of him as a writer is contained in Newman's *Poets of the Roman Empire*. (W. Y. S.)

PERSONAL ESTATE. Strictly speaking, the term *ESTATE* (*q. v.*) is confined in English law to the extent of interest which can exist in real property. But "personal estate" is a term often conveniently, if not accurately, applied to all property that is not real property. The division of property into real and personal represents in a great measure the division into immovable and movable incidentally recognized in Roman law and generally adopted since. "The only natural classification of the objects of enjoyment, the only classification which corresponds with an essential difference in the subject-matter, is that which divides them into moveables and immovables" (Maine, *Ancient Law*, ch. viii.). "Things personal," according to Blackstone, "are goods, money, and all other moveables which may attend the owner's person wherever he thinks proper to go" (*Comm.*, vol. ii. p. 16). This identification of things personal with moveables, though logical in theory, does not, as will be seen, perfectly express the English law, owing to the somewhat anomalous position of chattels real. In England real property is supposed to be superior in dignity to personal property, which was originally of little importance from a legal point of view. This view is the result of feudal ideas, and had no place in the Roman system, in which immovables and moveables were dealt with as far as possible in the same manner, and descended according to the same rules. The law of personal property has developed more rapidly and freely than that of real property, as it is of more modern growth and has not been affected by the notion of tenure. The main differences between real and personal property which still exist in England are these. (1) In real property there can be nothing more than limited ownership (see *ESTATE*), there can be no estate properly so called in personal property, and it may be held in complete ownership. There is nothing corresponding to an estate-tail in personal property; words which in real property would create an estate-tail will give an absolute interest in personalty. A life-interest may, however, be given in personalty, except in articles *quæ ipso iure communantur*. Limitations of personal property, equally with those of real property, fall within the rule against perpetuities. (See *REAL ESTATE*). (2) Personal property is not subject to various incidents of real property, such as rent, dower, or escheat. (3) On the death of the owner intestate real property descends to the heir; personal property is divided according to the Statute of Distributions. (4) Real property as a general rule must be transferred by deed; personal property does not need so solemn a mode of transfer. (5) Contracts relating to real property must be in writing by the Statute of Frauds, 29 Car. II. c. 3, s. 4; contracts relating to personal property need only be in writing when it is expressly so provided by statute, as, for instance, in the cases falling under s. 17 of the Statute of Frauds. (6) A will of lands need not be proved, but a will of personalty or of personal and real property together must be proved in order to give a title to those claiming under it. (7) Devices of real estate fall as a rule within the Mortmain Act, 9 Geo. II. c. 36 (see *CHARITIES, CORPORATION*), bequests of personal property, other than chattels real, are not within the Act. (8) Mortgages of real property need not generally be registered, mortgages of personal property for the most part require registration under the Bills of Sale Acts (see *PLEDGES*, and *BILL OF SALE*, vol. iii. p. 674).

Personal estate is divided in English law into *chattels*

real and chattels personal, the latter are again divided into *choses in possession and choses in action*. Chattels real are personal interests in real estate, which, though they are annexed to land, still descend in the same manner as personal estate. Blackstone speaks of them as being "of a mongrel amphibious nature." Examples are a term of years, the next presentation to a benefice, an estate *pur autre vie*, and money due upon a mortgage. Under the head of chattels personal fall all kinds of property other than real estate and chattels real. In cases of bequest to a charity the terms pure and impure or mixed personality are often used. The latter class is almost continuous with chattels real. It falls as a rule within the Mortmain Act. A chose in action denotes the right of recovery by legal proceedings of that which, when recovered, becomes a chose in possession. Choses in action were before the Judicature Acts either legal, as debts (whether arising from contract or tort), recoverable in a court of law, or equitable, as legacies (residuary personal estate of a deceased person), or money in the funds. A legal chose in action was not assignable. A consequence of this view was that until 1875 (subject to one or two statutory exceptions, such as actions on policies of insurance) an action on an assigned chose in action must have been brought at law in the name of the assignor, though the sum recovered belonged in equity to the assignee, and in equity he might have sued in his own name, making the assignor a party as co-plaintiff or as defendant. The Judicature Acts have made the distinction drawn between legal and equitable choses in action of no importance. The Judicature Act, 1873, 36 and 37 Vict. c. 66, s. 25, (6), enacts that the legal right to a debt or other legal chose in action may be passed by absolute assignment in writing under the hand of the assignor. The old law as to the reduction into possession by a husband of his wife's choses in action (see HUSBAND AND WIFE) seems to have been practically rendered obsolete by the Married Women's Property Act, 1882. Blackstone, who is followed by Mr Joshua Williams (*Law of Personal Property*), recognizes a further division of *incorporeal personal property*, standing between choses in action and choses in possession, and including personal annuities, stocks and shares, patents, and copyrights.

Interest in personal property may be either absolute or qualified. The latter case is illustrated by animals *feræ nature*, in which property is only coextensive with detention. Personal estate may be acquired by occupancy (including the *accessio, commixtio, and confusio* of Roman law), by invention, as patent and copyright, or by transfer, either by the act of the law (as in bankruptcy, judgment, and intestacy), or by the act of the party (as in gift, contract, and will).

There are several cases in which, by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property *prima facie* real which is treated as personal is an estate *pur autre vie*, which, since 14 Geo. II. c. 20, s. 9 (now replaced by 1 Vict. c. 26, s. 6), is distributable as personal estate in the absence of a special occupant. Examples of property *prima facie* personal which is treated as real are FIXTURES (*q. v.*), heirlooms, such as deeds and family portraits, and shares in some of the older companies, as the New River Company, which are real estate by statute. In ordinary cases shares in companies are personal estate, unless the shareholders have individually some interest in the land as land.

The terms *heritable and movable* of Scotch law to a great extent

correspond with the real and personal of English law. The main points of difference are these: (1) Leases are heritable as to the succession to the lessee, unless the destination expressly exclude heirs, but are movable as to the fee. (2) Money due on mortgages and securities on land is personal in England. At common law in Scotland debts secured on heritable property are likewise heritable. But by 31 and 32 Vict. c. 101, s. 117, heritable securities are movable as far as regards the succession of the creditor, unless executors are expressly excluded. They still, however, remain heritable *quoad fiscum*, as between husband and wife, in computing legitime, and as far as regards the succession of the debtor. (3) Up to 1868 the heir of heritage succeeded to certain movable goods called heritable movables, which bore a strong resemblance to the heirlooms of English law. This right of the heir was abolished by 31 and 32 Vict. c. 101, s. 160. (4) Annuities, as having *in actum futuri temporis*, are heritable, and an obligation to pay them falls upon the heir of the deceased (Watson, *Law Dict.*, s. v. "Annuities").

The law in the United States agrees in most respects with that of England. Heirlooms are unknown, one reason being, no doubt, that the importance of title-deeds is much less than it is in England, owing to the operation of the Registration Acts. Long terms in some States have annexed to them the properties of freehold estates. Thus in Massachusetts, if the original term be a hundred or more years, it is deemed a fee as long as fifty years remain unexpired (*Mass. Gen. Stat.*, c. 90, § 20). In the same State estates *pur autre vie* descend like real property (*Gen. Stat.*, c. 91, § 1). In New York and New Jersey an estate *pur autre vie* is deemed real, only during the life of the grantee after his death it becomes a chattel real. In other States the heir has a *vestiture* of interest as special occupant (Kent, *Comm.*, vol. iv p. 27). In some States railway rolling-stock is considered as purely personal, in others it has been held to be a fixture, and so to partake of the nature of real property. Shares in some of the early American corporations were, like New River shares in England, made real estate by statute, as in the case of the Cape Sable Company in Maryland (Schouler, *Law of Personal Property*, vol. i p. 619). In Louisiana animals employed in husbandry are, and slaves were, regarded as immovables. Pews in churches are generally real property, but in some States they are made personal property by statute, e.g., in Massachusetts (*Gen. Stat.*, c. 80, § 88). The assignment of choses in action is generally permitted, and in most States regulated by statute. The circuit court has jurisdiction in the case of an assigned chose in action unless a suit might have been presented in that court if no assignment had been made (*Revised Stat. of U. S.*, tit. xlii § 629) (J. W. +)

PERSPECTIVE. See PROJECTION.

PERTH, an inland county of Scotland, is situated almost in the centre of the country between 56° 4' and 56° 57' N. lat., and between 3° 4' and 4° 50' W. long. The larger part of its border-line is formed of natural boundaries, the Grampians separating it on the west and north from Argyll, Inverness, and Aberdeen, while the Ochils and the Firth of Tay in the south-east divide it from Kinross, Clackmannan, and Fife. In the south the river Forth forms a large portion of the boundary with Stirling, but the boundary with Forfar in the north-east is almost at no point defined either by rivers or mountains. The county is of an irregular circular form, the diameter being about 70 miles. A small portion in the south-east is separated from the main portion at the junction of Clackmannan and Fife, and another small portion is surrounded by Stirlingshire. Perthshire is the fourth largest county in Scotland, the total area being 1,617,808 acres, or 2528 square miles. Situated on the Highland border, Perthshire embraces characteristics scarcely combined in any other county of Scotland, and it excels them all in the picturesqueness and multifarious variety of its scenery. The finest passes into the Highlands are Killiecrankie, Leny, and the Trossachs. With hardly any exception the rivers and streams flow east and south and reach the ocean either by the Forth or the Tay. They generally issue from large elongated lochs formed by depressions at the foot of the mountains. The Ercht in the extreme north-west unites Loch Ercht and Loch Rannoch; and from the latter flows the Tummel, which, after passing through Loch Tummel and forming a series of rapids and falls, joins the Tay. The Tay, which rises on the borders of Argyllshire, passes through Loch Dochart and Loch Tay, and in its course

of rather over 100 miles receives nearly the whole drainage of the county, discharging a large volume of water to the sea than any other river in Great Britain, its principal tributaries are the Tummel at Logierath, the Bann near Dunkeld, the Isla near Kinclaven (after its junction with the Ercht), the Almond near Perth, and the Earn from Loch Earn, at the borders of Fifeshire. The Forth from Loch Ard skirts the southern boundary of the county, and receives the Teith from Lochs Katrine, Achray, Vennacher, Voil, and Lubnag, the Goodie Water from Loch Menteith, and the Allan, which rises in the Ochil Hills. Loch Ercht, partly in Inverness-shire, and Loch Tay are each more than 14 miles in length, Loch Rannoch is 9 miles long, Lochs Earn and Katrine are 7 each, and Lochs Vennacher, Lubnag, and Voil each between 5 and 3. There are an immense number of small lochs varying in length from 1 to 3 miles, among which may be mentioned Gary, Tummel, Lows, Lyon, Dochart, Freuchie, Ard, and Menteith. The lochs and rivers abound in salmon and varieties of trout; and scarcely any of the streams have been perceptibly injured by the pollution of manufactures. About four-fifths of the surface of the county, chiefly in the west and north-west, is occupied by the Grampians, or encroached on by their ridges or by isolated summits, among the highest of the chain in Perthshire being Ben Lawers (3884 feet), north of Loch Tay, Ben Mors (3843) and Stobinnain (3821), south of Loch Dochart, Ben-y-Gloe (3690), and other peaks, near Glen Tilt, Schiehallion (3547), south of Loch Rannoch, and Ben Vorlich (3180), south of Loch Earn. The Ochils, occupying a considerable area in the south-east, attain in many cases a height of over 2000 feet, and the Sidlaws, practically a continuation of the Ochils running into Forfarshire, reach a height of about 1500 feet. The lowland districts consist chiefly of the straths and river-valleys, as Strathtay; Strathmore, extending into Forfarshire, Strathearn, stretching across the county from west to east, and bounded on the south by the Ochils, the district of Menteith between the Teith and the Forth, and the Carse of Gowrie between the Sidlaws and the Forth of Tay.

Geology and Minerals.—As regards its geology Perthshire consists of two distinct areas, that differ from each other entirely in the rocks of which they are composed and consequently in their scenery. The larger of these regions comprises the mountainous ground and occupies the northern and by much the larger part of the county. The rocks in this region belong to the series of crystalline schists, and include varieties of gneiss, mica-schist, clay-slate, hornblende-rock, &c., with important bands of quartzite, quartz-schist, and limestone. These rocks are arranged in approximately parallel folds, the axes of which range in a general sense from south-west to north-east, the same groups of strata being repeated again and again by successive plications. The quartzites from their durability and whiteness form specially marked zones across the county, as in the ranges of Schiehallion and Ben-y-Gloe. The limestones also from their persistence afford excellent horizons for interpreting the geological structure. A notable band of them runs along the valley of Loch Tay, plunging under Ben Lawers and rising up again in Glen Lyon, whence it continues across Strath Tummel into Glen Tilt. These various crystalline rocks are believed to be prolongations of the schistose series that overlies the Lower Silurian rocks of Sutherland; but they have not yet yielded fossils. They are here and there pierced by masses of granite, porphyry, or other eruptive rocks.

The southern (or more correctly south-eastern) limit of the mountain ground is defined by a line drawn from the foot of Loch Lomond by Aberfoyle, Pass of Leny, Comrie,

a little below Dunkeld, and Bridge of Cally, to Lintrathen. On the southern side of this line the ground presents distinctively lowland scenery. It is occupied by the Lower Old Sandstone with its included conglomerates, flagstones, and volcanic rocks. A remarkable dislocation, which nearly coincides with the line just traced, separates the younger series of formations from the older rocks of the mountains. But here and there on the north side of the fracture, in bay-like hollows of the hills, the massive conglomerates of the Old Red Sandstone can be seen resting upon the upturned edges of the schists. These conglomerates with their associated strata appear to have been laid down in a large lake or inland sea which lay across central Scotland and northern Ireland, and was tenanted by the peculiar Old Red Sandstone fishes (*Cephalaspis*, &c.) A long line of active volcanoes extended through this lake. Their sites are still traceable in the Ochil and Sidlaw Hills. See *Geology*, vol. x. p. 345 sq. Much of the lower ground is covered with the clays, gravels, and sands left by the ice-sheets and glaciers that once occupied the surface. Raised beaches marking recent upheaval of the land are seen in the Firth of Tay. The larger rivers present a succession of three or more alluvial terraces. Copper ore is found in the southern Ochils and coal at their base. Ironstone is wrought at Culross. Lead and other metals are found sparingly in the neighbourhood of Tyndrum, Ben Ledi, and Glen Lyon. Roofing slates are quarried at Birnam. In many valleys there are large deposits of peat.

Agriculture.—The climate and soil of Perthshire present greater varieties than in any other county of Scotland. In the higher western regions it is very moist; and long stretches of exposed uplands alternate with finely-sheltered valleys. The arable land is chiefly in the drier eastern districts. For the most part the soil is sharp and fertile. The county, agriculturally, may be classed in four divisions: deer-forests, chiefly the wider mountain districts, grazing and pasture lands on the hills, embracing about four-fifths of the total area; light soils in the lower undulating districts, including the north portion of Menteith and the upper portion of the principal river-valleys, specially suited for oats, barley, turnips, and potatoes; clay and carse land, chiefly in the Carse of Gowrie, which extends to about 100,000 acres, in the Carse of Stirling north of the Forth and in the lower part of Strathearn below and above Bridge of Earn. The Carse of Gowrie has as its basis the boulder clay, above which rests the blue clay proper, or peat, or the carse clay,—a mixture of sand and clay, ranging from the finest clay soil to poor whitish "end clay." The best heavy carse land is very rich and productive, but requires to be thoroughly wrought, limed, and manured. The district is well adapted for wheat, although the area sown is decreasing. A considerable area is occupied by orchards, the light quick soil on Tayside and in the upper districts of Menteith being admirably adapted for apples.

Between 1875 and 1880 the number of holdings decreased from 5296 to 5129, although their area increased from 331,880 to 344,728 acres. Of the holdings 179 in 1880 were above 300 acres in extent, 1038 between 100 and 300 acres, 788 between 50 and 100 acres, and 3125 did not exceed 50 acres each. There are a large number of small holdings in the Highland valleys and in the neighbourhood of the villages and small towns. According to the agricultural returns for 1888 there were 844,240 acres, or only a little less than a fifth of the total area, under cultivation, 108,050 acres being under corn crops, 50,799 acres green crops, 100,681 rotation grasses, 87,064 permanent pasture, and 2696 fallow. Of the corn crops, 70,424 acres were under oats, 22,770 acres barley and bere, 6288 wheat, and 3087 beans; and of the green crops, 31,069 acres were under turnips and swedes and 18,611 under potatoes. The number of horses was 18,661, of which 10,524, chiefly Clydesdales, were used solely for agricultural purposes. Cattle numbered 78,067, of which 18,756 were cows and heifers in milk or in calf. Although dairy-farming is not in itself an important industry, a large number of cows are generally kept on the lowland farms. The cows are principally Ayrshires, but the West

Highland or Klyoc breed of cattle is common in the straths and lower grounds adjoining the Highlands. Sheep in 1888 numbered 696,640. All the pasturage in the Grampians, not in deer-forests, is occupied by sheep, and there are also large sheep-runs on the Ochil. The blackfells are principally kept in the Grampians, but there are also a large number of Cheviots, and in the lower grounds South Downs and Leicester are common. In 1812 there were 203,880 acres under wood, of which 61,164 were planted and 142,716 natural. The area under woods in 1884 was 94,563 acres, in addition to which 424 acres were under orchards, 536 acres market-gardens, and 113 acres nurseries. In Breadalbane and Menteith there are still extensive remnants of the old forest.

According to the latest return (1873-74) the land was held among 5787 proprietors, possessing 1,612,001 acres at an annual value of £295,366, or about 11s 10d an acre. Of the proprietors 4680, or nearly four-fifths, possessed less than one acre each. The following possessed upwards of 20,000 acres each, viz, duke of Athole, 194,840; earl of Breadalbane, 193,504; Baroness Willoughby d'Eresby, 76,837; trustees of marquess of Breadalbane, 60,662; earl of Moray, 40,553; Hon Lady Menzies, 35,500; Sir A. D. Drummond Stewart, 33,274; trustees of R. Stewart Menzies, 33,000; Sir Robert Menzies, 32,784; duke of Montrose, 32,294; earl of Mansfield, 31,197; D. R. Williamson, 29,494; C. H. Drummond Moray, 24,930; Miss Stuart Robertson, 24,000; W. M. Macdonald, 22,000; David Carnegie, 22,205; and Lieutenant-Colonel Farquharson, 20,056.

Manufactures.—The manufacture of coarser linen fabrics is largely carried on in the towns and villages, and there are a considerable number of flour-mills. Cotton-wools exist at Deanston and Stanley, hand-loom weaving is carried on at Auchterarder, Dunblane, Doune, Clief, and elsewhere, and in several places the manufacture of shawls, blankets, and other fabrics. For the industries of the city of Perth see below.

Railways.—The lowland districts of the county are intersected by branches of the principal railway lines of Scotland, supplying by the Highland and Oban railways, supplemented by coaches and steamers on the larger lochs, the finest scenery in the county has been rendered easy of access.

Administration and Population.—Anciently the county was divided into the hereditary jurisdictions of Athole in the north, Balquhader in the north-west, Perth in the west, Gowrie in the east, Menteith in the south, Perth in the south-west, and the north-west, and Stomont and Strathern in the middle. These jurisdictions were abolished by the Act of 1748, and in 1795 an Act was passed dividing the county for administrative purposes into the ten parishes of Auchterarder, Blairgowrie, Cairn of Gowrie, Clief, Culross, Coupar-Angus, Dunblane, Dunkeld, Perth, and Weem. The sheriffdom is divided into an eastern and a western district, the seat of the one being Perth and of the other Dunblane. The county is represented in parliament by one member, the city of Perth by one member, and Culross is included in the Stirling district of burghs. Perthshire embraces eighty-one parishes, and contains three ancient cities, Perth, formerly the capital of Scotland, and Dunkeld and Dunblane, formerly the seats of bishops, as was also Abernethy. The royal burghs are Perth (27,207) and Culross (380), and Auchterarder, Abernethy, and Dunblane formerly held this rank. The police burghs are Abernethy (606), Alyth (2877), Blairgowrie (4587), Callander (1522), Coupar-Angus (partly in Forfarshire), Clief (4469), Dunblane (2186), Perth (26,951), and Rattray (2338). The population of the county in 1881 was 142,166, which by 1861 had diminished to 138,660, and by 1871 to 127,768, but in 1881 it had increased to 129,007, of whom 61,552 were males and 67,455 females. The increase has been wholly in the town population, from 44,250 in 1871 to 49,642 (in 1881), the being a decrease in the village population from 28,321 to 23,948, and in the rural from 60,197 to 57,016. The number of persons speaking Gaelic was 14,505, or more than one-ninth of the total population.

History and Antiquities.—In the 2d century the district was divided, according to Ptolemy, among three tribes. The Damnonii inhabited Menteith, Strathern, and Forthrye (including the western part of Fife), and had their principal camp at Arden, at the junction of the Allan and Forth, guarding the entrance to the Highlands from the south, Lundum, at Ardoch; and Victoria, at Loch Orr in Fife. The Venicones inhabited part of Fife and the adjoining district of Perthshire, with the town of Orre, probably Abernethy, at the junction of the Earn and Tay, the nearest Roman station to which was at Ardarre. The Votadini skirted the Highland region, and had the towns of Tanea in Inchtuthil (an island in the Tay), where remains still exist, and Banchut at Banchut on the Almond, where there was a strong Roman station. In 83 A. D. Agricola explored the country beyond the Forth, and in the following year probably carried his legions to the foot of the Grampians. At Mons Graupius or Grampius, whose site is not ascertained, but which is, according to the most probable conjecture (Mr Skene's), in the district of Stomont in Perthshire, amongst the outliers of

the Grampians near Meikloom, where the Cleaveris Dyke and Buzzard Dykes perhaps mark the camps of Agricola and Galloway, and the Hill of Blau the scene of battle, the Romans (according to their own accounts) defeated the tribes of Caledonia with great slaughter, but they deemed it imprudent to pursue the victory. Perthshire was accordingly left in the possession of its native tribes till its invasion by Severus in 208. The Roman road of Severus passed by Alanna to Lundum at Ardoch, where there are extensive remains of a Roman station, and thence by Stagoath near Auchterarder, Dalgin Ross near Comrie, where there were prominent remains a century ago, and Buchanary, where one branch passed eastwards to the coast, and the other turned northwards to the Firth.

As Severus conquered the wall of Antoninus, he does not appear to have retained possession of the county north of the Forth and the Clyde. Perthshire was included in the kingdom of the Southern Picts, who had their capital first at Abernethy and afterwards at Fortrevort. On the burning of Fortrevort by the Northmen in the 8th century the seat of the Government was changed to Scone, which continued to be the capital of Albany, the chief royal residence, and the place where the king's kins were crowned, though circumstances led to James III., and May being crowned elsewhere. But, as Perth increased in population, it became the seat of the parliament, and the favourite residence of the kings, until it was succeeded by Edinburgh in the reign of James II. In the early history of the county the defeat of the Danes at Lunacy in the 10th century and of Macbeth by Earl Sverad at Dunblane in 1054. To its later history, apart from the various incidents connected with the city of Perth, the removal of the coronation stone from Scone to Westminster by Edward I., the battle of Dupplin, where Edward Balliol defeated the earl of Mar, the rout of the troops of General Mackay at Killcrankie by the Highlanders under Dundee, 17th July 1689; and the indecisive battle at Sheriffmuir, 13th November 1715, between the adherents of the Pretender under the earl of Mar and the forces of the Government under Amherst, the latter of which events, however, are not important. Of hill-forts the most remarkable is that on Dunsinane Hill. Among other relics of an early period are a ship-burrow of the vikings on the Hill of Rattray, weems in the parishes of Monzie, Alyth, and Banchuly, the witchstone near Canbuddie, where Macbeth is said to have met the witches,—probably a sepulchral memorial of some old battlefield, another stone in Monzie, near Callander, called Macbeth's grave, a group of standing stones near Pitlochry; and a number of sculptures on the ruins of Mearns.

Abernethy, originally founded by the Pictish king Nertan in the 5th century, and refounded by St. Columba in the 6th, succeeded Iona as the seat of the primacy of Scotland, afterwards transferred to St. Andrews. The round tower in the churchyard, resembling those in Ireland, is supposed to have been built in the time of Macbeth, 1292, and a Greyfriars monastery, 1460. Culross abbey, founded in 1292, and a Greyfriars monastery, 1460. Culross abbey, of which the tower and the Gothic choir still remain, was founded by the Cistercians in 1217, and there was also an abbey of Cistercian nuns at St. Leonards, Perth, founded in 1296. A Carmelite convent was founded at Tulliallan in 1267. There were collegiate churches at Methven and Tullibardine. Of the old castles of the chiefs mention may be made of Elcho Castle on the Tay, 4 miles south of Perth. Elcho Castle, formerly owned by Montrose in 1644, stormed by Cromwell in 1653, occupied by Claverhouse in 1689, and the House of the seat restored in 1870; Castle Huntly, built in 1452 by Lord Grey, master of the household to James II.; the ruins of Castle Dunn, near Moulin, once a stronghold of the Campbell family, the ruins of Fingraig Castle, Killin, the cradle of the Breadalbane family; Cluny Castle on the island in the loch of the same name between Dunkeld and Blairgowrie; and Doune Castle, on the Forth, a picturesque ruin of very old date, rebuilt by Murdoch, duke of Albany. Among modern mansions the principal are Kinnaird House, the seat of the late Sir W. Stirling-Maxwell; Blau Drummond House, the seat of the Drummonds; Blair Castle, duke of Athole; Taymouth Castle, earl of Breadalbane; Doune Lodge, earl of Moray; Dupplin Castle, earl of Kinnoul; Scone Palace, earl of Mansfield; Glenaeigies, earl of Campden; Strathallan Castle, Viscount Strathallan; and Drummond Castle, Baroness Willoughby d'Eresby.

PERTH, an ancient city, a royal and parliamentary burgh, and the chief town of the above county, is beautifully situated at the foot of Kinnoul Hill, chiefly on the west bank of the Tay, about 40 miles north of Edinburgh and about 20 west of Dundee. It is substantially built

of stone, and contains a number of good public buildings, while the lower slopes of Kinnoul Hill are studded with villas embosomed in woods. To the north and south of

in cargo and in ballast that entered the port in 1883 was 124 of 9767 tons, that cleared 124 of 9731 tons. The principal imports are Baltic timber, coal, salt, and manure, and the exports coin,

Plan of Perth

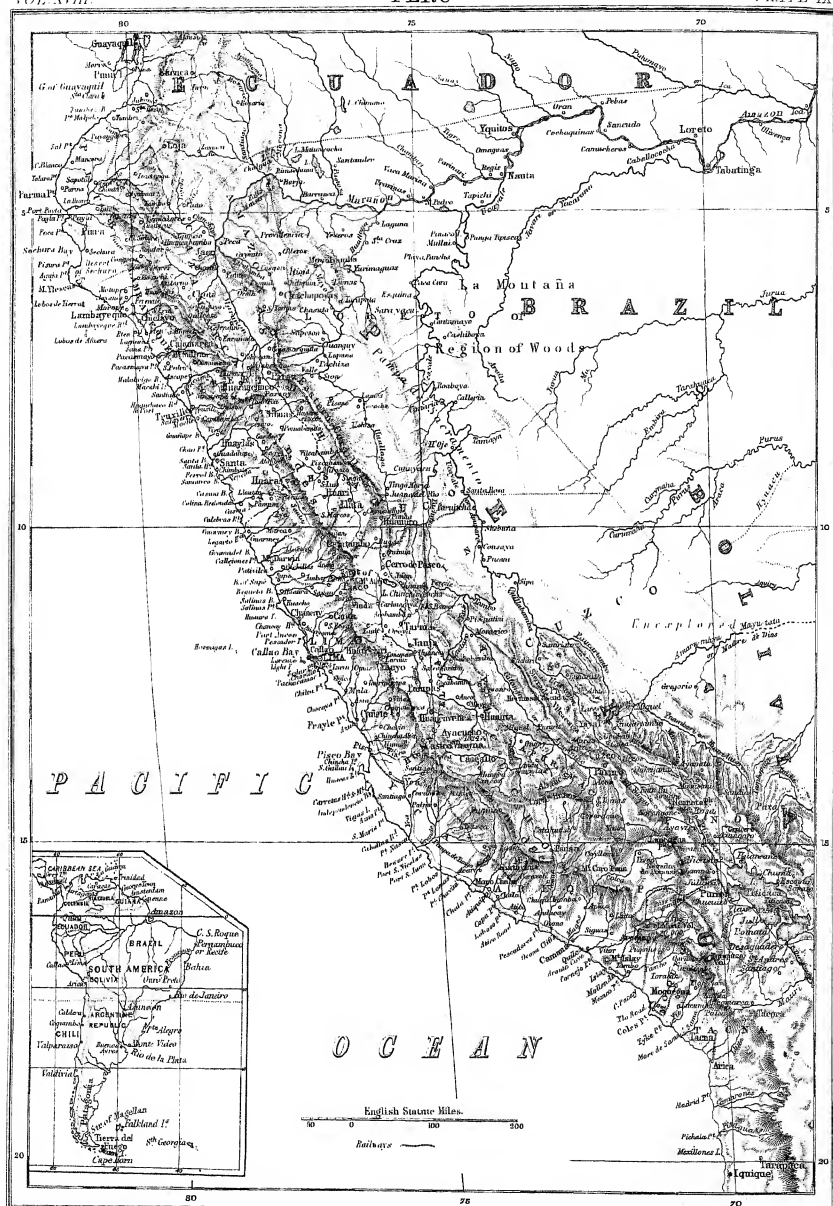

the town was a house of the Carmelites or Whitefriars, founded in 1280. The parliament house, where the ancient parliaments of Scotland were held, was cleared away in 1818, and was succeeded by the Freemasons' Hall. Earl Gowrie's palace, founded in 1520, was removed in 1805 to make way for the county buildings, the Spey tower near the Spey gate, a mural fortress long used as a prison, was taken down about fifty years ago. The cross, erected in 1668 in place of that demolished by Cromwell, was removed in 1807. The old church of St John is said to have been founded in the 5th century; the transept and nave of the existing structure date from the early part of the 13th century and the choir in its present state from the 15th, the building is now divided into an east, a middle, and a west church. Among other public edifices the principal are the county buildings (erected 1819-20 at a cost of £32,000, and enlarged in 1866), the general prison for Scotland (originally erected in 1812 as a dépôt for French prisoners, remodelled as a convict prison in 1840, and enlarged in 1858 and 1881), the city and county jail (1819), the military barracks (1793-94), the public seminary (1807), Marshall Museum and Library (1823), Murray's Royal Lunatic Asylum (1827), the infirmary (1836), the general railway station (1848), the new public hall (1881), the Boys' and Girls' Religious Society hall (1881), the new municipal buildings (1881),—a fine range in the Tudor style, cost £13,000.

Some of the most extensive bleach-fields in the kingdom are in the immediate neighbourhood of Perth on the banks of the Tay and the Almond. Perth itself has manufactures of gauge glasses, muslins, gingham, imitation India shawls and scarfs, union goods, and boots and shoes, and there are rope-works, coach-building yards, iron-foundries, breweries, and distilleries. The Tay has valuable salmon fisheries. The navigation of the river is considerably obstructed by sand. In 1834 an Act was obtained for constructing a harbour and docks and enlarging the quays, which were further extended in 1856. In 1840 Perth was made an independent port, vessels of 200 tons can unload at its quays. The number of vessels

potatoes, timber, and slates. The population of the parliamentary burgh in 1861 was 23,835, this had increased by 1861 to 25,250, and by 1881 to 28,949, of whom 13,453 were males and 15,496 females. *History*.—Perth is stated to have been anciently called Bertha, and to have been situated at the junction of the Almond and Tay, whence it was removed to its present site after an inundation in 1210. In any case the church of St John was founded long before this; and a variety of Roman remains seem to indicate that there was a Roman station on the present site of the city. The obscurity of its early history is accounted for by the fact that its records were removed by Edward I. Perth is stated to have been a burgh as early as 1106. The charter granted it by James VI makes mention also of another granted by David I, and the charter of King David was renewed by William the Lion, by whom Perth was created a royal burgh. It was fortified by the last-named king in 1210 and again by Edward I. in 1298. It was attacked without success by Robert Bruce in 1306, but in 1311 he succeeded in scaling its walls one dark night. It was captured by Edward III. in 1336 and retaken by the Scots in 1339. The seal of Cornwall is stated by Fordun to have been stolen in 1336 by his mother Edward III. before the great altar in the parish church of St John. In 1396 a famous combat took place on the North Inch, between Clan Chattan and Clan Kay, which has been made familiar to English readers by Sir W. Scott in his *Fair Maid of Perth*. The Blackfriars monastery, where the kings then resided, was the scene in 1437 of the murder of James I. by Walter, earl of Athole, and Gowrie House in 1600 of a mysterious conspiracy against James VI. Perth succeeded Scone as the capital of Scotland, but after the murder of James I. the parliament and courts were transferred to Edinburgh, which was declared the capital in 1482. The city was visited by the plague in 1512, 1585-87, 1603, and 1645, by the cholera in 1832, and by inundations in 1210, 1621, 1740, 1778, and 1814. It was taken by Montrose in 1644, capitulated to Cromwell in 1651, and was occupied by Dundee in 1689, it was recovered by Argyle from the adherents of the Pretender in 1715, and was occupied by Prince Charles Edward in 1745. The famous articles of Perth were agreed to at a meeting of the General Assembly in the parish church of St John, 26th August 1618.

PERTH, a city of Australia, capital of the colony of Western Australia, is picturesquely situated on the Swan

river, 31° 57' 10" S lat, 115° 52' 30" E long, 12 miles above Freemantle and 1700 west-north-west of Melbourne. The streets are wide and regular, and the houses are built chiefly of brick and stone. It is the seat of an Anglican and of a Roman Catholic bishop. In addition to the cathedrals the principal buildings are the town-hall, built entirely by convict labour, the mechanics' institute, the governor's palace, and the high school. Perth was founded in 1829, received a municipal constitution in 1856, and was created a city in 1880. In the same year railway communication was opened up by means of the Eastern Railway. The population of the city, including the military, in 1871 was 5007, and in 1881 it was 5044.

PERTHES, FRIEDRICH CHRISTOPH (1772-1843), German publisher, was born at Rudolstadt on 21st April 1772. At the age of fifteen he became an apprentice in the service of Boime, a bookseller in Leipzig, with whom he remained about six years. In Hamburg, where he settled in 1793 as an assistant to the bookseller Hoffmann, he started in 1796 a bookselling business of his own, in developing which he soon gave evidence of remarkable tact, energy, and intelligence. In 1798 he entered into partnership with his brother-in-law, J. H. Besser, with whose aid he rapidly succeeded in forming an establishment which commanded universal confidence and respect. By his marriage with a daughter of the poet Matthias Claudius (in 1797) he was brought into intimate relation with a group of Protestant writers, who, although of a liberal tendency, retained a strong belief in the essential doctrines of Christianity, and they exercised a powerful influence on the growth of his religious opinions. This, however, did not prevent him from being on friendly terms with a number of eminent Roman Catholic authors. Perthes was an ardent patriot; and during the period of Napoleon's supremacy he distinguished himself by his steady resistance to French pretensions. His zeal for the national cause led him to issue (in 1810-11) *Das Deutsche Museum*, to which many of the foremost publicists in Germany contributed. For some time the French made it impossible for him to live in Hamburg; and when, in 1814, he returned, he found that his business had greatly fallen off and that it would have to be thoroughly reorganized. In 1821, his first wife having died, he left Hamburg, transferring his business there to his partner, and went to Gotha, where he established what ultimately became one of the first publishing houses in Germany. Among other important works issued by him may be named the *Theologische Studien und Kritiken* and the *Geschichte der europäischen Staaten*, the latter conducted in the first instance by Heeren and Ukert, afterwards by Giesebrecht. Perthes died at Gotha on 18th May 1843.

Of the three sons of Perthes, the youngest, A. H. T. Perthes, succeeded him as a publisher. The elder sons became authors of some eminence, and one of them, C. T. Perthes, wrote an excellent biography of his father, *Friedrich Perthes' Leben*. In 1786 a publishing house was founded in Gotha by the uncle of F. O. Perthes, J. G. Justus Perthes, whose son Wilhelm became distinguished as a publisher of works relating to geography. Bernhard Wilhelm,

Wilhelm's son, who succeeded to the business in 1853 and died in 1887, greatly extended its operations. In 1854 he established a geographical institute, and the *Mittheilungen aus Justus Perthes' geographischem Institut*, conducted by A. Petermann, soon gained a European reputation. This house issues the *Almanach de Gotha*, and has published the maps and writings of many of the most eminent German geographers and travellers.

PERTINAX, HÆLVIVS, Roman emperor, was the son of a charcoal-burner, and was born in 126 A.D. in Liguria, or at Villa Martis among the Apennines. From being a teacher of grammar he rose through many important offices, both civil and military, to the consulate, which he held twice. Chosen on 31st December 192 to succeed the murdered Commodus, he was himself assassinated in a mutiny of the soldiers after a reign of eighty-six days.

PERTZ, GEORG HEINRICH (1795-1876), editor of the *Monumenta Germanie Historica*, was born at Hanover on 28th March 1795. From 1813 to 1818 he studied at Göttingen, chiefly under Heeren. His graduation thesis, published in 1819, on the history of the Merovingian mayors of the palace, attracted the attention of Baron Stein, by whom he was engaged in 1820 to edit the Carolingian chronicles of the newly-founded Historical Society of Germany. In search of materials for this purpose, Pertz made a prolonged tour through Germany and Italy, and on his return in 1823 he received at the instance of Stein the principal charge of the entire work of the society, which was to be the publication, under the title of *Monumenta Germanie Historica*, of accurate texts of all the more important historical writers on German affairs down to the year 1500, as well as of laws, imperial and regal archives, and other valuable documents, such as letters, falling within this period. In the discharge of this, the principal task of his life, Pertz made frequent journeys of exploration to the leading libraries and public record offices of Europe, publishing notes on the results of his explorations in the *Archiv der Gesellschaft f. Deutsche Geschichtskunde* (1824-72). In 1823 he had been made secretary of the archives, and in 1827 principal keeper of the royal library at Hanover; from 1832 to 1837 he edited the *Hannoversche Zeitung*, and more than once sat as a representative in the Hanoverian Second Chamber. In 1842 he was called as chief librarian to Berlin, where he shortly afterwards was made a privy councillor and a member of the Academy of Sciences. Failing health and strength led to the resignation of all his appointments in 1874, and on 7th October 1876 he died at Munich while attending the sittings of the historical commission.

The *Monumenta*, with which the name of Pertz is so closely associated, began to appear in 1826, and at the date of his resignation 24 volumes ("Scriptores," "Leges," "Diplomata") had appeared. The work, which for the first time made possible the existence of the modern school of scientific historians of medieval Germany, continues to be carried on under Waitz, Wattenbach, Dümmler, and others. In connexion with the *Monumenta* Pertz also published *Scriptores rerum Germanicarum in usum Scholarum* v.; among his other literary labours may be mentioned an edition of the *Gesammelte Werke* of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn von Stein*, 6 vols., 1849-55; also, in an abridged form, *Aus Stein's Leben*, 2 vols., 1856).

P E R U

Plate IX. **PERU** has, in different periods, included areas of territory of varying extent. The empire of the Incas and the Spanish viceroyalty were not continuous with the modern republic nor with each other. In the present article the sections relating to physical geography and the moral and material condition of the people will be confined to the limits of the republic, while in the historical section there will necessarily be references to events which took place beyond the existing limits of the country.

Extent.—The republic of Peru is situated between the Equator and the Tropic of Capricorn, yet, owing to the differences of elevation, it includes regions with every variety of climate. It lies between the parallels of 3° 21' S. and 19° 10' S. and between 68° and 81° 20' 45" W. long., and has an area of about 490,000 square miles.¹ The

¹ Before the war with Chili the southern limit of Peru was in 22° 28' S lat., the coast-line measured 1400 miles, and the area was 504,000 square miles (see p. 679 below).

length along the Pacific coast is 1240 miles, while the width ranges from 300 to 400 miles.

Boundaries.—The republic is bounded on the W by the Pacific Ocean, on the E by Brazil and Bolivia, on the N. by Ecuador, and on the S. by Chili. The northern boundary commences at the village of Santa Rosa, near the southern shore of the Gulf of Guayaquil, whence it passes southwards to the river Macara, a tributary of the China, which falls into the Pacific. It takes the course of the Macara, up the ravine of Espindula, to its source in the cordillera of Ayavaca, in the Amazonian basin it follows the river Cauchas to its junction with the Chunchipe, and the Chunchipe to the Marañon. The Marañon then forms the boundary until the first Brazilian town is reached at Tabatinga. The frontier with Brazil was determined by article 11 of the treaty of San Ildefonso in 1777. A treaty dated 23d October 1851 further settled the boundary, which was fixed by the commissioners who explored the Yavari in 1866 and 1871. It first follows the course of the Yavari from the point where it falls into the Amazon, in 4° 13' 21" S, up to a point near its source in 7° 1' 17" S, from thence it forms a straight line to a point in 6° 52' 15" S on the left bank of the Madera, being half the distance between the mouth of the Mamoré and that of the Madera. This is the point where the frontiers of Peru, Brazil, and Bolivia meet. The Peru-Bolivian frontier, within the basin of the Amazon, has not been accurately defined. It follows the Madera to the mouth of the Mamoré, then the Beni and its tributary the Madidi to the junction of the latter with a stream called the Pablo-bamba, ascending the ravine of the Pablo-bamba to the source of that stream in the eastern Andes. The line then crosses the Andes in a straight line southwards to the village of Conima on the shore of Lake Titicaca. Thence it passes across the lake in another straight line to the isthmus of Yunguyo, and thence to the mouth of the Desaguadero. From the Desaguadero the frontier takes a south-west direction to the source of the river Mauri, and then, until the recent war with Chili, it ran south along the watershed of the Maritime Cordillera to the source of the river Loa, which falls into the Pacific. The southern boundary separating the Peruvian province of Tarma from the Bolivian province of Atacama was formed by the ravine of Duende, south of the Loa, to the coast of the Pacific in 23° 23' S near Tacapilla. This part of the frontier was carefully delineated in 1823, and the boundary marks are recorded in a document which is still extant. But the Chilians conquered and in 1884 annexed the Peruvian province of Tarapaca.

Physical Geography.—Peru is divided longitudinally into three well-defined regions, the coast, the sierra, and the montaña. The coast, extending from the base of the Maritime Cordillera to the Pacific Ocean, consists of a sandy desert crossed at intervals by rivers, along the banks of which there are fertile valleys. The sierra is the region of the Andes, and is about 250 miles in width. It contains stupendous chains of mountains, elevated plains and table-lands, warm and fertile valleys, and ravines. The montaña is the region of tropical forests within the valley of the Amazon, and skirts the eastern slopes of the Andes.

The coast has been upraised from the ocean at no very distant geological epoch, and is still nearly as destitute of vegetation as the African Sahara. It is, however, watered by fifty streams which cross the desert at intervals. Half of these have their origin in the summits of the Andes, and run with a permanent supply of water into the ocean. The others, rising in the outer range, which does not reach the snow-line and receives less moisture, carry a volume of water to the sea during the rainy season, but for the rest of the year are nearly dry. The absence of rain here is caused by the action of the lofty uplands of

the Andes on the trade-wind. The south-east trade-wind blows obliquely across the Atlantic Ocean until it reaches Brazil. By this time it is heavily laden with vapour, which it continues to bear along across the continent, depositing it and supplying the sources of the Amazons and La Plata. Finally, the trade-wind arrives at the snow-capped Andes, and here the last particle of moisture is wrung from it that the very low temperature can extract. Coming to the summit of that range, it rushes down as a cool and dry wind on the Pacific slopes beyond. Meeting with no evaporating surface, and with no temperature colder than that to which it is subjected on the mountain-tops, this wind reaches the ocean before it becomes charged with fresh moisture. The constantly prevailing wind on the Peruvian coast is from the south. From November to April there are usually constant dryness, a clear sky, and considerable, though by no means oppressive, heat. From June to September the sky is obscured for weeks together by fog, which is often accompanied by drizzling rain called "garua." In 1877 the maximum temperature at Lima was 78½° Fahr. in February and the minimum 61½° Fahr. in July. At the time when it is hottest and driest on the coast it is raining heavily in the Andes, and the rivers are full. When the rivers are at their lowest, the "garua" prevails on the coast. The climate of various parts of the coast is, however, modified by local circumstances.

The deserts between the river-valleys vary in extent, the largest being upwards of 70 miles across. On their western margin steep cliffs generally rise from the sea, above which is the "tablazo" or plateau, in some places slightly undulating, in others with ridges of considerable height rising out of it, the whole apparently quite bare of vegetation. The surface is generally hard, but in many Sand-places there are great accumulations of drifting sea-sand, hills. The sand usually forms isolated hillocks, called "medanos," of a half-moon shape, having their convex sides towards the trade-wind. They are from 10 to 20 feet high, with an acute crest, the inner side perpendicular, the outer with a steep slope. Sometimes, especially at early dawn, there is a musical noise in the desert, like the sound of distant drums, which is caused by the eddying of grains of sand in the heated atmosphere, on the crests of the "medanos." Apparently the deserts are destitute of all vegetation; yet three Coast kinds of herbs exist, which bury themselves deep in the earth, and survive long periods of drought. One is an amar-anthaceous plant, whose stems ramify through the sand-hills, the other two are a *Martynia* and an *Antioea*, which maintain a subterranean existence during many years, and only produce leafy stems in those rare seasons when sufficient moisture penetrates to the roots. In a few hollows which are reached by moisture the trees of the desert find support, the "algarobos" (*Prosopis horrida*), a low tree of very scraggy growth, the "velaya" (*Cusparia crotonoides*), and "zapote del perro" (*Coliadendrum seabridium*), mere shrubs. Far away towards the first ascents to the Andes a tall branched cactus is met with, and there are *Salicornias* and *Salsolas* near the coast. But, when the mists set in, the low hills near the coast bordering the deserts, which are called "lomas," undergo a change as if by magic. A blooming vegetation of wild flowers for a short time covers the barren hills. Near Lima one of the low ranges is brightened by the beautiful yellow lily called "amancaes" (*Ismene amancaes*). The other flowers of the "lomas" are the "papiña de San Juan" (*Begonia geraniifolia*), with red petals contrasting with the white inner scales, valerians, the beautiful *Bomarea ovata*, several species of *Ocales*, *Solanum*, and crucifers. But this carpet of flowers is very partially distributed and lasts but a short time. Generally the deserts present a desolate aspect, with no sign of a living creature or of vegetation. Only in the very loftiest

Bound-
aries.

Physical
regions.

The
coast.

regions of the air the majestic condor or the turkey buzzard may be seen floating lazily, perhaps a lizard will dart across the path, and occasionally a distant line of mules or a solitary horseman seems to shimmer weirdly in the refraction on the distant horizon.

Valleys

The valleys form a marvellous contrast to the surrounding desert. A great mass of pale-green foliage is usually composed of the "algarrobo" trees, while the course of the river is marked by lines or groups of palms, by fine old willows (*Salix humboldtiana*), fruit-gardens, and fields of cotton, maize, sugar, and lucerne. In some valleys there are expanses of sugar-cane, in others cotton, whilst in others vineyards and olive-yards predominate. The woods of "algarrobo" are used for pasture, cattle and horses greedily enjoying the pendulous yellow pods.

Coast sections

For purposes of description the coast-region of Peru may be divided into six sections, commencing from the north—(1) the Piura region, (2) the Lambayeque and Tuxillo section; (3) the Santa valleys, (4) the section from Lima to Nasca, (5) the Arequipa and Tacna section, (6) Tarapaca.

(1) The great desert-region of Piura extends for nearly 200 miles from the Gulf of Guayaquil to the borders of the Moquegua valley, and is traversed by three rivers—the Tumbes, Chira, and Piura, the two former issuing their waters from the snow-capped Andes, and breaking through the outer range. It is here that the coast of South America extends furthest to the westward until it reaches Capes Blanco and Parilla, and then turns southward to the Bay of Payta. The climate of Piura is modified by the lower latitude, and also by the vicinity of the forests of Guayaquil. Fog and "garua" are much less frequent than in the coast-region farther south, while positive rain sometimes falls. At intervals of about ten years there are occasional heavy showers of rain from February to April. (2) The second section of the coast-region includes the valleys of the Moquegua, the Chiclayo, and Lambayeque, the Saka, the Jequetepeque, the Chicama, Moche, Viri, and Chao. With the intervening deserts this section extends over 200 miles. All these valleys, except Moquegua and Chao, are watered by rivers which have their sources far in the recesses of the mountains, and which furnish an abundant supply for the season from August to March. (3) The third section, extending for 200 miles, contains the valleys of Santa, Nepeña, Casma, Huarmey, Fortaleza, Pativilca, Supé, and Huancayo. The river Santa, which rises in the lake of Conococha, 12,907 feet above the sea, and has an entire length of 180 miles, is remarkable for its long course between the outer and central ranges of the Andes, in a trough known as the "Cañon de Huaylla," 100 miles in length. It then breaks through in a deep gorge, and reaches the sea after a course of 35 miles over the coast-belt, and after fertilizing a rich valley. The Santa and Nepeña valleys are separated by a desert 3 leagues in width, on the shores of which there is a good anchorage in the bay of Ferrol, where the port of Chumbote is to be the terminus of a projected railway. The Nepeña, Casma, Huarmey, Fortaleza, and Supé rivers rise on the slope of an outer range called the Cordillera Negra, and are consequently dry during the great part of the year. Wells are dug in their beds, and the fertility of the valleys is thus maintained. The Pativilca (or Buena Vista) river and the Huancayo break through the outer range from their distant sources in the snowy cordillera, and have a perennial supply of water. There are 9 leagues of desert between the Nepeña and Casma, 18 between the Casma and Huarmey, and 18 between the Huarmey and Fortaleza. The latter desert, much of which is loose sand, is called the "Pampa de Meta Cavallos," from the number of cavalry men on which it was used. (4) Between the Supé and Pativilca is the desert called the "Pampa del Mocho Mundo." (5) The next coast-section extends for over 300 miles from Chancay to Nasca, and includes the rivers of Chancay or Lacha, of Ocaibayillo, Rimac, Lurin, Mala, Cañete, Chincha, Pisco or Chunchungu, Yca, and Rio Grande. Here the maritime range approaches the ocean, leaving a narrower strip of coast, but the fertile valleys are closer and more numerous. Those of Ocaibayillo and Rimac are connected, and the view from the Bay of Callao extends over a vast expanse of fertile plain bounded by the Andes, with the white towers of Lima in a setting of verdure. Lurin and Mala are smaller valleys, but the great vale of Cañete is one green sheet of sugar-cane, and narrow strips of desert separate it from the fertile plain of Chincha, and Chincha from the famous vineyards of Pisco. The valleys of Yca, Palpa, San Xavier, and Nasca are rich and fertile, though they do not extend to the sea, but between Nasca and Acari there is a desert 80 miles in width. (6) The Arequipa and Tacna section extends over 350 miles, and comprises the valleys of Acari, Arequipa, Anco, Ocoña, Majes or Camana, Quiles, with the interior valley of Arequipa, Tambo, Ylo or Moquegua, Idé or Lomblanca, Sama, Tacna, and Azapa or Arica. Here the Maritime Cordillera recedes, and the important valley of Arequipa, though

on its western slope, is 7000 feet above the sea, and 90 miles from the coast. Most of the rivers here have their sources in the central range, and are well supplied with water. The coast-valleys through which they flow, especially those of Majes and Lomblanca, are famous for their vineyards, and in the valley of Tambo there are extensive olive plantations. (8) The most southern coast-section is that of Tarapaca, extending between the cordillera and the Pacific, in a narrow strip from the ravine of Camarones, south of Arica, to the former southern frontier of Peru. Only two rivers reach the sea in Tarapaca, the Tiliviche in the north of the province, and the Loa in the extreme south. The other streams are lost in the desert soon after they issue from their ravines in the Andes. The reason of this is that in Tarapaca there is an and range of hills parallel with the sea-shore, which is about 80 miles in width, and covered with sand and saline substances. Between this coast-range and the Andes is the great plateau called the "Pampa de Tamañali," from 3000 to 3500 feet above the sea, which is about 30 miles wide, and extends the whole length of Tarapaca. This plateau is covered with sand, and contains vast deposits of nitrate of soda. Here and there a few "tamagueas" or acacia trees are met with, which give them name to the region.

The coast of Peru has few protected anchorages, and islands and the headlands are generally abrupt and lofty. These and the few islands are frequented by myriads of sea-birds, whence come the guano-deposits, the retention of ammonia and other fertilizing properties being due to the absence of rain. The islets off the coast are all barren and rocky.

The most northern is Pisco, in 5° 13' 30" S., near the coast to the south of Payta. The islands of Lobos de Tierra and Lobos de Afuera (2), in 6° 27' 45" S. and 6° 56' 45" S. respectively, are off the desert of Sechura, and contain deposits of guano. The two Afuera islands are 90 and 88 miles from the coast at the point of San José. The islets of Machab, in 7° 48' 20" S., also have guano-deposits, now nearly exhausted. The two islets of Guñaque, surrounded by many rocks, in 8° 34' S., contain rich deposits. Chao lies 450 feet above the sea, off the coast, in 8° 46' 30" S. Corobordo is in 8° 57' S. La Virula is off the point of Casma, in 9° 23' 30" S., and Tortuga is 2 miles distant to the north. Santa Islet lies off the bay of Cosca, in 9° 14' 40", and the three high rocks of Ferrol in 9° 38' 30" S. Farther south these are the group of islets and rocks called Huanu, in 9° 57', and that of which are the Puntos Tambo, Chiriqueta, Baya, Quilacalones, and Mazorque. The Hormigas are in 11° 4' S. and 11° 58', and the Pescadoes in 11° 47' S. The island of San Lorenzo, in 12° 4' S., is a lofty mass, 4½ miles long by 1 broad, forming the Bay of Callao, its highest point is 1050 feet. Off its south-east end lies a small but lofty islet called Pronton, and to the south-west are the Palomitos Rocks. Hornada Islet, with a hole through it, is to the south of Callao Point. Off the valley of Lurin are the Pachacamac Islands, the most northern and largest being half a mile long. The next, called San Francisco, is like a sugar-loaf, perfectly rounded at the top. The others are mere rocks. Asia Island is farther south, 17 miles north-west of Cerro Azul, and about a mile in extent. Pisco Bay contains San Gallan Island, high, with a bold cliff outline, 2½ miles long by 1 broad, the Ballista Islets, and farther north the three famous Chincha Islands, whose vast guano-deposits are now exhausted. South of the entrance to Pisco Bay is Zazate Island, and farther south the white low islet of Santa Rosa. The Infernillo rock is quite black, about 50 feet high, in the form of a sugar-loaf, a mile west of the Point of Santa Maria, which is near the mouth of the Yca river. Alcatraz is a small islet off the lofty "morro" of Arica. A low island protects the anchorage of Iquique on the coast of Tarapaca, and farther south are the three islets of Follon in 20° 46' 20" S., and the Pajeros, with guano-deposits, in 22° 6' 45" S. All these rocks and islets are barren and uninhabitable, mere outcrops of the desert headlands.

The more common sea-birds, which haunt the islets and sea-headlands in countless myriads, are the *Sula variegata* or birds, the *Phaethon rubricauda*, and the *Sterna fuscata*, a beautiful tern with curved white feathers on each side of the head. The rarest of all the gulls is also found on the Peruvian coast, namely, the *Xema furcata*.¹ The immense flocks of birds, as they fly along the coast, appear like clouds, and one after another is incessantly seen to plunge from a height into the sea to devour the fishes, which they find in extraordinary numbers. The guano-deposits are in layers from 40 to 50 feet thick, of a greyish-brown colour outside, and more and more solid from the surface downwards, owing to the gradual deposit of strata and evaporation of fluid par-

¹ The third known example was shot in Paracas Bay, near Pisco, by Captain Markham, in 1851.

ticles. Sea-lions (*Otaria forstersi*) are common on the rocky islands and promontories. These large creatures frequent particular islets for the purpose of breathing their last, the wounded or aged being helped there by their companions.

The Maritime Cordillera, overhanging the Peruvian coast, contains a long line of volcanic mountains, most of them inactive, but their presence is probably connected with the frequent and severe earthquakes, especially in the southern section of the coast. Since the year 1870 there have been seventy violently destructive earthquakes recorded on the west coast of South America, but the register is of course incomplete in its earlier part. The most terrible was that of 1745, which destroyed Callao. There had been subterranean noises for some days previously, the first shock was at 10.30 P. M. on 28th October, and there were 220 shocks in the following twenty-four hours. The town was overwhelmed by a vast wave, which rose 80 feet, and the shocks continued until the following February. On 13th August 1868 an earthquake nearly destroyed Arequipa, and great waves rolled in upon the ports of Arica and Iquique. On 9th May 1877 nearly all the southern ports were overwhelmed. These fearful catastrophes are in greatest force where there are volcanoes, whether active or extinct, in the vicinity. That of 1877 had its origin in the volcanic mountains near the frontier of Peru and Bolivia, and spent its chief fury near its centre of origin, gradually working itself out as it went north. Usually the line of disturbance is meridional and along the coast, but in some instances the line takes a seaward direction at an angle with the mountain-chains.

The most important part of Peru is the region of the cordilleras of the Andes divided into "puna" or lofty uninhabited wilderness, and "sierra" or inhabitable mountain slopes and valleys. This great mountain-system, running south-east to north-west with the line of the coast, consists of three chains or cordilleras. The two chains which run parallel, and near each other on the western side, are of identical origin, and have been separated by the action of water during many centuries. On these chains are the volcanoes and many thermal springs. The narrow space between them is for the most part, but not always, a cold and lofty region known as the "puna," containing alpine lakes,—the sources of the coast-rivers. The great eastern chain, rising from the basin of the Amazon and forming the inner wall of the system, is of distinct origin. These three chains are called the Maritime Cordillera, the Central Cordillera, and the Andes. Paz Soldan and other Peruvian geographers give the name of Andes, *par excellence*, to the eastern cordillera.

The Peruvian Maritime Cordillera contains a regular chain of volcanic peaks overlooking the coast-region of Tarapaca, which attain a height of 16,000 to 18,000 feet. Chief among them are the snowy peak of Lirima over the ravine of Tarapaca, the volcano of Islaya overhanging Camiña, the unmeasured peak of Schama, and Tacora near the Bolivian frontier. In rear of Moquegua there is a group of volcanic peaks, clustering round those of Umas and Huaynaputina. A great eruption of Huaynaputina commenced on 15th February 1860 and continued until the 28th. An incessant rain of fine white sand was poured over the surrounding country for a distance of 40 miles, accompanied by a mighty subterranean roaring sound. But generally these volcanoes are quiescent. Farther north the Misti volcano rises over the city of Arequipa in a perfect cone to a height of over 18,000 feet, and near its base are the hot sulphur and iron springs of Yura. As the maritime chain advances northward it fully maintains its elevation. The peak of Sarasa, in Parinacoches (Ayacucho), is 19,500 feet above the sea, and in the mountains above Lima the passes attain a height of more

than 15,000. In latitude 10° S. the maritime chain separates into two branches, which run parallel to each other for 100 miles, enclosing the remarkable ravine or Callejon de Huaylas,—the eastern or main branch being known as the Cordillera Nevada and the western as the Cordillera Negra. On the Nevada the peak of Huascen reaches a height of 22,000 feet, according to the trigonometrical measurement of the railway engineer Hindle. The Huandoy peak, above Carhuaz, reaches to 21,088 feet, the Hualcan peak, overhanging the town of Yungay, is 19,945 feet high, and most of the peaks in this part of the chain reach a height of 19,000 feet. During the rainy season, from October to May, the sky is generally clear at dawn, and the magnificent snowy peaks, with sharply-defined outlines, stand out in lovely contrast to the deep-blue background. But as the day advances the clouds collect, and the whole is shrouded in a dense veil. In most parts of the Peruvian Andes the line of perpetual snow is at 16,400 feet above the sea; but on the Cordillera Nevada, above the Callejon de Huaylas, it sinks to 15,400 feet. This greater cold is obviously caused by the intervention of the Cordillera Negra, which intercepts the warmth from the coast. As this lower chain does not reach the snow-line, the streams rising from it are very scantily supplied with water, while the Santa, Pativilca, and other coast-rivers which break through it from sources in the snowy chain have a greater volume from the melted snows. At the point where the river Santa breaks through the Cordillera Negra that range begins to subside, while the Maritime Cordillera continues as one chain to and beyond the frontier of Ecuador.

The Central Cordillera is the true water-parting of the Central system. No river, except the Marañon, breaks through it either to the east or west, while more than twenty coast-streams rise on its slopes and force their way through the maritime chain. The Central Cordillera consists mainly of crystalline and volcanic rocks, on each side of which are aqueous, in great part Jurassic, strata thrown up almost vertically. In 14° 30' S lat. the central chain is connected with the Eastern Andes by the transverse mountain-knot of Vilcañota, the peak of that name being 17,500 feet above the sea. The great inland basin of Lake Titicaca is thus formed. The central chain continues to run parallel with the Maritime Cordillera until, at Cerro Pasco, another transverse knot connects it with the Andes in 10° 30' S. lat. It then continues northward, separating the basins of the Marañon and Huallaga, and at the northern frontier of Peru it is at length broken through by the Marañon flowing to the eastward.

The Eastern Andes is a magnificent range in the southern Eastern part of Peru, of Silurian formation, with talcose and clay slates, many quartz veins, and eruptions of granitic rocks. Mr Forbes says that the peaks of Illimpu (21,470 feet) and Illimani (21,040 feet) in Bolivia are Silurian and fossiliferous to their summits. The eastern range is cut through by six rivers in Peru, namely, the Marañon and Huallaga, the Pucallpa, Apurimac, Vilcanayo, and Pucallpa, the last five being tributaries of the Ucayali. The range of the Andes in south Peru has a high plateau to the west and the vast plains of the Amazonian basin to the east. The whole range is highly auriferous, and the thickness of the strata is not less than 10,000 feet. It is nowhere disturbed by volcanic eruptions, except at the very edge of the formation near Lake Titicaca, and in this respect it differs essentially from the Maritime Cordillera. To the eastward numerous spurs extend for varying distances into the great plain of the Amazons. It is here that the majestic beauty of the Andean scenery is fully realized: masses of dark mountains rise for thousands of feet, with their bases washed by foaming torrents and their

Andes

summits terminating in sharp peaks or serrated ridges; the lower slopes are covered with dense vegetation, and everywhere there is flowing water in cascades or rushing torrents, the condensation moisture of the trade-winds hurrying back to the Atlantic. The Andes lose their majestic height to the northward, and beyond Cerro Pasco the eastern chain sinks into a lower range between the Huallaga and Ucayali. But throughout the length of Peru the three ranges are clearly defined.

Sections of sierra. For purposes of description the sierra of Peru may be conveniently divided into four sections, each embracing portions of all three ranges. The first, from the north, comprises the upper basins of the Marañon and the Huallaga, and is 350 miles long by 100 broad. The second extends from the Knot of Cerro Pasco to Ayacucho, about 200 miles, including the Lake of Chinchay-cocha and the basin of the river Xauxa. The third, or Cuzco section extends 250 miles to the Knot of Vilacota with the basins of the Pampas, Apurimac, Vilcamayo, and Puncatambo. The fourth is the basin of Lake Titicaca, about 150 miles in length and breadth.

Lakes. The Lake of Chinchay-cocha, in the second section, is 86 miles long by 7 miles broad, and 13,000 feet above the sea. Its marshy banks are overgrown with reeds and inhabited by numerous water-fowl. From this lake the river Xauxa flows southwards, through a populous valley for 150 miles before entering the forests. Lake Titicaca, in the fourth or most southern section, is about 80 miles long by 40 broad, the frontier of Bolivia passing across it diagonally. It is 12,545 feet above the sea by the railroad-levels. The drainage is carried off southwards by the river Desaguadero to the great swampy Lake of Aullagas in the south of Bolivia, while it is fed by streams from the Andes and the Central Cordillera. The largest is the Ramis, formed by the two streams of Pucara and Azungue, both coming from the Knot of Vilacota to the north. The Schezur, formed by the Cavanilla and Lampa streams, falls into the lake on the north-west side, as well as the Yllpa and Yllave. Much of the water flows out by the Desaguadero, but a great proportion is taken up by evaporation in the dry season from April to September. The waters are clear and refreshing under the combined influence of evaporation and the sediment brought down by the rivers. The deepest part of the lake is on the Bolivian side, in other parts it is very shoaly, and along the shore there are many acres of tall reeds. The principal islands are Titicaca and Cosati (at the south end near the peninsula of Copacabana), Campanaria (9 miles from the east shore), Soto, and Esveres. There are two other lakes in the Colles, as the region round the Titicaca is called. Lake Ampa, a few miles from the northern shore of Titicaca, is 80 miles in circumference. Lake Umayo is on higher ground to the westward. The lake in Peru which is third in size is that of Paima-cochas on the coast watershed, near the foot of the snowy peak of Saianasi. It is 12 miles long by 6 broad, but has never been visited and described by any modern traveller. The smaller alpine lakes, often forming the sources of rivers, are numerous.

Rivers of sierra. The great rivers of the sierra are the Marañon, rising in the Lake of Lauticocha and flowing northward in a deep gorge between the Maritime and Central Cordilleras for 350 miles, when it forces its way through the mountains at the famous Pongo de Mauserche and enters the Amazonian plain. The Huallaga rises north of Cerro Pasco, and, passing Hinasuani, flows northwards on the other side of the Central Cordillera for 300 miles. It breaks through the range at the Pongo de Chacanta and falls into the Marañon. The other great rivers are tributaries of the Ucayali. The Pucuz, flowing eastward from the Knot of Cerro Pasco, joins the Pachitea, which is the most northern important affluent of the Ucayali. The Xauxa, becoming afterwards the Mantaro, receives the drainage of Xauxa, Huancavelica, and Ayacucho. The southern valleys of this part of the sierra furnish streams which form the main rivers of Pampas, Pachachaca, and Azungue. These, uniting with the Mantaro, form the Ene, and the Ene and Perene (which drains the province of Tumbes) form the Tambo. The classic river of Vilcamayo rises on the Knot of Vilacota, flows north through a lovely valley, receives the Yanatlito and Puncatambo on its right bank, and, uniting with the Tambo, forms the Ucayali. Most of these main streams flow through profound gorges in a tropical climate, while the lower slopes yield products of the temperate zone, and the plateaus above are cold and bleak, affording only pasture and the hardiest cereals.

Sierra flora. The great variety of elevation within the sierra produces vegetation belonging to every zone. There is a tropical flora in the deep gorges, higher up a sub-tropical, then a temperate, then a sub-alpine flora. In ascending from the coast-valleys there is first an arid range, where the grassy-branched cañi root themselves up among the rocks. Farther inland, where the rains are more plentiful, is the native home of the potato. Here also are other plants with edible roots—the "oca" (*Oxalis tuberosa*), "alluca" (*Ullucus tuberosus*), "massua" (*Tropaeolum tuberosum*), and "Isarcé" (*Poly-*

nna senchifolia). Among the first wild shrubs and trees that are met with are the "chilca" (*Dacchara Feuille*), with a pretty yellow flower, the *Mutisia acuminata*, with beautiful red and orange flowers, several species of *Senecio*, calceolarias, the *Schinus Molle*, with its graceful branches and bunches of red berries, and at higher elevations the "lamana" (*Azara acuminata*), the "cañi" (*Sambucus peruviana*), the "quadrant" (*Buddleia nana*), and the *Polygala racemosa*. The *Buddleia*, locally called "oliva silvestre," flourishes at a height of 12,000 feet round the shores of Lake Titicaca. The temperate valleys of the sierra yield fruits of many kinds. Those indigenous to the country are the delicious "chirimoyas," "paltas" or alligator pears, the "paca," a species of *Jugos*, the "lucuma," and the "granadilla" or fruit of the passion-flower. Vineyards and sugar-cane yield crops in the warm valleys, the sub-tropical valleys are famous for splendid crops of maize, wheat and barley thrive on the mountain slopes, and at heights from 7000 to 12,000 feet there are crops of "quinua" (*Chenopodium Quinua*). In the loftiest regions the pasture chiefly consists of a coarse grass (*Stipa Folia*), of which the llamas eat the upper blades while the sheep browse on the tender shoots beneath. There are also two kinds of shrubby plants, a thorny *Copaifera* called "canilli" and another called "sola," which is a resinous *Daccharia*, and is used for fuel.

The animals which specially belong to the Peruvian Andes are Fawns, the domestic llamas and alpacas and the wild vicuñas. There are deer, called "taruco" (*Ovis entellus*), the "vacauna," a large rodent, a species of fox called "ato," and the "puma" (*Felis concolor*) and "numan" or black bear, which the Indians call "yacuhualpa," wander into the loftiest regions. The largest bird is the condor, and there is another bird of the vulture tribe, with a black and white wing feather, formerly used by the Incas in their head-dress, called the "coraqueque" or "alcaman." The "toto" is a brown speckled creeper which flutters about the rocks. There is a little bird, the size of a sparrow, with brown back striped with black, and white breast, which the Indians call "yacuhualpa," it utters a monotonous sound at each hour of the night. A partridge called "yutu" frequents the long grass. On the lakes there is a very handsome goose, with white body and dark-green wings shading into violet, called "huachua," two kinds of this, a large gull (*Larus senegalensis*), frequenting the alpine lakes in flocks, flamingoes called "parihuanas," ducks, and water-hens. Many pretty little finches fly about the maize-fields and fruit-gardens, and a little green parakeet is met with as high as 12,000 feet above the sea.

The third division of Peru is the region of the tropical montaña.

forests, at the base of the Andes, and within the basin of the Amazonas. It is traversed by great navigable rivers. The Marañon, having burst through the defile of the Pongo de Mauserche, and the Huallaga through that of Chacanta, enter the forests and unite after separate courses of about 600 and 400 miles, the united flood then flowing eastward to the Brazilian frontier. After 150 miles it is joined by the Ucayali, a great navigable river with a course of 600 miles. The country between the Huallaga and the Ucayali, traversed by the eastern cordillera, is called the Pampa del Sacramento. The forests drained by the Marañon, Huallaga, and Ucayali form the northern portion of the Peruvian montaña. The southern half of the montaña is watered by streams flowing from the Eastern Andes, which go to form the river Madre de Dios or Amaru-mayo, the principal branch of the river Beni, which falls into the Madeira. The region of the Peruvian montaña, which is 800 miles long from the Marañon to the Bolivian frontier, is naturally divided into two sections, the sub-tropical forests in the ravines and on the eastern slopes of the Andes and the dense tropical forests in the Amazonian plain. The sub-tropical section is important from the value of its products, and interesting from the grandeur and beauty of its scenery. Long spurs run off from the Andes, gradually decreasing in elevation, and it is sometimes a distance of 60 or 80 miles before they finally subside into the vast forest-covered plains of the Amazon basin. Numerous rivers flow through the valleys between these spurs, which are the native home of the quinine-yielding cinchona trees. The most valuable species, called *C. Calisaya*, is found in the forests of Carabaya in south Peru and in those of Bolivia. The species between Carabaya and the head-waters of the Huallaga yield very little of the febrifuge alkaloid. But the forests of Huancayo

Huamalis abound in species yielding the grey bark of commerce, which is rich in chinchonine, an alkaloid efficacious as a febrifuge, though inferior to quinine. With the chinchona trees grow many kinds of *Melastomaceae*, especially the *Lavandula*, with masses of purple flowers, tree-ferns, and palms. In the warm valleys there are large plantations of coca (*Erythroxylon Coca*), or Cúca (see vol. i. p. 684), the annual produce of which is stated at 18,000,000 lb. The other products of these warm valleys are most excellent coffee, cocoa, sugar, tropical fruits of all kinds, and gold in great abundance. In the vast untrodden forests farther east there are timber trees of many kinds, incense trees, a great wealth of india-rubber trees of the *Hevea* genus, numerous varieties of beautiful palms, sarsaparilla, vanilla, ipecacuanha, and copoba. The abundant and varied fauna is the same as that of the Brazilian forests.

Population.

Population.—The earliest reliable enumeration of the people of Peru was made in 1793, when there were 617,700 Indians, 241,225 mestizos (Indian and white), 136,311 Spaniards, 40,337 negro slaves, and 41,404 mulattos, giving a total of 1,076,977 souls, without counting the wild Indians of the montaña. The ecclesiastics numbered 5496, including 1260 nuns. This tells a sad story of depopulation since the fall of the Incas, to which the abandoned terraces on the mountain-sides, once highly cultivated, bear silent testimony. In 1862 the population was officially estimated at 2,487,716. The latest census was taken in 1876 with much care. The result was 2,673,075 souls (males 1,352,151, females 1,320,924); of these 57 per cent. were Indians, 23 per cent. mestizos, and 20 per cent. of Spanish descent, negroes, Chinese, and foreigners; so that Peru is still the country of the Yncas people.

Political divisions.

Political Divisions.—The empire of the Incas was divided into four main divisions, Chinchay-suyu to the north of Cuzco, Anti-suyu to the east, Colla-suyu to the south, and Tanti-suyu to the west, the whole empire being called Tahuantinsuyu, or the four governments. Each was ruled by a viceroi, under whom were the "huaranca-camayocs," or officers ruling over thousands, and inferior officers, in regular order, over 500, 100, 50, and 10 men. All disorders and irregularities were checked by the periodical visits of the "tucuyricos" or inspectors. The Spanish conquest threw this complicated system out of gear. In 1569 the governor, Lope García de Castro, divided Peru into "corregimientos" under officers named "corregidores," of whom there were 77, each in direct communication with the Government at Lima. An important administrative reform was made in 1784, when Peru was divided into 7 "intendencias," each under an officer called an "intendente." These "intendencias" included about 6 of the old "corregimientos," which were called "partidos" under officers named "sub-delegados." Thus the number of officers reporting direct to Lima was reduced from 77 to 7, a great improvement. The republic adopted the same system, calling the "intendencias" "departments" under a prefect, and the "partidos" "provinces" under a sub-prefect. Peru is divided into 18 departments, 2 littoral provinces, and what is called the constitutional province of Callao. The departments contain 95 provinces. The Government recognizes 65 cities, 70 towns, 1337 smaller towns, 64 villages, 40 hamlets on the sea-coast, and 600 in the rural districts. The departments (going from north to south) are:—

Coast.	Sierra.	Montaña
Piura	Caxamarca	Amazonas and Loreto.
Lambayeque.	Eneasco	
Libertad.	Junín	
Ancacha	Huancavelica.	
Lima.	Ayacucho.	
Yca.	Ayurmasa.	
Arequipa	Cuzco	
Moquegua.	Puno.	
Tacna.		

Towns and Seaports.—The principal towns on the coast, towns except Payta, Callao, and Aica, are always some distance and from the seashore. San Miguel de Piura, founded by Pizarro in 1533, is on the river of the same name. The towns in all parts of Peru are built on the same plan, where the ground will allow of it, in squares or "quadrads," with the streets at right angles, and a quadrangular open space or "plaza," one side being occupied by the principal church, near the centre. The church usually has an ornamental façade in the Renaissance style, with two towers. The houses on the coast are flat-roofed, with folding doors to the street, leading to a court or "patio," with rooms opening on it. Piura is a town of this class. Farther south are the cities of Lambayeque, Chiclayo, and Saña. Truxillo, founded by Pizarro in 1535, is of more importance. It is of oval shape, and was surrounded by walls with fifteen bastions, built in 1686, which have recently been demolished. Besides the cathedral, seat of a bishopric founded in 1609, there are three churches, and formerly four monasteries and a Jesuit college. Truxillo is the most important city north of Lima.

To the north of Lima there are five principal ports and thirteen smaller ones. Payta has a good anchorage and exports the cotton of the Chira and Piura valleys, the anchorages of Tumbes to the north and Sechura to the south being subsidiary to it. Pimental is the port for the valleys of Lambayeque and Chiclayo, and Eten for that of Ferreñafe, the older port of San José having been abandoned as more dangerous. Pacasmayo, also a precarious anchorage, is the port which taps the rich valley of Jequetepeque. Farther south Malabrigo is the port for the valley of Chicama. Huancayo was formerly the port for Truxillo, but Salaverry, a few miles to the south, has been substituted as affording a safer anchorage. Santiago de Chao and Guafape in the Viru district are lesser ports, the latter being resorted to by ships loading with guano at the adjacent islands. Chimbote, in the bay of Ferrol, has a good anchorage, and is important as the principal outlet for the Santa valley and the department of Ancacha. Farther south are the lesser ports of Santa, Samanco, Casma, Huarney, Supé, Huacho, Chancay, and Ancon.

Lima, the capital (see vol. xiv. p. 644), according to the census of 1876, had a population of 100,046, of whom 33,020 were of European descent, 23,010 half-castes, 19,630 Indians, 15,378 foreigners, and 9008 negroes. South of Lima are the cities of Chincha and Yca, with the principal seaport of Pisco, whence the wines and spirits of the adjacent valleys are exported. The small ports of Cerro Azul and Tambo Mora export the sugars of the Cañete and Chincha valleys. Farther south the exposed port of Chala, with a bad anchorage, is used for the valley of Acari and the province of Parmacochas in the mountains. South-east of Yca are the charming agricultural towns of Palpa and Nasca. AREQUIPA (see vol. ii. p. 484), the most important coast-city south of Lima, was founded by Pizarro in 1536. South of Arequipa is the littoral province of Moquegua, with a pleasant town, the centre of a vine-growing industry. The cities of Tacna, Arica, and Iquique are in the Chilean province of Tarapaca. The ports of Arequipa were formerly Quila, then Islay, and now Mollendo. Ylo and Paococha, in the same bay, are the ports of Moquegua, Saña, under the lofty headland of the same name, is a port where landing is impossible except in "balsas," and it is little used. Arica was a very important port before the Chilean invasion, as through it passed all the trade to Bolivia. Iquique and Pisagua are the chief ports of Tarapaca, the others being Junín, Mexillones, Molle, Chumacata, Patillos.

In the sierra there is the same regularity in intention in laying out the plan of the towns, but it is often interfered

with by the irregularity of the ground. High-pitched tiled roofs take the place of the flat roofs of the coast. The upper stories often exceed, leaving wide corridors under the overhanging eaves, and in the "plazas" there are frequently covered arcades. Fruit-gardens and fields waving with lucerne and barley encircle the towns, and there is almost always a background of mountain-ranges. The principal interior towns in the north of Peru are Caxamarca, Huaraz, Huancayo, Cerro Pasco, the centre of the great silver-mining industry, 13,300 feet above the sea, Tarma, and Xauxa. Huancavelica owed its existence to the famous quicksilver mine Ayacucho, formerly Guamanga, founded by Pizarro in 1539, is a charming abode amidst lovely scenery. Between Ayacucho and Cuzco are the pleasant towns of Andahuaylas and Abancay. Cuzco (see vol. vi. p. 744), the centre of Peru, the old capital of the Incas, lies at the foot of the famous hill of Sacsahuaman. South of Cuzco are many delightful places in the vale of Vilcanamayo, and the towns in the Collias, the chief being Puno on the shore of Lake Titicaca.

Commerce.—The resources of Peru consist of its mineral wealth, its flocks, yielding valuable wool, its crops, and the products of its virgin-forests. Silver-mines extend along the whole length of the Cordilleras from Huancayo to Puno. The mines are worked here and there, the great centre of this industry being at Cerro Pasco, where 1,427,592 ounces of silver were produced in 1877. The value of the silver exported from Peru in that year was £575,000, of copper £380,000, of gold there is no return. The exportation of guano from the Chincha Islands began in 1846 and continued until 1872. Between 1853 and 1872 there were 6,000,000 tons shipped from these islands. The deposits on the Guapale Islands were first worked in 1869, and from that year to 1871 as many as 88,863 tons were shipped—460,000 tons remaining. On the three Macabi Islands there were 400,000 tons of guano in 1872, and large deposits on the Lobos Islands. But the most important discoveries of guano-deposits, since the exhaustion of the Chincha Islands, have been on the coast of Tarapaca. In 1876 the quantity at Pabellon de Pica was calculated at 550,000 tons, at Punta de Lobos 200,000 tons, at Huancillo 1,000,000 tons, and at San Antonio 1,000,000 tons; the Chincha 350,000 tons. The total quantity of guano on islands south of Lima may be 600,000 tons, and on the coast of Tarapaca 1,800,000 tons.

Since 1880 nitrate of soda has been exported from the southern parts of Peru, the deposits being found on the western side of the Pampa de Tamarugal in Tarapaca. This region contains sufficient nitrate for the supply of Europe. From 1880 to 1880 the export from Iquique amounted to 328,860 tons; in 1879 the annual export reached its maximum (328,860 tons).

The sugar cultivation in the coast-valleys is a great source of wealth. In 1877 the yield was estimated at 85,000 tons, valued at £1,360,000; of this quantity 68,870 tons went to Great Britain. Cotton, an indigenous product of the coast-valleys, is next in importance to sugar, the estates being worked with intelligence and a due outlay of capital. The distillation of the vine is also a profitable industry; well-known spirit and excellent wine being made in the valleys of Pisco and Yca, and in the districts of Mayas and Moquegua. Rice-crops are raised at Ferreñafe, olives are grown largely in the Tampo valley, and the silk-worm and cochineal insect have been successfully cultivated. In the sierra large quantities of wheat, barley, and potatoes are raised, and millions of pounds of alpaca and sheep's-wool are exported. From the forests of the mountains come chunchos bark, coca, coffee of the finest quality, cocoa, india-rubber, and some medicinal roots.

Communication.—Several railroads have been constructed of late years to connect the coast-towns and valleys with their seaports. That from Payta to Pisco, contracted for in 1872, is 63 miles long, one from this port of Pimental to Chiriquio and Lambayeque has a length of 46 miles. There are 50 miles of railway from Eten to Ferreñafe, 60 from Casapayco to Magdalena, 25 from Hualbuyo to Ascope and the Chincha valley, 85 from Chalcabuyo to Truxillo, 172 from Chimbote to Huaraz (only 52 finished). Several short lines radiate from Lima. A line from Pisco to Yca is 48 miles long, from Mollendo to Arequipa 107, from Ylo to Moquegua 68 miles, from Arica to Tacna 89 miles, and there are railroads in Tarapaca connecting the nitrate-works with the ports of Pisco, Iquique, and Paitos. At Cerro Pasco a short line, begun in 1869, connects the silver-mines with the town. A railroad was commenced in 1870, from Callao and Lima, across the western and central cordilleras to Oroya, 12,178 feet above the sea in the valley of Xauxa, a distance of 186 miles. It ascends the valley of the Huancayo, rising nearly 5000 feet in the first 46 miles. It then threads intricate gorges of the Andes, along the edges of precipices and over deep chasms. It

tunnels the Andes at a height of 15,645 feet. There are sixty-three tunnels, and the bridge of Vaitugas spans a chasm 580 feet wide, resting on three piers, the centre one being 352 feet high, made of hollow wrought-iron. This great work is completed (1884) as far as Chicla, a distance of 863 miles. Another railroad across the Andes connects Aispaya with Puno on the shores of Lake Titicaca. The summit is crossed in a cutting only 6 feet deep, 14,490 feet above the sea. The first locomotive reached Puno on 1st January 1874. The line is 233 miles long, and is to be prolonged to Cuzco. The cost of the Oroya line has been £4,626,887, and of the Aispaya and Puno line £2,846,659.

Two steamers were launched on Lake Titicaca in March 1874, which carry the traffic from Bolivia to Puno. Extensive inland-boats have been completed at Callao since 1870, and no new boats have been constructed at other ports. Steam communication connects the Peruvian ports on the Huallaga and Marañon with the Brazilian line at Tabatinga.

Education and Literature.—Universities and colleges were founded in Peru very soon after the conquest, and there was intellectual non-progression both among the Indians and the families of Spanish descent. The university of San Marcos at Lima is the most ancient in the New World, having been created by order of Charles V. in 1551. The college of San Carlos was founded in 1770, and the school of medicine in 1792. At Cuzco the university of San Antonio Abad was founded in 1568, and the college of San Genonimo at Arequipa in 1616. Since the independence there has been very considerable intellectual and educational progress in the country. There is a university of the first rank at Lima, 5 lower secondary schools for boys and 15 for girls, 1578 schools for boys and 729 for girls, besides private schools. The most prolific literary author in Spanish times was Dr Pedro de Penalta y Baunero, author of an epic poem called *Lima Fundada* and many other works. Towards the latter end of the last century scientific studies began to receive attention in Peru. M. Godin, a member of the French commission for measuring an arc of the meridian near Quito, became professor of mathematics at San Marcos in 1760, and the botanical expedition he sent out from Spain gave him rise to considerable research. Dr Gabriel Moreno (died 1806), a native of Huamantla in the Maritime Cordillera, studied under Dr Jussieu, and became an eminent botanist. Don Hipolito Unzueta, born at Arica in 1755, wrote an important work on the climate of Lima and contributed to the *Mercurio Peruano*. This periodical was commenced in 1791 at Lima, the contributors forming a society called "Amantes del Peru," and it was completed in eleven volumes. It contains many valuable articles on history, topography, botany, mining, commerce, and statistics. An epicurean and guide to Peru was commenced by the learned geographer Dr Cosme Bueno, and continued by Dr Unzueta, who brought out his guides at Lima from 1798 to 1798. In 1794 a nautical school was founded at Lima, with Andres Ballester as instructor and Pedro Alvarez as teacher of the use of instruments. Ballester also constructed a map of Peru. A list of Peruvian authors in various times occupies a long chapter in the life of St Pedro by Montalvo, and the bibliographical labours of the Puvrin Leon Puelo are still invaluable to Spanish students.

The topographical labours of Cosme Bueno and Unzueta were ably continued at Lima by Admiral Don Eduardo Cienfuegos, who compiled annual guides of Peru from 1826. But the most eminent Peruvian geographer is Dr Don Mariano Felipe Paz Soldan, whose *Geografia del Peru* appeared in 1859. His is the most important work, the *Diccionario geografico estadistico del Peru* (1877), is a gazetteer on a most complete scale, displaying an immense amount of labour, research, and literary skill. In 1868 appeared his first volume of the *Historia del Peru Independiente*, and two others have since been published. The earlier history of Peru has been written in three volumes by Sebastian Lorente; Mariano Ravago has ably discussed its antiquities; and Manuel Fuentes has edited the preceding volumes of many of the *Historia del Peru*. But the most valuable and important historical work by a modern Peruvian is undoubtedly General Madrid's *Diccionario de Historia Geografica del Peru*, a monument of patient and conscientious research, combined with critical discernment of a high order, which has certainly seemed for its accomplished author a permanent place in the history of literature. As laborious historical students, Don José Toribio Polo, the author of an ecclesiastical history of Peruvian dioceses, and Don Enrique Ferrey Saldaña, the historian of the Jesuits in Peru, have great merit. Among good local annals may be mentioned Juan Gilberto Valdivia, who has written a history of Arequipa, and Pio Benigno Mesa, the author of the *Annals of Cuzco*.

The leading Peruvian authors on constitutional and legal subjects are Dr José Santustegui, who has published volumes on civil and criminal law, Luis Felipe Villalaz, author of a work on con-

¹ The city of Lima produced two saints, the archbishop St Toribio, who flourished from 1578 to 1606, and Santa Rosa, the patron saint of the city of the kings (1588-1616), whose festival is celebrated on 26th August.

stitutional rights; Dr Francisco Garcia Calderon (late president of Peru), author of a dictionary of Peruvian legislation in two volumes; Dr Francisco Xavier Mariátegui, one of the fathers of Peruvian independence; and Dr Francisco de Paula Ypil (died 1876), orator and statesman as well as author, whose work *Defensa de los indios* was a noble and enlightened statement of the case for civil government against the passions of the court of Rome. Manuel A. Freyre, an able statistician and the author of the *Estadística de Lima*, has also written a manual of parliamentary practice.

On the whole, the Peruvian literature since the independence has attained to highest merit in the walks of poetry and romance. The Guayaquil author Olmedo, who wrote the famous ode on the victory of Junín, and the Llaneros Felipe Pardo and Manuel S. Pardo, as well as Segura, wrote in a satirical vein. Both died between 1860 and 1870. The comedies of Segura on the customs of Lima society, entitled *Un Pasa a Aduanas* and *La Seta y Manto*, have no equal in the dramatic literature of Spanish America and few in that of modern Spain. From 1848 date the first poetical efforts of Arnaldo Márquez, Manuel Nicolas Corpancho, Adolfo Garcia, Clemente Alizaga, Pedro Paz Soldán (better known under his name of *pluma* of "San de Arroyo"), Carlos Augusto Salaverry, a son of the ill-fated general, Juan Benjamin Cisneros, Tynndá Bermúdez, Constantino Cusaco, Narciso Asteagui, José Antonio Lavalle, Ricardo Palma, and Numa Pomilio Llona. Márquez is undoubtedly the most correct in diction and the most richly endowed with imaginative sentiment among Peruvian poets of the present generation. Corpancho was the dominant of the romantic school, and Segura a bright little volume entitled *El Puma*. He perished in a shipwreck off the coast of Mexico when barely thirty years old. Adolfo Garcia is the poet of most robust and vigorous thought, and he has written much, but only one volume of his select poems has been published (Havre, 1870). Among other productions of great merit this book contains a sonnet to Bolívar, which is one of the most beautiful that has appeared from the muse of Peru. Alizaga (d. 1880) was a poet, linguist, teacher, elegant, and very careful as regards rhythm and diction. Paz Soldán, a good classical scholar, has published three volumes of poems. Salaverry is one of Peru's best lyrical poets, and the novels of Cisneros, entitled *Julia* and *Edmundo*, have secured him a lasting reputation. Fernandez and Carrasco were two poets of merit who died very young. The universal work of Carrasco was his natural version of the Quechua drama of *Ollantay*. Lavalle and Asteagui are chiefly known as novelists. The latter has published three books of poetry, entitled *Araucana*, *Verbo y Gaudios*, and *Pasionarias*. Since 1870 he has devoted his great literary powers to writing the historical traditions of Peru in prose, of which six volumes have already appeared. They display great research, and are written in a graceful and agreeable style. Palma is a member of the Spanish Academy, a distinction shared, among Peruvian poets, with Felipe Pardo. The collection of poems of Llona have recently been published, his *Canto de la Vida* is highly spoken of for its depth of thought and elegance of diction.

Peruvians have not neglected their early history and the study of the literature and language of the Yucas. Several have followed in the footsteps of Rivero. José Sebastian Barranca, the naturalist and antiquary, and Gavino Pacheco Zegarra, a native of Cuzco, have published translations of the ancient Yucas drama of *Ollantay*. Among Peruvian scholars who have embraced the independence of thought have been Rivero, the geologist and mineralogist, and his friend and colleague Nicolas do Prieto, author of *Monografía de Ciencias Naturales*. Dr Cayetano Heredia, rector of the college of medicine in Lima from 1845 to his death in 1861, was an ardent patron of medical science. His successor, Dr Miguel de los Rios, has followed in his footsteps, and since 1859 many valuable contributions have been published by Peruvian physicians in the *Gaceta Médica de Lima*.

The most prominent publicists of Peru have been Mariátegui, Ypil, Reynaldo and Cesáreo Chacaltana, Ricardo Heredia, José Casimiro Ulloa, Toribio Pacheco, and Luciano Cisneros.

Church.

The Peruvian priesthood, though justly accused of tyranny in their relations with the Indians in early times, and of immorality in many instances, can point to no less learned and upright priests, to devoted parish priests to noble-minded teachers and ardent patriots, in their body. Founded in 1541, and raised to archiepiscopal rank in 1548, the see of Lima has been ruled by twenty-three prelates. The first was a Dominican friar, Dr Gerónimo de Loaysa (1542-1575), who was more a politician than a priest. But the second, Dr Toribio Mogrovejo (1581-1606), devoted himself to the welfare of his flock, and died in the odor of sanctity, being finally canonized as St Toribio. Since the independence, Archbishop Luna Pizarro has added lustre to the see by his learning and ability. The bishopric of Cuzco was founded by Pope Paul III. in 1537, and has had twenty-seven prelates. Among them, Dr Gouichastegui (1771-76) was an excellent Quechua scholar and preacher and a devoted friend of the oppressed Indians; Dr Moscoso y Peralta (1777-89) was a prelate of consummate virtue and learning. The

bishoprics of Arequipa, Guayaquil (Ayacucho), and Truxillo were created in 1609. The missionary bishopric of Maynas or Chachapoyas was founded in 1802, those of Huancayo and Puno in recent times. The Jesuits were once very powerful and wealthy in Peru, and both Jesuits and Franciscans, while working at their calling as missionaries, achieved much valuable geographical work on the rivers and in the forests of the mountains. Since the independence the religious orders have been gradually suppressed, yet monks as well as priests were in the front rank in advocating the cause of liberty. The ecclesiastical seminary at Lima, founded by St Toribio in 1601, was removed to part of the monastery of San Francisco in 1668, where it still flourishes, and where youths are trained for the holy orders are educated. The priests occupy a very important position in the social system, and much of the teaching is in their hands. Such men as Luna Pizarro and Ypil have performed their duties in a singularly faithful and enlightened spirit. Unfortunately there is still deplorable laxity among parish priests, though there are many noble exceptions.

Inhabitants.—The early inhabitants of Peru originally consisted Native of several distinct nations, subdivided into many tribes, which were habitually combined in the empire of the Yucas. The principal nation was that of the imperial Yucas themselves, inhabiting the two central sections of the sierra, from the Knot of Cuzco Pisco to that of Vilcabamba, a distance of 380 miles. Here nature has worked on her grandest and most imposing scale. The scenery is magnificent, the products of every zone are collected in the valleys and on the mountain-sides, but the difficulties in the way of advancing civilization, caused by the obstacles of climate, are such as to have man's ingenuity to the utmost. In countries like this we well adapted for the cradle of an imperial race. Six nations originally peopled this central mountain-region—the Yucas in the valley of the Vilcamayo and surrounding plateaus, the Camas round the sources of the Apurimac, the Quichus along the upper courses of the Pachachaca and the Apurimac, the Chincas, a very warlike people, from Guanaigua to the Apurimac, the Huancas in the valley of the Camas, and the Huancas round the summits and on the slopes of the Mantimio Cordillera. These six nations were divided into "ayllus" or tribes, the most distinct of which were the still famous Morochucos and Yquichanos, brave mountaineers of the Chincas nation. There are reasons for believing that these nations once spoke different languages, especially the Chincas, but, excepting a few words introduced in the general language of the Yucas, they are now lost.

In the basin of Lake Titicaca there was another race, anciently called Colla, but now better known as Aymara. Their language survives, and, though closely allied grammatically, the vocabulary differs from that of the Yucas. Within the Colla region, but differing from the rest of the inhabitants both in language and physical appearance, there was a savage tribe called Uru, inhabiting the reed-beds and islands in the southern part of Lake Titicaca. In the region north of the Knot of Cuzco Pisco, comprising the basin of the Marañon there were many warlike tribes speaking a language which the Yucas called Chunchuyuyu. The most important of these tribes were the Conducos, Huamachuco, and Ayahuasca far to the north.

The Peruvian coast appears originally to have been inhabited by a diminutive race of fishermen called Chancos, a gentle and hospitable people, never exceeding 6 feet in height, with flat noses. They fished in boats made of inflated sealskins, and carried their most huts, and slept on heaps of dried seaweed. Vestiges of this early race may be traced in the far south, as well as at Elzen, Morope, and Cacaecao in the north. The later and more civilized coast-people were a very different and an extremely interesting race. They appear to have formed distinct communities in the different valleys each under a chief, of whom the most civilized and powerful was the Chimu, who ruled over the five valleys of Pativilha, Huamayo, Santa Yula, and Moche, where Truxillo now stands. The subjects of this prince made great advances in civilization, and his vast palaces near Truxillo now form extensive ruins. The irrigation works of this coast-people were most elaborate, every acre of cultivable ground was brought under cultivation, and water was conveyed at high levels from great distances. The Yucas called these people Yucas, but they have entirely passed away, giving place to the negroes and Chimu aborigines who now swarm in the coast-valleys. There is no dictionary of the Yucas language, but there is a grammar and a short list of words written in 1644, before it had entirely ceased to be spoken.

The Yucas or Quichua tribes of the Andes of Peru average a height of 5 feet to 5 feet 6 inches. They are of slender build, but with well-knit muscular frames, and are capable of enduring great fatigue. Their complexions are of a fresh olive-color, skin very smooth and soft, beardless, hair straight and black, the nose aquiline. They are good cultivators, and are expert as shepherds by reason of their patience and kindness to animals. They are naturally gentle, most affectionate to their families, with an intense love of home, but at the same time they are enduring and brave. The Aymaras are more thick-set than the Yucas, and their chief phy-

seal peculiarity is that the thigh, instead of being longer, is rather shorter than the leg. The whole build is admirably adapted for mountain-climbing.

The policy of the Incas was to enforce the use of their language, called by the earliest Spanish grammarians "Quechua," among all the conquered tribes. Hence its very general use throughout the mountains past of Peru, the only differences being the survival of words in some of the districts from the language or dialect that was superseded. Quechua was the language of a people far advanced in civilization; it was assiduously cultivated by learned men for several centuries, not only songs but elaborate dramas and rituals were composed in it, and it is still the language of the majority of the people of Peru. Aymara, which is a closely-allied tongue, is spoken along the shores of Lake Titicaca.

The wild Indians of the mountains, except a few tribes on the skirts of the Andes, do not belong to the Peruvian family. They are part of the great Tump group of nations, and belong to the region of the Amazons. On the banks of the Huallaga are the Cocomas, Cholonas, Pecos, and Motilonas; and on the Ucayali the wild tribes of the Ceshobos, Capahuanas, Renos, Anajauas, and Mayurmas. The Combes, Pinos, Senos, Sotobos, and Shipobos are peculiar tribes. The Aits on Campus form a large and important tribe on the upper course of the Ucayali, with probably a large share of Ynca blood in their veins. The savage Indians on the tributaries of the Beni are called Chunchos. It is, however, to another family of the American race that the tribes of the Amazons mainly belong.

History.—Cyclopean ruins of vast edifices, apparently never completed, exist at Tiahuanaco near the southern shore of Lake Titicaca. Remains of a similar character are found at Huasac in the north of Peru, and at Cuzco, Ollantay-tambo, and Huñique near the Huacra and Tiahuanaco. These works appear to have been erected by powerful sovereigns with unlimited command of labour, possibly with the object of giving employment to subjugated people, while feeding the vanity or pleasing the taste of the conqueror. Their unfinished state seems to indicate the break-up of the Government which concerned them and which must have held sway over the whole of Peru, and the occurrence of Aymara words, especially in the names of places over the whole area, points to an Aymara origin for this lost and prehistoric empire. It is certain that for ages after the country was again broken up into many separate nations and tribes. Then the most civilized and most powerful people, the Incas of Cuzco and the Vilacama, began slowly to build up and cement a united and more civilized empire. This great work, which probably occupied five centuries, was just completed when the Spaniards discovered Peru. The history of Ynca civilization has yet to be written. Our knowledge even of the Spanish writers who collected information at the time of the conquest is still very incomplete. Much that is essential for a correct appreciation of this interesting subject is still hidden and in manuscript. But to comprehend it, it is knowledge is also necessary of the people of their country and languages. Without such qualifications for the task, the numerous traditions, customs, and beliefs cannot be understood nor assigned to the particular epochs and nationalities to which each belonged. With our existing imperfect knowledge the subject cannot be adequately treated without a detailed and critical examination of conflicting evidence which would be foreign to the purpose of the present article.

The great Inca, Capac, died in 1527 the year when Pizarro first appeared on the coast. His consolidated empire extended from the river Ancasmayo north of Quito to the river Maule in the south of Chili. The Incas had an elaborate system of state-worship, with a ritual, and frequently recurring festivals. History and tradition were preserved by the bards, and dramas were enacted before the sovereign and his court. Roads with post-houses at intervals were made over the wildest mountain-ranges and the blackest gorges of the Andes. A well-considered system of land-taxation and of colonization provided for the wants of all classes of the people. The administrative details of government were minutely and carefully organized, and accurate statistics were kept by means of the "quipus" or system of knots. The edifices displayed marvellous building skill, and their workmanship is unsurpassed. The world has nothing to show, in the way of stone-cutting and fitting, to equal the skill and accuracy displayed in the Ynca structures of Cuzco. As workers in metals and as artists they displayed infinite variety of design, though not of a high order, while as cultivators and engineers they in all respects excelled their European conquerors.

The story of the conquest has been told by Prescott and Hailes, who give ample references to original authorities; it will be sufficient here to enumerate the dates of the leading events. On 10th March 1532 the contract for the conquest of Peru was signed by Almagro and Luque, Captain de Empecina supplying the funds. In 1527 Francisco Pizarro, after enduring fearful hardships, first reached the coast of Peru at Tumbes. In the following year he went to Spain, and on 26th July 1529 the capitulation with the crown for the conquest of Peru was executed. Pizarro sailed from

San Lucar with his brothers in January 1530, and landed at Tumbes in 1532. The civil war between Huascar and Atahualpa, the sons of Huayna Capac, had been fought out in the meanwhile, and the victorious Atahualpa was at Cuzco when on his way into Quito to Cuzco. On 15th November 1532 Francisco Pizarro with his little army entered Cuzco, and in February 1533 his colleague Almagro arrived with reinforcements. The murder of the Ynca Atahualpa was perpetrated on 26th August 1533, and on 15th November Pizarro entered Cuzco. He allowed the rightful heir to the empire, Manco the legitimate son of Huayna Capac, to be solemnly crowned on 24th March 1534. Almagro then undertook an expedition to Chili, and Pizarro founded the city of Lima on 18th January 1535. In the following year the Ynca Manco bravely attempted to expel the invaders, and closely beset the Spaniards in Cuzco during February and March. But Almagro, returning from Chili, raised the siege on 18th April 1537. Immediately afterwards the dispute arose between the Pizarros and Almagro as to the limits of their respective jurisdictions. An interview took place at Mala, on the sea-coast, on 13th November 1537, which led to no result, and Almagro was finally defeated in the battle of Las Salinas near Cuzco on 26th April 1538. His execution followed. His adherents recognized his young half-caste son, a gallant and noble youth generally known as Almagro the Lad, as his successor. Bitterly discontented, they conspired at Lima and assassinated Pizarro on 26th June 1541. Meanwhile Vasco de Castro had been sent out by the emperor, and on hearing of the murder of Pizarro he assumed the title of governor of Peru. On 16th September 1542 he defeated the army of the lad at the battle of Chupas near Huamanga. The ill-fated boy was beheaded at Cuzco.

Charles V. enacted the code known as the "New Laws" in 1548. Civil "Encomiendas," or grants of estates on which the inhabitants were bound to pay tribute and give personal service to the grantee, were bound to pass to the crown on the death of the actual holder; a fixed sum was to be assessed as tribute; and forced personal service was forbidden. Blasco Nunez de Vela was sent out, as first viceroy of Peru, to enforce the "New Laws." Their punishment aroused a storm among the conquerors. Gonzalo Pizarro rose in rebellion, and entered Lima on 28th October 1544. The victory fell to Quito, but was followed, defeated, and killed at the battle of Amagato on 18th January 1546. The "New Laws" were weakly revoked, and Pedro de la Gasca, as first president of the Audiencia (court of justice) of Peru, was sent out to restore order. He arrived in 1547, and on 8th April 1548 he routed the followers of Gonzalo Pizarro on the banks of the Acayaguanza near Cuzco. Gonzalo was slain on the field. La Gasca made a redistribution of the "encomiendas" to the loyal conquerors, which caused great discontent, and left Peru before his scheme was made public in January 1550. On 23d September 1551 Don Antonio de Mendoza arrived as second viceroy, but died at Lima in the following July. The country was then ruled by the judges of the Audiencia, and a formidable insurrection broke out, headed by Francisco Hernandez Gruen, with the object of maintaining the right of the conquerors to exact forced service from the Indians. In May 1554 Gruen defeated the army of the judges at Changuinca, but he was hopelessly routed at Pucara on 11th October 1554, captured, and on 7th December executed at Lima. Don Andres Hurtado de Mendoza, marquis of Cañete, entered Lima as third viceroy of Peru on 6th July 1555, and ruled with an iron hand for six years. He at length brought the turbulent conquerors to the last year in which the Spaniards were to be seen on board a ship at Callao and sent to Spain. Corregidores, or governors of districts, were ordered to try summarily and execute every turbulent person within their jurisdictions. All unemployed persons were sent on distant expeditions, and moderate "encomiendas" were granted to a few deserving officers. The previous anarchy was thus completely stamped out. At the same time the viceroy wisely came to an agreement with Sayri Tupac, the son and successor of the Ynca Manco, and granted him a pension; then he took great care to supply the natives with priests of good conduct, and promoted measures for the establishment of schools and the foundation of towns in the different provinces. The cultivation of wheat, vines, and olives, and European domestic animals were introduced. The next viceroy was the Conde de Nieva (1561-64). His successor, the licentiate Lope Garcia de Castro, who only had the title of governor, ruled from 1564 to 1569. In 1569 there was a successful revolt against the Spaniards. The viceroys were chosen by the natives, but they were not supreme. In legal matters they had to consult the Audiencia of judges, in finance the Tribunal de Cuentas, in other branches of administration the Juntas de Gobierno and de Guerra.

Don Francisco de Toledo, the second son of the count of Oropesa, Toledo entered Lima as viceroy on 26th November 1569. Fearing that admiral the title count of the Ynca Tupac Amaru (who had succeeded his brother Sayri Tupac) might become a formidable focus of rebellion, he sent troops to seize the young prince, and unjustly beheaded the last of the Incas in the square of Cuzco in the year 1671. After a minute personal inspection of every province in Peru, he, with the experienced aid of the learned Polo de Ondegardo

by
Pizarro.

and the judge Matienzo, established the system under which the native population of Peru was ruled for the two succeeding centuries, and future viceroys referred to him as the great master of statesmanship who was their guide, and to his ordinances as their acknowledged text-book. His *Libro de Yuso* fixed the tribute to be paid by the Indians, exempting all men under eighteen and over fifty. He found it necessary, in order to secure efficient government, to revert in some measure to the system of the Yncas. The people were to be directly governed by their native chiefs, whose duty was to collect the tribute and exercise magistratical functions. The chiefs or "caciques" had subordinate native officials under their called "pucaes-puacinas" over 500 men, and "pucaes" over 100 men. The office of cacique (or "cacazgo") was male hereditary, and its possessor enjoyed several privileges. Many caciques were descended from the imperial family of the Yncas, or from great nobles of the Yncacal court. In addition to the tribute, which was in accordance with native usage, there was the "mita," or forced labour in mines, fairs, and manufactures. Toledo enacted that one-seventh of the male population of a village should be subject to conscription for this service, but they were to be paid, and were not to be taken beyond a specified distance from their homes.

Vice-royalty.

In their legislation the Spanish kings and viceroys showed a desire to protect the people from tyranny, but they were unable to prevent the rapacity and lawlessness of distant officials. The country was depopulated by the illegal methods of enforcing the mita, and an air of saluaries and desolation spread over the land. Toledo was succeeded in 1537 by Don Martin Henriquez, who died at Lima two years later. The subsequent destiny of the viceroys is well worthy of detailed attention by students of history in all countries possessing a colonial empire. The Spanish colonies suffered from the strict system of monopoly and protection, which was only slightly relaxed by the later Bourbon kings, and from the arbitrary proceedings of the Inquisition. Between 1581 and 1776 as many as fifty-nine heretics were burned at Lima, and there were twenty-nine "autos," or the Inquisition affected Europeans rather than natives, for the Indians, at such times, were exempted from its terrors. The caciques sorrowfully watched the gradual extinction of their people by the operation of the mita, protesting from time to time against the exactions and cruelty of the Spaniards. At length a descendant of the Yncas, who assumed the name of Tupac Amaru, rose in rebellion in 1780. The insurrection lasted until July 1783, and the cruel executions which followed its suppression failed to wipe out the people, and the death of Tupac Amaru shook the power of Spain, and made it easier to the fall. From that time both Indians and Peruvians of Spanish descent began to think for themselves, and to entertain ideas of liberty and progress. Tupac Amaru was followed by Dr. Pedro José Chaves de la Rosa, the Spanish bishop of Arequipa, and Dr. Toribio Rodríguez de Mendoza, rector of the university of San Carlos at Lima, whose pupils, among whom were the future republican statesmen Don Luna Pizarro and Viceroy Luna, became ardent advocates of reform. When, on 28 August 1814, Mateo García Pumacagua, a Peruvian chief, raised the cry of independence at Cuzco, he was joined by many Peruvians of Spanish descent, but was defeated in the battle of Umacchu (15th March 1815), taken, and executed. At the same time the youthful and enthusiastic poet Molgor suffered death in the cause of his country.

Peru independent.

Peru was the centre of Spanish power, and the viceroy had his military strength concentrated at Lima. Consequently the more distant provinces, such as Chili and Buenos Ayres, were able to throw off the yoke first. But the destruction of the viceroy's power was essential to their continued independent existence. The conquest of the Peruvian coast must always depend on the command of the sea. A fleet of armed ships was fitted out at Valparaiso in Chili, under the command of Lord Cochrane and officered by Englishmen. In some day the Argentine galleys, with some Chilians, under the command of the Argentine gunboat San Martin, which landed on the coast of Peru in September 1820. San Martin was enthusiastically received, and the independence of Peru was proclaimed at Lima on his entrance, after the viceroy had withdrawn (28th July 1821). On 20th September 1822 San Martin resigned the proterofate, with which he had been invested, saying that the "presence of a fortunate soldier is dangerous to a newly-constituted state," and on the first day of the Argentine gulf, became the sovereign power of the state. After a short period of government by a committee of three, the congress elected Don José de la Riva Agüero to be first president of Peru on 26th February 1823. He displayed great energy and capacity as an administrator, but the aid of the Columbians under Bolívar was sought, and the native ruler was unwisely deposed. Bolívar arrived at Lima on 1st September 1823, and began to organize an army to attack the Spanish viceroy in the interior. On 6th August 1824 the seaway action of Junin was fought with the Spanish general Canterac near the shores of the lake of Chumbay-cocha. It was won by a gallant charge of the Peruvians under Colonel Suarez at the critical moment. Soon afterwards Bolívar led the army to proceed to the coast, and the final battle of Ayacucho (9th December 1824)

with the viceroy and the whole Spanish power was fought by his second in command, General Sucre. The Spaniards were completely defeated. The viceroy and all his officers were taken prisoners, and Spanish power in Peru came to an end.

General Bolívar now showed that he was actuated by personal ambition, he intrigued to impose a constitution on Peru, with himself as president for life. He failed, and left the country on 2d September 1826, followed by all the Colombian troops in March 1827. General Lamar, who commanded the Peruvians at Ayacucho, Eaily was elected president of Peru on 24th August 1827, but was deposed, after waging a brief but disastrous war with Colombia, on 7th June 1829. General Gamara, who had been in the Spanish service, and was chief of the staff in the patriot army at Ayacucho, was elected third president on 31st August 1830.

For fifteen years, from 1830 to 1844, Peru was peacefully following her way to a right use of independence. The officers who fought at Ayacucho, and to whom the country felt natural gratitude, were all-powerful, and they had not learned to settle political difficulties in any other way than by the sword. From 1837 to 1839 there was a lawless and unpunished intervention on the part of Chili which increased the confusion. Three men, during that period of probation, won a prominent place in their country's history: Generals Gamara, Salaverry, and Santa Cruz. Gamara, born at Cuzco in 1785, never accommodated himself to constitutional usages, too often he made his own will the law, but he attached to himself many loyal and devoted friends, and, with all his faults, which were mainly faults of ignorance, he loved his country and sought its welfare according to his lights. Salaverry was a very different character. Born at Lima in 1804, of pure Basque descent, he joined the patriot army before he was fifteen and displayed his audacious valour in many a hard-fought battle. Feeling strongly the necessity that Peru had for repose, and the guilt of civil dissension, he wrote patriotic poems which became very popular. Yet he too could only see a remedy in violence. He seized the supreme power, and punished by an unguessed sentence on 15th February 1835. Andrés Santa Cruz was an Indian statesman. His mother was a lady of high rank, of the family of the Yncas, and he was very proud of his descent. Unsuccessful as a general in the field, he nevertheless possessed remarkable administrative ability and for nearly three years (1836-39) realized his lifelong dream of a Peru-Bolivian confederation. But Peruvian history is not confined to the hostilities of these military rulers. Three constitutions were framed, in 1823, 1833, and 1839. There were lawyers, statesmen, and orators who could defend the rights and liberties of the people. On 7th November 1839 Dr. Vial, the deputy for Tacna, rose in his place in congress and denounced the unconstitutional acts of President Gamara in a memorable speech of great eloquence. Nor should a much humbler name ever be omitted in writing the history of republican Peru. Juan Rios, a private soldier, was sentry at the door of congress when Gamara illegally sent his troops to disperse the members. He defended his post against two companies, and fell mortally wounded.

In 1844 General Ramón Castilla restored peace to Peru, and was elected constitutional president on 20th April 1845. Ten years of peace and increasing prosperity followed. In 1849 the regular payment of the interest of the public debt was commenced, steam communication was established along the Pacific coast, and a railroad was made from Lima to Callao. After a regular term of office of six years of peace and moral and material progress Castilla resigned, and General Echenagüe was elected president. But the proceedings of Echenagüe's government in connexion with the consolidation of the internal debt were disapproved by the nation, and, after hostilities which lasted for six months, Castilla returned to power in January 1855. From December 1856 to March 1859 he had to contend with and subdue a local insurrection headed by General Vivanco, but, with these two exceptions, there was peace in Peru from 1844 to 1879, a period of thirty-five years. The existing Constituent was framed in 1856, and reversed by a commission in 1860, then the Slavery and the Indian tribute were abolished, and by its provisions the president is elected for four years, and there are two vice-presidents. The congress consists of a senate and chamber of deputies. The senators are elected by departments and the deputies by the people, every 30,000 inhabitants having a representative. When congress is not sitting there is a permanent commission of the legislature, elected at the end of each session, and consisting of seven senators and eight deputies. The chamber of deputies may accuse the president of infraction of the constitution and the senate remove the president. The president appoints the prefects of departments and sub-prefects of provinces, the prefects nominate the governors of districts. In each province there is a judge, a superior court of justice sits at the capital of each department, and there is

1 The ignorance of his life has been admirably written by Manuel Bilbao (Casi de Lima, 1884; 2d ed., Buenos Ayres, 1897).

2 The succession of presidents and presidents of Peru from 1829 to 1854 was as follows:—1829-33, Agustín García; 1834-35, Luis José Olaya; 1835-36, Felipe Santiago Salaverry; 1836-38, Andrés Santa Cruz; 1839-44, Agustín Gamara; 1844-44, Manuel Menéndez.

mining is largely prosecuted in the vicinity, and 125,000 tons of ore are yearly despatched to the southern markets. The population was 3132 in 1860 and 4632 in 1880 (township, 5053).

PERUGIA, a city of Italy, the chief town of the province of Perugia (formerly Umbria), lies 1550 feet above the sea on a beautiful and green-clad hill, which affords a magnificent view over a wide sweep of the Apennines and the great Umbrian plain through which the Tiber flows. The railway station at the foot of the ascent, more than a mile from the city-gate, is 48½ miles south-east of Arezzo and 152 miles north of Rome. The walls, which follow a very irregular ground-plan, have a circuit of 8300 yards, and the length from Sant' Angelo in the north-west to Porta San Costanzo in the south-east is 2500 yards. Of the forty-two towers which could be counted in the 14th century only three or four—the Torre degli Scalzi, &c.—remain, but away from the line of the present enceinte there are several relics of the ancient Etruscan and Roman fortifications, notably the so-called arch of Augustus, a magnificent gateway in the Piazza Grimana, with the ancient inscription *AVGVSTA PERVIA* on the archivolt and a beautiful Renaissance loggia boldly crowning one of its towers. The Cittadella Paolina—a great fortress erected by Paul III. on a site previously occupied by ten churches, two monasteries, the palaces of the Baglioni, and a number of private houses—was destroyed by the citizens in 1848, and its place has been partly taken by a substantial block of public offices (the museum, &c.). In modern Perugia the great centre of interest is the Piazza del Duomo at the north end of the Corso. On one side stands the cathedral of San Lorenzo, a Gothic structure of the 14th and 16th centuries, in the plan of a Latin cross; on the other side is the Palazzo Pubblico, presenting a fine Gothic façade of the first half of the 14th century with the figures of the Perugian griffin and the Gueff lion above the outside stair; and in the centre rises the great marble fountain constructed about 1377 by Benignato, Fiate Alberto (both Perugians), and Boninsegna (a Venetian), and adorned by statues and statuettes sculptured by Niccolò and Giovanni Pisano. The cathedral contains the burial-place of the three popes, Innocent III., Urban IV., and Martin IV., and a reputed relic of great celebrity in Italy—the Virgin's wedding-ring; and at the north-west corner, in the Piazza del Papa, is a sitting statue of Pope Julius III. by Vincenzo Danti, erected about 1555 by the people of Perugia in gratitude for the restoration of their civic privileges. On the decoration of the Sala del Cambio or old exchange, contiguous to the Palazzo Pubblico, *PERUGINO* (*q.v.*) put forth the full force of his genius. Most of the movable paintings for which Perugia is famous have since 1863 been collected in the Pinacoteca Vannucci, established in the same Monte Moricino monastery of the Olivetans which now accommodates the university; besides a considerable number of pieces by Perugino, there are specimens of Pinturicchio, Niccolò Alunno, Bonfigli, &c. This centralization has somewhat impaired the interest of several of the churches, but others remain with undiminished wealth. San Domenico, a Gothic edifice originally designed by Giovanni Pisano, but rebuilt in 1632, contains that artist's magnificent monument of Pope Benedict XI., and in its east front a beautiful stained-glass window by Bartolommeo da Perugia. San Pietro de' Casimiri (outside the Porta Romana) is a basilica with a triple nave, founded in the beginning of the 11th century by Vinciole, and remarkable for its conspicuous spire, its granite and marble columns, its walnut stall-work designed by Raphael, and its numerous pictures (by Perugino, Parmigiano, Raphael, &c.). The Chiesa Nuova (formerly San Giovanni

Rotondo) possesses the tombs of Baldassarre Ferri, the Perugian musician, and Vernighiole, the leading Perugian antiquary. The university, which is not one of the "royal universities," though it dates from 1307 and has faculties of law, science, and medicine, numbers only seventy-nine students (1881-82). Other educational and benevolent institutions are a botanical garden, a meteorological observatory, a commercial library founded in 1582 by Prospero Podiani,² the Santa Margherita lunatic asylum, and the hospital of Santa Maria. Woollens, silks, wax candles, and liquors are manufactured on a small scale. The population of the city was 16,708 in 1871, and 17,395 in 1881, that of the commune 49,503 and 51,354 respectively.

A notice of ancient Perugia (Perusia) has been given under *ETRURIA*, vol. viii. p. 635. After the disasters of the Perugian war (411 B.C.) the city was rebuilt by Augustus and took the title Augusta, and at a later date it became a regular colony, *Colonia Fabia*. Its recovery from the Goths by Belisarius in 537, its protracted siege and sack by Totila (549), its restoration to the Eastern empire by Narses in 552, and its long occupation by the Lombards at the main points in the history of Perugia previous to the 9th century. At that time, with the consent of Charles the Great and Louis the Pious, it passed under the supremacy of the popes, but for many centuries the papal authority existed rather in name than in reality, and the city continued to maintain an independent and enterprising life, warring against its enemies and subduing many of the neighbouring lands and cities.—Foligno, Assisi, Spoleto, Montepulciano, &c. It remained true for the most part to the Guelles. On various occasions the popes found a personal asylum within its walls, and it was the meeting-place of the conclaves which elected Honorius IV. (1124), Honorius IV. (1285), Celestine V. (1294), and Clement V. (1305). But Perugia had no mind simply to subserve the papal interests. At the time of Rienzi's unfortunate enterprise it sent ten ambassadors to pay him honour, and, when papal legates sought to coerce it by foreign soldiers, or to exact contributions, they met with vigorous resistance. In the 15th century the real power, after passing from despot to despot, was at last concentrated in the Baglioni family, who, though they had no legal position as rulers or magistrates, defied all other authority, and filled the streets of the city with their broils and butcheries. Gian Paolo Baglioni was lured to Rome in 1520, and beheaded by Leo X., and in 1534 Rodolfo, who had slain a papal legate, was defeated by Pier Luigi Farnese, and the city, captured and plundered by his soldiers, was again the scene of pillage and gave over to the "worse tyranny of priests and bastards." In 1797 Perugia was occupied by the French, in 1832, 1838, and 1854 it was visited by earthquakes, in May 1849 it was seized by the Austrians, and, after a futile insurrection in 1860, it was finally united, along with the delegation, to Piedmont in 1860.

See B. Rossi Scotti, *Guida di Perugia*; Bonazzi, *Storia di Perugia* (1876, &c.), J. A. Symonds, *Sketches in Greece and Italy* (1874).

PERUGINO, PIETRO (1446-1524), whose correct family name was **VANNUCCI**, one of the most advanced Italian painters immediately preceding the era of Leonardo da Vinci and Raphael, was born in 1446 at Città della Pieve in Umbria, and belongs to the Umbrian school of painting. The name of Perugino came to him from Perugia, the chief city of the neighbourhood. Pietro was one of several children born to Cristoforo Vannucci, a member of a respectable family settled at Città della Pieve. Though respectable, they seem to have been poor, or else, for some reason or other, to have left Pietro uncared for at the opening of his career. Before he had completed his ninth year the boy was apprenticed to a master, a painter at Perugia. Who this may have been is very uncertain, the painter is spoken of as wholly mediocre, but sympathetic for the great things in his art. Benedetto Bonfigli is generally surmised; if he is rejected as being above mediocrity, either Fiorenzo di Lorenzo or Niccolò da Foligno may possibly have been the man. Pietro painted a little at Arezzo; thence he went to the headquarters of art, Florence, and frequented the famous Brancacci Chapel in the church of the Carmine. It appears to be sufficiently established that he studied in the atelier of Andrea del Verrocchio, where Leonardo da Vinci was also a pupil. He may have learned perspective, in which he particularly

¹ See Hawthorne's description in the *Marble Faun*.

² See the curious history in *The Fortnightly Review*, 1866.

excelled for that period of art, from Pietro della Francesca. The date of this first Florentine sojourn is by no means settled, some authorities incline to make it as early as 1470, while others, with perhaps better reason, postpone it till 1479. Pietro at this time was extremely poor, and his prospects of rising in his art, save by the exercise of incessant diligence day and night, were altogether dim; he had no bed, but slept on a chest or trunk for many months, and, bent upon making his way, resolutely denied himself every creature-comfort.

Gradually Perugino rose into notice, and in the course of some years he became extremely famous not only throughout all Italy but even beyond her bounds. He was one of the earliest Italian painters to practise oil-painting, in which he evinced a depth and smoothness of tint which elicited much remark; he transcended his epoch in giving softness to form and a graceful spaciousness to landscape-distances, and in perspective he applied the novel rule of two centres of vision. The Florentine school advanced in amenity under his influence. Some of his early works were extensive frescos for the Inghisati fathers in their convent, which was destroyed not many years afterwards in the course of the siege of Florence; he produced for them also many cartoons, which they executed with brilliant effect in stained glass. Though greedy for gain, his integrity was proof against temptation; and an amusing anecdote has survived of how the prior of the Inghisati doled out to him the costly colour of ultramarine, and how Perugino, constantly washing his brushes, obtained a surreptitious hoard of the pigment, which he finally restored to the prior to shame his stingy suspiciousness. Another (and possibly apocryphal) anecdote, to show that he was not incapable of rising superior to all sordid considerations, is that he painted some excellent frescos for the oratory annexed to S. Maria de' Bianchi and would only accept an omelette as a gratuity. A third anecdote (but it belongs to a late period of his life) is that, as he would trust no one, he was accustomed to carry his money about with him in travelling after he had received a payment, and on one occasion was robbed and had a narrow escape of his life; eventually, however, the bulk of the money was recovered. A good specimen of his early style, in tempera, is the circular picture in the Louvre of the Virgin and Child enthroned between Saints.

Perugino returned from Florence to Perugia, and thence, towards 1483, he went to Rome. The painting of that part of the Sixtine Chapel which is now immortalized by Michelangelo's Last Judgment was assigned to him by the pope; he covered it with frescos of the Assumption, the Nativity, and Moses in the Bulrushes. These works were ruthlessly destroyed to make a space for his successor's more colossal genius, but other works by Perugino still remain in the Sixtine Chapel,—Moses and Zipporah (often attributed to Signorelli), the Baptism of Christ, and Christ giving the keys to Peter. This last work is more especially noted, and may be taken as a typical example both of Perugino's merits and of his characteristic defects,—such as formal symmetry of composition, set attitudes, and affectation in the design of the extremities. Pinturicchio accompanied the greater Umbrian to Rome, and was made his partner, receiving a third of the profits; he may probably have done some of the Zipporah subject.

Pietro, now aged forty, must have left Rome after the completion of the Sixtine paintings in 1486, and in the autumn of that year he was in Florence. Here he figures by no means advantageously in a criminal court. In July 1487 he and another Perugian painter named Aulista di Angelo were convicted, on their own confession, of having in December waylaid with staves some one (the name does not appear) in the street near S. Pietro

Maggiore. Perugino limited himself, in intention, to assault and battery, but Aulista had made up his mind for murder. The minor and more illustrious culprit was fined ten gold florins, and the major one exiled for life. The next recorded incident in his career is also not wholly honourable to Perugino,—that of his undertaking but not fulfilling a contract to paint in Orvieto, as the commission fell through we need not pursue the details.

Between 1486 and 1499 Perugino resided chiefly in Florence, making one journey to Rome and several to Perugia. He had a regular shop in Florence, received a great number of commissions, with proportionate gain and fame, and continued developing his practice as an oil-painter, his system of superposed layers of colour being essentially the same as that of the Van Eycks. One of his most celebrated pictures, the Pieta in the Pitti Gallery, belongs to the year 1495. From about 1498 he became increasingly keen after money, frequently repeating his groups from picture to picture, and leaving much of his work to journeymen. In 1499 the guild of the Cambio (money-changers or bankers) of Perugia asked him to undertake the decoration of their audience-hall, and he accepted the invitation. This extensive scheme of work, which may have been finished within the year 1500, comprised the painting of the vault with the seven planets and the signs of the zodiac (Perugino doing the designs and his pupils most probably the executive work), and the representation on the walls of two sacred subjects—the Nativity and Transfiguration—the Eternal Father, the four Virtues of Justice, Prudence, Temperance, and Fortitude, Cato as the emblem of wisdom, and (in life-size) numerous figures of classic worthies, prophets, and sibyls. On the mid-pier-form of the hall Perugino placed his own portrait in bust-form. It is probable that Raphael, who in boyhood, towards 1496, had been placed by his uncles under the tuition of Perugino, bore a hand in the work of the vaulting; but, besides Raphael, the master had many and distinguished scholars acting as his assistants. The Transfiguration in this series has often been spoken of as the latest work of eminent excellence produced by Perugino, and from about 1500 he declined in a marked degree; this, however, is not to be accepted as true without some qualification, as we shall see in the sequel. It may have been about this time (though some accounts date the event a few years later) that Vannucci married a young and beautiful wife, the object of his fond affection; he loved to see her handsomely dressed, and would often deck her out with his own hands. He was made one of the priors of Perugia in 1501.

While Perugino, though by no means stationary or unprogressive as an executive artist, was working contentedly upon the old lines, and carrying out, almost to their highest point of actual or potential development, the ancient conceptions of subject-matter, treatment, style, and form, a mighty wave of new art flooded Florence with its rush and Italy with its rumour. Michelangelo, twenty-five years of age in 1500, following after and distancing Leonardo da Vinci, was opening men's eyes and minds to possibilities of achievement as yet unsurpassed. Vannucci in Perugia heard Buonarroti bruieted abroad, and was impatient to see with his own eyes what the stir was all about. In 1504 he allowed his apprentices and assistants to disperse, and he returned to Florence. It was not in the nature of things that he should simply swell the chorus of praise. Though not openly detracting, he viewed with jealousy and some grudging the advances made by Michelangelo; and Michelangelo on his part replied, with the intolerance which pertains to superiority, to the faint praise or covert disparage of his senior and junior in the art. On one occasion, in company, he told Perugino to

his face that he was "a bungler in art" (*goffo nell' arte*). This was not to be borne, and Vannucci brought, with equal indiscretion and ill success, an action for defamation of character. Put on his mettle by this mortifying transaction, he determined to show what he could do, and he produced the chef-d'œuvre of the Madonna and Saints for the Certosa of Pavia. The constituent parts of this noble work have now been sundered. The only portion which remains in the Certosa is a figure of God the Father with cherubim. An Annunciation has disappeared from cognizance; three compartments—the Virgin adoring the infant Christ, St Michael, and St Raphael with Tobias—are among the choicer treasures of the London National Gallery. The current story that Raphael bore a hand in the work is not likely to be true. This was succeeded in 1505 by an Assumption, in the Cappella dei Rabatta, in the church of the Servi in Florence. The painting may have been executed chiefly by a pupil, and was at any rate a failure. It was much derided, Perugino lost his scholars; and towards 1506 he once more and finally abandoned Florence, going to Perugia, and thence in a year or two to Rome.

Pope Julius II had summoned Perugino to paint the Stanza in the Vatican, now called that of the Incendio del Borgo, but he soon preferred a younger competitor, that very Raphael who had been trained by the aged master of Perugia, and Vannucci, after painting the ceiling with figures of God the Father in different glories, in five medallion-subjects, found his occupation gone, he retired from Rome, and was once more in Perugia from 1512. Among his latest works one of the best is the extensive altar-piece (painted between 1512 and 1517) of St. Agostino in Perugia, the component parts of it are now dispersed in various galleries.

Perugino's last frescoes were painted for the monastery of S. Agnese in Perugia, and in 1522 for the church of Castello di Fontignano hard by. Both series have disappeared from their places, the second being now in the South Kensington Museum. He was still at Fontignano in 1524 when the plague broke out, and he died. He was buried in unconsecrated ground in a field, the precise spot now unknown. The reason for so obscure and unwonted a mode of burial has been discussed, and religious scepticism on the painter's own part has been assigned as the cause; the fact, however, appears to be that, on the sudden and widespread outbreak of the plague, the panic-struck local authorities ordained that all victims of the disorder should be at once interred without any waiting for religious rites. This leads us to speak of Perugino's opinions on religion. Vasari is our chief, but not our sole, authority for saying that Vannucci had very little religion, and was an open and obdurate disbeliever in the immortality of the soul. Gasparo Cecho, a painter of the 16th century, cites Niccolò delle Pomarance (whose wife was related to Perugino's wife) as averring that the aged master on his deathbed rejected the last sacraments, and refused to confess, saying he was curious to know the final fate of an unconfessed soul, and *therefore* he was buried in unconsecrated ground. For a reader of the present day it is easier than it was for Vasari to suppose that Perugino may have been a materialist, and yet just as good and laudable a man as his orthodox Catholic neighbours or brother-artists, still there is a sort of shocking discrepancy between the quality of his art, in which all is throughout Christian, Catholic, devotional, and even pietistic, and the character of an anti-Christian contemner of the doctrine of immortality. It is difficult to reconcile this discrepancy, and certainly not a little difficult also to suppose that Vasari was totally mistaken in his assertion; he was born twelve years before Perugino's death, and must have talked

with scores of people to whom the Umbrian painter had been well known. We have to remark that Perugino in 1494 painted his own portrait, now in the Uffizi Gallery of Florence, and into this he introduced a scroll lettered "Tumete Deum." That an open disbeliever should inscribe himself with "Tumete Deum" seems odd; one's first impression is either that he cannot have been a disbeliever or else that he must have been a hypocrite as well, which, however, is still inconsistent with Vasari's account of the facts. It is possible, after all, that a man might fear God and yet have no confidence in immortality, or in many of the things which seemed in 1494 to be essentials of religion. The portrait in question shows a plump face, with small dark eyes, a short but well-cut nose, and sensuous lips; the neck is thick, the hair bushy and frizzled, and the general air imposing. The later portrait in the Cambio di Perugia shows the same face with traces of added years. Perugino died possessed of considerable property, leaving three sons.

The character of Perugino's art is, as we have just said, throughout religious, although, in some instances already indicated, he strayed outside the circle of Christian history and tradition. His art is reserved, self-contained, not demonstrative, yet conspicuously marked by a tendency to posing and balance, and to little artifices wherein the graceful merges in the affected. He had a particular mastery over abstracted purism of expression, this appears constantly in his works, and, while it carries the finer of them to a genuinely ideal elevation, it leaves upon many a mingling and mawkish taint which it is not easy to view without some impatience. Perugino did not recruit his strength from study of the antique; his drawing, though frequently solid and able, is unequal, and there is a certain littleness of style in his forms, especially (with rare exceptions) the nude. His technical attainment was exceptional, and in colour he may be regarded as standing first in his generation in central Italy if we except Francia. Perugino does not leave upon us the impression of personal greatness, he does not seem to have had struggling in his mind the profound messages to convey than he succeeded in conveying. There is neither massiveness of thought, nor novel initiative, nor glowing intensity, though there is some fervour of inspiration. Still, within his own province, he is a rare and excellent master.

Among the very numerous works of Perugino a few not already named require mention. Towards 1501 he produced the picture of the marriage of Joseph and the Virgin, now in St. Peter's in the museum of Casini, that he loved indubitably as the original, to a great extent, of the still more famous Sposalizio which was painted by Raphael in 1504, and which forms a leading attraction of the Brera Gallery in Milan. A vastly finer work of Perugino's than his Sposalizio is the Ascension of Christ, which, painted a little earlier for St. Pietro di Perugia, has for years past been in the museum of Lyons, the other portions of the same altar-piece are dispersed in other galleries. In the chapel of the Disciplinati di Città della Pieve is an Adoration of the Magi, a square of 21 feet containing about thirty life-sized figures, thus was executed, with scarcely credible celerity, from the 1st to the 25th March (or thereabouts) in 1505, and must no doubt be in great part the work of Vannucci's pupils. In 1507, when the master's work had for years been in a course of decline and his performances were generally weak, he produced, nevertheless, one of his best pictures—the Virgin between St. Jerome and St. Francis, now in the Palazzo Ponna. In S. Onofrio of Florence is a much-lauded and much-debated fresco of the Last Supper, a careful and blandly correct but not inspired work, it has been ascribed to Perugino by some connoisseurs, by others to Raphael; it may more probably be by some different pupil of the Umbrian master.

Our account of Perugino follows in its main lines that given by Crowe and Cavalcaselle in their *History of Painting in Italy*, vol. II. (Vasari, as usual, by far the most graphic narrator, but lax in his facts (though not so much so in several other instances). Other leading authorities are Orsini, *Vita, &c.*, di Pietro Perugino e degli Scolari, 1804, and Mazzanti, *Vita, &c.*, di Pietro Perugino, 1839.

PERUGINO BARK. See CINCHONA and QUININE.
PERUZZI, BALDASSARE (1481-1536), architect and painter of the Roman school, was born at Anagnino, in the diocese of Viterbo, and passed his early life at Siena, where his father resided. While quite young Peruzzi went to Rome, and there studied architecture and painting; in the latter he was at first a follower of Perugino. The choir-frescoes in San Onofrio on the Janiculum Hill, usually attributed to Pinturicchio, are by his hand. One of the first works which brought renown to the young architect was the villa on the banks of the Tiber in Rome now

(W. M. R.)

known as the Farnesina, originally built for the Senesese Agostino Chigi, a wealthy banker. This villa, like all Peruzzi's works, is remarkable for its graceful design and the delicacy of its detail. It is best known for the frescos painted there by Raphael and his pupils to illustrate the stories of Psyche and Galatea. One of the *loggie* has frescos by Peruzzi's own hand,—the story of Medusa, a work of considerable decorative beauty. On account of his success in this building Peruzzi was appointed by Leo X. in 1520 architect to St Peter's at a salary of 250 scudi, a handsome sum for that time, his design for its completion was not, however, carried out. During the sack of Rome in 1527 Peruzzi was taken prisoner, and barely escaped with his life, on condition of his painting the portrait of Constable de Bourbon, who had been killed during the siege (see Vasari). From Rome he escaped to his native city Siena, where he was made city architect, and designed fortifications for its defence, a great part of which still exist. Soon afterwards he returned to Rome, where he made designs for a palace for the Orsini family, and built the palaces Massimi and Vidoni, as well as others in the south of Italy. He died in 1536, and was buried by the side of Raphael in the Pantheon.

Peruzzi was an eager student of mathematics and the science of perspective; he was also a fair classical scholar, and was much influenced by the treatise of Vitruvius. Like many of the great artists of his time, he was remarkable for the varied extent of his knowledge and skill. A most able architect, a fair painter, and a scientific engineer, he also practised minor arts, such as stucco-work in relief, graffiti, and the decorative painted arabesques which the influence of Raphael did so much to bring into use. His best existing works in fresco are in the Castel di Belcaro and the church of Fontegusta in Siena. For Siena cathedral he also designed a magnificent wooden organ-case, painted and gilt, rich with carved arabesques in friezes and pilasters, he also designed the high altar and the Cappella del Battista.

His chief pupil was the architect Serlio, who, in his work on architecture, gratefully acknowledges the great debt he owed to Peruzzi's instruction. The English National Gallery possesses an interesting drawing by his hand (No. 167). The subject is the Adoration of the Magi, and it is of special value, because the heads of the three kings are portraits of Michelangelo, Raphael, and Titian. The Uffizi and the library at Siena contain a number of Peruzzi's designs and drawings, many of which are now of priceless value to the student of Roman antiquities, as they show ancient buildings which have been destroyed since the 16th century.

Vasari, *Vita di Baldassarre Peruzzi* (Milanese's ed., vol. iv p. 489, 1892), Milza, *Memoire degli Architetti* (1781, vol. i. pp. 210-216); Della Valle, *Lettere Senesi* (1782-86), Gaye, *Carteggio inedito d'Artisti* (1899-40); Lanzi, *Storia Pittorica* (1804); and Platner, *Beschreibung der Stadt Rom* (1800-42).

PERVIGILIUM. See VIGIL.

PERVIGILIUM VENERIS, the Vigil of Venus, a short Latin poem, in praise of spring as the season of love and flowers. Written professedly in early spring on the eve of a three-nights' festival (Vigil) in honour of Venus (probably April 1-3), it describes in warm and poetical language the annual awakening of the vegetable and animal world in spring through the all-pervading influence of the foam-born goddess, whose birth and connexion with Rome and the Cæsars are also touched upon. The joyous tone which runs through the poem passes suddenly at the close into one of lyric sadness: "The nightingale is singing, but I am silent. When comes my spring?" It consists of ninety-three verses in trochaic tetrameter catalectic and is divided into strophes of unequal length by the refrain, "Cras amet qui nunquam amavit; quique amavit

cras amet." The author, date, and place of composition are unknown. Formerly it was ascribed to Catullus, but from its late Latinity, approximating in some points to Italian,¹ it can hardly have been earlier, and was probably later, than the latter half of the 2d century A.D. It is certainly earlier than Fulgentius (about 480-550 A.D.), who imitated it. The references to Hybla and Etna (or Enna), from which some have thought that the poem is Sicilian, need be no more than poetical allusions to Sicily as the flowery land. Virgil's description of spring (*Georg.* ii. 323-342) is imitated somewhat closely, compare especially verse 62 with Virgil's 327, again, v. 85 is a copy of *Æneid*, xi. 458. This seems to disprove Bernhardt's conjecture that the poem is a translation from the Greek. From its exuberant rhetoric Orelli ascribes it to an African poet of the 3d or 4th century A.D. Bucheler places it between Flavius and Nemesianus, i.e., in the 2d or 3d century A.D. Wernsdorff suggested as its author Annius Flavius in the time of Hadrian; Heidtmann conjectured Appuleius, Baehrens refers it to Tiberianus, a poet of the 4th century. But there are not data enough to determine the authorship.

The *Pervigilium* is preserved in the Paris MSS 10818 (*Codex Salmasianus*) and 8071 (*Codex Thuanensis* or *Pithœanensis*), the former (the better of the two) belongs to the 7th or beginning of the 8th century, the latter to the 9th or beginning of the 10th. They differ too much to have been copied from the same original. The age of the MSS. refutes the theory, sometimes broached, that the poem is modern. The first edition was published by Lapsius at Antwerp in 1611, and there are modern editions by Wernsdorff (*Poetes Latini Minores*, vol. iii), Orelli (1832), Bucheler (1859), Baehrens (1877). There are translations into English verse by Thomas Stanley (1851) and Pannell, into prose by W. K. Kelly, a French translation by Sanadon, a German one by Kirehnen.

PESARO, a city and seaport of Italy, the capital of the province of Pesaro and Urbino, lies on the coast of the Adriatic 36 miles north of Ancona and 20½ south of Rimini on the right bank of the Foglia, the ancient Psarus. The ground on which it is built is only from 10 to 40 feet above the sea, but it is surrounded by hills,—on the east by Monte Ardzio, on the west by Monte Accio or San Bartolo, which derives one of its names from the Roman dramatist L. Attius, born and buried on the spot. The city walls, which were strengthened by bastions and moat and made a circuit of about a mile, were in 1830 transformed into a public promenade. Besides the ancient cathedral of the Annunciation (restored since 1860) the more conspicuous buildings are the prefecture (a palace originally erected by the Sforza, and restored by Francesco Maria della Rovere), the seminary, the Rossini theatre (opened in 1818), the fortress or Rocca Costanzina (built by Costanzo Sforza in 1474), the harbour-fort (due to Napoleon I.), and the large lunatic asylum. Rossi, who was a native of Pesaro, left all his fortune to found a musical lyceum in the city, and his statue by Marchetti (1864) stands near the railway station. The Oliveri library (established by the antiquary of that name, author of *Marmora Pisarense*, &c.) contains about 14,000 volumes, MSS. of Tasso's, &c., various antiquities, and a fine collection of majolica from the old Urbino manufactory. Among the industries of Pesaro are the growing, spinning, and weaving of silk, tanning, iron-founding, and the manufacture of glass and pottery. The harbour is of no great importance, and the aggregate burden of the 437 vessels entering or clearing in 1883 was less than 12,000 tons. The population of the city and port in 1870 was 11,952 and in 1880 12,913; that of the commune 19,691 and 20,909 in the same years.

The ancient *Pesumum* in the territory of the Galli Senones became a Roman colony in 184 B.C. and soon grew to be a flourishing

¹ Thus *de* is very frequently used like Italian *di*; *totus* (v. 22) instead of *omnes*, Ital. *tutti*; and *mane* (ib.) in the sense of "to-morrow," Ital. *domani*.

ing town. It was recruited with a body of military colonists by Mark Antony, and after the disastrous earthquake of 31 A.C. received another accession from Augustus and took the title *Colonia Julia Felix*. Destroyed by Vitiges the Goth, it was restored and strengthened by Belisarius, and afterwards along with Ancona, Fano, Sinigaglia, and Rimini formed the Pentapolis Maritime. In the course of the 13th century Pesaro was sometimes under the government of the popes, sometimes under that of the emperor, but the Malatesta family, which first took root in the city about 1285, gradually became the real masters of the place. In 1445 they sold their rights to Francesco Sforza, and in 1512, through the influence of Julius II., the Sforza were supplanted by his nephew Francesco Maria, duke of Urbino. Leo X. took the city away from Francesco and gave it to Lorenzo de' Medici, but on Lorenzo's death Francesco was restored and Pesaro became the ordinary residence of the dukes of Urbino till the death of Francesco Maria II. in 1631, when it reverted to the States of the Church. It has formed part of the present kingdom of Italy since 1860. Teodoro Mamiani della Rovere, poet and statesman, was born at Pesaro in 1800.

PESHAWAR, or **PESHAWUR**, a district in the lieutenant-governorship of the Punjab, with an area of 2504 square miles, situated in the extreme north-western corner of British India, between 33° 50' and 34° 30' N lat and 71° 30' and 72° 50' E. long. Except on the south-east, where the Indus flows, it is encircled by mountains, and is bounded on the N. by the Mohmand, Uman Khel, and other hills, E. by the Indus, S. by the Khatak and Afridi Hills, and W. by the Khyber Mountains. It forms an important part of the frontier of the Punjab, being crossed by the great route from India to Cabul. The only hills of any consequence in the district are the Khatak Hills, a continuation of the Afridi Hills, which are themselves a spur of the great Sufed Koh range. The plain consists of alluvial deposits of silt and gravel, and throughout the whole valley its surface is studded with water-worn shingle or boulders. The district presents, especially in its western and central portions, an appearance of great beauty: it is covered with luxuriant vegetation, which is relieved by the meanderings of the numerous canals and set off by its bare stony surroundings and the far distant snow peaks. Its rivers, all tributaries of the Indus, are the Cabul, Swat, Dara, Budai, and Ludnai. The district is naturally fertile and well watered, and the valley is entirely drained by the Cabul river. The temperature ranges from a minimum of 17° in February to a maximum of 137° in July. The average rainfall is about 14 inches.

According to the census of 1881 the population was 592,674, of whom 322,524 were males and 269,150 females. The people are mostly Afghans and almost entirely of the Moslem religion, no less than 546,117 being Mohammedans, while Hindus numbered only 39,321, Christians 1088, Sikhs 3103, and others 45. The largest tribe in the district is that of the Pathans, of whom in 1881 there were 276,656. The Moslem portion of the population is occupied chiefly in agriculture and the rearing of cattle, while the Hindus are engaged in trade as bankers, merchants, and shopkeepers. The prevailing languages are the Urdu and Pushtu.

Out of the total area of 2504 square miles 1414 are cultivated and 470 are returned as cultivable. The chief products are wheat, barley, maize, millet. Peshawar also produces some of the finest rice in the world, known as "Bara rice," named after the river by which the ground yielding it is irrigated. Since the district came into British possession its trade has increased considerably. The principal foreign markets with which it deals are Cabul and Bokhara; the imports from the latter country are chiefly silks and fruits, carpets, timber, dyes, and spices, and from the latter gold bullion and gold thread, which go principally to Bombay. The exports consist mainly of piece goods, tea, fancy wares, sugar, salt, and spices. The chief manufactures are Peshawar scarves, celebrated throughout India for their fine texture and tasteful colouring, leather goods, cutlery, the preparation of snuff, and a great deal of handicraft. The gross revenue of the district in 1882-83 was £95,981, of which the land revenue contributed £68,201.

Peshawar in 1881 had five towns with a population exceeding 5000, namely Peshawar (see below); Nowshera, 12,983, Tangi, 9037, Maira Parang, 8874, and Chasadda, 8363.

¹ The division of this name comprises the three districts of Peshawar, Kohat, and Hazara, with an area of 8381 square miles. In 1881 it had a population of 1,181,289—males 649,506, females 531,780. By religion 1,101,095 were Moslems, 68,992 Hindus, 6724 Sikhs, 4890 Christians, and 88 others.

History.—The first authentic record of the tribes seated about Peshawar is in the time of Mahmud. What little is heard of them before then points to them being a bold and independent race. Baidham was introduced into the district in the reign of Asoka, 263 A.C., and one of his rock edicts still exists. From the time of Seleukian, governor of Khorasani, in 378 A.D., who took possession of the country up to the Indus, Peshawar became the scene of fierce contests. Mahmud, his son, was the first Moslem conqueror of Hindustan, and succeeded in converting the Pathans to the Mohammedan faith, and this tribe remained true to him in all his subsequent engagements with the infidels. The last decisive battle of Mahmud with the Hindus was fought on the plains of Chini in Raval Pindi, where he totally defeated Anang Pal, the last champion of the Hindu creed and nationality in the north. For a century and more after Mahmud's death (1028) Peshawar continued to be a province of Ghazni, and under his numerous successors it acquired great importance, becoming the centre of their dominions, which were extended to Lahore. Timu's invasion of India at the close of the 13th century did not disturb the district or the tribes about it, but a century later the Khakhar Pathans, a body of roving adventurers, invaded the district in three main clans—the Yusufzai, Giginis, and Muhammadzai—and obtained permission from the Dilazaks, who then held it, to settle on a portion of their waste lands. Quelling with the Dilazaks, they routed them and swept them into the neighbouring district of Hazara. The Giginis then settled in the fertile strip of land about the confluence of the Swat and the Cabul, the Muhammadzai took Hashkhan, and the Yusufzai the country north of the Cabul river. For some time these tribes remained unmolested, but in 1519 Babar, fifteen years after his capture of Cabul, allied himself with the injured Dilazaks and subdued the Afghans of Peshawar. After his death in 1530 the country was the scene of constant feuds, which ended in the Dilazaks being completely ousted. The year 1553 marks the last immigration of Afghans into the district. In 1587 Akbar came to the throne. During the next three reigns the valley rendered an unwilling allegiance to the central authority, and in the reign of Aurangzeb the Pathans succeeded in fleeing themselves from Mogul supremacy. In 1788 Nadir Shah held possession of the district, and under the succeeding Durrani dynasty it was often the residence of the Cabul court. On the death of Timur Shah in 1793 the throne was left to be contended for by his sons, whose adventurous enterprises and varied fortunes form a romantic page in Oriental history. In 1813 the Sikhs entered into the valley and overran the whole district to the foot of the hills; and the country continued to be ravaged by them until it at last fell into their hands, when they ruled it with their usual severity. In 1848 the district became an integral portion of British India, and, except for its connexion with the mutiny in 1857, there is little else of importance to notice.

PESHAWAR, chief town in the above district, situated in 34° 2' N lat. and 71° 37' E long., is about 14 miles east of the Khyber Pass, and distant from Lahore 276 miles and from Cabul 190 miles. Its population in 1881 was 79,982 (50,332 males, 29,650 females). It is built on a plain 1068 feet above the sea, and is surrounded by a mud wall 10 feet high. Among the chief buildings of the town are the Ghor Khatri, originally a Buddhist monastery, afterwards rebuilt as a Hindu temple, and now used as a serai. Peshawar is commanded by a mud-fort to the north-west, built on the ruins of Bala Hissar; and it is well watered, and said to be one of the best-drained cities in the Punjab.

PESSIMISM is a word of very modern coinage, employed to denote a mode of looking at and estimating the world, and especially human life, which is antithetical to the estimate designated by the term (a much older one) "Optimism." Both terms have a general as well as a special application. In their non-technical usage they denote a composite and ill-defined attitude of mind which gives preponderating importance to the good or to the evil, to the joys or to the sorrows, respectively, in the course of experience. The optimist sees everything in *couleur de rose*, the pessimist always turns up the seamy side of things. But in their special and technical employment, optimism and pessimism denote specific theories elaborated by philosophers,—the former to show that the world is the work of an author of infinite goodness and wisdom, and is, all things considered, conducive to the happiness of its sentient life, the latter, that existence, when summed up, has an

enormous surplus of pain over pleasure, and that man in particular, recognizing this fact, can find real good only by abnegation and self-sacrifice. As a speculative theory optimism is chiefly associated with the *Phédocte* of Leibnitz (1710), while pessimism is the work of Schopenhauer (*Die Welt als Wille und Vorstellung*, 1st ed. 1819) and Von Hartmann (*Philosophus des Unbewussten*, 1st ed 1869). In either case, however, the modern doctrines have their predecessors. The Stoics and the Neoplatonists were earlier labourers in the cause of optimism, in their attempt to exhibit the adaptations in nature for the welfare of its supreme product man. And in the metaphysical dogmas of Brahmanism, as well as in the practical philosophy of the Buddhists, the creed of the modern pessimist, that the world is vanity and life only sorrow, is found preluded with startling sameness of tone.

Though later as a philosophical creed in the European world, pessimism is far earlier than optimism as a mood of feeling in mankind at large. The ordinary human being, so long as he is engrossed with action and identified with his immediate present, is neither optimist nor pessimist. But in proportion as reflexion awakens—as the fulness of life and vigour of will give place to the exhaustion of age or to brooding thoughtfulness—there comes a sense of doubt as to the value of the aims on which energy is spent and as to the issue of the struggle with nature. It is failure that excites meditation: the obvious disproportion between desire and attainment impresses the poet and thinker, as they scan the page of human life, with the predominant darkness of the record. The complaint is heard from every land and in every language that the days of man are few and evil, that the best lot of all is not to be born at all, and next in order is the fate of those cut off by early death. Even the great king himself (says Socrates in the *Apology*, xxxii.), far less any private man, as he reviews the course of his past life, cannot point to any better or happier time than a night of dreamless sleep, and Byron bids us—

“Count o’er the joys thine hours have seen,
Count o’er thy days from anguish free,
And know, whatever thou hast been,
’Tis something better not to be.”

In a religious form this pessimism appears as a belief that man is a creature at the mercy of more potent agents, to whom his wishes and fears are of slight importance. Called into existence by instrumentalities over which he has no control, he is involved in a lifelong conflict with forces, natural and supernatural, which work out their inevitable issues with utter indifference to his woe or woe. The wheels of the universe are deaf to the cry of human hearts. There is a hopeless sense of inequality in the struggle between the petty self-centred will of man and the capricious and irresistible forces of nature.

This natural and instinctive pessimism is contemporaneous with the non-theistic religions of the world,—with all the forms of nature-worship, from the grossest and most trivial polytheism to the abstrusest schemes of naturalistic pantheism. In such a state of belief man tries to obtain relief from the burden of troubles in various ways. There is first of all the vulgar method of adulation and sacrifice. The powers of the unknown which he ready to thwart the plans of man, and which he conceives in the likeness of beings with vaster forces but with passions and susceptibilities like his own, may be bribed by gifts or placated by flattery. Hence the common practices of superstitious worship. A second means of escape from the burden of life is given by what may be called Epicureanism. While not denying the divine, it explains away the gods of popular religion, and at the same time rejects the attempt to transform the idea of necessary connexion from a principle for

the explanation of phenomena into a controlling agency at the summit of the universe. Within the limits fixed by his natural conditions it represents man as free to work out his own welfare without interference from superior powers. But it is forced to admit that the happiness which man can obtain is after all only negative,—all pleasure is but the withdrawal of pain, and the utmost range of pleasure lies in varying the methods of such deliverance. Epicureanism is pessimistic; but it is an egotistic pessimism which is content to aim at the maximum of painlessness for the individual, and which ignores the metaphysics of universal pain and of universal relief from that pain.

The third method of relief from the troubles of existence Buddhism has a closer analogy with the pessimism of modern times. It is the Buddhism of the East. Buddhism, whatever be the uncertainty attaching to its founder's personal story, is to all intents a school which has been cut off from the main tree of Brahmanism. Its theory rests on the metaphysics of the Brahmanical schools; its scheme of life is one out of the many phases of Hindu asceticism. Buddhism left the parent stock of Hindu religion at a time when the metaphysicians had carried up the polytheism of their country into a unified pantheism, when the philosophy of the Upanishads had worked up the comparatively rude theology of the Vedic hymns into a compact doctrine. The fundamental dogma presented by this system is the contrast between the true self or permanent reality of the world and the changes and plurality of the phenomenal scene in which men live or seem to live. On the one hand is Brahma, or Ātman: from one side, the universe, the All, and everything,—from another, the true self, the Ego, the absolute, whose name is the No, No, because no words can describe him, the very reality of reality. On the other hand is the world of growth and decay, of sorrow and death,—the world, as it was subsequently called, of illusion, *Māyā*, where the semblance of firm reality is deceitfully assumed by the phantoms of creation. And as in the universe, so is the contrast in the human soul. There is the unembodied soul, which desires and action (the *will* *in posse* and *in esse*) hold fast in the bonds of changeable existence, in the mutations of metempsychosis; there is also the redeemed soul, which by ascetic virtues, by renunciation of domestic ties, by the continued practice of self-denial and mortification, has found its way from the world of illusory semblances to its true and abiding self.

It is on some such conception of the world, in which over against Brahma in his eternal quiet there stands man suffering and yearning for relief, that Buddhism ultimately reposes. But, while the speculative theories of the Brahmins put in the foreground the august mystery of the All-one, Buddha starts from the other side of the picture, from the actual experience of life. The four truths of Buddhism, which are the foundation of its religious creed and the recurring burden of its teachings, leave the metaphysical basis out of sight. All life is sorrow, says the first: birth, age, disease, death, is sorrow, and the cause of this sorrow, adds the second truth, is the thirst which leads from birth to birth,—the thirst for pleasures, for existence, for power. The third is, that sorrow can only be removed by the complete annihilation of desire; and the fourth prescribes the means of word and act forming the eight parts of the way which frees from sorrow. The practical need is everything; the theoretical basis, the Brahma, which the orthodox schools presented as the sole reality, is so completely lost sight of that the modern critics are at variance with each other as to how far the goal of Buddhist endeavour can be described as anything positive. That all life is pain is the one perpetual refrain of Buddhism. The search for pleasure is vain and ends in increased misery. But the true Buddhist does not allow the per-

Natural
and in-
stinctive
form

Methods
of relief

ception of this fact to cause, still less to perpetuate, a feeling of melancholy. It only urges him to have compassion on his suffering brother, and to look forward joyously to the goal of release which he has set before himself.

For further details reference may be made to the article on **Buddhism**. It is enough to say here that the chief point of Buddhist theory is to see in all apparent being only a process of becoming—events happen, nothing is, the only permanence can be but the law of their occurrence. The cosmic philosophy of Durdha is like that of Heraclitus: "All things flow, nothing abides"; only this flux of everything serves to emphasize the fact that the happiness of man is thereby rendered vain. The end which Buddha seeks is the redemption of man from this toilsome world of birth and death. It is not absorption in the unity of Brahma, not felicity in a higher and better world. It is, to cast off the conditions which trammel existence, the consciousness which leads to desire and action, the body and all its appurtenances; it is, to attain death in life, to have so mortified flesh and spirit that the individual can no longer be in the ordinary sense said to exist. He has attained, when so perfected, what is called Nirvāna, "the land of peace where transitoriness finds rest."

Religious
recon-
ciliation

Before discussing the development of this pessimistic ethics in modern days, it remains to notice a fourth issue from the evil that is in the world. This view of life and of the universe is specially connected with Hebrew monotheism and its later developments in Mohammedan as well as Christian doctrine under the potent stimulus of Greek philosophy. It is in the belief of a moral God—a good and wise creator and governor of the universe—that the optimistic problem and theory finds its chief origin. When the idea of God has been purged of its naturalism and identified with the ideal of wisdom, goodness, and justice, there soon arises for thinking minds the necessity of a "theodicee,"—a justification of providence. Can the evil and misery found upon earth, the disproportion between merit and recompense, be explained on the hypothesis of a wise and beneficent ruler in heaven? One of the most familiar and typical instances of such a feeling is given by the book of Job. In the later times of Israel, when the vigour of creative faith was undermined by a critical spirit, born of bitter fates and foreign influences, voices were heard, like those of the writer of Ecclesiastes, giving utterance to pessimistic doubt. The story of Job is another and more edifying presentation of the same theme. How, it is asked, can the misfortunes of the just man be harmonized with the idea of a righteous God? Is suffering the penalty of sin, and must virtue be always paid its wages in pleasure?

The difficulty, it is evident, arises with the perception of the antagonism between the natural and the moral, and implies a desire to bridge over the gulf between them. With the gradually deepening conviction that the central principle of the universe is a moral principle, the need is felt for explaining the immorality (so to speak) of the natural laws, for reconciling the unconditional imperative of the word of duty with the indifference to right and wrong displayed in the facts of life. Sometimes we are referred for answer to another world, which shall compensate for the mistakes of the present. At other times it is suggested that physical evil has the function of a moral discipline, that suffering teaches nobility, that misfortunes are blessings in disguise.

Leib-
nitz's op-
timism.

The optimism of Leibnitz is of a different cast, and goes more boldly to face the real difficulty of the situation. It argues against the common estimate of moral and physical evil, and seeks to reduce them both to little more than privations of good,—to mere absence of good, to a defect rather than a blemish, to what is called metaphysical evil.

The world, it is admitted, is far from perfect, but it is as good as it could be made if all the good which it contains was to be realized. Like everything else, it is not free from the defects of its qualities. It is, we may be sure, the best of possible worlds. But this is far from saying that it is a good world. Ignorant as we are of the limits of what is possible, it is not for us to say that the quality of the best, under the given circumstances, is at all distinguishable from what is really very bad. The defence of theism which Leibnitz thus undertook against the sceptical suggestions of Bayle is only the common argument that the work must be judged as a whole, that it is unfair to pronounce judgment on an isolated event or thing apart from the question how it is affected by its interdependence. But, unfortunately, in the case before us, in the problem of the universe, we do not know the whole, and can only grope our way tentatively from point to point, feebly endeavouring to forecast the plan of the total structure.

But Leibnitz goes farther than this assertion of interconnection or adaptation. It is the ultimate assumption of his argument that the forces of the universe are in the hands of a perfectly wise intelligence, that, as in man there is a rational power of initiation and guidance, so in the world as a macrocosm there is a primal reason which governs its movements and co-ordinates them to a desirable end. The actual phases of existence only carry out in palpable shape and successive or simultaneous manifestations an ideal or rational plan, which is their original and sufficient reason. The world at large is somewhat of a machine, or a congeries of machines, which run down according to their own internal and innate conditions of existence; but these machines are wound up by one supreme machinist, who has predetermined the aim and object of their combined movements. Thus the doctrine of the pre-established harmony, while on the one hand it is an apotheosis of logic by the emphasis it lays on the necessary causal interdependence of the several partial movements, is on the other hand, by its principle of sufficient reason—the *principe du meilleur ou de convenance*—a doctrine of teleology, whereby an ideal principle of design interpolates the contingent and subordinates necessity to freedom. The world is not a mere group of causes and effects governed by the logic of contradiction and identity, over and above the necessitarian logic is a mind which looks behind and before, and combines all events, not recklessly or necessarily, but in the bands of reciprocal subservience to the greatest good of which they admit.

In this argument Leibnitz is open to the criticism of Kant, that he has passed from a legitimate conception presiding over the synthesis of phenomena to the illegitimate idea of a self-subsistent and personal principle, which, far from being a mere ideal of complete synthesis, itself creates and predetermines that synthesis. To the logical scientist the phenomena are merely connected by a formal unity; to the theist like Leibnitz this unity is identified with a cosmical mind, an intelligent power which regulates the evolution of things and subordinates them all to the fulfilment of its original plan. Leibnitz thus manipulates two ideas, the logical and the religious, as if they were interchangeable, though in reality they lie in different planes. The reason which at one time is treated as an abstract principle of self-consistency is at another time clothed in the concrete mental life associated with it under its human aspects. Mere reason, says Aristotle, can imitate no change, it neither chooses nor commands, but simply asserts. But human reason is always in the long-run wrapped up with some aim, is always (in the technical sense) practical, and only for moments of abstraction ever merely theoretical. Thus the reason in the universe was

spoken of as God, and conceived anthropomorphically after the pattern of human personality.

English
views.

The optimism of Leibnitz found its well-sounding but somewhat misleading phrase that all is for the best in this best of possible worlds bitterly satirized in Voltaire's *Candide*, and painfully commented upon by the earthquake of Lisbon. But the real object of the Frenchman's wit was the baser optimism of the age which sheltered its vulgar features under the mask of the Leibnizian *Théodicée*. An easy-going generation had settled down in the pleasing faith that their barns were filled with good things for many years, and that they might eat, drink, and be merry. The creed found in England a prophet of solemn pomp in Pope, whose *Essay on Man* has fixed in pregnant lines the main half-truths of the Leibnizian theory, which the poet had probably learned from Bolingbroke. The same optimism appears in Shaftesbury ("The good which is predominant"), and shows its presence in Paley. Some opposition to the current eudemonism is found in the well-weighed and all but sceptical judgments pronounced by Butler, as well as in the cynical pessimism that tried to raise its voice in Mandeville. But the great instance against the comfortable view of life is the striking passage which Hume in his *Dialogues concerning Natural Religion* has put in the mouth of Demas, beginning "The whole earth, believe me, Philo, is cursed and polluted. A perpetual war is kindled amongst all living creatures," &c.

German
Natural
Theology.

In Germany, under the head of Natural Theology, the ordinary optimism flourished again. The whole range of creation was ransacked to show how well man had been provided for by God. The poetry of Brookes (the translator of Pope) is full of the theme,—the laudation of the many gifts we owe to Providence, of the multifarious uses to which each animal and plant can be put. It is an anthropocentric optimism which thus makes man's welfare the main end of the creation, and which, above all, finds that welfare in what we eat and drink and wherewithal we are clothed. The good which Leibnitz had spoken of was understood as material prosperity, comfort, happiness. God's goodness was measured by the amount of worldly wellbeing which He bestows upon us.

Attitude
of Kant.

The great Kant, as late as 1759, when he printed a short sketch *On Optimism*, was still inclined to keep terms with this base caricature of a great theory, and spoke with full agreement of that theory itself. But here as elsewhere Hume's influence was potent upon him, and in a paper published in 1791 (*On the Failure of all Philosophical Attempts in Theology*) he had altered his tone. Our intelligence, he argues, is absolutely powerless to discover the proportion in which the world, at least as known to us in experience, stands to the supreme wisdom. And to the grounds adduced to prove that the pleasures of life far exceed its pains his reply is: take a man of sound mind, who has lived long enough and thought enough on the value of life to be able to form a judgment on the subject, and ask him whether he would like to play out the game of life once more (not on the same terms, but) on any terms he pleases, be it only in this terrestrial world of ours, and not in fairy land. In one direction indeed Kant may be called optimist (or at least meliorist),—in his belief in the ample possibilities of moral and political improvement, and in his enthusiastic hopes for the cessation of some chief causes of human misery.

But in one way Kant had laid the axe to the chief root of optimism. That root is the utilitarian or eudemonistic theory of conduct,—the theory which seeks to explain morality away into a sort of magnified selfishness, and regards the authority of moral rules as due to their origin in counsels of prudence. The moral law, said Kant, is the one clear utterance of the Absolute. And the lesson

thus taught bore fruit. At first indeed idealism with its optimistic interpretations returned. The double-faced dictum of Hegel, that the real is the rational and the rational the real, was often understood to justify the principle that, whatever is, is right. The net of Hegelian thought seemed to grasp everything, everything fell as it were naturally into its place, and seemed to be justified by the symmetry of its position in the logical evolution. For in idealism we find the true home of optimism. The world as experienced in sense and feeling is full of discords and defects, and the more we abstract each part of the whole into its "beggary elements," the greater seems the weakness and the triviality. But, when we rise in thought to the contemplation of the unity and order, these real discords pale before the spectacle of ideal harmony. The formal symmetry carries the day. The corpse may be hideous and yet the theory of the anatomist has its beauty. The sorrows of the hero do not make impossible the pleasure of the spectator in the drama. Just as the hardships long ago endured are sweet to remembrance, so the individual sufferings are lost in the conception of the universal ends they subserved. The real pain is compatible with a formal pleasure; reason can find commendable and good what is torment to flesh and blood.

But, while the life-work of Hegel had been to show that at bottom the principle of being and the principle of thought were the same, that nature and history were the incarnations of reason, the succeeding philosophy of Schopenhauer reverted to the distinction of Kant, which it emphasized, between thought and existence. Schopenhauer dethroned Schopenhauer's Will, the primary reality being which we know as an idea. This root of existence is what he called Will. The source of the reality which we cognize—the secret essence which is objectified in the forms of the universe as it presents itself to our conceptions—is Will. By this Will he meant a blind but irresistible effort to exist, a craving of inexhaustible strength towards life and objective being, an unconscious lust for the pleasure of manifesting itself as something acting here and now. It is something less than Will, as we know will, and yet something more than force. Under every known kind of actions and phenomena in space-and-time—phenomena, known by their reciprocal relations—there is an unknown but felt something, an endless, aimless, limitless struggle to be upraised into the light of existence. This ultimate basis of will-force we must assume as the fact presupposed by all specific causal explanations. But in its generic basis the Will has no definite aim; it is the will to be everything in general and nothing in particular,—the will to be, to do, to act. End or purpose supervenes only with the rise of consciousness. Intelligence comes forward at first as a mere organ in the service of the Will; it is only a means for the preservation of the individual and the species. It is observable first in the animal, where the purely instinctive stimuli fail to procure sufficient material for subsistence, where the food has to be selected, and the motions of the animal are accordingly dependent on motives, i.e., on conceptions of objects to be attained. It is this need which occasions the development of the brain; with the brain intelligence rises upon the scene; and thus the world now comes to see itself, not in its reality, but in its phenomenal objectification, as the realm of causes and effects in the element of space and time. This conscious knowledge, which at first consists merely in momentary and individual perceptions, attains higher powers, as abstract and general reason, by the aid of speech.

Now intelligence, which originally came with the formation of brain-tissue as a mere tool of the Will in the more complex forms of its objectification, may rise at length, according to Schopenhauer, to be the liberator of the

human race from the restless tyrant which works in them now, as it ever will brought them to the birth. For, firstly, knowledge in its own character emancipates, it lets its possessor know that he suffers and why he suffers. Such is the first prerogative of reason. But, secondly, in the occasional intervals when the storm of Will is laid to rest, the mind, instead of striving in the interests of practical intelligence to detect the causal relations of things, can concentrate itself exclusively on a single isolated object. A transformation is thus accomplished whereby the object, ceasing to be a mere particular, becomes the type-idea, the Will and eternal form, the generic and adequate embodiment of Art. Will in a special grade, while, on the other hand, the individual who has become absorbed in such contemplation is no longer a mere individual, but has become the "will-less, painless, timeless subject of knowledge." It is this power of rising above the prosaic requirements which sense gratifies, of seeing the permanent and one reality in the dependent and disunited phenomena of the particulars, which what we call Art imitates by production. The artist produces the eternal types which the blind Will only realizes in many imperfect and particular adumbrations, he conquers nature by fixing in a single image the traits which constitute the true and permanent meaning confusedly presented by her in many exemplars. For the mind which can see that idea in the natural forms, or which beholds it in the works of art, for him who contemplates without reference to the Will, "the wheel of Ixion stands still, freed from the prison-house of blind desire, he enjoys the sabbath of æsthetic beatitude."

Schopenhauer's ethics. But the relief obtained in art is only for blessed moments. Perennial consolation can be found only in the ethical life, and in an ethics of asceticism and self-sacrifice. True life begins only when we have learnt that happiness is impossible by means of gratifying the cravings of desire. Each satisfaction of the will is only a starting-point for fresh effort, the achievement of the desired object suggests a new want. "Alles Leben ist Leiden." At every point desires are thwarted, even when they gain their end the satisfaction is merely negative. The weary Titan of humanity knows no repose; his feeble pleasures are drops in a sea of pain. Thus the central principle of pessimism asserts that in the order of nature, *i. e.*, so long as the will to live remains unbroken, happiness in the true sense is impossible. Life as life necessarily involves misery. No doubt the man of the world may turn round and declare that notwithstanding this he means to gather the rose without the thorn. Undismayed by the analysis of the consequences involved in will, he affirms the will to life. Adopting the principles of the Cyrenaic hedonists, he closes his eyes to far-reaching eventualities and lives in the moment, he turns life in every portion into art, he revels in the insipid sense of action without care for past obligations and future anxieties. It is otherwise with the man who has surveyed all the issues of things, who looks at the net result of life as a whole and in all individuals. For him it is a duty to deny and abjure this will to life. He must, in other words, renounce the works of egoism and of injustice. He must see through the illusion of the *principium individuationis*, must recognize that his very self, his will, is identical in essence with every creature, even with the suffering. When he has done this, and is in love and sympathy with all around him, "the veil of Maya" has for him become transparent. In every way he proceeds (over and above cultivating in active love compassion for others) to deny the exercise of the will to life in his individual case, in his own body. He will, above all, according to Schopenhauer, perpetually keep the vow of chastity; he will by fasting and penance so mortify his body that the will to life shall be utterly broken in him.

"And," adds Schopenhauer (§ 67), "I think I may assume that along with the highest manifestation of will the feeble counterpart of it in the animal kingdom would also disappear." Man, by ascetic mortification of the will, and by sanctity of beneficence, becomes the redeemer even of the rest of the animated creation.

The contrast between nature and grace, between the physical and the moral, the life of the flesh and the life of the spirit, stands out in these outlines as the central doctrine of pessimism. It is in essentials the same doctrine which was preached by Buddha, which is put into the mouth of Socrates in the *Phædo* (philosophy is a rehearsal of death, *μελένημα θανάτου*); it is the doctrine which stands indelible in the early archives of Christianity, and was proclaimed as the better and more excellent way by myriads of the noblest Christian teachers for more than ten centuries of the church. The pessimistic ethics of Schopenhauer casts aside the feeble compromises by which it is alternately assented that morality makes for happiness and happiness is morality; it rejects the postulates by which Kant tried to lighten for human nature the burden of imperative duty, it goes behind the social sanctions which see in good conduct acts subservient to the good of a human community. In pessimistic ethics—and the pessimism of Schopenhauer has essentially an ethical aim—we have the wreck left on the wastes of time by Hegelianism. Hegelianism had taught, or seemed to teach, that God was in the beginning by Himself as a Logos, or self-evolving idea, which uttered itself in the unconscious forms of nature, till in the conscious spirit of man He gradually realized Himself in moral and intellectual life, in art and religion. Schopenhauer stripped this cycle of its first period. There was no idea, no logical machinery, at the basis of things; nature began out of a blind impulse; and it was only in man's intelligence that the vague longing of the heaving world knew itself to be. But that intelligence has for its supreme aim—not, as in Hegel, to enter into and carry on the great process which is the absolute, but—to deny its creator and annihilate the principle of being. The world of Will, in its process of objectification, has thus given birth to a child which in the fulness of time will destroy the womb that bore it.

It will be apparent that in Schopenhauer's system we can distinguish two parts,—the first, the doctrine of the positivity of pain, and that life is always and only pain; the second, the ethical condemnation of the principle of such a world, and the method for correcting the evil which it had introduced. In the latter lies his chief and characteristic achievement,—in what we may call his metaphysics of ethics. Man by morality (ascetical morality) is to be the redeemer of the world. In this conviction Schopenhauer shows himself the descendant of the metaphysical systems of the past, which find in man the key to the mystery of the universe. It is a strange and a weary way of redemption which he delineates, the cross is heavier than humanity seems able to bear. Yet the suggestion to deliver ourselves shows that the old belief in human spontaneity, in the primacy of the moral principle, in the possibility of noble deeds and of a victory over egoism, was still vigorous in his mind. Another pessimism neglects this ethical element altogether. To this ignoble pessimism man is in truth only an animal like the rest, and the distinction on which he prides himself—his moral nature—is but a confused and illusory product of simpler animal experiences. He has knowledge of wider range, it is true, but knowledge is powerless to change his nature. His acts in every case are necessarily determined; his fancied freedom is found on examination to be no whit more spontaneous than the fall of the unsupported stone. The necessitarianism of evolution did away with the independ-

ent existence of morality, and reduced it to conventional stereotyping of natural symbols, with forgetfulness and misinterpretation of their meaning and applications.

To an age so minded the consolations of pessimism sounded faint and unreal. They had lost the old *ποσειδών*,—the optimistic creed that man was the undisputed head of creation. They saw themselves no longer a select race, favourites of God, but as engaged in the struggle for life with thousands of other species. The rôle of saviour of the world was not for them. And so, turning a deaf ear to the high words of Schopenhauer, they sought easier consolations in the common and casual pursuits and pleasures in the world, they determined to make the best of this vale of tears,—even in Pandemonium there might be shady spots and cool retreats. A few spirits who had drunk more deeply at the wells of suffering, and who were alike without the mental energy of Schopenhauer and the comfortable inconsistency of the mass of men, could not rise beyond the ever-present sense of the emptiness and infelicity of life. There are many such types in literature, but perhaps no more perfect expression has been given to the strange abysmal melancholy of a withered life than by the Italian poet-scholar Leopardi. At one time dallying lovingly with the idea of death, at another finding only deception and illusion in love, liberty, progress, and all human ideals, and almost always with irony, bitterness, and hopeless living in the sense of an inexorable destiny, a malign nature, which calmly motions man to destruction, Leopardi presents pessimism in its naked terrors. For him there are no consolations, either base or noble. Man is at the mercy of a pitiless nature, he must endure a thousand deaths daily. This mood of Leopardi's, however he himself protested against the suggestion, was unquestionably to a main extent due to the tremendous disproportion in which his mental and æsthetic nature stood to the circumstances of his life, and not a little to the general political condition of his country.

When the first edition of Schopenhauer's great work appeared in 1819 it did not attract much immediate attention. Pessimism was in the air—the Romantic school in Germany, and especially Heine and Lenau, Byron in England, and Chateaubriand in France,—not to mention many other names,—all in their several ways gave expression to the "Weltschmerz." Yet it was not till 1844 that a second and much enlarged edition of the work appeared, followed by a third in 1859. By this time the doctrines of Schopenhauer had found many enthusiastic followers, and a flood of literary works poured from the press in criticism or support of them. With the year 1866 the title "Pessimism" began to show itself in books which discuss his views. And in 1869 appeared the *Philosophy of the Unconscious*, by E. von Hartmann. The popularity of this work was enormous. In the ten years which elapsed between its publication and that of Hartmann's next systematic work (*The Phenomenology of the Moral Consciousness*) it had run through eight editions. The lesser works of Hartmann, his articles in reviews, the pamphlets by friends and opponents during the last fifteen years, are truly named legion. The question "Is life worth living?" has become a question of the day, to which the problems of socialism, liberalism, and religion contribute their quota. The novels of Turgenieff and Sachar-Masoch are full of the ideas of Schopenhauer's pessimism.

Hartmann's first work was written when its author was twenty-five. It bears traces of the paradox and exaggeration which sometimes go with youthful talent, and occasionally pays the tribute of imitation to the naturalistic pruriency and sensationalism of the contemporary novel. The style is cumbersome and pretentious. And yet its popularity proves that its author has the faculty of directing

with no unskilful or incompetent hand the vague and incoherent tendencies of the cultivated masses. The world which has lost hold of, and perhaps broken with, the faith of its fathers is on the look-out for a "Weltanschauung," it wants to know the metaphysical inferences to be gathered from the recent advances of scientific theory. Not merely had Darwinism, as may be seen from the character of Hackel's *Natural History of Creation*, caught the public ear more widely in Germany than in England, but the deductions from its principles had been carried to far greater lengths. Amid the decay of distinctively Christian beliefs, and even of theism, the doctrine of pessimism attracted a sort of religious fervour. The prevalent sense of dissatisfaction and baffled endeavour was met by a theory that the principle of the universe was radically perverse, and could not be amended. And, if it be urged that it is difficult to believe in the genuineness of a pessimism when its professors take their ease and mirthfully jeer the stranger who expected to find people not clad in soft raiment nor dwelling in kings' houses, it may be replied that pessimism is not the only temporizing creed. The moral indignation (*Entsetzungs-Pessimismus*) of a Carlyle or a Juvenal, which pours its vials of scorn on the selfish meanness of mankind, and the churchly exhibition of the sores and frailties of human flesh and blood in which books like the *De Contemptu Mundi* of Innocent III. reveal, alike overshoot their mark and leave the world unconvinced of its nothingness.

It is out of place here to enter into any lengthened exposition of Hartmann's metaphysics. This world, according to him, is the work of an Unconscious, a being which is at once will and intelligence,—a will urging to be and to do somewhat and an intelligence which adapts means to ends. But the will is only instinct, and the intelligence is the unconscious reason which guides the somnambulist or the clairvoyant. Thus there is wisdom in the frame of the world, but the original resolution to exist was the work of a blind will. Reason did not prompt the initial act, yet at every movement towards existence an unconscious reason effectively correlates the elements into united action. The various individuals seem indeed to be acting of themselves: they pursue aims of their own; but they are only puppets in the hand of nature, the unconscious intelligence and will. Apparently, there are many agents, each in some degree independent, really, there is only one source of action, the union of will and idea in instinctive adaptation and unwitting design.

With man at length consciousness awakes, and the possibility is laid for a new relation between the two elements in the universal principle. Knowledge, however, is not an end in itself; it is not enough to know the process of the world. The consciousness which is generated at length by the unconscious reason out of the workings of will has its function marked out for it beforehand by its unconscious author. Its final purpose is to revoke the effects of that irrational step by which the unconscious will in its eagerness to exist dragged the idea with it in its service. The hour of vengeance may come some day. The intelligence which has become conscious in man may at length induce his will to take the backward step, to retire into non-existence even as it erewhile rose into existence. In that day when the force of will has been mainly accumulated in the province where intelligence prevails, it is probable that a successful act of suppression of the will to life on the part of human reason would entail the utter prostration and annihilation of the will to life throughout the universe. By the act of its intelligent portion, in which the major part both of the cosmoical will and intelligence has been gradually accumulated, the world, as a whole, will commit suicide.

Leopardi's pessimism.

Various pessimistic writers.

Hartmann's metaphysics

But Hartmann is not merely a metaphysician, he proposes to supply inductive proof for his propositions. The question of the preponderance of pleasure or pain in the world is to be worked out by observation of facts and summation of figures. So far differing from Schopenhauer, he admits the positivity of pleasure, but maintains nevertheless that pleasure and pain are representable by quantities of the same denomination, prefaced respectively by the *plus* or *minus* sign. When the accounts of debt and credit are drawn out, it appears that the balance is enormously on the side of pain. To him who has once perceived the surplus of pain it is an obvious duty to extinguish the source whence sprang the unmitigated evil. Yet mankind in the past has shrank from the acceptance of this conclusion, and sought refuge in three successive illusions: (1) the naive illusion of the natural mind that happiness is to be found in this present world, (2) the illusion that happiness, though a failure here, will be realized in the world beyond the grave; (3) the illusion which puts its hopes on the amelioration of humanity in the future history of the world. One after another these illusions are shown to be vanity. A little taste of pleasure, amid the insupportable bitterness of life, is snatched by a select few from the consolations of art and science. But at last, as wisdom grows and the hopeless monotony of grief is more acutely felt by the race, humanity will rise up boldly to the last great act of despairing suicide, and reduce the unconscious to its primeval nullity.

If we pass from this grandiose drama of the birth and destruction of the universe to consider the ethical doctrine which Hartmann supposes himself to base upon his metaphysical theory, we find ourselves on safer ground. For, apart from the method by which he reaches it, his moral principle is not very different from the general view on such subjects. The basis of morality in his theory is the relation of the individual consciousness to the Absolute in which consists its true being. It is in this ultimate identity of the individual with the All-one—not merely in the preservation of his phenomenal welfare, or of the welfare of the society he belongs to, or the furtherance of some one ideal good—that the obligation to be moral is to be sought. On the other hand, there is nowhere in the universe a surplus of pleasure; and therefore the moral agent cannot either here or elsewhere look for happiness in a positive sense as the reward of his virtue. Egoism of every range—from the more materialistic to the more religious pleasures—is incompatible with genuine virtue. The aim of morality is the redemption of the whole world from the evil into which its initial act has plunged it. And in this act of redemption—the result of which will not be joy, but rest, the quiescence of the universe—man by his intelligence and will is the main worker, the fellow-worker of the Absolute; it is by him that God works out the redemption of himself and of the universe. "Real existence," so closes the *Phenomenology of the Moral Consciousness*, "is the incarnation of the God-head; the world-process is the story of the Passion of the God who has become flesh, and at the same time the way to the redemption of Him who is crucified in the flesh, but morality is the co-operation towards shortening this way of suffering and redemption."

It would be vain to criticize in detail these speculations, out of which a few principal points have been adduced, and which, besides being in themselves vague, are pliable in the hands of their author. But a few remarks may be made on some main issues involved in the dispute. It may be admitted in the first place that the doctrine of the origin of existence in an a-logical principle is but an extravagant way of stating that the intelligence when it awakes to consciousness finds itself in presence of another world of

nature and custom which seems irrational and antagonistic—a world which is outside of us and seems to mock our puny individual efforts for its improvement. Secondly, it may be admitted that there is no evidence for the thesis that the world was intended to suit the convenience of man, or of any species whatever. As a matter of fact, there is abundance of misery in the world. But, quite apart from the reducibility of the amount by the application of intelligent means, it seems certain that no attempt to draw up a balance-sheet of absolute cosmic misery or happiness is ever likely to be successful. It is as irrational to pronounce this to be the worst of all possible worlds as the best. The superlatives employed in the terms "optimism" and "pessimism" betray a passionate estimate of things. Life, one has said, would be tolerable but for its pleasures. Even those who, like Leopardi, have declared themselves in love with death, show, by still electing to live, that life has something not measurable by pleasures, yet chosen even amid mental tortures and extreme ill-health. As Aristotle said long ago, we are not unbiassed judges *in re* Pleasure & Pain. Thirdly, if it were worth while, it might be urged that the main terms of the pessimists are extremely vague. The "Will" and the "Unconscious" cannot be tied down to a definite meaning without losing their power; the contrast between the positivity and negativity of pleasure and pain shows an ignorance of logic, and, above all, the habit of transferring the terms of religion to express what are supposed to be analogous ideas in pessimistic metaphysics is misleading.

The pessimistic theories of modern times are in part a commendable protest against the common compromises which slur over the antithesis between the moral and the natural. They show tolerably conclusively that the world is not a felicific institution, and that he who makes happiness the aim of his life is on the wrong tack. But, when they proceed to dogmatize that existence has a root of bitterness and life is a burden of pain, they fall into the common error of exaggerating a statement relatively true into an absolute principle. You cannot tell if life is worth living, so long as life is held to be the sum or difference of pains and pleasures. If pains and pleasures were only and always such, the argument might be admitted, if they were permanent real entities, not liable to be transformed into each other, not constantly associated in the same act, it might be possible to treat them as ultimate and irreversible standards for our estimate of life and the guidance of our conduct. If pleasure and pain are unequally and unfairly distributed, it is probable that this is a fault which human agency can cure to an unspeakable degree, quite without the desperate remedy of self-torture or cosmic suicide. If pessimism can teach the world that the highest reward of virtue is self-respect, and that there is no pleasure available anywhere to bribe us to be good, it has done well. It has also done well if it points out the barriers to happiness in this world, so long as these barriers prevent true life and can be removed by wise methods. But in the meanwhile, till the burden of existence has become universally unbearable, it may be well to remember that we shall be as likely to benefit the Absolute by doing our work well as by macerating ourselves, and that the sum of existence is a big thing, of which it were rash to predicate either that it is altogether and supremely good or altogether and supremely bad.

The works on pessimism have been numerous lately. Most of them, however, deal with it mainly in connexion with the two German philosophers, and of these several treat exclusively of the special metaphysical and psychological theories. For Buddhism, see BUDDHISM, vol. iv p. 494 sq. and also Oldenberg's *Buddhism* (1881), since translated into English. An account of Schopenhauer was given by R. Adamson in *Mind* for 1876, and in Miss Zimmer's *Life of Schopenhauer* (1876), the first account of Hart-

ethics

Critical
remarks

manu to English readers was given in an article by E. Wallace in the *Westminster Review* (1876). In 1877 there was published a full discussion of the subject by J. Sully, *Pessimism, a History and a Criticism*. There are chapters on the question in many recent works, among the latest Talloch, *Modern Theories in Philosophy and Religion* (1884). In France we have Ribot, *Schopenhauer* (1874), Gail, *Le Pessimisme en XIXe Siècle* (1878), who gives an account of Leopardi, Schopenhauer, Hartmann. In Italy may be mentioned Barzotti, *Il pessimismo dello Schopenhauer* (1878). The books published in Germany are countless, e.g., Duhing, *Der Wille des Lebens* (1865), Bahnen, *Zur Philosophie der Geschichte* (1872) and *Pessimisten-Bücher* (1879), Hartmann, *Philosophische Abhandlungen* (1872), Meyn, *Weltende u. Weltbeginn.* (1872), Taubert, *Der Pessimismus und seine Grenzen* (1873), Volkelt, *Der Unbewusste u. der Pessimismus* (1873), E. Pholad, *Der Moderne Pessimismus* (1875), Cass, *Optimismus u. Pessimismus* (1876), Huber, *Der Pessimismus* (1876), Rehmke, *Die Philosophie des Welt-schmerzes* (1876); Sommer, *Der Pessimismus und die Sittlichkeit* (1883), Plunmacher, *Der Pessimismus in Vergangenheit Gegenwart, gesch u. Kritik* (1884). There is a list of books on the subject up to 1880 in Laban's *Schopenhauer-Lexikon*. For LAOPARIN, see vol. xiv p. 464 *g*. Schopenhauer's *Welt als Wille und Vorstellung* is in course of translation by H. J. and Kemp (vol. 1, 1883); and Hartmann's *Philosophie des Unbewussten* has been translated by W. Gotpland, 8 vols (1883). (W. W.)

PESSINUS, or PESINUS (Πεσσινός, Περσινός), an ancient city of Galatia in Asia Minor, situated on the southern slope of Mount Dindymus. It stood on the left bank of the river Sangarius, about 150 stadia (17 miles) from its source, and 16 miles south of Geima on the road from Ancyra to Amorium. It was the capital of the Tolistobogii and the chief commercial city of the district. It was famous for its worship of the mother of the gods (Cybele), who here went by the name of Aglathis. Her priests were anciently princes as well, but in the time of Strabo (1st century B.C.) their privileges were much diminished. The kings of Pergamum built a new temple adorned with porticoes of white marble. The image of the goddess, a stone (or piece of wood) said to have fallen from heaven, was taken to Rome in 204 B.C., in compliance with an oracle in the Sibylline books to the effect that the foreign foe could be driven from Italy if the Idaean Mother (Cybele) were brought from Pessinus to Rome. But the goddess continued to be worshipped in her old home as well as at Rome; her priests, the Galli, went out to meet Manlius on his march in 189 B.C., and at a later age the temple was visited by Julian the Apostate. In the division of the empire under Constantine, Pessinus was made the capital of the province Galatia Salutaris. It was also the seat of a metropolitan bishopric. After the 6th century the town disappears from history. The ruins discovered by Texier occupy three hills near the village of Bala-Hissar, 9 or 10 miles south-east of Sevi-Hissar. They include a theatre in partial preservation and numerous fragments of marble columns, friezes, &c. The modern town of Sevi-Hissar is built at the height of about 3000 feet on the southern base of a steep granite rock, half-way up which are the ruins of a castle.

PESTALOZZI, JOHANN HEINRICH (1746-1827). See EDUCATION, vol. vii p. 677.

PESTH, the chief town of Hungary and the second of the Austrian-Hungarian monarchy, is situated on the left bank of the Danube, 140 miles to the south-east of Vienna, in 47° 29' 10" N. lat. and 19° 2' 56" E. long. Since 1873 it has formed one municipality with BUDA (*q.v.*) on the opposite bank, and the joint city, officially styled Budapest (Ger. *Pest-Ofen*), is the capital of Hungary, the second residence of the Austrian emperor, the seat of the Hungarian ministry, diet, and supreme courts, and the headquarters of the commander of the Honvéds or Hungarian landwehr.

The imposing size of the Danube, here somewhat wider than the Thames at London, and the sharp contrast of the two banks, place Budapest among the most finely-situated

of the larger towns of Europe. On the one side is a flat sandy plain in which lies Pesth, modern of aspect, regularly laid out, and presenting a long frontage of handsome white buildings to the river. On the other the ancient town of Buda struggles capriciously over a series of small and steep hills, commanded by the fortress and the Blocksberg, and backed by spurs of the vine-clad mountains beyond. The Danube is crossed by three bridges, the fine suspension bridge constructed by the brothers Clark in 1842-49, at a cost of £440,000; the iron Margarethenbrücke, a little farther up, dating from 1872-76, and a long railway bridge at the lower end of the town.

Budapest is divided into ten municipal districts, three of which are on the right bank and belong to Buda. The nucleus of the town on the left bank is formed by the inner town or old Pesth on the Danube, in a semicircle round which lie the districts of Leopoldstadt, Theresenstadt, Elisabethstadt, Josephstadt, and Franzstadt, while

to the east of these is the outer district of Steinbruch. Perhaps the most attractive part of Pesth is the line of broad quays on the Danube, which extend for a distance of 2½ miles, from the Margarethenbrücke to the custom-house, and are lined with imposing white buildings. The inner town, part of which is somewhat irregularly built, is separated from the other quarters by a ring of spacious boulevards on the site of the old wall, and the lines of demarcation between the different districts also consist of wide tree-shaded streets, mostly paved with asphalt. Most of the larger public buildings are in the Leopoldstadt, which shares in the fine frontage on the Danube, or in the handsome new Radial Strasse, which traverses the Theresenstadt, with a width of 100 to 150 feet. Pesth covers more ground than most towns of a similar population on account of the large number of one-storied houses, which form 70 per cent of its buildings (as compared with 8 per cent in Paris, 3 per cent in Leipzig, &c.).

Though of ancient origin, Pesth has nothing to show in the shape of venerable buildings; and the modern edifices may perhaps be described as more noticeable for the general air of prosperity they diffuse than for marked individual merit. The oldest ecclesiastical edifice is the parish church, dating from 1500, while the university church and those of the Leopoldstadt and the Franzstadt are the best of the more modern structures. The synagogue, however, is finer in many respects than any of its Christian rivals. The long range of substantial buildings fronting the Danube

includes the new houses of parliament, the academy, the exchange, the redoute, a large structure in a mixed Romanesque and Moorish style, erected for balls and other social purposes, the Greek church, the parish church, the old town-house, the extensive custom-house at the lower end of the quays, and several fine hotels and insurance offices. In the Radial Strasse are the new opera-house, the academy of music, the exhibition building, and the national drawing-school. The largest building in Pesth is the so-called New Building, in the Leopoldstadt, erected by Joseph II., and covering as much ground as an ordinary London square. It is at present used as artillery barracks, and the Carl's Barracks in the inner town, also used for housing troops, are little inferior in size. Another large military establishment is the Ludovicum, or officers' college, at the south-east end of the town. The remaining buildings remarkable for their size or interest are the new town-house, the post-office, the national museum, the theatres (of which there are about half a dozen), and the palaces of several of the Hungarian magnates. To the south-east of the town lie the new slaughter-houses, which are admirably fitted up, and, with the adjacent cattle-market, cover nearly 30 acres of ground.

The artistic and scientific culture of Pesth, and indeed of Hungary, finds its most conspicuous outward expression in the academy of sciences and the national museum, two large and handsome modern buildings. The academy, founded for the encouragement of the study of the Hungarian language and the various sciences, possesses a library of 100,000 volumes, and harbours the national picture gallery, a good collection of 700 to 800 works, formed by Prince Eszterházy, and purchased for £130,000. The national museum contains extensive collections of antiquities, natural history, and ethnology, a gallery of mediocre paintings, and a library of 150,000 printed volumes and 12,000 documents. Pesth also possesses numerous societies for the cultivation of science and art, most of which, however, limit their usefulness by publishing their proceedings in the Magyar tongue alone. The university of Pesth, the only one in Hungary proper, was established at Tyrnau in 1635, removed to Buda in 1777, and transferred to Pesth in 1783. It is attended by upwards of 2000 students, and possesses the usual medical and scientific collections, an admirable chemical laboratory, a botanic garden, and a library of 120,000 volumes. Pesth also contains a Protestant theological college and a rabbinical institute. The second place among the educational establishments of the town is taken by the Polytechnic Institute, with its three faculties of applied chemistry, engineering and architecture, and mechanics; it is attended by about 1000 students. The other schools comprise six gymnasias, six normal seminaries, and a large number of special and elementary schools, in spite of which 32 per cent of the adult population were unable to read or write in 1880. The charitable institutions of the city are on a liberal scale. Characteristic of Budapest is the large number of its public baths, the most interesting of which are at Buda.

In commerce and industry Budapest is by far the most important town in Hungary, and in the former, if not also in the latter, it is second to Vienna alone in the Austrian-Hungarian monarchy. The chief articles of manufacture are machinery, railway plant, carriages, gold and silver wares, chemicals, cutlery, starch, tobacco, and the usual articles produced in large towns for home consumption. The great staple of trade is grain, of which about 4½ million bushels are brought into the town annually. One-fourth of this amount merely passes through Pesth, while most of the remainder is ground into flour and exported in this form. Other important articles of commerce are wine, wool,

cattle, timber, hides, honey, wax, and "slivovitz," an inferior spirit made from plums. The imports, so far as they do not belong to the transit trade, consist chiefly of manufactured articles and colonial produce. The four annual fairs, formerly attended by many thousand customers, have now lost much of their importance. The swine market of Steinbruch is the largest in Hungary, about half a million animals being annually disposed of. The trade of Pesth is in great part carried on by the Danube, the navigation of which has increased enormously since the introduction of steamboats in 1830, but the town is also connected by railway with all the chief places of Austria and Hungary.

The largest and most popular of the public gardens and promenades in Pesth itself is the Stadtwaldchen on the north-east side, with its pleasant lake and trees. A still more delightful resort, however, is the Margaret Island, a long narrow island in the Danube, laid out in the style of an English park, with fine trees, velvety turf, and a group of villas and bath-houses.

Few European towns have grown so rapidly as Pesth during the present century, and probably none has witnessed such a thorough transformation in the last twenty years. In 1780 Pesth was still a badly-built town of the third rank, with only 18,000 inhabitants, and it was not till 1799 that its population (28,000) surpassed that of Buda (24,000). By 1840, however, Buda had added but 14,000 souls to its population, while that of Pesth had more than doubled, and of the joint population of 270,000 in 1869 fully 200,000 fell to the share of Pesth. In 1880 the population of Budapest was 370,767 souls, including a garrison of 10,000 men, showing an increase since 1869 of 83 per cent, and since 1800 of an average of 6 per cent per annum. Of this total 198,748 were retained as having Hungarian for their mother-tongue, 119,902 as Germans, and 21,561 as Slovaks. Divided according to religious sects, we find 242,981 Roman Catholics, 70,879 Jews, 42,264 Protestants, and 3014 members of the Greek Church. Of these the Jews show the greatest relative increase since 1869 (66 per cent) and the Roman Catholics the least. Of the gross increase of population in Hungary between 1869 and 1880 no less than two-thirds are due to Budapest alone, which in the same interval rose from the twenty-third to the fifteenth place among the towns of Europe. About 35 per cent of the population are supported by trade and industry, 20 per cent are engaged in service, and 4 per cent belong to the professional and official classes. Nearly 60 per cent, including women and children, are returned as belonging to the non-working classes, but less than 1 per cent are described as living on their capital or property. In spite of the large proportion of one-story houses, the ratio of inhabitants to each dwelling-house is somewhat high (83, as compared with 8 in London, 35 in Paris, and 59 in Vienna).

As Paris is sometimes said to be France, so may Pesth with almost greater truth be said to be Hungary. Its composite population is a faithful reflexion of the heterogeneous elements in the empire of the Hapsburgs, and the trade and industry of Hungary are centralized at Pesth in a way that can scarcely be affirmed of any other European capital. In virtue of its museum and academy it is also the scientific centre of Hungary, and nine-tenths of all books in the Magyar tongue are published there. The average rate per head of imperial taxation is five or six times as great in Pesth as in the rest of Hungary. The recent patriotic movement in favour of Magyarizing all institutions has found its strongest development in Pesth, where the German names have all been removed from the streets and buildings. It is, of course, too, that the children of German parents born in Pesth easily become Magyarized, while a survey of Hungary at large during the last sixty years shows a relative increase of barely 1 per cent in the Hungarian as opposed to the German tongue. The inhabitants are good-natured, hospitable, and fond of luxury and display. The upper classes are much addicted to sports of all kinds, and cultivate horse-racing, fox-hunting, and rowing with energy and success. Almost the only popular festival of importance, that of St Stephen on the 20th August, when thousands of people flock to inspect the relics of that saint in the palace-church of Buda.

History.—The origin of Pesth proper is obscure, but the name, apparently derived from the old Slavonic "pesti," a stove (like Ofen, the German name of Buda), seems to point to an early Slavonic settlement. The Romans never gained a foothold on this side of the river, though Aquincum, on the site of old Buda, is believed, from the extant remains to have contained about 60,000 inhabitants. When it first appears in history Pesth was essentially a German settlement, and a chronicle of the 13th century describes it as "Villa Teutonica ditissima." Christianity was introduced early in the 11th century. In 1241 Pesth was destroyed by the Tatars, after whose departure in 1244 it was created a royal free

city by Bela IV., and repossessed with colonists of various nationalities. The succeeding period seems to have been one of considerable prosperity, though Pesth was completely eclipsed by the sister-town of Buda with its fortress and palace. In 1526 Pesth was taken and pillaged by the Turks, and from 1541 to 1586 Buda was the seat of a Turkish pasha. Pesth in the meantime entirely lost its importance, and on the departure of the Turks was left little more than a heap of ruins. Its favourable situation and the renewal of former privileges helped it to revive, and in 1723 it became the seat of the highest Hungarian officials. Maria Theresa and Joseph II. did much to increase its importance, but its rapid growth which enabled it completely to outstrip Buda belongs entirely to the 19th century. A signal proof of its vitality was given in 1838 by the speed and ease with which it recovered from a disastrous inundation that destroyed 3000 houses. In 1848 Pesth became the seat of the revolutionary diet, but in the following year the insurgents had to retire before the Austrians under Windischgratz. A little later the Austrians had to retire in their turn, leaving a garrison in the fortress of Buda, and, while the Hungarians endeavoured to capture this position, General Hentzi retaliated by bombarding Pesth, doing great damage to the town. The inhabitants to the number of 50,000 took refuge in the Stadtvaellen. Between 1867 and 1873 Pesth is said to have doubled in size, and during the last four or five years the building activity has been little if at all inferior.

(C. P. M.)

PETAU, DENYS (1583-1652), better known in some departments of literature under the Latin form of his name as DIONYSIUS PETAVIUS, a highly-distinguished Catholic theologian and one of the most learned men of the 17th century, was born on 21st August 1583 at Orleans, where his father was a well-to-do merchant with some literary culture. Petau received his early education at Orleans, but finished his university course in Paris, where, after graduating in arts, he attended theological lectures at the Sorbonne. By Isaac Casaubon, who had perceived his abilities, he was introduced to the MS. treasures of the Bibliothèque Royale, and, at the suggestion of that scholar, he began to work for the edition of Synesius which he afterwards published. In 1603, before he had completed his twentieth year, he received a teaching appointment in the faculty of philosophy at the university of Bourges; here his leisure hours were devoted to his editorial labours and to a systematic study of the ancient philosophers and mathematicians. Having come under the influence of the learned Jesuit Fronton le Duc, he was induced to resign his post at Bourges in order that he might join the Society of Jesus, and in June 1605 he entered upon his novitiate at Nancy. After an interval of four years, he taught rhetoric successively at Rheims, La Flèche, and Paris, taking the four vows of the order at the last-named place in 1618, from 1621 to 1644 he was professor of positive theology in the college of the order. On account of growing infirmities and to secure leisure for his great work, to be mentioned below, he then retired from teaching duties, but retained the librarianship in the Collège de Clermont until his death, which took place on 11th December 1652.

The list of Petau's literary labours bears witness to an extraordinary and many-sided activity, and includes several works which still enjoy the recognition of scholars. He edited Synesius (1611, 2d ed. 1631, 3d ed. 1633), Themistius (1613), Juhan (1630), the *Invocarium* of Nicephorus (1616), and Epiphanius (1622); his *Animadversiones* on the last-named have been reprinted by Dindorf as a still uncheated mine of valuable material, in the fifth vol. of his *Epiphanius Opera* (1859). Carrying on and improving on the chronological labours of Scaliger, he published in two folio volumes an *Opus de doctrina temporum* (1627, frequently reprinted), followed in 1630 by *Uranologion s. systema variorum authorum graecae sphaerae ac sideribus eorumque mobibus graece commentatus sunt et Parvarum dissertationum ad Uranologion libri VII.* Of the first-mentioned of these he made an abridgment, entitled *Rationarium temporum*, which passed through numerous editions, was translated into English and French, and in a recent reprint has been brought down to the year 1849. In theology proper Petau's first appearance was polemical, and quite in the manner of that time,—a pseudonymous criticism on the recently-published com-

mentary of Salmasius on Tertullian's *De Pallio* (*Antoniae Ke. Loetii Antonii us animadversionum liber*, 1622). The controversy was continued in a series of replies and rejoinders, and was renewed in connexion with other publications of his distinguished antagonist. In particular, some references to the church doctrines as to the authority of bishops made by Salmasius in his *De fœderis interpretatio* was the occasion of Petau's *Dissertationum ecclesiasticarum libri duo, in quibus de episcoporum dignitate et potestate deque aliis ecclesiasticis dogmatibus disputatur* (1641) and also of his *De ecclesiastica hierarchia libri V* (1641). Petau also had his share in the Jansenist controversy, and has the honour of being twice mentioned as a Jesuit authority in the *Provinciales*. His first appearance in the dispute was against Arnould's *De la fréquente communion*, which he met with a treatise, *De la penitence publique et de la préparation à la communion* (1643), his subsequent works, viewed in the light of the struggle then at its height, explain themselves by their titles (*De lege et gratia libri II* (1648), *De Trulentum consensu interpretatione et S. Augustini doctrina* (1649), *De adiutorio sine quo non et adiutorio suo* (1651)). In his great but unfinished work, *De theologiae dogmatibus* (3 vols. fol., 1644-50), he deals with the doctrine of God, the Trinity, Creation, and the Incarnation; his design had been to complete it by an exhaustive treatment of the sacraments and of the Christian graces and virtues. Its scope, which was to free theology from the subtleties of scholasticism and to rest the science on the simple and firm basis of Scripture, the councils, and the fathers, is well enough explained by his own avowal, "nova quædam alii, mihi prisca peto." The work is a treasury of well-digested learning, and justly entitles its author to the name of *Mirator*, who speaks of him as "the restorer of dogmatic theology." By some of his fellow-Jesuits he was supposed to have been too ready to recognize the Jansenism of Augustinus, and in various quarters his declaration that many of the ante-Nicene fathers were less orthodox than the decrees of the first council has been made a matter of reproach. But in these charges the impartial critic will recognize only proof of his candour. Petau, it may be added, was a rigid ascetic, and in particular is said to have indulged in the discipline of self-flagellation to a degree that injured his health.

PETER Simon Peter was "an apostle of Jesus Christ" (1 Peter i. 1). His two names are both found in two forms (1) of the one the full form is Symeon (Συμεών, Συμεών), which is found in the speech of James, Acts xv. 14, and in most MSS of 2 Peter i. 1, the shorter and more usual form being Simon, the other is found both in its Greek form Peter (Πέτρος) and in the Grecized form Cephas (Κεφάς) of the Aramaic Kepha (כֶּפֶא). Simon is the name by which he is always addressed by Jesus Christ, Peter is that by which he is most commonly spoken of in the Synoptic Gospels, the Acts of the Apostles, and subsequent ecclesiastical literature, the combined name, Simon Peter, is found once in St. Matthew, once in St. Luke, and frequently in St. John; sometimes Peter is expressly stated to be a surname (Matt. iv. 18, x. 2; Acts x. 6, 13, 32, xi. 13); St. Paul, in 1 Cor. and in Gal. i. 18, in 1, 14 (according to the chief uncial MSS., except D), uses Cephas, but in Gal. ii. 7, 8, he uses Peter.¹ The name of his father is also found in two forms, John (*Ἰωάννης*, *Ἰωάνης*, in most MSS of John i. 42, xxi. 15, 16) and Jonas (*Ἰωάνης*, Matt. xvi. 17, and cod. A in John). In John i. 44 he is said to have been of Bethsaida, which was possibly the place of his birth; but it appears from Mark i. 29 (= Matt. viii. 14, Luke iv. 38) that he and his brother Andrew had a house together at Capernaum. With the same brother, and with James and John as partners, he was engaged in what was probably the thriving business of a fisherman on the Lake of Genesareth; and from the fact that he went back to his business after the resurrection it has been inferred that, at least up to that time, he had never wholly left it. That he was married is clear from the mention of his wife's mother

¹ Throughout the New Testament the Peshito-Syriac uses Cephas where the Greek has Peter, and there is no reasonable doubt of the identity of the two names; but Clement of Alexandria, in a fragment preserved by Eusebius, *II. E. p.* 12, 2, and the so-called "Two Ways" (Harnack, *Lehre der zwölf Apostel*, p. 295, and Hilgenfeldt, *Nom. Test. eccles. Canonem receptum*, fasc. iv. p. 111) take them to refer to different persons, probably from an unwillingness to believe that Gal. ii. 11 really referred to Peter.

(Mark i. 30 and parallels), and that his wife accompanied him when he finally left his home to preach the gospel as implied by St Paul (1 Cor. ix. 5), there is an early tradition, which is not inconsistent with probability, that she also suffered martyrdom, and that Peter called out to her as she was being led away, "O wife, remember the Lord!"¹ The statement that he had children² is probably only an inference from the fact of his having been married, the alleged name of his daughter, Petronilla, is as suspicious as the story of his having cured her of the palsy³, and the majority of commentators take the expression "Mark, my son," in 1 Peter v. 13, to refer only to spiritual kinship.

Of the beginning of his discipleship there are two accounts which have sometimes (by Baur, Keim, Holtzmann, and others), though without sufficient reason, been supposed to be inconsistent with each other.

(1) According to St John, he was brought to Jesus by his brother Andrew, who had been a follower of John the Baptist, but who, after the Baptist's testimony, recognized in Jesus the promised Messiah (John i. 40-42). The fact that he was then not at Capernaum but in the Jordan valley, where John was baptizing, seems to indicate that he, like his brother, had been attracted by John's preaching. It is not stated that he at once became one of those who followed Jesus, and there is consequently room for the supposition that he returned home, and the statement that it was upon the occasion of this first meeting that he received his distinctive surname, Cephas or Peter, is not inconsistent with Mark in 16, Luke vi. 14, which mention the fact rather than the occasion, or with Matthew xvi. 18, which gives to an existing name a new application.

(2) According to St Matthew and St Mark, it was at the beginning of the Galilean ministry that Jesus called Simon and Andrew to become "fishers of men" (Matt. iv. 18-20; Mark i. 16-18). The manner of the call seems to imply a previous acquaintance, and is consequently not out of harmony with that of St John. It is less easy to determine whether the account in Luke v. 1-11 refers to the same or to a different incident. Schliermacher, Neander, Bleek, and others treat it as the fuller and more accurate account, Ewald, Weiss, Keim, and others regard the miraculous draught of fishes as a reminiscence of a later tradition, and probably identical with John xxi. 5-11.

From the time of his call Peter has a place in most of the important events of the Gospel narrative. It was to his house in Capernaum that Jesus went as if to a home (Matt. vii. 14; Mark i. 14, 33; Luke iv. 38), and it is consequently sometimes spoken of as simply "the house" (Matt. ix. 28, xii. 1, 36, xvi. 25). He formed, with his two former partners, James and John, an apostolic triumvirate, which was admitted when all others were excluded, and to whom, with Andrew, was committed the great prophecy of the last days (Mark xiii. 3). The most important incident which is recorded of him between his call and the crucifixion is that which happened at Caesarea Philippi (Matt. xvi. 13-23; Mark viii. 27-33; Luke ix. 18-22, probably recorded in substance, though in a different form, in John vi. 66-69). The incident links itself closely with the history which had immediately preceded it. The expectation which the Galilean peasantry had begun to form of Jesus had been disappointed; the miracles of healing and feeding had not been followed by the assumption of the national leadership, many of the disciples had begun to drift away, and those who were looking for the Messiah saw in Him only "one of the prophets." Those who

remained were tested by a direct question, whether the form of the question was that of the Synoptists, "Whom say ye that I am?" or that of St John, "Will ye also go away?" it was Peter who answered for the rest, in words which have an equivalent meaning, whether they were in the form "Thou art the Christ," or in the form "Lord, to whom shall we go? Thou hast the words of eternal life." The further detail which St Matthew gives, xvi. 17-19, has sometimes been thought to be a later addition, reflecting a fact of subsequent ecclesiastical history, but its absence from St Mark does not seem to be an adequate ground for rejecting it, and its substance is found in Justin Martyr (*Tryph.*, c. 100). Round the words which St Matthew records many controversies have raged, nor does it seem possible, with existing means of investigation, to fix to the sentence "upon this rock I will build My church" a meaning that will be beyond dispute. Whatever may be its precise meaning, it seems at any rate to be in harmony with other passages of the Synoptic Gospels, which indicate, not only that Peter was foremost among the apostles by virtue of natural force of character, but that he was also their ordinary leader and representative: the most important passage is Matt. x. 2, where the expression "the first," which is applied to him, cannot be restricted to mere priority of enumeration in the list. It is possible that his colleagues James and John, or their more ambitious mother, endeavoured to dispute this position with him (Matt. xx. 20, 21; Mark x. 35-37), and it has been contended (Baur, Strauss, Holtzmann) that in the Fourth Gospel John holds the place which the Synoptists assign to Peter, but even if this contention were admitted it would merely afford one more argument to show that the priority of rank was limited by natural affection as well as by the law of equality among the Christian brotherhood (Matt. xxiii. 8-11; Mark ix. 33-35; Luke xxii. 24-27). But, although Peter was foremost in expressing the confident belief of the disciples that Jesus was the Messiah, it seems clear that in his conception of the Messiah he did not rise above the current ideas of his countrymen. "He that should come" was to be a national deliverer. This conception appears on two occasions especially—when Jesus first told the disciples of His coming sufferings, "Peter took Him and began to rebuke Him," and received the answer, "Get thee behind Me, Satan," as though this attitude of the disciples were a new temptation (Matt. xvi. 21-23, Mark viii. 31-33), and, when Jesus was actually in the power of His enemies, and no "legions of angels" appeared either to rescue or to enthronize Him, Peter's natural hopefulness gave way to complete despondency, and he more than once "denied that he knew Him."

In the earliest account of the resurrection (that of St Paul, 1 Cor. xv. 5) it is mentioned that Jesus appeared to Peter before and separately from the twelve, and the last chapter of the Fourth Gospel gives him an especial prominence: it adds one more example of the impulsive energy of his character (ver. 7), it portrays more vividly than any other passage in the Gospels the depth of his attachment to his Master (vers. 15-17), and it forecasts the manner of his death (vers. 18, 19). His prominence in the early community at Jerusalem is proved by the testimony of St Paul, for it was to visit "Cephas" that he made his first journey to Jerusalem after his conversion, and fourteen years afterwards, though James and John as well as Cephas "were reputed to be pillars," it was the latter who stood out above the rest as the special preacher of "the gospel of the uncircumcision" (Gal. i. 18, ii. 1-10). These facts undoubtedly confirm the general picture of the relations of Peter to the early church which is drawn in the Acts of the Apostles; at the same time no part of the New Testament has been more strongly attacked by modern

¹ Clem. Alex., *Strom.*, vii. 10, p. 869, quoted by Eusebius, *II B.*, iii. 80, 2.

² Clem. Alex., *Strom.*, iii. 6, p. 535, quoted by Eusebius, *ibid.*

³ St Augustine, c. *Admont. Manich.*, c. 17, vol. viii. 139, ed. Ben

writers than the first twelve chapters of that book, in which the "Acts of Peter" are contained. The attack has been made (Daur, Schwegler, Overbeck, Zeller, and others) partly on the speeches and partly on the narrative. (1) It is alleged that the Petrine speeches form no exception to the general uniformity of phraseology and style which characterizes the Acts, and that they ignore the marked differences in the conception of Christianity between Peter and Paul. It must be admitted that the coincidences are such as to render it probable that the author of the Acts dealt freely with his materials, but at the same time the peculiarities are sufficiently numerous to support the view that these speeches contain a true representation of the primitive teaching.¹ (2) The narrative passages which have been most keenly contested are those which relate to Simon of Samaria and to Cornelius. It is alleged that the account of the former is the mere reflex of the later legends in which the name of Simon Magus was substituted for that of St Paul as the representative of false Christianity, and it is said of the latter that it is a mere attempt to claim for Peter the opening of the door to the Gentiles which was the special honour of Paul, and that it cannot be reconciled with the division of labour between the apostle of the circumcision and the apostle of the uncircumcision which is spoken of in the Epistle to the Galatians.² At the great crisis of early Christianity which is known as the conference or council of Jerusalem Peter advocated (according to the Acts), or accepted (according to Paul), the policy of conciliation. Afterwards he went to Antioch, where Paul had preceded him, and there he carried out his acceptance of Gentile Christianity to the further point of eating at the common meals at which Gentiles were present. For this step the members of the original community at Jerusalem were not prepared, and, when a deputation from them came to Antioch, Peter "drew back and separated himself" (Gal. ii 12). Thereupon followed an argument and a remonstrance on the part of Paul which has been fruitful of results to both ancient and modern Christianity. Peter was "withstood to the face" because of (1) inconsistency, (2) practical calumny of Christ, (3) transgression of the law, (4) making void the gift of God (Gal. ii 14-21). It is altogether too much to assume that this remonstrance led to a permanent alienation of the two apostles from one another, it is more probable that with a character such as Peter's, which had more energy than steadiness of resolution, it may even have been effectual. But it is upon the assumption of such an alienation that the Jewish party in the ancient church pictured Peter as the champion and hero of the faith, and Paul as its vanquished opponent, and also that in modern times the Tübingen school have endeavoured to reconstruct not only early church history but also the New Testament.

This incident at Antioch is the last that is certainly known of Peter. The prophecy recorded in John xxi 18, 19, is in harmony with early tradition in pointing to a violent death. But of the time and place of that death we know nothing with even approximate probability. The only historical mention of him for more than a hundred years afterwards is in Clement of Rome (*Ep.*, i 5, 4), who sets before the Corinthians the example of "Peter, who through zeal undertook not one or two but numerous labours, and so having borne witness went to the place

that was due to him." It is sometimes supposed that an indication of the place in which he "bore witness" or "suffered martyrdom" is afforded by the phrase "among us," i.e., among the Romans, in the next chapter, but this, though possible, is quite uncertain. Outside this statement, which if it were more definite would be conclusive, there is only the doubtful interpretation of "Babylon" in 1 Peter v 13 as meaning "Rome," and the echo of a vague tradition in the apocryphal *Petri et Pauli Predicatio*.³ The testimony of the "presbyter" who is quoted by Papias in reference to Peter's connexion with Mark (Euseb., *H. E.*, iii 39, 15) says nothing of the place at which they were together, and the coupling of the names of Peter and Paul by Ignatius (*Ad Roman.*, c. 4) would not, even if the early date of Ignatius were established, afford a solid argument that "in their death they were not divided." But from the beginning of the last quarter of the 2d century the testimony to the presence and death of Peter at Rome is almost uniform, the tradition, whatever may have been its foundation in fact, had firmly established itself. Dionysius of Corinth (*Enseb.*, *H. E.*, ii 25, 8) says that Peter and Paul founded the church at Corinth together and then proceeded to Italy. Irenæus (*Adv. Hæres.*, iii 1) speaks of Peter and Paul as having together founded the church at Rome, the Muratorian Fragment (not earlier than the end of the 2d century) refers to the "passion of Peter," i.e., his martyrdom, the presbyter Gaus (Euseb., *H. E.*, ii 25, 7, early in the 3d century) says that he saw the *σπορά* (whatever that may mean) of the two apostles Peter and Paul at Rome, in Tertullian (*e.g.*, *Scorp.*, c. 15, *De Præscr.*, c. 24 and 36) the tradition is fairly established; and no later Latin father expresses any doubt of it.

But, besides the fact that there is an interval of more than a hundred years between what must have been, in the ordinary course of nature even if not through violence, the approximate time of Peter's death and the first certain tradition of the place and manner of it, there are two other important considerations which render the ordinary patristic statements doubtful. (1) One stream of tradition, for the existence of which it is difficult to account if the other tradition had been uniform, represents Peter as having worked at Antioch, in Asia Minor, in Babylonia, and in the "country of the barbarians" on the northern shores of the Black Sea. This is in harmony with the geographical details of the first of the two epistles which bear his name. That epistle is addressed to the "elect who are sojourners of the dispersion in Pontus, Galatia, Cappadocia, Asia, and Bithynia," and the "Babylon" from which it is obviously written (v 13) is best understood not as a cryptographic expression for Rome, but, like the other geographical names of the epistles of the New Testament, in a literal sense. All this, no doubt, is not inconsistent with the supposition that Peter went to Rome towards the end of his life, but it seems to exclude the theory that he made a lengthened stay there and was the founder of the Roman Church. (2) The other consideration is that the presence of Peter at Rome is almost inextricably bound up with a story of whose legendary character there can be little doubt, that of the Simon Magus of the *Clementines*.⁴ Under the name of Simon Magus the conservative Jewish Christians, who could never forgive the admission of the Gentiles to be "fellow-heirs" with the "children of the promise," seem to have represented Paul⁵ and, throwing

¹ The question of the relation of their language to the rest of the Acts and to the Petrine epistles is discussed in detail with various results by several writers, e.g., Meyerhoff and Weiss in the works mentioned below, and more fully Kahler in *Studien u. Kritiken* for 1873, p. 492 sq.

² The details of the discussion will be found in most recent books which deal with the Acts; on the negative side the most convenient book for English readers is the translation of Zeller's *Contents and Origin of the Acts of the Apostles*, 1875.

³ Hilgenfeld, *Nov. Test. extra Can. rec.*, fasc. iv p. 57.

⁴ Uhlhorn, *Die Homilien u. Recognitionen des Clemens Romanus*, Göttingen, 1855, makes an unsuccessful attempt to show that the two stories may be separated.

⁵ For the detailed proofs of this reference may be made to Baur, *Church History*, B. T., vol. i. p. 91; Zeller, *The Acts of the Apostles*, B. T., vol. i. p. 260; and Hilgenfeld, in his *Zurichyrt f. wissenschaft. Theologie*, 1868, p. 387.

back into the 1st century, and into the personal relations between the two apostles, the violent controversies between the catholic and the Jewish parties which came to a head in the 2d century, they framed a romance of which Peter was the hero, and in which, under the mask of Simon Magus, Paul played the part of the "false apostle." The romance in its original form has perished, its substance is partly preserved and partly recast in the Clementine *Homilies and Recognitions*, of which the former exist in their original Greek, the latter in an incomplete Latin translation. In course of time the original identity of Paul with Simon Magus was forgotten, and in the later forms of the legend (see the *Acts of Peter and Paul* below) Peter and Paul are joined together in the combat with the pretender. But in almost all later patristic accounts of Peter Simon Magus has an important place; he is said to have gone to Rome in the time of Claudius, and Peter is said to have at once followed him in 43 A. D., hence, as Peter lived until the Neronian persecution in 67 there was room for an episcopate of twenty-five years. Thus last tradition can hardly be reconciled with the facts mentioned in the New Testament of his presence at Jerusalem and at Antioch (Acts xv; Gal. ii); but Lipsius has endeavored to show, not only that single points in the story must be given up, but that the whole tradition of the presence of Peter at Rome is a fiction which grew out of the Judæo-Christian attack upon Paul.

The probabilities of the case are evenly balanced; on the one hand it is difficult to account for the complete silence as to Peter in the Pauline epistles, and it is impossible with those epistles in sight to regard Peter as the founder of the Roman community, on the other hand, it is difficult to suppose that so large a body of tradition had no foundation in fact; such a supposition, besides its general improbability, would assume that the extreme form of Judæo-Christianity which the *Clementines* reflect had a much greater influence over the conceptions of the 2d century than the evidence warrants.¹

¹ The question whether Peter was ever at Rome has been so much discussed that the following list of the chief treatises and articles on either side will be convenient for reference, it is not exhaustive. The question was at first discussed as one between Protestants and Catholics. The earliest treatise on the Protestant side is probably that of Ulrich Velehm (Velehm) in his *Demonstratio contra Romanam ymaginem privatis signum*, 1620, reprinted by M. Flavius Illyricus in his *Refutatio innotens Di. vni. consilii a. historiam ecclesiasticam*, p. 86; it was answered at the time by Bishop Faber of Rochester in his *Conversio calumniam Aldrichi Velehm*, reprinted in his works, ed. Würzburg, 1607, p. 1299. The most important account of the older arguments on the Catholic side is that of Spanheim, *Dissertatio de fidei professione. Petri Apostoli in urbem Romanam deique non va. traditionis origine*, 1679, reprinted in his works, Leyden, ed. 1703, vol. ii, p. 331. In modern times the question has been discussed chiefly on literary grounds and without reference to its bearing on the Roman controversy. It was first stated on the negative side by Baur in the *Tübinger Zeitschrift für Theologie*, 1831, p. 136, and in his *Pastor*, B. 7, vol. i, p. 236. His most important account of the older arguments on the Catholic side, the *Chronologie der römischen Bischöfe*, Kiel, 1839, and *Die Quellen der römischen Petrus-Sage*, Kiel, 1872, are of great value apart from the results which they endeavor to establish; he also deals with the question more concisely in the *Jahrb. f. deutsche Theol.*, 1876, p. 561. On the same side are Mayhoff, *Historisch-kritische Einleitung in die petrusischen Schriften*, Hamburg, 1836, Gundert, in the *Jahrb. f. deutsche Theol.*, 1869, p. 303, Holzmayer, e. g. "Petrus," in Schenkel's *Bibliothek*; Huvelin, in *N. D. Z. f. wissenschaftl. Theol.*, vol. ii, p. 344, Zeller, in the *Deutsche Rundschau*, 1875, p. 215 (reprinted in his *Vorträge u. Abhandlungen*, 2te Samml., 1877), and in the *Z. f. wissenschaftl. Theol.*, 1876, p. 31. The truth of the early tradition has been maintained in opposition to these writers by Ciedner, *Einleitung in das N. T.*, 1836, p. 62; Olshausen, *Romerbr.*, 1840, p. 40; Wieseler, *Chronologie des apost. Zeitalters*, 1846, p. 553, Bwald, *Gesch. des Volkes Israel*, vol. vi, p. 618; Hilgenfeld, in *N. D. Z. f. wissenschaftl. Theol.*, 1872, p. 373, 1876, p. 67 (in answer to the article of Zeller in the same number mentioned above), 1877, p. 486 (in answer to the article of Lipsius mentioned above); Deitrich, in *Stud. und Krit.*, 1874, p. 213; Renan, *L'Antéchrist*, p. 186, and appendix; Seyerlein, *Entstehung*

It would be inappropriate to enter in the present article into the causes and consequences of the enormous influence which the belief that Peter founded and presided over the first Christian community at Rome has exercised upon Christianity. It was no doubt natural, considering that influence, that curiosity should be largely exercised as to the details of his life and death at Rome, and that legends of respectable antiquity should express themselves in visible memorials. Modern Rome contains many such memorials. The chapel of S. Pietro in Carcere preserves the tradition that he was imprisoned in the Tullianum, and that a spring of water issued from the ground that he might baptize his gaolers. The churches of S. Prassede and S. Pudenziana preserve the tradition that much of the later part of his life at Rome was spent in the house of Rufina on the Viminal Hill. The latest localisation of a legend has built a church outside the old Porta Capena to mark the spot where, when he was fleeing from persecution, he met his Master going into Rome. "Loi, whither goest Thou?" (Domine, quo vadis?) was his question. "I go to Rome to be crucified again" was his Master's answer. Besides these visible memorials of Petrine legends there are four annual feasts. (1) On 29th June is celebrated the Feast of St. Peter and St. Paul. The day is supposed to be that of their martyrdom, it is in reality that of the removal of their supposed remains in 258, which is recorded in the *Kalendarium Liberianum* of 354 (printed by Mommsen in the *Abhandlungen der königl. sächs. Gesellschaft, phil.-hist. Classe*, 1850, p. 862). Those of Peter were then rebuied "ad catacumbas," i. e., in the cemetery of St. Sebastian on the Appian Way, they were afterwards said to have been transferred to the basilica which Constantine erected on the Vatican. (2) On 29th January is celebrated a feast in commemoration of Peter as bishop of Antioch (*Festum Cathedrae Petri Antiochenae*), which also is mentioned as early as the *Kalendar Liberianum*. (3) On 18th January has been celebrated since the 8th century a feast in commemoration of his episcopate of Rome. (4) On 1st August has been celebrated since the 9th century a feast in commemoration of his imprisonment (*Festum S. Petri ad Vincula*), but whether of that by Herod which is mentioned in Acts xi, or of that by Nero, is uncertain.

Besides the two canonical epistles (see PETER, EPISTLES) of the following works have either been (erroneously) attributed to him or bear closely upon his history.

1 *The Gospel according to Peter*.—Eusebius (*H. E.*, vi, 12, 2-6) mentions that the public use of this Gospel was at one time allowed, but afterwards disallowed on the ground of its Docetism, by Serapion, the successor of Theophilus in the bishopric of Antioch (191-213). It is mentioned by Origen (*Hom.*, x, 17, vol. ii, p. 462), by Jerome (*De Vir. Illust.*, c. 1), and by Theodoret (*Hard. Fab.*, ii, 2). Hilgenfeld (*Nov. Test. extra canon. loc.*, fasc. iv, p. 39) thinks that it held a middle place between the *Gospel according to the Hebrews* and the *Gospel of the Ebionites*. No certain fragments of it remain.

2 *The Preaching of Peter* (*Πέρων κήρυγμα*), and

3 *The Journeys of Peter* (*Πέρων περιόδοι*).—These two works are mentioned together in the *Epistola to James* which is prefixed to the Clementine *Recognitions*, the former appears to have been Judæo-Christian, the latter was an attack on Paul under the guise of Simon Magus. Both works underlie the Clementine *Recognitions* and *Homilies*; the patristic references to them will be found in Hilgenfeld, *l. c.*, p. 52, and *Einleitung*, pp. 42, 155, 580, 618.

4 *The Preaching of Peter and Paul*.—This, in distinction from the previous one, belongs to the period at which Pauline and Petrine tendencies had become combined. The fragments of it and references to it are collected by Hilgenfeld, *l. c.*, p. 66.

5 *The Acts of Peter and Paul*.—The history of this work is obscure; in its present form (as printed by Tischendorf, *Acta Apostolorum Apocrypha*, p. 139) it is probably a late recasting of an earlier work or works. Of such earlier work or works there are traces which are collected by Hilgenfeld, *l. c.*, p. 66, in addition to the fact that, besides the period at which Pauline and Petrine tendencies had become combined, the fragments of it and references to it are collected by Hilgenfeld, *l. c.*, p. 66.

6 *The Acts of Peter and Paul*.—The history of this work is obscure; in its present form (as printed by Tischendorf, *Acta Apostolorum Apocrypha*, p. 139) it is probably a late recasting of an earlier work or works. Of such earlier work or works there are traces which are collected by Hilgenfeld, *l. c.*, p. 66, in addition to the fact that, besides the period at which Pauline and Petrine tendencies had become combined, the fragments of it and references to it are collected by Hilgenfeld, *l. c.*, p. 66.

7 *The Apocryphal Acts of Peter*.—This is mentioned as a deuterocanonical book in the Muratorian Fragment, by Clement of Alexandria (ap. Euseb., *H. E.*, vi, 14, 1), and by Eusebius (*H. E.*, in 26, 4). Theodoretus of Tyre placed it among the unapocryphal (*Synopsis*, i, 6), and Sozomen (*H. E.*, vi, 19) says that in some churches of Palestine it was publicly read once a year. A few short

and in the *Schicksale der Christengemeinde zu Rom*, 1874, p. 51, Schmid, *Petrus in Rom*, Lucerne, 1879 (which is a convenient summary of earlier literature and arguments rather than an independent contribution to the subject); Lange, *Geschichte der christlichen Kirche*, 1881, p. 40; Sieffert, in *Körner-Pitt.*, Z. 2, e. 4. The story is first found in a sermon sometimes attributed to St. Ambrose and printed in some editions of his works, e. g., ed. Pais, 1603, vol. v, p. 100.

fragments of it are collected by Gabe, *Spici*, i 74, and by Hilgenfeld, *l. c.*, p 71. (The work under the same title which was partly translated by Jacobus de Vitracio in the 13th century, and of which some MSS still remain, e.g., an Arabic translation in the Bodleian library—*MSS Arab. Christ.*, xlviii—is a much later composition.)

7. *Epistle of Peter to James*—This is prefixed to the Clementine Homilies (ed. Lagade, p. 1), according to Photius (*Biblioth.*, cod. 42, 113) there was a similar letter, which is now lost, prefixed to the *Recognitions*. Its character and literary value are the same as those of the Clementines in general.

8. *The Teaching of Simon Cephas in Rome*—This treatise exists in Syriac, and was first published and translated by Cherton, *Journal des Savantes*, 1864, p. 85 (since by B. P. Pratten, in the Antiquarian Library, vol. xx.). (A. H. A.)

PETER, EPISTLES OF. 1 *Peter*—The first of the two canonical epistles which bear the name of St Peter is addressed "to the elect who are sojourners of the dispersion in Pontus, Galatia, Cappadocia, Asia, and Bithynia." Most commentators in both ancient and modern times (e.g., of the former, Athanasius, Jerome, Euphrasius, of the latter, Lange, Weiss, and Benschlag) have interpreted this phrase to refer primarily to Jewish Christians. But this interpretation creates a difficulty. The countries named were countries in which St Paul and his companions had been especially active, and in which they had formed many communities, chiefly from the Gentile population. If therefore "the sojourners of the dispersion" be understood to refer to Jews, it becomes necessary to suppose the existence side by side in the same countries of two sets of communities, Pauline and Petrine, and further to suppose either (with Weiss) that the latter were already in existence when Paul preached, or (with the majority of writers) that Peter followed Paul upon his own ground. Both these suppositions are improbable, and it is preferable to understand the phrase of the "children of God that are scattered abroad" whether Jews or Gentiles. That some of the latter were included in it seems clear from i. 21, ii. 10, which imply that before they were Christians they knew not God, and from iii. 6, which implies that their wives had only now become daughters of Abraham.

The epistle was evidently written at a time when the Christians of Asia Minor were both calumniated (ii. 12, iii. 16, iv. 4, 14) and persecuted (i. 6, 7, ii. 14-17, iv. 12-19). It exhorts those to whom it was addressed not only to bear their trials patiently, and even to rejoice inasmuch as they were "partakers of the sufferings of Christ" (iv. 13), but also to give no occasion to the hostile world which surrounded them to reproach them as evildoers (ii. 12, 15, iv. 14, 15), and it specializes this exhortation to well-doing by addressing separately servants (ii. 18-26), wives (iii. 1-6), and husbands (iii. 7). This fact that Christianity had come to be persecuted, and also the fact, which is manifested in its whole tone, that Christians were in danger of retrograding, show that the epistle cannot be placed in the earlier part of the apostolic age. The time of the Neronian persecution is the earliest that will satisfy the required conditions; and some (e.g., Schwegler, Baur, Hilgenfeld) have thought that even this is too early for those conditions, and that it must be referred to the time of Trajan. It may, however, be said in reference to this latter view that the words of Tacitus in regard to the Christians under Nero, if they be not merely a reflexion from his own time, exactly suit the circumstances to which this epistle refers, "quos per flagitia universos vulgus Christianos appellabat" (*Ann.*, xv. 44).

Like most documents of the apostolic age, it deals less with doctrine than with practice. But, though the doctrine is incidental, it is clear, taken in connexion with the Petrine speeches in the Acts of the Apostles, with which it is on the whole in harmony, it probably gives a faithful transcript of the original apostolic teaching. The Messiah

of whom the prophets had spoken had been revealed (i. 10-12). He had come to suffer (i. 11) for sins (ii. 24, iii. 18), and by His sufferings He had rescued the elect from their former evil life (i. 18-20) and brought them to God (ii. 18), and in His conduct under suffering left an example for them to follow (ii. 21-23). Belief in God who raised Him from the dead on the one hand is a purification of the soul and an obedience to the truth, and on the other it results in love of the brethren (i. 22), it constitutes a bond of brotherhood, like that which had existed between the children of Abraham, and made the elect, what the Jews had failed to be, "a royal priesthood, a holy nation" (ii. 9, from Exod. xix. 6). But the fulfilment of the promise is not for this world, Christians are "strangers and travellers" (ii. 11), the end of all things is at hand (iv. 7), and that is the revelation of the glory of the Messiah in which those who believe in Him will be partakers (iv. 13, v. 1).

The picture of the Christian communities which the epistle presents is of the simplest, and is in entire harmony with the general facts of the apostolic and sub-apostolic age. The organization was that of the Jewish synagogues; the "elders" were as shepherds of the flock, exercising over the younger members the control of a simple discipline. The ministering to the wants of those who needed help was the common and personal duty of all who had wherewith to minister (iv. 10), and a special class of officers for the purpose was not yet needed. It is evident that "liberty of prophesying" prevailed, the only injunction on the point is, "if any man speak, let him speak as the oracles of God" (iv. 11).

The coincidences of thought and expression between some passages of this epistle and some passages in the Acts of Peter and Paul, and in both the disputed and undisputed epistles of St Paul have given rise to much discussion. The chief coincidences are the following—(1) between i. Peter and James, i. 6, 7, and i. 2, 3, i. 12 and i. 25, i. 22 and iv. 8, ii. 1 and i. 21, iv. 8 and v. 20, v. 5, 9, and iv. 6, 7, v. 6 and iv. 10; (2) between i. Peter and Romans, i. 14 and xii. 3, ii. 6 and xii. 1, ii. 6-10 and ix. 82, ii. 18 and xii. 1, ii. 9 and xii. 19, ii. 22 and xii. 34, iv. 8, 9, and xii. 18, v. 9 and xii. 18, v. 10 and xii. 6; (3) between i. Peter and Ephesians, i. 1 *sy* and i. 8 *sy*, i. 14 and ii. 3, ii. 18 and vi. 5, ii. 1 and v. 22, ii. 22 and i. 20, v. 5 and v. 21. Of these coincidences several explanations have been given. Weiss (*Die petrusische Lehrbegriffe*, 1855, and *Biblical Theology of the New Testament*, E. T., vol. i. p. 167) holds that this epistle preceded the other epistles and gave rise to the expressions which they contain. The Tübingen school hold that the contrary is the case, and that it represents either a late and weakened form of Paulinism (Baur, Zeller, Pfleiderer), or an attempt to mediate between the Pauline and Petrine parties by clothing the doctrines of the latter in the phraseology of the former (Schwegler). Others (notably Mayerhoff, *Erklärung in die pet. Schriften*, 1836) consider that there is no copying on either side of the other, but that all the coincidences of expression come from a common stock of apostolic teaching.

The epistle was used by Papias and is possibly referred to by Polycarp, and it is expressly quoted by Irenaeus and Tertullian; it is not mentioned in the Muratorian Fragment, but it is translated in the Peshito version, and is included by Eusebius among the admitted books (*homologoumena*). Its genuineness was generally admitted until the present century, and some of its peculiarities have been accounted for by the hypothesis of its having been originally written in Aramaic, and translated, or possibly amplified, by Mark or Silvanus. On the other hand there are some who hold that the attacks upon it by Schwegler, Baur, Pfleiderer, Holtzmann, and others have been stronger than the defence of it.

2 *Peter*.—The second epistle is addressed to a wider circle than the first, i.e., to Christians in general. Its aim is mainly polemical; it is directed partly against a tendency towards libertinism, which was growing up and which took for one of its supports the Pauline doctrine of Christian freedom (ii. 1, iii. 16), and partly against the reaction which had set in against the earlier eschatology (ii. 3, 4). It protests in powerful language against the separation of Christianity from holy living, maintaining that Christianity without holy living is worse than no Christianity at

all (c ii), and it reasserts the reality of the Second Coming, resting it upon the reality of the supernatural evidence of the First Coming (1 16 18).

The correspondence between this epistle, especially c ii, and that of Jude is too strong to be a mere coincidence. It was at one time supposed to be the original which Jude imitated (so Semler and Michaelis, and more recently Luthardt and Hofmann), but the preponderance of opinion in modern times is in favour of the opposite view (not only by those who question the authenticity of this epistle but by some also of those who maintain it, e.g., Weiss). A leading argument in favour of the latter hypothesis is that 2 Peter ii 13-17 is an amplification (and some maintain also a misapplication) of Jude ii 11, 12, and that 2 Peter ii 11 requires Jude 9 for its explanation. An equally well marked correspondence has recently been pointed out between this epistle and Josephus, and the balance of probability is in favour of the priority of the latter.¹

The differences of style which distinguish the second from the first epistle have been noted since the time of Jerome (*De Vir. Illust.*, c i, and *Epist. ad Helio.*, c ii). They are sometimes explained on the ground of the epistles having had different purposes, or having been written at different times; they are more commonly used as indications of a difference of authorship; and, although the argument from differences of style in comparatively short documents cannot be held to be decisive where the external evidence in their favour is strong, such is not the case with this epistle. The external evidence for it is singularly weak; there are no certain traces of it earlier than the 3d century, when Origen (ap. Euseb., *H. E.*, vi 26), who is the first to mention it, also mentions that it was questioned. It is not included in either the Muratorian Fragment or the Peshito-Syriac (though it is in the later Philoxenian). Eusebius (*H. E.*, in 3) ranks it among the disputed books (*antilegomena*), and Jerome, although he included it in his translation (which fact probably accounts for its general acceptance in the Western churches), mentions that many rejected it. These doubts of early writers, which were revived by Erasmus and Calvin, have been shared by a large proportion of those who have written on the book in modern times; at the same time it cannot be said that there is a consensus of opinion against it.

The best editions of both the epistles are those in the commentaries of De Wette and Meyer, as revised the former by Bucke and the latter by Huther (this has been translated, with the text of Meyer's *Commentarii*, into English, there is a convenient short English commentary by Dean Plumptre in the *Cambridge Bible for Schools*). For the doctrinal and other questions which arise out of the two epistles reference may be made, in addition to the works mentioned in the course of the article, to Weiss, "Die petrusche Frage," in *Stud. u. Krit.*, 1866, p. 612; Grimm, "Das Problem d. ersten Petrus," *ibid.*, 1872, p. 637; Schmidt, *New Testament Theology*, translated in Clark's Foreign Theological Library, Messner, *Die Lehre des Apostels*, 1866, Paris; *Early Days of Christianity*, vol. i, pp. 121, 174, and Sieffert, s.v. "Petrus," in Herzog-Platt's *Real-Encyclopædie*, 2d ed. vol. xi. (E. H. A.)

PETER OF BLOIS, otherwise known as PETRUS BLESSENSIS, a writer of the 12th century, was born at Blois in France about the year 1120. He studied theology at Paris, where one of his teachers was John of Salisbury, who exercised a considerable influence over him; he afterwards resided for some time as a student of law at Bologna. He was then appointed preceptor to William II. of Sicily, and in 1167 made keeper of the privy seal (augillifer); political occurrences, however, compelled his return in the following year to France, whence he was invited into England by Henry II., who made him his private secretary. About 1176 he withdrew from court and entered the household of Richard, archbishop of Canterbury, whose chancellor he became.

This office he also held under Baldwin, Richard's successor, by whom he was sent to Rome in 1187 to support his cause in the controversy with the monks of Canterbury. Peter died about 1200.

His writings, which cover all the fields of intellectual activity then accessible, show him to have been one of the most widely and deeply learned men of his age. They include a number of allegorizing sermons and edifying tracts, a homiletic address, *De Tricolymidana peregrinatione acceleranda*, a discourse *Contra periculum Judaeorum*, and, most interesting for its bearing on the political and ecclesiastical history of his time, a collection of 188 letters to Henry II., as well as to various popes, cardinals, and scholars, including his old master John of Salisbury. The best edition of his works is that of Pierre de Goussauville, Paris, 1667, fol.

PETER THE HERMIT, the apostle of the first crusade, was born of good family, it is supposed, in the diocese of Amiens about the year 1050. His early history is obscure, but he appears to have seen some military service under the counts of Boulogne before his withdrawal from the world as a hermit. His crusading zeal originated in a pilgrimage he made to the Holy Sepulchre shortly before 1094, in which year he began to preach in the transalpine countries the immediate deliverance of Jerusalem from the infidel (see CRUSADES, vol. vi, p. 623 sq.). After the failure of the expedition headed by him in 1096, he founded and became first prior of the abbey of Neumünster at Huy in the diocese of Liège, where he died on 7th July 1115.

PETER I., ALEXEIEVICH, surnamed THE GREAT (1672-1725), czar of Russia, was born at Moscow on 11th June 1672. His mother, Natalia Narishkina, was the second wife of the czar Alexis. He was taught reading and writing, and the limited range of subjects which then constituted education in Russia, by the deacon Nikita Zotoff. He came to the throne in the year 1682, on the death of his elder brother Feodore, there was another brother, Ivan, who was six years his senior, but he was weak both in body and mind. Feodore therefore had wished Peter to succeed him, but Sophia, his sister, a woman of strong character and great ambition, was desirous that Ivan should rule, so that she might be proclaimed regent and in reality exercise the sovereignty. She therefore fomented a revolt of the "streltzi," or native militia, and the result was a compromise, whereby Ivan and Peter were to reign jointly. On the death of Ivan in 1696 Peter became sole ruler, and punished Sophia by incarcerating her for life in the Devichi monastery, where she died in 1704.

With the aid of Lefort, a Swiss adventurer, and other foreigners, Peter commenced his remarkable reforms, for which see RUSSIA. Here nothing more than a brief summary of the leading events of his life is given. In the year 1696 he besieged and took Azoff, his great object being to give Russia a seaboard. In 1697 he made his first Continental tour, on which occasion he worked at the dockyards of Zeeland and Deptford. On leaving England he took with him many ingenious men who wished to try their fortunes in a new country,—among them Perry the engineer, who has left us an interesting account of Russia at that time. From England Peter went to Vienna, where he studied the tactics of the imperial army, then enjoying a great reputation throughout Europe, and was meditating a visit to Italy when he heard of a revolt of the streltzi, fomented by the partisans of the old régime, in consequence of which he hurried back to Moscow, and on his arrival punished the rebels with the greatest severity.

In the year 1700 he joined Poland and Denmark against Sweden. Although defeated at Narva the same year, he pursued his plans unremittently, and in 1709 won the battle of Poltava, after which Charles, the Swedish king, became a fugitive in Turkey. In 1703 the foundations of St Petersburg were laid. Peter had married in 1689

¹ Abbott, in the *Expositor*, 1882, p. 49, and Farrar, *The Early Days of Christianity*, vol. i, p. 190.

Eudoxia Lopukhin, but had divorced her in 1696, she bore him a son, Alexis. In 1711 he took as his second wife Maria Skavronska, whom he caused to be baptized in the Greek Church under the name of Catherine. In this year took place Peter's unsuccessful campaign in Turkey, which ended with the loss of Azoff. The well-known story of his being rescued by Catherine when on the point of being obliged to surrender to the enemy has been shown to be of very doubtful authority. In 1713 Peter had made himself master of a considerable strip of the Swedish coast. In 1716 he went on another European tour in the company of his wife, on this occasion he visited, among other places, Amsterdam, Copenhagen, and Paris. During his absence his son Alexis, who had been a constant source of trouble to him, became more rebellious and estranged from his father. He was openly leagued with the reactionary party in Russia, who looked forward to his assistance in reversing the policy of Peter, as soon as he should succeed to the throne. Peter on his return in 1718 forced his son to renounce all claim to the sovereignty. Alexis was afterwards tried for high treason and sentenced to death; soon it was given out that he had died suddenly. The fate of this wretched young man has only been ascertained in modern times, it seems tolerably clear that he sank under repeated inflictions of torture. His death is a dark stain upon the character of Peter. On 10th September 1721 the peace of Nystad was concluded, by which Sweden ceded Livonia, Esthonia, Ingria, Carelia, Viborg, and the adjacent islands to Russia. In 1724 Peter went to inspect the works on Lake Ladoga, and further weakened his constitution, which had long been in an unhealthy state on account of the continual excitement and arduous labours of his life. The czar died on 28th January 1725.

The character of Peter exhibits a strange congeries of opposed qualities. According to some he "knouted" Russia into civilization, others see in him the true "father of his country" and the founder of Russian greatness. In spite of his errors, no one will deny that he was a man of great genius, his was the "fiery soul that, working out its way," exhausted prematurely a vigorous physical organization. Although frequently cruel, on many occasions he showed humanity and tenderness, and even in his most violent fits of temper was amenable to advice, as he evinced in enduring the rebukes of Prince James Dolgoruki. All Russia seems but the monument of this strange colossal man. He added six provinces to her dominions, gave her an outlet upon two seas, a regular army trained in European tactics in lieu of the disorderly militia previously existing, a fleet, and a naval academy, and, besides these, galleries of painting and sculpture and libraries. The title of "Great" cannot justly be refused to such a man.

PETER II., ALEXEEVICH (1715-1730), son of Alexis and grandson of Peter the Great, was born at St Petersburg in 1715, and ascended the throne in 1727. He was under the guardianship of Menshikoff, to whose daughter Mary he was betrothed. The faction of the Menshikoffs was overthrown, however, by the Dolgorukis, to a daughter of whose house the czar was now to be married. All these political plans were rudely broken by the death of Peter in January 1730. During his short reign this youth showed reactionary tendencies, and it seemed as if the capital of Russia was again to be transferred to Moscow. The young czar was buried in the cathedral of the Archangel in that city.

PETER III., FREDOROVICH (1728-1762), was son of Anna, daughter of Peter the Great, who had married the duke of Holstein. He was born at Kiel in 1728, his real names being Karl Peter Ulrich; he went to Russia in 1742 on being named heir to the throne. In 1745 he married Sophia Augusta, princess of Anhalt-Zerbst, who,

on entering the Greek Church, took the name of Catherine. They lived very unhappily together. In January 1762 the czarina Elizabeth died and Peter succeeded her. He soon became unpopular on account of his fondness for the Prussians and the introduction of German regulations in the army. His wife took advantage of his unpopularity and caused herself to be crowned empress, July 1762. Peter showed great want of energy, and only attempted to stem the insurrection when it was too late. He was removed to Ropsha in the government of St Petersburg, and, after having been forced to sign a renunciation of all rights to the throne, was strangled by Orloff and others. He was first buried in the Alexandro-Neviski monastery, but his remains were removed in 1796 by Paul to the Petropavlovski church.

PETERBOROUGH, a city and municipal and parliamentary borough, chiefly in Northamptonshire, but partly in Huntingdonshire, is situated on the river Nene, 76 miles north of London by the Great Northern Railway. The town is also a station on the London and North-Western, the Great Eastern, and the Midland systems. It is built chiefly along the river on the north side, the streets being straight and wide, and containing many good houses. The first bridge over the Nene at Peterborough was erected in 1140, the present bridge in 1872. The cathedral of St Peter is the third church that has occupied the site, the first, founded by Peada, king of the Mercians, in 656, was entirely destroyed by the Danes in 870, and the second, founded by King Edgar in 971, was accidentally burnt in 1116. The present building, founded in the following year, was inclusive of the west front, 120 years in building, being consecrated on 4th October 1237. It is one of the three Norman cathedrals in England, and, though scarcely entitled to a place among cathedrals of the first rank, possesses special features rendering it second almost to none in point of architectural interest. It embraces in all eight periods of construction, and in no other building can the transition be better studied through the various grades of Norman to Early English, while the later addition is an admirable example of Perpendicular. The edifice proceeded as usual from east to west, and, while an increase in elegance and elaboration is observable in the later parts, the character of the earlier buildings has been so carefully kept in mind that no sense of incongruity is produced. A series of uniform Decorated windows were added throughout the church in the 14th century, and the effect has been rather to enhance than detract from the unity of design. The choir, Early Norman, was founded on 12th March 1117 (or 7th March 1118) by John de Sez, and dedicated in 1140 or 1143; the aisles of both transepts and the whole of the south transept were built by Martin de Bec, 1140-55; the remaining portions of the transepts and the central tower, of three stories, were completed by William de Waterville, 1155-75; the nave, Late Norman, was completed by Abbot Benedict, 1177-93, who added a beautiful painted roof of wood; the western transepts, Transition Norman, were the work of Abbot Andrew, 1193-1200, the western front, with its magnificent triple arch, the unique feature of the building, and one of the finest specimens of Early English extant, must have been built between 1200 and 1250; but there exists no record of its construction. The lady chapel, built parallel with the choir by William Parys, prior, was consecrated in 1290; the bell-tower was erected by Abbot Richard between 1260 and 1274; the south-west spire, the pinnacles of the flanking tower of the west portal, and the enlargement of the windows of the nave and aisles were the work of Henry de Morcot in the beginning of the 14th century; the new building or eastern chapel in the Perpendicular style, begun in 1438, was not completed till 1528. In 1541 the

church was converted into a cathedral, the abbot being made the first bishop. The extreme length of the building is 471 feet, and of the nave 211 feet, the breadth of the west front being 156, the height of the central tower, as reconstructed in the 14th century, was 150, that of the spire and tower of the west front is 156 feet. In 1613 the building was defaced by the soldiers of Cromwell, who destroyed nearly all the masses and monuments, burnt the ancient records, levelled the altar and screen, defaced the windows, and demolished the cloisters. To obtain materials for repairs the lady chapel was taken down. In the latter part of the 18th century the church was repaired. In 1831 a new throne, stalls, and choir-screen were erected and other restorations completed. On account of the insecure state of the central tower in 1833, it was taken down; but it is now (1884) being rebuilt. Catherine of Aragon was interred in the cathedral in 1536, and Mary queen of Scots in 1588, but the body of the Scottish queen was removed to Westminster Abbey in 1612. Of the monastic buildings there are some interesting remains. The cathedral is approached by a Norman gateway, above which is the chapel of St Nicholas, built by Abbot Benedict, and now used as the music school, and on the left the chapel of St Thomas a Becket, built by Abbot Ashton in the 15th century, and now used as the grammar-school. The gateway to the bishop's palace, formerly the abbot's house, was built by Abbot Godfrey de Croyland in 1319, and the deanery gate by Abbot Kinton in 1515. One of the canonry houses is formed partly from a hall of the 13th century. To the north of the cathedral is Touthill, said to have been erected for the defence of the monastery.

Peterborough is included for civil purposes in the parish of St John the Baptist, but for ecclesiastical purposes it is divided into four, the additional parishes being St Mary's Doorgate (1837), St Mark's (1838), and St Paul's (1839). The old parish church of St John originally stood to the east of the cathedral, but was rebuilt on its present site in the centre of the city (1401-7) in the Perpendicular style. It consists of chancel, nave, aisles, and an embattled tower adorned with pinnacles. The educational establishments include the Henry VIII. grammar or chapter school, the St Peter's training college for schoolmasters for the dioceses of Peterborough, Ely, and Lincoln, erected from designs of Sir Gilbert Scott (1864), and attended by forty-six pupils, the boarding school attached to this training college, attended by 250 boys, and Deacons and Island's charity school, established in 1721 for the clothing and educating of twenty poor boys, but lately reorganized. The principal public buildings are the market-house (1671), used as a town-hall, the corn exchange (1848) in the Italian style, the liberty jail and house of correction in the Norman style (erected in 1848 and enlarged in 1855 and 1870), the assembly rooms (1853), and the county court and probate office (1873). A cattle-market, 5 acres in extent, was opened in 1867. The benevolent institutions include the dispensary and infirmary, several almshouses, and the union workhouse. The modern prosperity and rapid growth of the town are chiefly due to the trade caused by the junction of so many railway lines. Adjoining the town are extensive works and sheds connected with the Great Northern and Midland Railways. Important cattle-markets and fairs are held, and there is a large transit of meat and cattle to London and elsewhere. An extensive trade in corn, coal, and timber is also carried on. The principal manufacture is that of agricultural implements. The entire parliamentary city of Peterborough has an area of 6558 acres (of which 6310 are in Northamptonshire), with a population of 22,894 (of whom 30,128 are in Northamptonshire). The population of the municipal borough (area, 1818 acres) in 1871 was 16,810, and in 1881 it was 21,328. Since 1841 it has more than trebled.

The ancient name of the borough was *Middelmarche*. The foundation of the great Benedictine abbey of St Peter was laid in 655 by Oswy, king of Northumbria, and Peada, the first Christian king of Mercia. It was the first of the Benedictine abbeys in Gyrra land (Fenland). In 870 it was plundered by the Danes, after which it remained desolate till 966, when it was restored to its former splendour by Athwold, bishop of Winchester. From that time the town was called a borough, being probably then surrounded by walls, and under Abbot Leofric, nephew of Earl Leofric of Mercia, the abbey became one of the wealthiest in England. In 1169 it was plundered by Hereward. Since the first of Edward IV the borough has returned two members to parliament. Until 1874 the city was included in the liberty of

soke of Peterborough, the government of which was vested in the lord paramount, the custos totolorm, and magistrates appointed by the crown, with powers equal to those of judges of assize, a high bailiff of the city was appointed by the dean and chapter as lords of the manor, who acted as returning officer till the incorporation of the city in 1874. Peterborough is divided into three wards, six parishes, and sanitary purposes it is governed by a mayor, six aldermen, and eighteen councillors, but for magisterial and sessional purposes is still included in the liberty of Peterborough.

Ganton, *History of the Church of Peterborough*, 1686; Britton, *History and Antiquities of the Abbey and Cathedral Church of Peterborough*, 1828; Faley, *Peterborough*, on the *Antiquities of Peterborough Cathedral*, 1840; Swearing, *Notes on Peterborough Cathedral*, 1860.

PETERBOROUGH AND MONMOUTH. CHARLES MORDAUNT, EARL OF (c. 1658-1735), a man whose whole life was passed in the turmoil of excitement, was born about 1658. His father, John Mordaunt, was created Baron Mordaunt of Reigate, Surrey, in 1659; his mother was Elizabeth, the daughter and sole heiress of Thomas Cary, the second son of Robert Cary, earl of Monmouth. He entered upon a long career of warfare when only about sixteen years of age by joining Sir John Narborough's fleet in the Mediterranean, and won his first distinction in arms in Cloudesley Shovel's destruction of the dey's fleet under the very guns of Tripoli. On two subsequent occasions—the first in September 1678, the second in June 1680—he embarked in expeditions for the relief of Tangier, but the adventure met with little success, and that troublesome possession was soon after abandoned. His father died 5th June 1675, and Charles Mordaunt succeeded to the peerage. On his return from the second expedition to Tangier he plunged into active political life as a zealous Whig and an unswerving opponent of the duke of York. But his continued hostility to James II. forced him to retire to Holland, when he proposed to William of Orange to invade England. The disposition of the cold and cautious William had little in common with the fierce and turbulent English peer. His plan was rejected, though the prudent prince of Orange deemed it judicious to retain his fiery adherent by his side. When William sailed to Torbay his friend accompanied him, and when the Dutch prince was safely established on the throne of England honours without stint were showered upon Lord Mordaunt. He was sworn of the privy council 14th February 1689, made a lord of the bedchamber in the same month, created lord-lieutenant of Northamptonshire shortly after, and in April of the same year appointed first lord of the treasury and advanced in the peerage to be earl of Monmouth. In less than a year he was out of the treasury, but he still remained by the person of his monarch. He was with William in his dangerous passage to Holland in January 1691, and in June 1693, when crossing from England to the same country, he narrowly escaped shipwreck. Although the English king had refused his consent to a bill for triennial parliaments in the previous session, Lord Monmouth did not shrink from reintroducing it in December 1693. This led to a disagreement with the court, though the final breach did not take place until January 1697, when Monmouth was accused of complicity in Sir John Fenwick's conspiracy and of the use of "undutiful words" towards the king. He was committed to the Tower, staying in confinement until April 1697, and deprived of his employments. Some consolation for these troubles came to him in June of the same year, when he succeeded to the earldom of Peterborough. The four years after his release from the Tower were mainly passed in retirement at Parson's Green, Fulham, at a house long since pulled down, but famous for its "extraordinary good rooms" and its spacious gardens. At the close of William's reign Lord Peterborough emerged from his suburban retreat for a time to take part in the prosecution of Lord Somers, and on the accession of Anne he plunged into political life again with avidity. His first act was to draw down on himself in February 1702 the

censure of the House of Commons for the part which he took in the attempt to secure the return of his nominee for the borough of Malmesbury. In the same year he was appointed governor of Jamaica, but he never visited the island over which he ruled, preferring to remain in a part of the world where he could play a more active part in the government of affairs. Through the fear of the ministry that his restless spirit would drive him into opposition to its measures if he stayed at home, he was appointed early in 1705 to command an expedition of English and Dutch troops in Spain. He was created sole commander of the land-forces and joint-commander with Sir Cloudesley Shovel of the fleet, and at the same time was reinstated a member of the privy council. His first exploit was to seize Denia in Valencia, then, with all the impetuosity of his character, he urged upon the Austrian claimant to the throne the expediency of dashing for Madrid, less than 250 miles distant, only to find that he was overruled by his colleagues in council. After this repulse he sailed for Barcelona (August 1705) and commenced to besiege that town. For three weeks the siege languished, until, by a sudden night-attack on 14th September, Peterborough seized the outworks of Montjuich, and three nights later captured the citadel itself. On 14th October the city was his. This was his greatest feat, and in this enterprise he showed, what was usually wanting in his character, both tact and conciliation. After this victory Catalonia declared for the Austrian prince, and Peterborough advanced into Valencia with the object of reducing it to subjection. By threats, cajolements, intrigues, and plots he obtained possession of its chief towns, but the prince for whom he was fighting allowed himself to be surrounded in Barcelona. Peterborough's advice, that Charles should travel by sea to Lisbon and march against Madrid with the allied force of 25,000 men, was disregarded, and the English commander with his little body of 2000 foot and 600 horse then advanced towards Barcelona, which was besieged by a greatly superior force of the enemy. The city was on the point of being captured, when Peterborough, warned of the approach of the English fleet—it is said that the signal of its arrival was a blank sheet of paper—put off in an open boat, and, after journeying to and fro, met with his country's vessels. On 8th May he brought the leading ships into the port of Barcelona, and three days later the French beat a retreat. Again did the English commander urge upon the Austrian claimant of the Spanish throne the expediency of immediately advancing to Madrid, and again was the advice rejected, although the capital was occupied by the allied forces under Galway and Das Minas. Charles remained at Barcelona for some weeks, and when at last he did move towards Madrid it was by a route which Peterborough disapproved of. When difficulties beset Charles on his way the earl joined him, but he soon retired to Valencia in disgust, and then left the country to raise money at Genoa. In a short time he returned to Spain once more, but during his absence the prospects of the allied forces had passed from bad to worse. The leaders of the army differed in their views, and Lord Peterborough quitted the country for ever (March 1707).

On his return to England he allied himself with the Tories, and received his reward in being contrasted, much to his advantage, with the Whig victor of Blenheim and Malplaquet. The differences between the three peers, Peterborough, Galway, and Tyrlewel, who had served in Spain, formed the subject of angry debates in the Lords, when the majority declared for Peterborough, after some fiery speeches the resolution that he had performed many great and eminent services was carried, and votes of thanks were passed to him without any division. His new friends were not desirous of detaining him long on English soil,

and they sent him on a mission where he characteristically engaged the ministry in pledges of which they disapproved. His resentment at this disagreement was softened by the command of a cavalry regiment, and by his appointment as a Knight of the Garter. A few months before the close of Queen Anne's reign (November 1713) he was despatched as ambassador-extraordinary to the king of Sicily, but was recalled by the Whigs as soon as they obtained the reins of power. With the accession of George I. Lord Peterborough's influence was gone. Hatred of Marlborough became the ruling passion of his mind. His last twenty years of life were passed with the recollection of disappointed hopes and with the continual presence of disease. Worn out with suffering, he died at Lisbon, 25th October 1735. His remains were brought to England and buried at Turvey in Bedfordshire, 21st November.

Lord Peterborough was short in stature and spare in habit of body. His activity knew no bounds. He was said to have seen more kings and postulations than any man in Europe, and the whole point of Swift's lines on "Moiadants" consisted in a description of the speed with which he hastened from capital to capital. Nature had bestowed many gifts upon him, but had denied him more. He was elegant in debate and successful in war, but his influence in the senate was ruined through his inconsistency, and his vigour in the field was wasted through his want of union with his colleagues. He could do nothing like other men. His first wife, Carey, daughter of Sir Alexander Fraser of Means, died 18th May 1709, and was buried at Turvey 20th May. Some years later he married Anastasia Robinson, a dramatic singer of great beauty and sweetness of disposition, but she was unrecognized as his wife, and lived apart from him at her mother's house at Person's Green. Nor was it until a few months before his death that she was introduced to society as the countess of Peterborough. (W. P. C.)

PETERHEAD, a seaport, market town, burgh of barony, and parliamentary burgh of Aberdeenshire, Scotland, is situated on a rocky peninsula on the North Sea, about 30 miles north-north-east of Aberdeen and 2 north of Buchan Ness. It has railway communication by a section of the Great North of Scotland line, opened in 1862. The town is built of the red granite of the district. At the extremity of the peninsula is the insular suburb of Keith-Inch. Among the principal buildings are the town-hall (1788), with a granite spire 125 feet high, the music hall, and the court-house. The reading society (1808) possesses a library with upwards of 5000 volumes, and the mechanics' institute one with about 1000 volumes. The Arbuthnot Museum contains natural history specimens, a collection of coins, and objects of antiquarian interest. In front of the town-hall is a statue to Field-Marshal Keith (1696-1758), presented to the burgh by William I. of Prussia in 1868. A market cross was erected in 1832 when the town was created a parliamentary burgh. Peterhead at an early period had an extensive trade with the ports of the Baltic, the Levant, and America. Formerly it was a bonding suburb to Aberdeen, but was made independent in 1832. The north and south harbours lie between the town and Keith-Inch, and the isthmus dividing them is pierced by a canal, which is crossed by an iron swing-bridge. In the north harbour are two graving-docks. A new harbour was completed in 1878, and the south harbour has been deepened and enlarged. The south bay is to be converted into a national harbour of refuge. The Arctic seal and whale fishing, which in 1802 was prosecuted by only one vessel, employed in 1887 as many as 32 vessels, but since that time it has declined somewhat. The herring fishing, in which the port has long held a leading position (681 boats in 1883), was begun in 1818 by a joint-stock company. The general trade is of considerable importance. The chief exports are herrings (£180,000 in 1883), granite, cattle, and agricultural produce. In 1883 the number of vessels that entered the port with cargoes and in ballast was 864 of 87,839 tons, the number that cleared 840 of 86,318 tons. The town possesses ship and boat building

yards, saw-mill, an iron-foundry, cooperages, agricultural implement works, woollen manufactures, hewmills, and a distillery. In the neighbourhood there are extensive granite and polishing works. The limits of the police burgh and the parliamentary burgh are identical, with a population in 1871 of 8535 and in 1881 of 10,922.

The town and lands of Peterhead belonged anciently to the abbey of Deir, built by William Cunningham, earl of Buchan, in the 14th century. When the abbey was evicted into a temporal lordship in the family of Keith, the superiority of the town fell to the earl marischal, with whom it continued till the forfeiture of the earldom in 1715. The town and lands were purchased in 1720 by a fishing company in England, and on this failure by the Merchant Blacken Hospital of Edinburgh for £3000. Who are still the superiors of the town. Peterhead was made a burgh of barony in 1693 by George Keith, fourth earl marischal of Scotland. It was the scene of the hauling of the Pretender, 25th December 1715. Peterhead is included in the Elgin district of burghs.

PETERHOF, a town of European Russia, in the government of St Petersburg, and 18 miles west of the capital, on the south coast of the Gulf of Finland, has grown up round the palace built by Peter the Great in 1711, was constituted a district town in 1848, and has increased its population from 7647 in 1860 to 14,298 in 1881. It is almost exclusively a residential town, but is garrisoned by a cavalry regiment and has the military schools lodged in its barracks for six weeks in the summer. The palace, which is still occupied by the imperial family during part of the summer, has undergone alterations and additions, but retains a distinct Petrine stamp. It is built on a height 60 feet above the sea. The gardens, which owe their magnificence to Alexander I. and Nicholas I., are laid out in the Versailles style, with elaborate water-works. From the "Maily" summer-house Peter I. loved to watch his fleet beneath the Cronstadt batteries, and in that of "Mon-plaisir" he died. It was at Peterhof that the empress Alexandra used to celebrate her birthday by fêtes at which more than 100,000 persons were present. Peterhof is connected with Oranienbaum on the west and with Strelna on the east by an uninterrupted series of gardens and villas.

PETERS, or PETER, HUGH (1698-1660), a man whose name has for three centuries been rarely mentioned except in terms of infamy, was the son of Thomas Dyckwoode *alias* Peters, by Martha, daughter of John Freffry of Fovey, Cornwall, and was baptized in Fovey parish church 29th June 1698. His parents were in good circumstances, and they sent him to Trinity College, Cambridge, where he took the degree of B.A. in 1616 and M.A. in 1622. About the latter date he was licensed by Dr George Montaigne, bishop of London, to the lectureship at St Sepulchre's, London, but his first definite post in the church was at Rotterdam (1623-32), as colleague of William Ames, whom he much admired, and who died "in his bosom." In October 1635 he emigrated to Boston in New England, and in the following year became the minister of the first church at Salem in Massachusetts. His abilities soon gave him a prominent place in all the civil and ecclesiastical affairs of the colony, and in 1641 his reputation was so great that he was sent to England as the best guardian of the colony's interests at home. His shrewd judgment, his ready wit, and his zeal for the cause of the Parliament endeared him to the army and its leaders; he accompanied Fairfax and Cromwell on their campaigns, and described their achievements in numerous letters to the House of Commons. To the adherents of the vanquished cause Hugh Peters always lent his good offices. He was denounce that Laud should be banished, and not executed. It was through his influence that Juxon was permitted to attend Charles after his condemnation, and his acts of kindness to some of the Royalist clergy are mentioned in Walker's *Sufferings of the Clergy*. Through the favour of the Pro-

testant he filled several important offices. He was one of the twenty-one persons appointed to consider the abuses of the national laws, he was a judge for granting probates of wills, and a trier for licensing candidates to the ministry. At the Restoration he was seized and imprisoned in the Tower of London, where he composed his affecting tract, "A Dying Father's Last Legacy to an Only Child." His trial as a regicide took place on 13th October 1660, and he was, of course, condemned to death. Four days later he was drawn on a sledge to Charing Cross and there hanged and quartered, his head being set on a pole on London Bridge. Hugh Peters suffered his cruel death without any sign of wavering. For many years after his death the grossest charges against his memory were circulated in catchpenny pamphlets by his enemies, and his name was held up to general execration, but it is clear that these accusations are but the creation of party malice. He was twice married, his first wife was Elizabeth, said to have been the daughter of Thomas Cooke of Felmish, Essex, and the widow of Edmund Read, who died at Wickford in the same county November 1623. She died about 1640, and he subsequently married Deliverance Sheffield, the mother of his only child, Elizabeth Peters. The writings of Hugh Peters and the publications, in print and manuscript, relating to his life are described in the *Bibliotheca Cornubiensis*. He pleaded, in opposition to Pymme and others, for the admission of the Jews into England. The chief blot on his fame is his advocacy of the burning of the records.

PETERSBURG, a city and port of entry of the United States, in Dinwiddie county, Virginia, lies 22 miles south of Richmond on the south side of the Appomattox river, which is navigable for large vessels from the James river up to the falls opposite the city, and for flat boats 107 miles above the falls to Farmville. Petersburg is an important railway junction, manufactures tobacco, cotton goods, and non-ware, and carries on a very extensive shipping trade in the export of tobacco, cotton, flour, and peanuts (groundnuts). Its public buildings comprise a court-house, a custom-house, and post-office, two markets, and a theatre; there are two public libraries and two public parks, Central and West End. The population was 14,010 in 1890, 18,266 in 1860, 18,950 (10,185 coloured) in 1870, and 21,656 in 1880.

Petersburg was laid out at the same time with Richmond (1733) by Colonel William Byrd, on the site of an Indian village destroyed in 1678. It was first incorporated in 1748. During the Revolutionary War it was twice the headquarters of the British under General William Phillips, who died while in possession of the town in 1781. The bravery of the Petersburg volunteers on the Canadian frontier in 1812 procured it the title of Cockade City of the south. The terrible siege of Petersburg, lasting from June 1864 to 3d April 1865, was the final scene of the Civil War.

PETERWARDEIN (Hungarian *Pétervárad*, Serbian *Petrovaradin*), a town and strong fortress of Hungary, is situated on a promontory formed by a loop of the Danube, 45 miles to the north-west of Belgrade. It is connected with Neusatz on the opposite bank by a bridge of boats 800 feet long. The fortifications consist of the upper fortress, on a lofty serpentine rock rising abruptly from the plain on three sides, and of the lower fortress at the northern base of the rock. The latter includes the town, which contains (1880) 3603 inhabitants, engaged in wine-growing, agriculture, and the manufacture of liqueurs (rosogho) and vinegar. The two fortresses can accommodate a garrison of 10,000 men. The arsenal contains interesting trophies of the Turkish wars.

Peterwardein, the " Gibraltar of Hungary," is believed to represent the Roman *Acinnum*, and received its present name from Peter the Hermit, who here marshalled the levies of the first crusade. It was captured by the Turks in 1526 and retained by them for 160 years. In 1716 it witnessed a signal defeat inflicted

on the Turks by Prince Eugene. During the revolutionary struggles of 1848-49 the fortress was held by the insurgents for a short time.

PÉTION DE VILLENEUVE, JÉRÔME (1753-1794), was the son of a procureur at Chartres, where he was born in 1753. He himself became an avocat in his native place in 1778, and at once began to try to make a name in literature. His first printed work was an essay, *Sur les Moyens de prévenir l'Infanticide*, which failed to gain the prize for which it was composed, but pleased Brissot so much that he printed it in vol. vii. of his *Bibliothèque philosophique des Législateurs*. Péton's next works, *Les Lois Civiles*, and *Essai sur le Mariage*, in which he advocated the marriage of priests, confirmed his position as a bold reformer, and when the elections to the States-General took place in 1789 he was elected a deputy to the Tiers État for Chartres. Both in the assembly of the Tiers État and in the Constituent Assembly Péton showed himself a radical leader. He supported Mirabeau on 23d June, attacked the queen on 5th October, and was elected president on 4th December 1790. On 21st June 1791 he was chosen one of three commissioners appointed to bring back the king from Varennes. After the last meeting of the assembly on 30th September 1791 Robespierre and Péton were made the popular heroes and were crowned by the populace with civic crowns. Péton received a still further proof of the affection of the Parisians for himself on 14th November 1791, when he was elected second mayor of Paris in succession to Dailly. In his mayoralty he exhibited clearly his republican tendency and his hatred of the old monarchy, especially on 20th June 1792, when he allowed the mob to overrun the Tuileries and insult the royal family. For neglecting to protect the Tuileries he was suspended from his functions by the Directory of the department of the Seine, but the leaders of the Legislative Assembly felt that Péton's cause was theirs, and rescinded the suspension on 13th July. On 3d August, at the head of the municipality of Paris, Péton demanded the dethronement of the king, and on 10th August, while the monarchy was falling with the Tuileries, he patiently underwent a form of detention in his own manie. He was still mayor of Paris when the massacres of September in the prisons took place, and must bear the blame of not having endeavoured to interfere. He was elected to the Convention for Eure-et-Loir, and became its first president. Manuel then had the folly to propose that the president of the Assembly should have the same authority as the president of the United States, his proposition was at once rejected, but Péton got the nickname of "Roi Péton," which contributed to his fall. His jealousy of Robespierre allied him to the Girondin party, as did also his assiduous attention at Madame Roland's salon. With the Girondins he voted for the king's death and for the appeal to the people, as one of them he was elected to the first committee of general defence in March 1793, as their representative he attacked Robespierre on 12th April, and it is no matter of wonder, therefore, that his name was among those of the twenty-two Girondin deputies proscribed on 2d June. Péton was one of those who escaped to Caen and raised the standard of provincial insurrection against the Convention; and when the Norman rising failed he fled with Guadet, Buzot, Barbaroux, Salle, and Louvet to the Gironde, and hid in a grotto at St Émilien. At last, but a month before Robespierre's fall in June 1794, the escaped deputies felt themselves tracked down, and deserted the grotto, Louvet found his way to Paris, Salle and Guadet to Bordeaux, where they were soon taken; Barbaroux committed suicide; and the bodies of Péton and Buzot were found in a field, half-eaten by wolves.

For Péton's published works, see the edition of his *Œuvres*, 8 vols., 1792, for his life, see the ridiculous eulogy in J. Regnaud-Warmin's *Vie de Péton*, 1792, and *Mémoires inédits de Péton et*

Mémoires de Buzot et de Barbaroux, with an introduction by C. A. Dauban, 1866, and for his last days and death, see C. Vatel, *Châtillon Corbiat et les Girondins*, 8 vols., 1872.

PÉTIS DE LA CROIX, FRANÇOIS (c. 1653-1713), the best representative of Oriental learning in France during the last decades of the 17th century and the beginning of the 18th century, was born in Paris about 1653. He was son of the Arabic interpreter of the French court, and inherited this office at his father's death in 1695, afterwards transmitting it to his own son, Alexandre Louis Marie. At an early age he was sent by Colbert to the East, during the ten years he spent in Syria, Persia, and Turkey he mastered Arabic, Persian, and Turkish, and also collected rich materials for future writings.¹ He found, besides, opportunity to equip himself for those diplomatic missions which the French Government entrusted to him soon after his return to Paris in 1680. Having served a short time as secretary to the French ambassador in Morocco, he accompanied as interpreter the French forces sent against Algiers, and greatly contributed to the satisfactory settlement of the treaty of peace between the two countries, which was drawn up by himself in Turkish and ratified in 1684. In a similar capacity he conducted the negotiations with Tunis and Tripoli in 1685 and those with Morocco in 1687, and the zeal, tact, and linguistic knowledge he manifested in these and other transactions with Eastern courts were at last rewarded in 1692 by his appointment to the Arabic chair in the Collège Royal de France, which he filled until his death in 1713.

He published *Contes Turcs*, Paris, 1707, and *Les Mille et un Jours*, 5 vols., Paris, 1710-12, and proved his acquaintance with the Armenian and Ethiopic languages (a new civil impulse to the study of the latter having been given just at that time by the masterly works of Hub. Ludolf) in his *Armenian Dictionary* and his *Account of Ethiopia*. But the lasting monument of his literary fame, the one standard work that has outlived many generations and still keeps a distinct merit of its own, is his excellent French version of Shahr-astadhin 'Ali Yazdi's *Zafarnama*, or *History of Timur* (completed 828 A.D., 1425 A.D.), which was given to the world nine years after his death, and 1728 (4 vols., Paris, translated into English by J. Barbary, London, 1728). This work, renowned throughout the East as a model of elegant style, and one of the rare specimens of a fairly critical history, Persia can boast of, was compiled under the auspices of Mirza Ibrahim Sultan, the son of Shah Rukh and grandson of the great Timur himself. This prince collected all the official records of Timur's reign, both in Turkish and Persian, collated and revised them, and had then an accurate text drawn up by his secretaries, which was turned by Shahr-astadhin into elegant and refined language and revised by Ibrahim Sultan himself (see Rieu's *Cat. Persian MSS. in the Brit. Mus.*, i. p. 178 sq.). The only error committed by Petus de la Croix in his otherwise very correct translation is that he erroneously ascribed the important share which Ibrahim Sultan had in the *Zafarnama* to Timur himself.

PÉTITION is an application for redress by a person aggrieved to an authority capable of relieving him. It may be made in the United Kingdom to the crown or its delegate, or to one of the houses of parliament.

The right of petitioning the crown was recognized indirectly as early as Magna Charta in the famous clause, *Nulli vendemus, nulli negabimus aut differemus, rectum aut iustum*, and directly at various periods later, e.g., in the articles of the Commons assented to by Henry IV., by which the king was to assign two days in the week for petitions, it being an honourable and necessary thing that his lieges who desired to petition him should be heard (*Rot. Parl.*, 8 Hen. IV., p. 586). The case of the seven bishops in 1688 confirmed the right, and finally the Bill of Rights in 1689 declared "that it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal." Petitions to the crown appear to have been at first for the redress of

¹ Many of these—as the account of *Jerusalem, Modern and Ancient*, the *Travels through Syria and Persia*, the *Antiquities and Monuments of Egypt*, the translations of Pseudo-Wikid's *Conquest of Syria* and of Hâfi Khalîf's *Dictionary*, and the *History of the Ottoman Empire*—still remain in manuscript.

private and local grievances, or for remedies beyond those possessed by the courts. As equity grew into a system, petitions of this kind tended to become superseded by bills in chancery (see CHANCERY). Statutes were originally drawn up by the judges at the close of the session of parliament from the petitions of the Commons and the answers of the crown. In the drawing up of the statutes frauds were at times committed, the judges not always reciting correctly the tenor of the petition or answer. To obviate this danger complete statutes in the form of bills began to be introduced into parliament in the reign of Henry VI. The crown could accept or reject them, but could not alter them (see Hallam, *Middle Ages*, ch. viii. pt. 3). A relic of the old form of the statute founded upon petition still remains in the preamble of Appropriation Acts and other statutes creating a charge upon the public revenue. It runs thus. "We, your majesty's most dutiful and loyal subjects, the Commons of the United Kingdom . . . do most humbly beseech your majesty that it may be enacted, and be it enacted, &c." from this point following the enacting words common to all statutes. Petitions to the crown from the House of Commons in other matters now usually take the form of addresses. The crown may refer petitions presented to it to be adjudicated upon by a delegated authority. This is the course pursued in the case of peerage claims, which are referred to the House of Lords, and by that House to the committee for privileges, and in the case of petitions to the crown in council, with which the judicial committee in most cases deals (see below); or the crown may delegate the power of receiving petitions in the first instance. Examples of petitions to the delegated authority are those addressed to a court of justice or those addressed to the home secretary for the pardon or mitigation of punishment of a convicted criminal. Petitions to the houses of legislature seem to have been later in origin than petitions to the crown. The political importance of petitioning dates from about the reign of Charles I. The development of the practice of petitioning had proceeded so far in the reign of Charles II. as to lead to the passing of 13 Car. II. c. 5 against tumultuous petitioning. This is still law, though it has ceased to be enforced. It provides that no petition or address shall be presented to the king or either house of parliament by more than ten persons, nor shall any one procure above twenty persons to consent or set their hands to any petition for alteration of matters established by law in church or state, unless with the previous order of three justices of the county, or the major part of the grand jury. Up to 1868 petitions usually dealt only with some specific grievance; from that time dates the present practice of petitioning with regard to general measures of public policy. Since 1833 more than 700,000 petitions on public matters have been presented to the House of Commons. Petitions to the crown need not apparently be in any particular form, but no doubt they would not be received if couched in unbecoming language. Petitions to the Houses of Lords and Commons must be framed in a prescribed form. They must be properly superscribed, and must conclude with a prayer. They must be in writing (in the Commons), must contain none but genuine signatures, and must be free from disrespectful language or imputations upon any tribunal or constituted authority. They must be presented by a member of the House, except petitions to the House of Commons from the corporation of London, which may be presented at the bar by the sheriffs, and from the corporation of Dublin, which may be presented by the lord mayor. Though a petition is made to the House, in practice petitions to the Commons are referred to the committee on public petitions, under whose directions they are classified and analysed. In the Lords receivers and triers of petitions

are still appointed, though their functions have long been obsolete. Petitions may be sent free by post to members of either house, provided they fulfil certain conditions as to weight, &c. (see May, *Parliamentary Practice*, ch. xix.).

In the United States the right of petition is secured by Art. I of the Amended Constitution, which enacts that "Congress shall make no law abridging . . . the right of the people peaceably to assemble and to petition the Government for a redress of grievances."

Petitions to a Court of Justice.—Strictly speaking these are no doubt an indirect mode of petitioning the crown, for in the theory of English law the crown is the fountain of justice. But it is more convenient to treat them separately, as they now form a part of the practice of the courts. Appeals to the House of Lords and the privy council are prosecuted by petition of appeal. The House of Lords has now no original jurisdiction in judicial matters; the original jurisdiction of the privy council in such matters is confined to petitions under certain statutes, such as the Endowed Schools Acts 1867 and 1873, the Public Schools Act 1868, the Universities Act 1877, and the Patents Act 1883. In most cases the petitions are referred to the judicial committee of the privy council. Petitions may be addressed to the lord chancellor in a few instances, such as the sealing of patents and the removal of cojoners and county court judges. The most important use of petitions in England is in the Chancery Division of the High Court of Justice. They may be presented either as interlocutory proceedings in the course of an action, or as original proceedings where no litigation exists,—a petition being generally a more cheap and speedy form of remedy than an action. Petitions in the course of an action are usually presented to the court in which the action is brought. Examples of original petitions are those under the Lands Clauses Acts, the Trustee Acts, the Companies Acts. In a few cases they may be brought by way of appeal, e.g., under the Charitable Trusts Act 1860. Petitions are also modes of procedure in other courts with jurisdiction in equity, as the chancery courts of the county palatine of Lancaster and the county courts, in the latter only in certain cases falling within the County Courts Act 1865, 28 and 29 Vict. c. 99, s. 1 (5) and (6). They are used to initiate proceedings in bankruptcy and divorce, but are almost unknown in the Queen's Bench Division, the only case of procedure by petition in that division seems to be the petition to sue *in forma pauperis*. Evidence in support of a petition is usually given by affidavit.

In Scotland petitions in the Court of Session are either original or in a pending action. Original petitions are presented to one of the divisions of the inner house, unless they are included in any of the matters mentioned in 20 and 21 Vict. c. 56, s. 4, when they are brought before the junior lord ordinary, or unless, by special statutory provision, they may be brought before any lord ordinary, as in the case of petitions under the Conjugal Rights Act 1861, or the Trusts Act 1867. In the sheriff court actions are commenced by petition (39 and 40 Vict. c. 70, s. 6). A *petition and complaint* is a process of a quasi-criminal nature by which certain matters of extraordinary jurisdiction are brought under the notice of the Court of Session. It lies against magistrates and officers of the law for breach of duty, against parties guilty of contempt of court, &c. The concurrence of the lord advocate is necessary to a petition and complaint. A *reclaiming petition*, obsolete in the Court of Session, is a form of process of appeal in the sheriff court. See 39 and 40 Vict. c. 70, ss. 28, 30.

In the United States petitions can be presented to the courts under much the same circumstances as in England. "It is a general rule in such cases that an affidavit should be made that the facts therein contained are true as far as

known to the petitioner, and that those facts which he states as knowing from others he believes to be true" (Bouvier, *Law Dict*)

Election Petition.—The article ELECTIONS must now be read subject to the Parliamentary Elections Act 1879 and the Judicature Act 1881. By the Act of 1879 the trial of an election petition is conducted before two judges instead of one, as before. If the judges differ in opinion as to whether the member petitioned against is duly elected or not, he is deemed to be duly elected. The Act of 1881 provides for the annual appointment of three judges of the Queen's Bench Division for the trial of election petitions, and makes the judgment of the High Court of Justice in election cases final unless leave be given to appeal to the Court of Appeal. No appeal lies to the House of Lords, nor can any judge who is a peer sit on the trial of an election petition.

Petition of Right is a term confined to English law. It is used in two senses. (1) It denotes the statute 3 Car. I. c. 1, a parliamentary declaration of the liberties of the people. (See ENGLAND, vol. viii p. 345.) (2) It denotes a mode of prosecuting a claim against the crown by a subject. This remedy is said to owe its origin to Edward I. It lies as a rule for obtaining possession of real or personal property, or for breach of contract, not for breach of public duty, as failure to perform treaty obligations, or for trespass, or for negligence of crown servants. The remedy where the crown is in possession of property of the suppliant, and the title of the crown appears by record, as by inquest of office, is a somewhat different one, called *monstrans de droit*. The procedure on a petition of right is either at common law or by statute. At common law the petition suggests such a right as controverts the title of the crown, and the crown indorses upon the petition *Scot droit fuit al partie*. Thereupon a commission is issued to inquire into the truth of the suggestion. After the return to the commission, the attorney-general pleads or demurs, and the merits are then determined as in actions between subject and subject. If the right be determined against the crown, judgment of *oustementain* or *amoveas manus* is given in favour of the suppliant. The Petitions of Right Act 1860 (23 and 24 Vict. c. 34, extended to Ireland by 36 and 37 Vict. c. 69) preserves to the suppliant his right to proceed at common law, but gives an alternative remedy. In proceedings under the statute the petition is left with the secretary of state for the home department for her majesty's consideration. She, if she think fit, grants her fiat that right be done, whereupon the fiat is served upon the solicitor to the treasury, and a statement of defence is put in on behalf of the crown. The proceedings are thenceforth assimilated as far as possible to those in an ordinary action. A judgment in favour of the suppliant is equivalent to a judgment of *amoveas manus*. Costs are payable to and by the crown. A petition of right is tried in the Chancery or Queen's Bench Division, unless the subject-matter of the petition arises out of the exercise of belligerent right on behalf of the crown, or would be cognizable in a prize court if the matter were in dispute between private persons. In either of these cases the suppliant may at his option intitule his petition in the Admiralty Action (27 and 28 Vict. c. 25, s. 52). (J. W.)

PETRA (πέτρα, in ecclesiastical writers also αἰθήρα), the capital city of the NABATÆANS (q.v.), and the great centre of their caravan trade, is described by Strabo (xvi. p. 779) as lying in a level place, well supplied with water for horticulture and other uses, but encircled by a girdle of rocks, abrupt towards the outer side. The surrounding country was barren, especially towards Judæa; the distance from Jericho was three to four days' journey, and from Phenicum on the Red Sea coast five (see plate VI, vol. vii.). Accord-

ing to Pliny (*N. H.*, vi. 114) the little valley of Petia is not quite 2 miles across, and lies at the junction of two roads, from Palmyra and Gaza respectively, 600 miles from the latter. These and other ancient notices leave no doubt as to the identity of the site with the modern Wādī Mūsā in the mountains which form the eastern wall of the great valley between the Dead Sea and the Gulf of Akaba. Wādī Mūsā lies just north of the watershed between the two seas, in 30° 19' N lat. and 35° 31' E long.¹ Travellers coming up the Arabah usually approach the ruins of Petia from the south-west by a rough path, partly of artificial construction², but the natural entrance is from the east down a narrow defile more than a mile long, called the Sîk ("shaft"). The Sîk is a contraction in the valley of a stream which comes down from the east, rising in a spring now known as the Fountain of Moses ('Ain Mûsâ),³ and passing between the villages of Eljî and 'Aireh (Palmer). Both these places are ancient, the latter is the fortress Wo'ana of Yâkût,⁴ while Eljî, mentioned by Edrisi, is the "Gaza urbs juxta civitatem Petram" of the *Onomasticon*.⁵ Below these and above the ravine the characteristic rock-cut tombs and dwellings of the Nabatæans begin to appear. But to reach the city proper from these upper settlements one must traverse the whole length of the defile, which is simply a narrow waterway, in some places not more than 10 or 12 feet broad, and walled in by rich brown or red precipices rising from 60 to 120 feet (De Luynes, Stanley doubles this height) above the stream. In ancient times there was a paved path beside the channel, and remains of an arch spanning it are seen high in the air near the entrance. Towards the lower end of the gorge, a turn in the dark path and the descent of a side valley admit a sudden flood of light, and here stands the most famous ruin of Petia, the so-called Khazna, or "treasury of Pharaoh," with a rich façade of late Roman style, not built but hewn out of the rose-coloured limestone. The next turn gives room for a rock-cut theatre, and from this point the gorge begins to open out into the little plain described by Strabo, and gives perhaps the most striking view of the multiplicity of grottoes with elaborate classical façades which line the enclosing mountain-wall. The plain itself is strewn with ruins of temples and other buildings, and stairs once led up the rocky walls to higher structures, of which the most notable is now called the "convent" (Al-Derr). The grottoes are uninhabited in cold weather by the Lyâthina Fellâhin, who also hold the upper part of the valley, and are so troublesome and extortionate that no thorough exploration of the district has yet been carried out. It is not even known where the torrent-bed leads on leaving the plain of Petia. De Luynes describes the water as wholly absorbed by the sands near the theatre, but there is an unexplored gorge to the south-west which is the continuation of the valley.

The Nabatæans, as we see from Diodorus, used Petia as a place of refuge and a safe storehouse for their treasures of frankincense, myrrh, and silver before they gave up their nomadic habits. But Petia was not only safe and well

¹ The latitude and longitude are taken from De Luynes's map. Ptolemy, who, according to Olympiodorus, spent some time in Petia, and doubtless owes to this fact his excellent information about the caravan-routes in Arabia, gives the latitude, with surprising accuracy, as 80° 30'.

² Compare Diod., xix. 97, who describes the Nabatæan fortresses—it was not a town at the time in question (812 B.C.), for the Nabatæans were still nomads when they were attacked by Antigonus—as ascended to by a single artificial path.

³ This seems to be the fountain mentioned by Nowanî, ap. Quatremère's *Mémoires*, p. 64, which flowed with blood and was changed to water by Moses. The name Oû-démâ, which gave rise to this legend, may possibly be a relic of the old name of Bêlam.

⁴ Perhaps also the Iram, אִירָם, of Gen. xxxvi. 48.

⁵ See Tuch's *Genesis*, 2d ed., p. 271, note.

watered, it lay close to the most important lines of trade. The modern pilgrim-road from Damascus to Mecca, which has taken the place of the old incense-route, passes indeed a little to the east by Ma'an. But to touch Petra involves no great detour even on this line, and in ancient times, when Gaza was the great terminus of the Arabian trade, Petra was the place where the Gaza road branched off from that to Bostra, Palmyra, and north Syria. The route from Egypt to Damascus is also commanded by Petra, and from it too there went a great route direct through the desert to the head of the Persian Gulf. Thus Petra became a centre for all the main lines of overland trade between the East and the West, and it was not till the fall of the Nabataean kingdom that PALMYRA (*q.v.*) superseded it as the chief emporium of north Arabia. Many Roman and other foreign merchants were settled here even in the time of Strabo, and he describes the caravans which passed between it and Leuce Come on the Red Sea coast as comparable to armies.

Petra¹ is a Greek name which cannot have been that used by the Semitic inhabitants, and from Josephus (*Ant.* iv. 7, i, 4, 7) and the *Onomasticon* (ed. Lag., p. 286 sq.) it may be concluded that the natives called the place Rikem (*רִקֶּם*), a designation probably derived from the variegated colours of the rocks about Wādy Mūsā, to which all travellers refer with admiration.² But Petra had yet another ancient name familiar from the Bible. The Biblical Sela (generally with the article שֵׁלָה), a city of Edom (2 Kings, xiv. 7; Isa. xvi. 1, also Judges i. 36, where E.V. has "the rock"; perhaps also Isa. xlii. 11), appears to be identified with Petra by the LXX., and certainly is so by the *Onomasticon*. Petra, in fact, or the "rock," seems to be simply a translation of Sela, but a somewhat loose one,—for the Hebrew name, corresponding to the Arabic *Sal'*, is properly a hollow between rocks, just such a place as Petra is. The fortress of Edom, according to Oladian 3, lay "in the clefts of the Sela," and seemed invulnerable. And that the name of Sela survived the Nabataean occupation is known from Yāqūt, who places a fortress *Sal'* in Wādy Mūsā (comp. Noldeke in *Z.D.M.G.*, xxv. 259). Petra, therefore, was a city before the Nabataeans, and, occupying one of the few cultivable spots in the district, probably never wholly ceased to be inhabited. This identification disposes of another which was accepted alike by the Jewish and Christian Aramaic versions of the Old Testament, and, passing from the Aramaeans to the Arabs, has given rise to the modern names Fountain and Wādy of Moses (comp. Yāqūt, iv. 879). According to these versions Rikem, Rkām, or more precisely Rikēm of Gaur (that is, Elj), is Kadesh Barnea, where flowed the waters of Strife or "well of judgment" (Gen. xiv. 7; Num. xx. 1 sq., xxvii. 14), where Moses struck the rock. This view is ably supported by Greene (*The Hebrew Migration from Egypt*), others identify Kadesh with 'Ain Kadis (Kudais) on the south border of Judea.

Petra survived the fall of the Nabataean kingdom, and indeed most of the buildings may be dated from the 2nd and 3rd centuries. It appears from coins that Hadrian took it into favour and gave it his name. But Palmyra absorbed its trade with the Persian Gulf, and long before Islam the great incense-route was deserted and left Petra, like the more southern Nabataean city of Egra (Hijr), to fall into ruin. The ruins were an object of curiosity in the Middle Ages, and were visited by Silban ibn Bars (Quatremère, *l.c.*). The first European to describe them was Buckland, and since his time they have often been visited. See the descriptions, plans, and views of Laborde and Lunet, *Arabie Pétrée* (Paris, 1830-34), the *Duc de Luynes, Voyage d'exploration à la mer morte, &c.*, Paris,

¹ Arabia Petraea is not properly Stony Arabia, but the Arabia of which Petra is the centre—*hence Petra* *hence* *Arabia* of Agathemerus.

² The rock-heaven city of Rikim (Isaiah, 64, *Geogr. d'Abulf.*, Fr. tr. i. 2, 5), which Solimetus (*Ind. Geog. et Vit. Sal.*) proposes to identify with Petra, is a different place, close to 'Ammān (Mokaddasi, p. 176).

PETRARCH (1304-1374). Francesco Petrarca, eminent in the history of literature both as one of the four classical Italian poets and also as the first true reviver of learning in mediæval Europe, was born at Arezzo on 20th July 1304. His father Petracco held a post of notary in the Florentine Rolls Court of the Riformagioni; but, having espoused the same cause as Dante during the quarrels of the Blacks and Whites, Petracco was expelled from Florence by that decree of 27th January 1302 which condemned the poet of the *Divine Comedy* to lifelong exile. With his wife he took refuge in the Ghibelline township of Arezzo; and it was here, on the very night when his father, in company with other members of the White party, made an unsuccessful attempt to enter Florence by force, that Francesco first saw the light. He did not remain long in his birthplace. His mother, having obtained permission to return from banishment, settled at Incisa, a little village on the Arno above Florence, in February 1305. Here Petrarch spent seven years of boyhood, acquiring that pure Tuscan idiom which afterwards he used with such consummate mastery in ode and sonnet. Here too, in 1307, his brother Gherardo was born. In 1312 Petracco set up a house for his family at Pisa; but soon afterwards, finding no scope there for the exercise of his profession as jurist, he removed them all in 1313 to Avignon. This was a step of no small importance for the future poet-scholar. Avignon at that period still belonged to Provence, and owned King Robert of Naples as sovereign. But the popes had made it their residence after the insults offered to Boniface VIII. at Anagni in 1303. Avignon was therefore the centre of that varied society which the high pontiffs of Christendom have ever gathered round them. Nowhere else could the youth of genius who was destined to impress a cosmopolitan stamp on mediæval culture and to begin the modern era have grown up under conditions more favourable to his task. At Incisa and at Pisa he had learned his mother-tongue. At Carpentras, under the direction of Courvennot of Prato, he studied the humanities between the years 1315 and 1319. Avignon, at a distance from the party strife and somewhat parochial politics of the Italian commonwealths, impressed his mind with an ideal of civility raised far above provincial prejudices. What Petrarch lost in depth and intensity he gained in breadth and serenity by this exile's education. That disengagement from local circumstance which marks his patriotic theories, that conception of self-culture as an end in itself which distinguishes the humanism he inaugurated, were natural to a man who had no country, and who found the spiritual city of his studies and his aspirations in all quarters of the habitable globe.

Petrarch's real name, according to Tuscan usage, was Francesco di Petracco. But he altered this patronymic, for the sake of euphony, to Petrarca, proving by this slight change his emancipation from usages which, had he dwelt at Florence, would most probably have been imposed on him. It does not appear that he was attached to either his father or his mother; and, though he loved his brother Gherardo dearly, we recognize in him that type of character for which the self-chosen ties of friendship are more enthralling than the piety of domestic affection. Petracco, who was very anxious that his eldest son should become an eminent jurist, sent him at the age of fifteen to study law at Montpellier. Like Ovid and many other poets, Petrarch felt no inclination for his father's profession. His intellect, indeed, was not incapable of understanding and admiring the majestic edifice of Roman law; but he shrank with disgust from the illiberal technicalities of practice. There is an authentic story of Petracco's flinging

the young student's books of poetry and rhetoric upon the fire, but saving Virgil and Cicero half-burned from the flames at his son's passionate entreaties. Notwithstanding Petrarach's firm determination to make himself a scholar and a man of letters rather than a lawyer, he so far submitted to his father's wishes as to remove about the year 1323 to Bologna, which was then the headquarters of juristic learning. There he stayed with his brother Gherardo until 1326, when his father died, and he returned to Avignon. Banishment and change of place had already diminished Petrarach's fortune, which was never large, and a fraudulent administration of his estate after his death left the two heirs in almost complete destitution. The most precious remnant of Petrarach's inheritance was a MS. of Cicero. There remained no course open for him but to take orders. This he did at once on his arrival in Provence; and we have good reason to believe that he advanced in due time to the rank of priest. A great Roman noble and ecclesiastic, Giacomo Colonna, afterwards bishop of Lombez, now befriended him, and Petrarach lived for some years in partial dependence on this patron.

On the 6th of April 1337 happened the most famous event of Petrarach's history. He saw Laura for the first time in the church of St Clara at Avignon. Who Laura was remains uncertain still. That she was the daughter of Audibert de Noves and the wife of Hugh de Sade rests partly on tradition and partly on documents which the abbé de Sade professed to have copied from originals in the last century. Nothing is now extant to prove that, if this lady really existed, she was the Laura of the *Canzoniere*, while there are reasons for suspecting that the abbé was either the fabricator of a romance flattering to his own family, or the dupe of some previous impostor. We may, however, reject the sceptical hypothesis that Laura was a mere figment of Petrarach's fancy; and, if we accept her personal reality, the poems of her lover demonstrate that she was a married woman with whom he enjoyed a respectful and not very intimate friendship.

Petrarach's inner life after this date is mainly occupied with the passion which he celebrated in his Italian poems, and with the friendships which his Latin epistles dimly reveal to us. Besides the bishop of Lombez he was now on terms of intimacy with another member of the great Colonna family, the Cardinal Giovanni. A German, Ludwig, whom he called Socrates, and a Roman, Lello, who received from him the classic name of Lælius, were among his best-loved associates. He probably owed his livelihood to the generosity of prelates, with whom he played the courtier or the secretary, for we do not hear of his having occupied any benefice at this period. Avignon was the chief seat of his residence up to the year 1333, when he became restless, and undertook his first long journey. On this occasion he visited Paris, Ghent, Liège, Cologne, making the acquaintance of learned men and copying the manuscripts of classical authors. On his return to Avignon he engaged in public affairs, pleaded the cause of the Scaligers in their lawsuit with the Rossi for the lordship of Parma, and addressed two poetical epistles to Pope Benedict XII. upon the restoration of the papal see to Rome. His eloquence on behalf of the tyrants of Verona was successful. It won him the friendship of their ambassador, Azzo di Correggio,—a fact which subsequently influenced his life in no small measure. At the same time his treatment of the papal question made him pose as an Italian patriot clinging to the ideal of Rome as the sovereign city of civilization. Not very long after these events Petrarach made his first journey to Rome, a journey memorable from the account which he has left us of the impression he received from its ruins.

It was some time in the year 1337 that he established

himself at Vaucluse and began that life of solitary study, heightened by communion with nature in her loneliest and wildest moods, which distinguished him in so remarkable a degree from the common herd of mediæval scholars. Here he spent his time partly among books, meditating on Roman history, and preparing himself for the Latin epic of *Africa*. In his hours of recreation he climbed the hills or traced the Sorgues from its fountain under those tall limestone cliffs, while odes and sonnets to Madonna Laura were committed from his memory to paper. We may also refer many of his most important treatises in prose, as well as a large portion of his Latin correspondence, to the leisure he enjoyed in this retreat. Some woman, unknown to us by name, made him the father of a son, Giovanni, in the year 1337, and she was probably the same who brought him a daughter, Francesca, in 1343. Both children were afterwards legitimized by papal bulls. Meanwhile his fame as a poet in the Latin and the vulgar tongues steadily increased, until, when the first draughts of the *Africa* began to circulate about the year 1339, it became manifest that no one had a better right to the laurel crown than Petrarach. A desire for glory was one of the most deeply-rooted passions of his nature, and one of the points in which he most strikingly anticipated the humanistic scholars who succeeded him. It is not, therefore, surprising to find that he exerted his influence in several quarters with the view to obtaining the honours of a public coronation. The result of his intrigues was that on a single day in 1340, the 1st of September, he received two invitations, from the university of Paris and from King Robert of Naples respectively. He chose to accept the latter, journeyed in February 1341 to Naples, was honourably entertained by the king, and, after some formal disputations on matters touching the poet's art, was sent with magnificent credentials to Rome. There, in the month of April, Petrarach assumed the poet's crown upon the Capitol from the hand of the Roman senator amid the plaudits of the people and the patricians. The oration which he delivered on this occasion was composed upon these words of Virgil.

"Sed ne Parnassus deserta per ardua dulcis
Raptat auct."

The theme was well chosen, and the ceremony, though we cannot but regard it with a somewhat pitying smile, was symbolical of much. According to mediæval conceptions, Rome, though abandoned by her emperor and pope, was still the mistress of the world; and the poet, who upon that April day uttered the passion for Parnassus which drew him through steep and desert regions, was destined to revive the arts and sciences in the midst of a barren age. The ancient and the modern eras met together on the Capitol at Petrarach's coronation, and a new stadium for the human spirit, that which we are wont to style Renaissance, was opened.

With the coronation in Rome a fresh chapter in the biography of Petrarach may be said to have begun. Henceforth he ranked as a rhetorician and a poet of European celebrity, the guest of princes, and the ambassador to royal courts. During the spring months of 1341 his friend Azzo di Correggio had succeeded in freeing Parma from subjugation to the Scaligers, and was laying the foundations of his own tyranny in that city. He invited Petrarach to attend him when he made his triumphal entry at the end of May, and from this time forward for a considerable period Parma and Vaucluse were the two headquarters of the poet. The one he called his transalpine, the other his cisalpine Parnassus. The events of the next six years of his life, from May 1341 to May 1347, may be briefly recapitulated. He lost his old friend the bishop of Lombez by death and his brother Gherardo by the entrance of the latter into a Carthusian monastery. Various

small benefices were conferred upon him, and repeated offers of a papal secretaryship, which would have raised him to the highest dignities, were made and rejected. Petrarach remained true to the instinct of his own vocation, and had no intention of sacrificing his studies and his glory to ecclesiastical ambition. In January 1343 his old friend and patron Robert, king of Naples, died, and Petrarach was sent on an embassy from the papal court to his successor Joan. The notices which he has left us of Neapolitan society at this epoch are interesting, and it was now, perhaps, that he met Boccaccio for the first time. The beginning of the year 1345 was marked by an event more interesting in the scholar's eyes than any change in dynasties. This was no less than a discovery at Verona of Cicero's *Familiar Letters*. It is much to be regretted that Petrarach found the precious MS so late in life, when the style of his own epistles had been already modelled upon that of Seneca and St Augustine. No one, not even Erasmus, would have profited more by the study of those epistolary masterpieces, or would have been better able to imitate their point and ease of diction, had he become acquainted with them at an earlier period.

In the month of May 1347 Cola di Rienzi accomplished that extraordinary revolution which for a short space revived the republic in Rome, and raised this enthusiast to titular equality with kings. Petrarach, who in politics was no less visionary than Rienzi, hailed the advent of a founder and deliverer in the self-styled tribune. Without considering the impossibility of restoring the majesty of ancient Rome, or the absurdity of dignifying the medieval Roman rabble by the name of *Populus Romanus*, he threw himself with passion into the republican movement, and sacrificed his old friends of the Colonna family to what he judged a patriotic duty. To follow the meteoric course of Rienzi through those months of mock supremacy, exile, and imprisonment at Avignon does not concern Petrarach's biography. It will be enough to say that the poet contented himself with writing a rhetorical exhortation to the Roman people on the occasion of the tribune's downfall, giving vent, as usual, through eloquence to emotions which men of more practical character strive to express in act.

Petrarach built himself a house at Parma in the autumn of 1347. Here he hoped to pursue the tranquil avocations of a poet honoured by men of the world and men of letters throughout Europe, and of an idealistic politician, whose effusions on the questions of the day were read with pleasure for their style. But in the course of the next two years this agreeable prospect was overclouded by a series of calamities. Laura died of the plague on the 6th April 1348. Francesco degli Albizzi, Manaiolo Accursio, Roberto de' Bardi, Sennuccio del Bene, Lucchino Visconti, the cardinal Giovanni Colonna, and several other friends followed to the grave in rapid succession. All of these had been intimate acquaintances and correspondents of the poet. Friendship with him was a passion; or, what is more true perhaps, he needed friends for the maintenance of his intellectual activity at the highest point of its effectiveness. Therefore he felt the loss of these men acutely. We may say with certainty that Laura's death, accompanied by that of so many distinguished associates, was the turning-point in Petrarach's inner life. He began to think of quitting the world, and pondered a plan for establishing a kind of humanistic convent, where he might dedicate himself, in the company of kindred spirits, to still severer studies and a closer communion with God. Though nothing came of this scheme, a marked change was henceforth perceptible in Petrarach's literary compositions. The poems written *In Morte di Madonna Laura* are graver and of more religious tone. The prose works touch on retrospective topics or deal with subjects of deep meditation. At the

same time his renown, continually spreading, opened to him ever fresh relations with Italian despots. The noble houses of Gonzaga at Mantua, of Canara at Padua, of Este at Ferrara, of Malatesta at Rimini, of Visconti at Milan, vied with Azzo di Correggio in entertaining the illustrious man of letters. It was in vain that his correspondents pointed out the discrepancy between his professed zeal for Italian liberties, his recent enthusiasm for the Roman republic, and this alliance with tyrants who were destroying the freedom of the Lombard cities. Petrarach remained an invincible rhetorician, and, while he stigmatized the despots in his ode to Italy and in his epistles to the emperor, he accepted their hospitality. They, on their part, seem to have understood his temperance, and to have agreed to recognize his political theories as of no practical importance. The tendency to honour men of letters and to patronize the arts which distinguished Italian princes throughout the Renaissance period first manifested itself in the attitude assumed by Visconti and Canara to Petrarach.

When the jubilee of 1350 was proclaimed, Petrarach made a pilgrimage to Rome, passing and returning through Florence, where he established a firm friendship with Boccaccio. It has been well remarked that, while all his other friendships are shadowy and dim, this one alone stands out with clearness. Each of the two friends had a distinguished personality. Each played a foremost part in the revival of learning. Boccaccio carried his admiration for Petrarach to the point of worship. Petrarach repaid him with sympathy, counsel in literary studies, and moral support which helped to elevate and purify the younger poet's over-sensuous nature. It was Boccaccio who in the spring of 1351 brought to Petrarach, then resident with the Canara family at Padua, an invitation from the seignior of Florence to accept the rectorship of their recently-founded university. This was accompanied by a diploma of restoration to his rights as citizen and restitution of his patrimony. But, flattering as was the offer, Petrarach declined it. He preferred his literary leisure at Vaucluse, at Parma, in the courts of princes, to a post which would have brought him into contact with jealous priors and have reduced him to the position of the servant of a commonwealth. Accordingly, we find him journeying again in 1351 to Vaucluse, again refusing the office of papal secretary, again planning visionary reforms for the Roman people, and beginning that curious fragment of an autobiography which is known as the *Epistle to Posterity*. Early in 1353 he left Avignon for the last time, and entered Lombardy by the pass of Mont Genève, making his way immediately to Milan. The archbishop Giovanni Visconti was at this period virtually despot of Milan. He induced Petrarach, who had long been a friend of the Visconti family, to establish himself at his court, where he found employment for him as ambassador and orator. The most memorable of his diplomatic missions was to Venice in the autumn of 1353. Towards the close of the long struggle between Genoa and the republic of St Mark the Genoese entreated Giovanni Visconti to mediate on their behalf with the Venetians. Petrarach was entrusted with the office, and on 8th November he delivered a studied oration before the doge Andrea Dandolo and the great council. His eloquence had no effect; but the orator entered into relations with the Venetian aristocracy which were afterwards extended and confirmed. Meanwhile, Milan continued to be his place of residence. After Giovanni's death he remained in the court of Bernabò and Galeazzo Visconti, closing his eyes to their cruelties and exactions, serving them as a diplomatist, making speeches for them on ceremonial occasions, and partaking of the splendid hospitality they offered to emperors and princes. It was in this capacity of an independent man of letters,

highly placed and favoured at one of the most wealthy courts of Europe, that he addressed epistles to the emperor Charles IV upon the distracted state of Italy, and entreated him to resume the old Ghibelline policy of imperial interference. Charles IV passed through Mantua in the autumn of 1354. There Petrarch made his acquaintance, and, finding him a man unfit for any noble enterprise, declined attending him to Rome. When Charles returned to Germany, after assuming the crowns in Rome and Milan, Petrarch addressed a letter of vehement invective and reproach to the emperor who was so negligent of the duties imposed on him by his high office. This did not prevent the Visconti sending him on an embassy to Charles in 1356. Petrarch found him at Prague, and, after pleading the cause of his masters, was despatched with honour and the diploma of count palatine. His student's life at Milan was again interrupted in 1360 by a mission on which Galeazzo Visconti sent him to King John of France. The tyrants of Milan were aspiring to royal alliances, Gian Galeazzo Visconti had been married to Isabella of France, Violante Visconti, a few years later, was wedded to the English duke of Clarence. Petrarch was now commissioned to congratulate King John upon his liberation from captivity in England. This duty performed, he returned to Milan, where in 1361 he received news of the death of his son Giovanni and his old friend Socrates. Both had been carried off by plague.

The remaining years of Petrarch's life, important as they were for the furtherance of humanistic studies, may be briefly condensed. On 11th May 1362 he settled at Padua, from the neighbourhood of which he never moved again to any great distance. The same year saw him at Venice, making a donation of his library to the republic of St Mark. Here his friend Boccaccio introduced to him the Greek teacher Leontius Pilatus. Petrarch, who possessed a MS of Homer and a portion of Plato, never acquired the Greek language, although he attempted to gain some little knowledge of it in his later years. Homer, he said, was dumb to him, while he was deaf to Homer, and he could only approach the *Iliad* in Boccaccio's rude Latin version. About this period he saw his daughter Francesca happily married, and undertook the education of a young scholar from Ravenna, whose sudden disappearance from his household caused him the deepest grief. This youth has been identified, but on insufficient grounds, with that Giovanni Malpaghini of Ravenna who was destined to form a most important link between Petrarch and the humanists of the next age of culture. The public affairs of Italy and Europe continued to interest him, nor was he ever idle in composing letters and orations, some of which were not without political importance, while all of them contributed to form a style that had the greatest influence over successive generations of Italian chancellors and secretaries. Gradually his oldest friends dropped off. Azzo di Correggio died in 1363, and Lelius, Simondes, Barbato, in the following year. His own death was reported in 1365; but he survived another decade. Much of this last stage of his life was occupied at Padua in a controversy with the Averroists, whom he regarded as dangerous antagonists both to sound religion and to sound culture. A curious treatise, which grew in part out of this dispute and out of a previous duel with physicians, was the book *Upon his own Ignorance and that of many others*. At last, in 1369, tired with the bustle of a town so big as Padua, he retired to Arquà, a village in the Euganean hills, where he continued his usual train of literary occupations, employing several secretaries, and studying unremittingly. All through these declining years his friendship with Boccaccio was maintained and strengthened. It rested on a solid basis of mutual affection and of common studies, the

different temperaments of the two scholars securing them against the disagreements of rivalry or jealousy. One of Petrarch's last compositions was a Latin version of Boccaccio's story of Griselda. On 18th July 1374 his people found the old poet and scholar dead among his books in the library of that little house which looks across the hills and lowlands toward the Adriatic.

When we attempt to estimate Petrarch's position in the history of modern culture, the first thing which strikes us is that he was even less eminent as an Italian poet than as the founder of Humanism, the inaugurator of the Renaissance in Italy. What he achieved for the modern world was not merely to bequeath to his Italian imitators masterpieces of lyrical art unrivalled for perfection of workmanship, but also, and far more, to open out for Europe a new sphere of mental activity. Standing within the threshold of the Middle Ages, he surveyed the kingdom of the modern spirit, and, by his own inexhaustible industry in the field of scholarship and study, he determined what we call the revival of learning. By bringing the men of his own generation into sympathetic contact with antiquity, he gave a decisive impulse to that European movement which restored freedom, self-consciousness, and the faculty of progress to the human intellect. The warm recognition which he met with in his lifetime and the extraordinary activity of his immediate successors prove indeed that the age itself was ripe for this momentous change. Yet it is none the less certain that Petrarch stamped his genius on the spirit of the time, that he was the hero of the humanistic effort. He was the first man to collect libraries, to accumulate coins, to advocate the preservation of antique monuments, and to collate MSS. Though he knew no Greek, he was the first to appreciate its vast importance; and through his influence Boccaccio laid the earliest foundations of its study. More than this, he was the first to approach the great authors of antiquity with intelligence. It was not the extent but the lucidity of his erudition, not the matter but the spirit of his scholarship, that placed him at an immeasurable distance of superiority above his predecessors. When we compare the use which even Dante made of classical knowledge in his *De Monarchia* with Petrarch's touch upon the ancients in his numerous prose works, we perceive that we have passed from the mediæval to the modern conception of literature. For him the authors of the Greek and Latin world were living men,—more real, in fact, than those with whom he corresponded, and the rhetorical epistles he addressed to Cicero, Seneca, and Varro prove that he dwelt with them on terms of sympathetic intimacy. So far-reaching were the interests controlled by him in this capacity of humanist that his achievement as an Italian lyric seems by comparison insignificant.

Petrarch's ideal of humanism was essentially a noble one. He regarded the orator and the poet as teachers, bound to complete themselves by education, and to exhibit to the world an image of perfected personality in prose and verse of studied beauty. Self-culture and self-education seemed to him the highest aims of man. Everything which contributed to the formation of a free, impassioned, liberal individuality he regarded as praiseworthy. Everything which retarded the attainment of that end was contemptible in his eyes. The authors of antiquity, the Holy Scriptures, and the fathers of the church were valued by him as one common source of intellectual enlightenment. Eminently religious, and orthodox in his convictions, he did not seek to substitute a pagan for the Christian ideal. This was left for the scholars of the 15th and 16th centuries in Italy. At the same time, the Latin orators, historians, and poets were venerated by him as depositaries of a tradition only second in importance to revelation. For

him there was no schism between Rome and Galilee, between classical genius and sacred inspiration. Though the latter took the first rank in relation to man's eternal welfare, the former was necessary for the perfection of his intellect and the civilization of his manners. With this double ideal in view, Petrarach poured scorn upon the French physicians and the Italian Averroists for their illiberal philistinism, no less than for their materialistic impiety. True to his conception of independent intellectual activity, he abstained from a legal career, refused important ecclesiastical office, and contented himself with paltry benefices which implied no spiritual or administrative duties, because he was resolved to follow the one purpose of his life,—self-culture. Whatever in literature revealed the hearts of men was infinitely precious to him, and for this reason he professed almost a cult for St Augustine. It was to Augustine, as to a friend or a confessor, that he poured forth the secrets of his own soul in the book *De Contemptu Mundi*.

In this effort to realize his truest self Petrarach was eminently successful. Much as he effected by restoring to the world a sound conception of learning, and by rousing that genuine love and curiosity which led to the revival, he did even more by impressing on the age his own full-blooded and striking personality. In all things he was original. Whether we regard him as a priest who published poem after poem in praise of an adored mistress, as a plebeian man of letters who conversed on equal terms with kings and princes, as a solitary dedicated to the love of nature, as an amateur diplomatist treating affairs of state with pompous eloquence in missives sent to popes and emperors, or again as a traveller eager for change of scene, ready to climb mountains for the enjoyment of broad prospects over spreading champaigns; in all these diverse manifestations of his peculiar genius we trace some contrast with the manners of the 14th century, some emphatic anticipation of the 16th. The defects of Petrarach's character were no less striking than its qualities, and were indeed their complement and counterpart. That vivid conception of intellectual and moral self-culture which determined his ideal took the form in actual life of all-absorbing egotism. He was not content with knowing himself to be the leader of the age. He claimed autocracy, suffered no rival near his throne, brooked no contradiction, demanded unconditional submission to his will and judgment. His friends were treated by him as subordinates and vassals with exacting magnanimity. The preoccupation with himself, which makes his letters and prose treatises a mine of autobiographical information, rouses a certain contempt when we watch it degenerating into vanity, appetite for flattery, intrigues for the poet's crown, restless change from place to place in search of new admirers, desire for ceremonial pomp, and half-concealed detraction of superior genius. Petrarach was made up of contradictions. Praising solitude, playing the hermit at Vaucluse, he only loved seclusion as a contrast to the society of courts, while he penned dissertations on the futility of fame and the burden of celebrity, he was trimming his sails to catch the breeze of popular applause. No one professed a more austere morality, and few medieval writers indulged in cruder satire on the female sex, yet he passed some years in the society of a concubine, and his living masterpiece of art is the apotheosis of chivalrous passion for a woman. These discords of an undecided nature displayed themselves in his political theories and in his philosophy of conduct. In one mood he was fain to ape the antique patriot; in another he affected the monastic saint. He was clamorous for the freedom of the Roman people; yet at one time he called upon the popes to re-establish themselves in the Eternal City; at another he besought the emperor to make it his

headquarters, at a third he hailed in Rienzi the founder of a new republic. He did not perceive that all these plans were incompatible. His relations to the Lombard nobles were equally at variance with his professed patriotism, and, while still a housemate of Visconti and Correggi, he kept on issuing invectives against the tyrants who divided Italy. It would not be difficult to multiply these antitheses in the character and the opinions of this singular man. But it is more to the purpose to remark that they were harmonized in a personality of potent and enduring force. Petrarach was essentially the first of the moderns, the ancestor of Hamlet and Faust, Rousseau and Childe Harold. That strange spirit of unrest and melancholy, of malady and isolation, which drove him from time to time into the desert, where he sought companionship with the great writers of the past, was the inner witness to an irresolvable contradiction between himself and the age in which he lived.

The point to notice in this complex personality is that Petrarach's ideal remained always literary. As philosopher, politician, historian, essayist, orator, he aimed at lucid and harmonious expression,—not, indeed, neglecting the importance of the material he undertook to treat, but approaching his task in the spirit of an artist rather than a thinker or a man of action. This accounts for his bewildering versatility, and for his apparent want of grasp on conditions of fact. Viewed in this light Petrarach anticipated the Italian Renaissance in its weakness,—that philosophical superficiality, that tendency to ornate rhetoric, that preoccupation with stylistic trifles, that want of profound conviction and stern sincerity, which stamp its minor literary products with the note of mediocrity. Had Petrarach been possessed with a passion for some commanding principle in politics, morality, or science, instead of with the thirst for self-glorification and the ideal of artistic culture, it is not wholly impossible that Italian humanism might have assumed a manlier and more conscientious tone. But this is not a question which admits of discussion, for the conditions which made Petrarach what he was were already potent in Italian society. He did but express the spirit of the period he opened, and it may also be added that his own ideal was higher and severer than that of the illustrious humanists who followed him.

As an author Petrarach must be considered from two points of view,—first as a writer of Latin verse and prose, secondly as an Italian lyricist. In the former capacity he was speedily outstripped by more fortunate scholars. His eclogues and epistles and the epic of *Africa*, on which he set such store, exhibit a comparatively limited command of Latin metre. His treatises, orations, and familiar letters, though remarkable for a prose style which is eminently characteristic of the man, are not distinguished by purity of diction. Much as he admired Cicero, it is clear that he had not freed himself from current medieval Latinity. Seneca and Augustine had been too much used by him as models of composition. At the same time it will be conceded that he possessed a copious vocabulary, a fine ear for cadence, and the faculty of expressing every shade of thought or feeling. What he lacked was that insight into the best classical masterpieces, that command of the best classical diction, which is the product of successive generations of scholarship. To attain to this, Giovanni da Ravenna, Coluccio Salutati, Poggio, and Filelfo had to labour, before a Poliziano and a Bembo finally prepared the path for an Erasmus. Had Petrarach been born at the close of the 15th instead of at the opening of the 14th century there is no doubt that his Latinity would have been as pure, as versatile, and as pointed as that of the witty stylist of Rotterdam.

With regard to his Italian poetry Petrarach occupies a

very different position. The *Rime in Vita e Morte di Madonna Laura* cannot become obsolete, for perfect metrical form has here been married to language of the choicest and the purest. It is true that even in the *Canzoniere*, as Italians prefer to call that collection of lyrics, Petrarch is not devoid of faults belonging to his age, and affectations which have imposed themselves with disastrous effect through his authority upon the literature of Europe. He appealed in his odes and sonnets to a restricted audience already educated by the chivalrous love-poetry of Provence and by Italian imitations of that style. He was not careful to exclude the commonplaces of the school, nor anxious to finish a work of art wholly free from fashionable graces and from contemporary conceits. There is therefore a certain element of artificiality in his treatment, and this, since it is easier to copy defects than excellences, has been perpetuated with wearisome monotony by versifiers who chose him for their model. But, after making due allowance for peculiarities, the abuse of which has brought the name of Petrarchist into contempt, we can agree with Shelley that the lyrics of the *Canzoniere* "are as spells which unseal the inmost enchanted fountains of the delight which is the grief of love." That is to say, Petrarch in this monumental series of odes and sonnets depicted all the moods of a real passion, and presented them in a style of such lucidity, with so exquisite a command of rhythmical resources, and with humanity of emotion so simple and so true, as to render his portrait of a lover's soul applicable to all who have loved and will love for ages. If space sufficed much might be written about the peculiar position held by Petrarch between the metaphysical lyrists of Tuscany and the more realistic amorists of succeeding generations. True in this respect also to his anticipation of the coming age, he was the first Italian poet of love to free himself from allegory and mysticism. Yet he was far from approaching the analysis of emotion with the directness of a Heine or De Musset. Though we believe in the reality of Laura, we derive no clear conception either of her person or her character. She is not so much a woman as woman in the abstract, and perhaps on this very account the poems written for her by her lover have been taken to the heart by countless lovers who came after him. The method of his art is so generalizing, while his feeling is so natural, that every man can see himself reflected in the singer and his mistress shadowed forth in Laura. The same criticism might be passed on Petrarch's descriptions of nature. That he felt the beauties of nature keenly is certain, and he frequently touches them with obvious appreciation. Yet he has written nothing so characteristic of Vaucluse as to be inapplicable to any solitude where there are woods and water. The *Canzoniere* is therefore one long melodious monody poured from the poet's soul, with the indefinite form of a beautiful woman seated in a lovely landscape, a perpetual object of delightful contemplation. This disengagement from local circumstances without the sacrifice of emotional sincerity is a merit in Petrarch, but it became a fault in his imitators. Lacking his intensity of passion and his admirable faculty for seizing the most evanescent shades of difference in feeling, they degenerated into colourless and lifeless insipidities made insupportable by the frigid repetition of tropes and conceits which we are fain to pardon in the master.

Petrarch did not distinguish himself by love-poetry alone in the Italian language. His odes to Giacomo Colonna, to Cola di Rienzi, and to the princes of Italy display him in another light. They exhibit the oratorical fervour, the pleader's eloquence in its most perfect lustre, which Petrarch possessed in no less measure than subjective passion. Modern literature has nothing nobler, nothing more

harmonious in the declamatory style than these three patriotic effusions. Then spirit itself is epoch-making in the history of Europe. Up to this point Italy had scarcely begun to exist. There were Florentines and Lombards, Guelfs and Ghibellines, but even Dante had scarcely conceived of Italy as a nation, independent of the empire, inclusive of her several component commonwealths. To the high conception of Italian nationality, to the belief in that spiritual unity which underlay her many discords and divisions, Petrarch attained partly through his disengagement from civic and local partisanship, partly through his large and liberal ideal of culture. It was the function of the Renaissance to bring all parts of the Italian peninsula into an intellectual harmony by means of common enthusiasm for arts and letters. But it remained for the present century to witness the political consolidation of the Italian people under a single government.

The materials for a life of Petrarch are afforded in abundance by his letters, collected and printed in edition under his own eyes. These are divided into *Familiari*, *Correspondence*, *Correspondence in Old Age*, *Divine Letters*, and *Letters without a Title*, to which may be added the emulous autobiographical fragment entitled the *Epistle to Posterity*. Next in importance rank the epistles and eclogues in Latin verse, the Italian poems, and the rhetorical addresses to popes, emperors, Cola di Rienzi, and some great men of antiquity. For the comprehension of his character, inspired by a visit to his brother Gherardo in his convent near Marseilles. On historical subjects the most considerable are *Herem Memoranda* and *Libri*, a miscellany from a student's commonplace-book, and *De Viris illustribus*, an epitome of the biographies of Roman worthies. Three polemical works require mention: *Contro a quidam anonymi Galii calumnias Apologus*, *Contro a Medicum quendam Inventionis Libri*, and *De vita et ynnuato viri Ignorantis*, all on casual and satirical compositions, which give Petrarch's quarrels with the physicians of Avignon and the Averroists of Padua. In this connection it might also be well to mention the remarkable satires on the papal court, included in the *Epistole sine Titulo*. Five public orations have been preserved, the most weighty of which, in explanation of Petrarch's conception of literature, is the speech delivered on the Capitol upon the occasion of his coronation. Among his Latin poems *Africus*, an epic on Scipio Africanus, takes the first place. Twelve *Eclogues* and three books of *Epistles* in verse close the list. In Italian we possess the *Canzoniere*, which includes odes and sonnets written for Laura during her lifetime, those written for her after her death, and a miscellaneous section containing the three patriotic odes and three famous poetical invectives against the papal court. Besides these lyrical compositions are the semi-epical or allegorical *Trionfi*, *Trionphs of Love*, *Chastity*, *Death*, *Fame*, *Time*, and *Divinity*, written in terza rima of smooth and limpid quality. Though these *Trionfi*, as a whole, are deficient in poetic inspiration, the second canto of the *Trionfo della Morte*, in which Petrarch describes a vision of his dead loved Laura, is justly famous for reserved passion and pathos tempered to a tranquil harmony.

The complete bibliography of Petrarch forms a considerable volume. Such a work was compiled by Domenico Rossetti (Turin, 1820). It will be enough here to mention the Basel edition of 1561, in folio, as the basis for all subsequent editions of his collected works. Two editions of the *Canzoniere* deserve especial notice,—that of Marsand (Paris, 1840) and that of Leopold in Le Monnier's collection. Not must Fracassetti's Italian version of the *Letters* (published in 5 vols by Le Monnier) be neglected. De Sade's life of the poet (Amsterdam, 1764) makes an epoch in the history of his numerous biographies, but this is in many important points untrustworthy, and it has been superseded by Gustav Koebner's exhaustive volume on *Petrarch's Leben und Werke* (Leipzig, 1878). Vogt's *Untersuchungen über Petrarca's Leben und Werke* (Leipzig, 1880) contains a well-digested estimate of Petrarch's relation to the revival of learning. Mezerius's *Petrarchus* (1688) is a monograph of merit. English readers may be referred to Little book on Petrarch by Henry Reeve, and to vol. vi. of *Studies of Symonds's Renaissance in Italy* (G. A. S.).

PETREL, the name applied in a general way to a group of Birds (of which more than 100 species are recognized) from the habit which some of them possess of apparently walking on the surface of the water as the apostle St Peter (of whose name the word is a diminutive form) is recorded (Matt. xiv 29) to have done. For a long while the Petrels were ranked as a Family, under the name of *Pterod-*

aquila,¹ and thought to be either very nearly allied to the Gull, *Larus*, or intermediate between that Family and the *Streptopodidae*.² But this opinion has gradually given way, and it is now hard to resist the conclusion that they have to be regarded as an "Order," to which the name *Tubinariae* has been applied from the tubular form of their nostrils, a feature possessed in greater or less degree by all of them, and by which each may at a glance be recognized. They have usually been subdivided into three groups or Subfamilies, (1) *Pelecanoidinae* (or *Halodrominae*), containing some three or four species known as Diving-Petrels, with habits very different from others of the Family, and almost peculiar to high southern latitudes from Cape Horn to New Zealand, (2) *Procellariinae*, or Petrels proper, and (3) *Diomedinae*, or Albatrosses (cf. MALLERUD, vol. xv p. 334). Recently, however, the anatomy of the group has been subjected to very close examination by Garrod and W. A. Forbes, the latter of whom has summed up the results obtained by himself and his predecessor in an elaborate essay, forming part ix. of the Zoology of the voyage of the "Challenger," which shew determinations that differ greatly from any that had been reached by prior systematists. According to these investigators, the *Tubinariae* are composed of two Families, *Procellariidae* and *Oceanitidae*, whose distinctness had never before been suspected³—the latter consisting of four genera not very much differing in appearance from many others, while the former includes as Subfamilies the Albatrosses, *Diomedinae*, with three genera, *Dionidea*, *Thalasidroma*, and *Phoebastria*, and the true Petrels, *Procellariinae*, in which last are combined forms so different externally and in habit as the Diving-Petrels, above noticed, the Storm-Petrels, *Procellaria*, the Flat-billed Petrels, *Puffin*, the FULMAR (vol. ix p. 817), the SHEARWATERS (v), and others. Want of space forbids us here dwelling on the characters assigned to these different groups, or the means which have led to this classification of it, set forth at great length in the essay cited, where also will be found copious references to previous studies of the Petrels, among which may here be especially mentioned those of M. M. Hombon and Jacquinet (*Comptes Rendus*, 1844, pp. 353-358, and *Zool. Voy. au Pol Sud*, vol. iii.), Prof. Cones (*Proc. Acad. Philadelphia*, 1864, pp. 72-91, 116-144, and 1866, pp. 25-33, 134-137), and M. Salvin (*Orn. New Zealand*, vol. i. pp. 223-233, 249-257, and *Zoology, Voy. "Challenger,"* pt. viii. pp. 140-149).

Petrels are dispersed throughout all the seas and oceans of the world, and some species apparently never resort to land except for the purpose of modification, though nearly all are hable at times to be driven ashore, and often very far inland, by gales of wind.⁴ It would also seem that during the breeding-season many of them are wholly nocturnal in their habits, passing the day in holes of the ground, or in clefts of the rocks, in which they generally nestle, the hen of each pair laying a single white egg, sparsely speckled in a few species with fine reddish dots. Of those species that frequent the North Atlantic, the common Storm-Petrel, *Procellaria pelagica*, a little bird which has to the ordinary eye rather the look of a Swift or Swallow, is the "Mother Carey's chicken" of sailors, and is widely believed to be the harbinger of bad weather,⁵ but seamen hardly discriminate between this and others nearly resembling it in appearance, such as Leach's or the

Fork-tailed Petrel, *Cymochorea leucorhoa*, a rather larger but less common bird, and Wilson's Petrel, *Oceanites oceanicus*, the type of the Family *Oceanitidae* mentioned above, which is more common on the American side. But it is in the Southern Ocean that Petrels most abound, both as species and as individuals. The Cape-Pigeon or Pintado Petrel, *Diaption capensis*, is one that has long been well known to mariners and other wayfarers on the great waters, while those who voyage to or from Australia, whatever be the route they take, are certain to meet with many more species, some, as *Ossifraga galeata*, as large as Albatrosses, and several of them called by sailors by a variety of choice names, generally having reference to the strong smell of musk emitted by the birds, among which that of "Stink-pot" is not the most opprobrious. None of the Petrels are endowed with any brilliant colouring—sooty-black, grey of various tints (one of which is often called "blue"), and white being the only hues their plumage exhibits; but their graceful flight, and their companionship when no other life is visible around a lonely vessel on the widest of oceans, give them an interest to beholders, though this is too often marred by the wanton destruction dealt out by brutal or thoughtless persons who thus seek to break the tediousness of a long voyage. The distribution of the several species of Petrels in the Southern Ocean has been ably treated by Prof. A. Milne-Edwards in the *Annales des Sciences Naturelles* for 1882 (ser. 6, *Zoologie*, vol. xiii. art. 4, pp. 1-22), of which essay a translation will be found in the *Mittheilungen des Ornithologischen Vereins in Wien* for 1884. (A. N.)

PETRIE, GEORGE (1790-1866), Irish antiquary, was the son of James Petrie, a native of Aberdeen, who had settled in Dublin as a portrait and miniature painter. He was born in Dublin in January 1790, and was educated to become a painter. Besides attaining considerable reputation as a landscape painter of Irish scenes, he devoted much of his artistic skill to the illustration of the antiquities of the country. Even in boyhood his love of archaeology vied with his love of art and of nature. In 1828 he was appointed to conduct the antiquarian and historical section of the Ordnance Survey of Ireland, but this department of the work was not persevered in by the Government. In 1832 he became editor of the *Dublin Penny Journal*, a periodical designed to disseminate information among the masses, to which he contributed numerous articles on the history of the fine arts in Ireland. Petrie may be regarded as the first scientific investigator of Irish archaeology, his contributions to which are also in themselves of prime importance. His *Essay on Round Towers*, for which in 1830 he received the prize of the Irish Academy, must still rank, whether or not his opinion be accepted that the round towers served the joint purpose of beacons and fortresses, as the standard work on the subject. A second edition was published in 1845. Among his other more important contributions to Irish archaeology are his *Essay on the Military Architecture of Ireland* and his *History and Antiquities of Tara Hill*. In 1847 he received the degree of LL.D. from the university of Dublin, and in 1849 he was placed on the civil list for an annual pension of £300. He died 17th January 1866.

See the *Life and Labours in Art and Archaeology of George Petrie*, by William Stokes, 1868.

PETROLEUM. The word "petroleum" (*rock-oil*; Germ., *eröl*, *steinöl*) is used to designate the forms of bitumen that are of an oily consistence. It passes by insensible gradations into the volatile and ethereal naphthas on the one hand and the semi-fluid malthas or mineral-tars on the other.

History.—Petroleum has been known by civilized man

¹ Most commonly but erroneously spelt *Procellaria*.

² It is due to Prof. Cones to state that in 1864 he had declared the genus *Oceanites*, of which he only knew the external characters, to be "the most distinct and remarkable" of the "*Procellariinae*," though he never thought of making it the type of a separate Family.

³ Thus *Exeladina leucata*, the Capped Petrel, a species whose proper home seems to be Guadeloupe and some of the neighbouring West-Indian Islands, has occurred in the State of New York, near Boulogne, in Norfolk, and in Hungary (*Ibis*, 1884, p. 202).

from the dawn of history. Herodotus wrote of the springs of Zacynthus (Zante), and the fountains of Hit have been celebrated by the Arabs and Persians. Pliny and Dioscorides describe the oil of Argemone, which was used in lamps under the name of "Sicilian oil," and mention is made of petroleum springs in China in the earliest records of that ancient people. The abundance of petroleum and the fire-temple at Bakou on the Caspian have been frequently described by travellers who have gone overland from Europe to India, from the time of Marco Polo to recent years. Petroleum in North America was first mentioned by a Franciscan missionary, Joseph de la Roche d'Allion, in a letter written in 1629 and published in Sagard's *Histoire du Canada* in 1636. Peter Kalm described the springs on Oil Creek in his book of travels in North America, published in London in 1772. In 1750 the French commander at Fort Duquesne described them in a letter to General Montcalm, and later, towards the close of the last century, frequent mention is made of oil-springs in correspondence relating to what is now western Pennsylvania, Ohio, West Virginia, and Kentucky. In 1765 and 1826 the British Government sent ambassadors to the court of Ava, in the reports of which mention is made of the petroleum springs and wells near Rangoon on the Irrawadi. During the early years of the present century the occurrence of bitumen, and particularly of its liquid forms, was noticed by scientific men and travellers in various localities. In Europe, Boussingault's researches upon the petroleum of Bechelbronn (Lower Alsace) and the discovery of paraffin by Reichenbach attracted much attention. Petroleum was observed and described as early as 1814 in Washington county, Ohio, in wells at that time being bored for brine. In 1819 a well bored for brine in Wayne county, Kentucky, yielded so much black petroleum that it was abandoned. It has continued to yield small quantities until the present time. In 1829 a well drilled for brine near Burkesville, Cumberland county, Kentucky, yielded such a flow of petroleum that it was regarded as a wonderful natural phenomenon. This well is estimated to have yielded, up to 1860, 50,000 barrels of oil, the larger part of which was wasted. Of the rest a few barrels were bottled and sold as a liniment in the United States and Europe under the name of "American oil."

About the year 1847 E. W. Binney of Manchester, England, called attention to the petroleum discovered at Riddings, near Alfreton in Derbyshire, and a few years later he, together with James Young and others, commenced the manufacture of illuminating and other oils from it. The supply of crude material from this source soon became inadequate, and they then commenced distilling the Boghead mineral that had been found near Bathgate in Scotland. The success attending this enterprise soon attracted attention in the United States of America, and a number of establishments were in operation in the course of a few years, some of them being licensed under Young's patents. In 1851, when petroleum on Oil Creek was worth 75 cents a gallon in the crude state, it was tested as a crude material for the manufacture of illuminating oil by Messrs William and Luther Attwood, and Joshua Merrill, at the United States Chemical Manufacturing Company's works at Waltham, near Boston, Massachusetts, and its merits for that purpose fully established. But its scarcity at that time prevented its use in commercial quantities, and the establishments at Boston and Portland, Maine, under the charge of Messrs Merrill and William Attwood, continued to use Boghead mineral and albertite for a number of years after petroleum was produced in sufficient quantity. Petroleum was refined and offered for sale in Pittsburgh, Pennsylvania, as early as 1855, but the quantity was too small to influence even the local trade, it, however, created a small demand for the

crude oil. The well-known fact that brine-wells often produced petroleum led those who sold the "American oil" to embellish the label on the bottles with a derrick and other accompaniments of a brine-well, and the story is told that the projector of the first well drilled exclusively for petroleum was led to undertake it through reflecting upon this picture. Some oil from one of the natural springs near Titusville, Pennsylvania, was sent to Professor B. Sillman, junior, of Yale College, and he made a report upon it which has become a classic in the literature of petroleum. This report was so satisfactory that a company was organized in New Haven, and E. L. Drake was sent to drill a well upon land that was leased in the valley of Oil Creek, a short distance below the spot where the city of Titusville now stands. The region was then almost a wilderness, and many delays were experienced before he succeeded in getting his men and machinery in operation. He was at first thwarted by quicksands and water, but he finally drove an iron pipe 36 feet down to the rock. This device, said to have been original with Drake, has been of great value in artesian boring ever since he used it. After drilling 33 feet on the 28th of August 1859, the drill fell suddenly 6 inches into a crevice, and was left until the next day, when the drill-hole was found to be nearly filled with petroleum. No spot in the entire territory where petroleum has since been obtained could have been selected where the oil was to be obtained nearer the surface. The success of this enterprise led to the immediate drilling of other wells, first in the valley of Oil Creek and its tributaries, and later over the higher land between Oil Creek and the Alleghany river below Tidouate. As this territory began to be exhausted, the region of the lower Alleghany, in Butler and Clarion counties, yielded wells of great richness, and finally the Bradford field in McKean county became the centre of production. A careful comparison of the situations of some of the most productive wells led to the discovery that the areas yielding oil were not irregular in outline, but extended across the country in narrow belts, without regard to the present configuration of the surface. The areas of these belts were in general parallel, and extended in a north-east and south-west direction, 15° to 20° from the meridian. As the exhaustion of the oil-fields of Butler and Clarion counties led producers to seek a more productive locality, lines were run by compass on the supposed axis of the oil-belt over forest-covered hills for many miles, until they reached the town of Bradford, near which wells had previously been drilled without success. Deeper wells were drilled, and oil was obtained, resulting in the development since 1875 of about 68,000 acres of the most uniformly productive and extensive oil-territory yet discovered.

In the province of Ontario, Canada, principally in the vicinity of Enniskillen, a territory of limited extent but great productiveness has been under development for the last twenty years. In the region about Bakou and in the valley of the Kuban, at the eastern and western extremities of the Caucasus, petroleum has been obtained for an unknown period, and is now being produced from artesian borings in large quantities. In Galicia and Roumania it is also obtained in commercial quantities. These regions with the United States furnish the petroleum of commerce. Japan, China, Burmah, and Italy have yielded petroleum in quantities sufficient to supply a local demand, but the vast quantity of the American oil and low price at which it is furnished have rendered the production in these countries unprofitable.

Geographical Distribution.—Petroleum "was found about one hundred years since in making the duke of Bridgewater's tunnel at Worsley, at Wigan and West Leigh in the Lancashire coal-fields, at Coalbrookdale and Wellington

in Shropshire and Riddings in Derbyshire, two other coal-fields, also in a peat-bog at Down Holland, near Omskirk, in Lancashire, but never in commercial quantities. The greatest supply has not been more than fifty gallons a day, and even that soon diminished? A tail-spring was known at Coalport, in Shropshire, early in the present century. Although there are extensive deposits of solid bitumen in eastern France and Switzerland, the petroleum springs that occur at Saint Bob, Dax, Pyrénees, are unimportant. In Alsace, at Lobsann and Bechelbrunn, petroleum has been obtained for many years for local uses. Although reported from many localities in Germany, the only point that has promised to be of any importance is the Luneburg heath, south of Hamburg. Petroleum is also reported near Halle, in Dithmarschen, Schleswig-Holstein. On the eastern shores of the Adriatic—in Dalmatia and Albania—and in the Ionian Islands, petroleum springs have been mentioned by the writers of classical antiquity. In Armenia and Persia petroleum has been used for unknown centuries, and it appears to be widely distributed in the mountains that surround the tableland of Iran. In Algeria, Egypt, Kashmir, the Punjab, Assam, Java, and other East Indian islands petroleum is reported. In North America the successful development of the petroleum-fields of north-west Pennsylvania following the completion of Drake's well led in a few years to the drilling of wells in a great many localities where petroleum-springs had been observed. The following so-called "petroleum-fields" have produced oil in commercial quantities more or less valuable

Name	Maximum production in	Yield in barrels to 1880
Oil Creek, Venango county, Pennsylvania	1862	35,517,997
Pithole, " "	1866	8,816,289
Central Alleghany, " "	1871	6,182,900
Lower Alleghany, Butler and Clarion counties " "	1874	37,342,978
Tihroute, Venango and Warren counties "	1874	4,674,345
Bullion, Venango county "	1877	2,312,090
Brallott, McKean county "	1881	44,574,921
Warren, Warren county "	1878	448,215
Smith's Ferry, Beaver county "	1879	339,631
Mecca, Tumbull county, Ohio	A continuous small production since 1865. No record	
Grafton, Lorain county, "		
Macksburg, Washington county, "		
Hoise Neck, Pleasant county, W. Virginia		
Volcano, Wood county, "		
Burning Springs, Wirt county, "		
Glasgow, Barton county, Kentucky		
Santa Clara Valley, Ventura county, California		

Besides these localities petroleum has been observed over an area 1500 miles long by an unknown breadth in the valley of the Mackenzie and its tributaries, and in New Brunswick, Newfoundland, and other portions of eastern Canada. It also occurs at many different points along the Appalachian system of mountains from Point Gaspé on the St Lawrence to northern Alabama. It has been noticed in Kansas, Missouri, Wyoming, Colorado, and Texas in the United States, in southern Mexico, in the West India Islands, and in the northern states of South America. Petroleum is one of the most widely distributed substances occurring in nature, but an examination of the geographical localities in which it chiefly occurs will show them to be intimately connected with the principal mountain-chains of the world.

Geological Relations.—It has been frequently remarked that petroleum occurs in all geological formations, from the Silurian up to the Tertiary. While this is true as a general statement, it is misleading, for petroleum is not uniformly distributed through all formations, but occurs principally in two epochs of geological history; these are

the Silurian and the lower half of the Tertiary. The vast accumulations along the principal axis of occurrence in the western hemisphere are found in Silurian and Devonian rocks, the most productive axis of occurrence in the eastern hemisphere lies in the Eocene and Miocene of the Cretaceous, Transylvania, and the Caucasus. In England the small quantity of petroleum that has been observed has sprung from the Coal-measures. In the valley of the Rhone and in Savoy it is in Jurassic limestones. The bitumen of the Apennines, of Dalmatia and Albania, of Roumania, Galicia, and the Caucasus, issues for the most part from rocks that are Eocene. But little is known respecting the geology of the bitumen of Asia Minor and Persia, the Punjab is also Eocene, and the little that is known of the deposits in Burmah and the East Indian Islands indicates that they are of the same age. East of the Mississippi river petroleum has been reported from localities that describe an ellipse upon the border of the Cincinnati anticlinal, which consists of an elevation of Silurian rocks extending from central Kentucky to Lake Erie, with the city of Cincinnati nearly in its centre, sloping beneath the newer formations in all directions. Starting at Great Manitoulin Island, in the northern part of Lake Huron, it is next reported at Port Huron, Michigan; Chicago, Illinois, Terre Haute, and in Crawford county, Indiana, Henderson, Cloverport, Bowling Green, and Glasgow, Kentucky, and around Nashville, and south-eastwards to Chattanooga, Tennessee, where the Silurian rocks again reach the surface. Turning north, the line extends almost unbroken through the eastern counties of Kentucky into Ohio and West Virginia, into Pennsylvania and New York, the ellipse being completed by the petroleum-fields of Canada. At Great Manitoulin Island petroleum was obtained in the Trenton limestone, at Chicago and Terre Haute in the Niagara limestone, both of which are Silurian. The Kentucky geologists regard the great Devonian black slate as the source of the oil in that State. There it is found saturating sandstones at Glasgow, and in crevices at Burkesville and other points on the Cumberland river. In the neighbourhood of Nashville, where the Lower Silurian rocks reach the surface, petroleum occurs within geodes, which are enclosed in the solid mass of the blue limestone. North-east of Nashville the present location of the oil is found to be in rocks that lie in an ascending series. Around Burkesville it is found in the Upper Silurian, immediately beneath the Devonian black slate. Farther north it lies in the Devonian and Subcarboniferous sandstones, which, in Johnson county, Kentucky, are now partly above the drainage-level of the country. The so-called "oil-break" of West Virginia and Ohio yields petroleum from sandstones that lie within the Coal-measures. Still farther to the north-east, in Pennsylvania and New York, the oil-sands are all found beneath the Coal-measures in the Upper Devonian, while in Canada they again descend to the Lower Devonian. "Petroleum exists in the Cretaceous rocks which extend along the eastern slope of the Rocky Mountains from British Columbia to Mexico, and in many of the interior valleys." The bitumen of the Pacific slope, of Mexico, the West Indies, and South America, is Miocene in California and Eocene in Trinidad and Peru. From these statements it will be seen that there is a vast area in the Mississippi valley, estimated at 200,000 square miles, beneath which petroleum has been obtained, the formations of which are nowhere more recent than the Coal-measures. Another vast area, extending from California through Mexico to Peru, and including the West India Islands, yields petroleum from Tertiary rocks; while on the eastern continent a belt of country extends from the North Sea to Java, the bitumen-bearing rocks of which are Tertiary so far as is known. At present

the bulk of petroleum produced issues from rocks older than the Carboniferous, while the formations yielding bitumen, in by far the greater number of localities, are of Eocene age. In the great "oil-region" of the United States petroleum occurs in crevices to a very limited extent. In Canada and West Virginia it occurs beneath the crowns of anticlinals, and in Pennsylvania it saturates the porous portions of formations that lie far beneath the influence of superficial erosion, like sand-bars in a flowing stream or detritus on a beach. These strata are not of any particular geological age, but run through a vast accumulation of sediments embraced in all the formations between the Lower Devonian and Upper Carboniferous. They lie conformably with the enclosing rocks, and slope gently to the south-west. The Bradford field in particular resembles a sheet of coarse-grained sandstone 100 square miles in extent, by from 20 to 80 feet in thickness, lying with its south-western edge lowest and submerged in salt water, and its north-eastern edge highest and filled with gas under an extremely high pressure. In Galicia the sandstones holding the oil are very much disturbed, while in the Caucasus the deposits of sand are erratic both in regard to position and extent, and lenticular in outline, being enclosed in a formation consisting of stiff blue clay.

Chemistry.—The first chemical research upon petroleum was conducted by Vauquelin in 1817 upon the naphtha of Amiano. Prior to the discovery of petroleum in commercial quantities, a number of European chemists had made determination of the atomic constitution of several different varieties, and it had become generally understood that the oil consisted of an equal number of atoms of carbon and hydrogen. It has since been determined that some varieties of petroleum contain nitrogen and others contain sulphur and oxygen. These last-named elements are, however, to be properly considered as components of impurities. The proximate principles of petroleum have been determined and examined chiefly by Schorlemmer in England, Pelouze and Cahours in France, and C. M. Wauken and S. P. Sadtler in the United States. Many other chemists have contributed valuable assistance to the work. These researches have established the fact that Pennsylvania petroleum consists chiefly of two homologous series of isomeric compounds having the general formula C_nH_{2n+2} , at one extremity of which marsh gas is found and solid paraffin at the other (see PARAFFIN). This oil also contains a smaller proportion of the olefine series, having the formula C_nH_{2n} , with traces in the Bradford oil of the benzole series. Rangoon petroleum contains a larger proportion of both the olefine and the benzole series than Pennsylvania oil. It has been shown that Caucasian petroleum contains the additive compounds of the benzole group which have the same percentage composition as the olefines and furnish an illuminating oil containing more carbon than Pennsylvania oils of the same specific gravity. The residues from the manufacture of petroleum have been shown to contain very dense solids and liquids of high specific gravity, having a large proportion of carbon and possessed of remarkable fluorescent properties. Some petroleumums are easily oxidized into asphaltum and kindred products. Colourless illuminating oils under the action of light absorb oxygen, which is converted into ozone, and they become yellow and viscid and of greatly impaired quality when the action is prolonged.

Origin.—The origin of petroleum has been a subject of speculation among scientific men during the last half century. It is a subject involved in much greater obscurity than the origin of coal, for, unlike coal, it has no organic structure; hence it can only be inferred upon circumstantial evidence that it is of organic origin, yet such evidence is so strong that few competent judges have ventured to decide

otherwise. The arguments in favour of a chemical origin have been advanced almost wholly by a school of French chemists during the last twenty years. They are based upon the results of a class of experiments first inaugurated by Berthelot, in which powerful deoxidizing agents like the alkali metals or iron at a white heat are caused to react with steam and carbonic acid. The hydrogen of the water and the carbon of the carbonic acid, having been deprived of their oxygen, unite in the nascent state to form a mixture of oily fluids closely resembling petroleum. Sufficient quantities of these oils have been prepared to prove their identity with each other and with crude petroleum. Before concluding from this circumstance that petroleum is the product of similar reactions, it is necessary to assume a condition of the earth's interior concerning which we know nothing; and, while the theoretical chemistry of the earth, based upon the nebular hypothesis, does not forbid such possibilities, there are other considerations relating to the origin of petroleum based upon the known rather than the possible that render the assumption that petroleum is of mineral origin forced and unnecessary. It is found that, when shale, coal, peat, wood, or animal matter, in fact any recent or fossil organic matter, is subjected to destructive distillation at low temperatures, there is obtained among other products an oily fluid which chemistry shows to consist chiefly of the same compounds of carbon and hydrogen as are found in Pennsylvania petroleum. There are other petroleumums, however, occurring in Canada, Tennessee, and other localities somewhat different in composition, which are often found under conditions that make it extremely difficult to account for their origin upon any hypothesis that does not regard them as a product of the decomposition of animal remains. They fill the cavities of fossil coals and orthoceratites in Canada and of geodes in Tennessee, in all of which the oil appears to be hermetically sealed until the rock-mass is broken. The formation in which these oils occur consists of thickly-bedded Silurian limestones that were probably deposited in a deep sea at a somewhat high temperature, in which vast quantities of sea-animalcules perished and became buried. It is therefore most strictly in accordance with observed facts to assume that these oils, in whatever manner they may have been produced from the original animal remains, are indigenous to the rocks in which they are found. These indigenous oils do not occur locally in considerable quantity, although the aggregate amount scattered through any formation in which they occur can easily be shown to be large.

In those localities, notably north-western Pennsylvania and eastern Ohio, where petroleum occurs in large quantity, it occurs quite uniformly, saturating heavy beds of unmetamorphosed sandstone. This sandstone is overlaid with an impervious shell of slate, containing much silica, that holds down both the oil and gas within the sandstone under great pressure, not locally in cavities but over wide areas. The sandstone is also, so far as can be ascertained, underlaid with a vast formation of shale more than 1000 feet in thickness, containing large numbers of fossil animals and such a quantity of fossil sea-weeds that Dr J. S. Newberry has suggested that the Silurian ocean here contained a veritable sargasso sea. This shale, so filled with the remains of fucoidea, has been several times submitted to destructive distillation, and has yielded as high as 50 gallons to the ton of distillate oil that was in many respects scarcely to be distinguished from crude petroleum. During the present century the French chemical geologists have held that all forms of bitumen are the product of metamorphism. Prominent among these may be mentioned Daubrée, who in his *Observations sur le Métamorphisme* has shown the strict correspondence between his laboratory experiments, in which all forms of bitumen were produced, and the opera-

tions of nature. No evidence appears to be lacking to show that those operations of nature in which heat, pressure, and steam have joined, usually denominated by physicists "metamorphism," when acting upon strata containing organic remains, are an adequate origin for petroleum as it occurs in the oil-regions of Pennsylvania and in Galicia. Petroleum occurs on the western slope of the Appalachian system from Point Gas to the Gulf of St. Lawrence to northern Alabama, and there it is most abundant in the neighbourhood of strata in which there is the greatest accumulation of organic remains. The accumulations of sediment from which this mountain-system was constructed were deposited in a current whose course was parallel with the axis of the system, and, as has been so fully shown by Professor James Hall (*Paleontology of New York*, vol. III, Introduction), these sediments were deposited in great thickness and of very coarse materials in the north-east, gradually thinning and increasing in fineness as they reached the Mississippi valley in the south-west. From the latest conclusions of American geologists it may be inferred that originally the eastern border of these deposits lay over a region now covered by the Atlantic Ocean. When the elevation took place that brought the metamorphic rocks of New England, New York, Pennsylvania, and Virginia to the surface, the eastern border remained submerged, while the western border was brought above the sea-level. The facts that concern petroleum are found in the comparatively undisturbed and nearly level position of this western border, in which the rocks holding the petroleum lie at present, like sand-bars in a current, and the further evidence that they afford that the metamorphic action which has altered nearly all the formations of the eastern border became extinct almost on a plane that descended deeper and deeper from the surface as the western slope of the system is traversed. This evidence further shows that along the western borders of the system, although the rocks and the coal that they enclose are unaltered near the surface, at the same time vast areas of the fossiliferous shale and even limestones containing indigenous petroleum may have been invaded by the heat-action and their volatile contents distilled at great depths. This distillate, being forced up by heat and hydrostatic pressure, would naturally accumulate in any overlying bed of rock porous enough to receive it. In Galicia, Roumania, and Transylvania the metamorphic core of the Carpathians is flanked by beds of fossiliferous shale rich in the remains of marine animals, which are intercalated with the beds of sandstone that contain the oil. This hypothesis, which regards petroleum as a distillate, includes the facts as thus far observed, is in harmony with scientific possibilities, and is reasonable, as it does not require any extraordinary assumption of either chemical or geological conditions. While the maintenance of any particular theory concerning the origin of petroleum is primarily of very little practical value, it is indirectly of value to conclude whether by some deep-seated chemical action the oil is at present being prepared in the laboratories of nature, or whether its generation has been long since completed. If a correct interpretation of the phenomena observed in relation to petroleum leads to the hypothesis that the fluid is in most instances a distillate, and especially in those localities where it is most abundant, then the conclusion is inevitable that the generation of petroleum is practically completed, and the deposits are vast natural storehouses which when once emptied are as completely removed from future production as a worked-out bed of coal.

Methods of Production.—While petroleum has been produced for an immemorial period in Persia, China, Japan, Burmah, Baku, and Galicia, and while the primitive

methods employed in each country in its production furnish interesting subjects for study, it is scarcely possible in this article to do more than indicate in a general manner how the vast quantities produced at the present time in the United States and Canada are brought to the surface, stored, and transported. In both Galicia and the Caucasus, which, with Canada and the United States, now furnish the petroleum of commerce, the ancient methods of production are being rapidly superseded by those employed in America. In the United States the development of oil-territory has acquired a habit that has become well defined, and has been repeatedly exemplified during the last twenty years. The first step is the sinking of a test or "wild-cat" well outside the limits of any proved productive territory, the progress of such well being eagerly watched not only by those who pay for it but also by many others who hope to profit by the experiment. The striking of oil in such a well is the signal for a grand rush, and a speculative floating population invades the place. After a time the speculative phase is succeeded by that of settled development. The oil-territory has become outlined. The sagacious ones have secured control of the most profitable tracts, while the floating element has moved on to a new field. Between the period of active development and absolute exhaustion comes that of decay, when the derricks are tottering and falling to wreck, and when property that has ceased to be productive has been sold at an extravagant price, and after accumulating debts has been abandoned. Finally the wave passes over and nature restores as she restores after the ruin of battle-fields. A visit to Pithole city, which in 1865 was, next to Philadelphia, the largest post-office in Pennsylvania, showed in 1881 fields of maize and timothy where some of the most famous wells had been, and of the city a score of houses tumbling to decay and not an inhabitant. It is not to be inferred, however, that any of the sections into which the oil-regions have been divided entirely cease to produce oil. There are wells now producing within sight of the spot where Drake drilled the first well, but large tracts cease to be centres of speculative investment, the old wells cease to be remunerative, and the new wells no longer hold out the possibilities of a grand lottery.

Wells are sometimes drilled by the owners of the land, but the larger part are drilled under leases. These leases are drawn with a great variety of conditions, but they usually stipulate that the lessee shall pay to the lessor a certain portion of the oil produced, the amount varying from one-tenth to one-fourth in proportion to the supposed richness of the territory. One well to five acres is considered as many as a judicious arrangement will allow, but many wells have been drilled much closer, and in some instances several wells have been drilled on one acre. The oil-sand of different localities varies as it occupies different geological horizons. The Venango oil-sand extends from Tidoute in Warren county to Harman Station in Butler county, Pennsylvania, a distance of 62 miles. It is uniformly a conglomerate of smooth white quartz pebbles, from a quarter to three-quarters of an inch in thickness. In other districts of the United States, Canada, and Galicia the oil-sand is a true sandstone of varying colour and texture. In the Caucasus the sand is fine, and resembles a quicksand, as it rises with the oil and accumulates around the wells.

When the location of a well has been determined, a derrick or "rig" is built, which consists of the derrick itself and a small house for an engine, with the necessary foundation for both. This foundation is made of heavy timbers dovetailed and keyed together. The derrick consists of a framework firmly braced in the form of a truncated pyramid, and about 70 feet high. At its base are two large reels, upon one of which the drilling cable is coiled and upon the other the sand-pump rope. At one side of the derrick a heavy post, called the Samson post, is flamed into the main sill, upon the top of which rests the walking-beam, one end of it being connected with the engine of from 12 to 15 horse-power, whilst the other supports the derrick. When the engine is in motion the walking-beam alternately raises and drops the derrick. The boiler is made like the tubular boilers usually employed on locomotives, and is placed at a distance from the well to prevent the ignition of the gas that often accompanies the oil. The engine should be reversible, and so

placed that the derrick in the derrick can easily control its motion by the use of coils and pulley. A string of is represented in fig. 1. First we have the a , which is attached directly to the end of beam, into the jaws of which the cable is self-screw 1, and the long screw of which, c , is used by the derrick as the rock is penetrated of the cable is fastened to the rope-socket screwed into the sinker-bar g , that is, a solid about 20 feet in length which serves to give tools. The sinker-bar is screwed into the jaws. The jaws, f , consist of two links of which are 21 inches long with cross-heads 8 inches deep, in consequence of which the links have 13 inches of play. The lower link of the jaws is screwed into another long iron bar called the auger-stem, g , which is in turn screwed to the lat or drill h . The jaws are the centre of action, and the manner in which they perform their work may be best explained, perhaps, in this way. Suppose the tools to have been just run to the bottom of the well, the jaws closed, and the cable slackened, the men now reel up the slack until the sinker-bars rise, the "play" of the jaws allowing it to come up 18 inches, without lifting the auger-stem, when the links come together they slack back about 4 inches and clamp the cable into the temper-screw. If now the vertical movement of the walking-beam is 24 inches, the sinker-bar rises 4 inches, when the cross-heads of the links come together with a smart blow; then the auger-stem is picked up and lifted 20 inches. On the down-stroke the auger-stem falls 30 inches, while the links slide 4 inches carrying the sinker-bar down 24 inches. The links are never allowed to strike on the down-stroke, while the blow of the up-stroke prevents the drill from becoming wedged into any seam or crevice into which its weight might drive it. When the tools are all ready for operation, either a wooden conductor is placed perpendicularly in a sort of shaft sunk to the bed-rock, or an iron tube called a "drive-pipe" is driven down it through the soil. In either case great care is taken to start the well perpendicularly to the derrick-floor. The tools are swung into position from the top of the derrick, and the free end of the cable is coiled around the shaft of the reel in such a manner that when the free end is tightened the tools are lifted, and when it is loose the reel-shaft revolves within the coils. By holding the cable firmly the tools rise, and as it is loosened they fall. The well is started in this manner and carried down until the string of tools can be suspended beneath the walking-beam, when a cable as long as the supposed depth of the completed

well is wound upon the reel, the end carried over a pulley at the top of the derrick and then fastened into the rope-socket, the temper-screw attached, and the drilling continued to the bottom of the well. Day and night the machinery is kept in motion, one driller and one engine and tool-dresser work from noon until midnight, and another pair work from midnight until noon. The driller, with a short lever inserted in the temper-screw, walks round and round to rotate the drill. He watches the jaws, and at intervals lets down the temper-screw. When the screw is run out of the drill needs sharpening, he arranges the slack cable so that it will run freely over the pulley and proceeds to "draw out." The cable is unclamped from the temper-screw and the engine disconnected from the walking-beam and attached to the cable-rod.

When all is ready the long cable is reeled up and the tools drawn out. The bit is replaced by one newly sharpened, and after the well has been sand-pumped the tools are again lowered and drilling resumed. When the drilling proceeds without accident the work is exceedingly monotonous.

From the top of the bed-rock to a point below the surface-water of the region, the well is drilled of the same diameter as the interior of the drive-pipe. This point is usually from 300 to 400 feet below the surface. At this point the drill-hole is tapered, and a pipe aimed with a steel shoe is ground into the tapered hole to a water-tight joint. The inside diameter of this casing-pipe is 5 1/2 inches, and below it the well is carried down 5 1/2 inches in diameter to the bottom. The casing-pipe excludes the fresh surface-water, and only water enough is put into the well to wash out the drillings, unless salt water is encountered. The casing-pipe becomes a permanent fixture, into which is introduced the 2-inch pipe, through which the oil flows or is pumped. This 2-inch pipe may be introduced or removed at pleasure, without disturbing the casing-pipe or drive-pipe, or letting water into the well upon the oil.

When drilling has been completed the well is torpedoes. From one to twenty-five gallons of nitro-glycerin are lowered into the well in tin cylinders and exploded, usually by percussion. The effect of firing such a large amount of this powerful explosive is not apparent at the surface, but soon a gurgling sound is heard approaching from beneath, the oil rises from the well and falls first like a fountain and then like a geyser, forming a torrent of yellow fluid, accompanied by a rattle of small stones and fragments of the canister in a shower of spray 100 feet in height.

The generation of such an enormous volume of gas in a limited area, the walls of which are already under a very high gas-pressure,

Fig. 1—String of Tools

Fig. 2—Pumping Well

and which is held down by 2000 feet of motionless air, must be followed by an expansion into the porous rock that drives both oil and gas before it, until a point of maximum tension is reached. The resistance then becomes greater within the rock, and, reaction following, oil and gas are driven out of the rock and out of the well until the expansive force is expended.

Figs. 2 and 3 show the general arrangements of pumping and flowing wells. After the well is tap-holed it is prepared to flow. A section of 2-inch pipe, perforated with holes, which serves as a stamper, is lowered into the well and other sections coupled to it, until a sufficient length is introduced to reach from the bottom to a point above the oil-sand. An Indian rubber packer is then attached in such a manner that within it the pipe that is above it slides in that which is below it, and the rubber is forced against the sides of the drill-hole with the weight of 1200 to 1500 feet of 2-inch pipe, thus making a gas-tight joint. The pressure of the gas within the oil-sand and below the packer forces the oil to the surface. As the flow diminishes, a pump-barrel is introduced to the bottom of the well and the oil is lifted to the surface. Gas-pumps are also used to remove the pressure of the atmosphere from the well and rock. In some of the older districts from twelve to forty wells are attached to one engine, and pumped by what is called a "cable-tool" connexion. In West Virginia five different horizons of sandstone have yielded oil. A well was put down there in 1865 to the "first white oak sand," 255 feet in depth, and pumped at intervals for fifteen years; it was then reamed out to 8 inches in diameter, and from the bottom of the old well was carried down 4½ inches in diameter to the third sand. A tube was inserted with a packer at the bottom of the 8-inch hole to stop off the heavy oil of the first sand. Through this oil of a specific gravity 79 (46° B) was pumped from the third sand, and through a second tube, introduced below the first, to the bottom of the old well, oil of a specific gravity 83 (27° B) was pumped from the first sand, both pumps being simultaneously worked by the same walking-beam. The first-sand oil was worth seven dollars a barrel, while the third-sand oil was worth only one dollar a barrel.

The average duration of the profitable production of an oil-well is estimated at five years. This period is subject to great fluctuations, as there are wells in the Ole Creek district of the Bradford field that were abandoned in two years, while wells on Triumph Hill, Venango county, where the sand is 125 feet thick, have been pumped fifteen years. The yield of some single wells has been enormous. A well in Donegal township, Butler county, Pennsylvania, produced more

than 110,000 barrels in ten years, and twelve wells, of which this was one, on the same farm produced over 750,000 barrels.

In Duinagh and other Eastern counties petroleum was stored and transported in flasks and jars. In the United States it was being stored in barrels made tight for oil by being coated on the inside with a stiff solution of glue. Later, it was transported on the rivers in bulk barges, and on the railroads in tanks upon cars. These tanks were at first made of wood, but they have lately been made of iron. The usual form is a plain cylinder, 24 feet 6 inches long and 66 inches in diameter, having a capacity of from 4000 to 5000 gallons. These cars are also used in the Caucasus. At the present time, in all the regions producing petroleum in commercial quantities, the bulk of the crude oil is transported through pipe-lines, which consist of lines of pipe carried across the country, often for hundreds of miles, through which the oil is forced by powerful pumps under a pressure of from 1000 to 1600 lb to the square inch. Each well has a tank into which the oil flows from the well, and from which it is carried in a 2-inch pipe by gravity to a pumping station, where it is pumped into the "main line." Main lines run out of the oil-regions of Pennsylvania to Cleveland (Ohio), Pittsburgh (Pennsylvania), Buffalo (New York), and New York, Philadelphia, and Baltimore on the Atlantic coast. They are constructed of 6-inch pipe, the joints of which are sealed into couplings like sections of gas-pipe. During recent years the production of petroleum in excess of any demand for it has led to the storage of vast quantities (30,000,000 barrels in 1882) in iron tanks of enormous size. Many of these are owned by private individuals, but the majority belong to the pipe-lines. There are 1375 iron tanks connected with the united pipe-lines, ranging in capacity from 1000 to 38,000 barrels, and representing a total storage capacity of 38,000,000 barrels. These tanks are frequently fired by lightning or other accidents, and when burning present a spectacle of unsurpassed grandeur.

The bulk of the trade in crude petroleum in the United States is conducted through the pipe-lines and then certificates. When oil is received into the line from a well, the amount is ascertained and passed to the credit of the well-owner on the books of the company, less 3 per cent to cover loss in handling. This oil is held like a bank-deposit, subject to transfer on a written order. When such an order has been "accepted" by an officer of the company it becomes an "acceptance" or "certificate," and is then negotiable like a certified cheque. As the exchanges deal only in certificates of 1000 barrels they are made of that amount, so far as is possible. When oil is delivered by the pipe-line it is weighed and 20 cents per barrel is paid and a storage fee of \$12.50 per 1000 barrels per month must be paid at least once in six months. The issuing of certificates by the pipe-lines has made speculation in oil, brokerage, and exchanges possible to an extent vastly beyond the requirements of any actual trade in the oil itself.

About 250,000,000 barrels of petroleum have been produced in the United States and Canada from 1859 to 1884. No reliable statistics are to be had of the production in other regions, but of late years the Caucasian fields have yielded about 5,000,000 barrels per annum. The total annual production for 1883 cannot be far from 35,000,000 barrels.

Technology.—The technology of petroleum is quite simple. In the crude state it enters largely into mixtures with other oils, tallow, lead, soap, graphite, &c., that are chiefly used for lubrication. Crude petroleum is also often filtered through charcoal. Crude oils that are too fluid for lubrication are reduced to the required consistence by partial evaporation, both by exposure to the sun in shallow tanks and also by distillation of the more volatile portion in stills. Such oils are called "reduced oils." In the technology of petroleum by distillation a great variety of details are employed by different manufacturers, but in general they may be treated under the three heads of destructive distillation or "coking," distillation with superheated steam, and distillation *in vacuo*. The stills used vary greatly in respect of form and capacity. Formerly stills holding 80,000 gallons were used, but recently they have been constructed of a capacity of from 40,000 to 48,000 gallons. They are ordinarily made either in the form of plain cylinders 80 feet in length and 12 feet 6 inches in diameter, and set horizontally in banks of three or more, or they may be an upright cylinder 30 feet in diameter and 9 feet in height, set vertically with numerous fire-bricks arranged around the circumference. Another form of still is an upright cylinder holding about 1000 gallons, heated from beneath and furnished with a steam-coil immersed in the body of the oil. In this coil the steam is superheated to the temperature of the oil, and is then allowed to escape into it, by which means the overheating of the oil is prevented and the distillation assisted by the mechanical action of the steam in lifting the oil-vapour out of the still. Another form of still is a vacuum still, in which a partial vacuum is maintained by a pump. The top of the still is usually constructed with a high dome, into which the vapours rise and from which they escape into the condensers. The condensers usually consist of a large number of 2-inch pipes immersed in water contained in a long trough. The distillation

Fig. 3.—Flowing Well.

commences at a very low temperature and proceeds at a constantly rising temperature, the distillate steadily increasing in specific gravity. The last portions distil at nearly a red heat, and are nearly solid at ordinary temperatures, with a specific gravity above 900°.

The oil is first allowed to settle in large tanks, when about 1 per cent of water and sediment is removed. It is then pumped to stills into which "live" steam is introduced. Distillation commences at once and is allowed to proceed until the specific gravity of the distillate reaches 74° (60° B). The oil in this condition is called "gas-oil," and is used to a limited extent in the manufacture of illuminating gas. The distillate is crude naphtha, and is redistilled and divided into (1) ligoline or cynogene, having a specific gravity of 62 and boiling at 65° Fahr. (2) gasolene, specific gravity 68 (50° to 80° B), (3) C naphtha, specific gravity 70 (80° to 68° B), (4) B naphtha, specific gravity 72 (68° to 64° B), and (5) A naphtha, specific gravity 74 (64° to 60° B). Below 60° goes to illuminating oil. The crude oil from which the naphtha has been removed is then put into a suitable still and distilled until the distillate has a specific gravity of 81 (40° B). This distillate is crude illuminating oil. The oil remaining in the still may then be "cracked" by destructive distillation, or may be distilled for lubricating oil. If it is to be "cracked" the fires are slackened and the distillation allowed to proceed slowly, in consequence of which the vapours of the heavy oil are repeatedly condensed upon the dome of the still and made to fall back upon the hot oil beneath. The result is the production of a large volume of permanent gas, chiefly marsh gas and hydrogen, a distillate of suitable specific gravity illuminating oil, and a heavy tar residue, called "residuum," that remains in the still. By this method of manipulation the crude oil is converted into crude naphtha, crude illuminating oil, and residuum, while the gas is burned as a waste product. The residuum is run out of the still and sold to manufacturers of lubricating oil. If the oil is not to be cracked, the heavy oil, from which the illuminating oil and naphtha have been removed, is often distilled with superheated steam and treated for lubricating oil. If simply distilled and treated with chemicals after removal of the paraffin, the oil is called in the United States "paraffin oil." The crude paraffin oil is placed in barrels in an ice-house, and, after it has been several days at rest, paraffin crystallizes from it. The paraffin is removed by pressure, and may be purified by any of the methods described under PARAFFIN (p. 242 above). The oil from which the paraffin has been pressed may be further treated, and is called in the United States "oil of other suitable still," and deprived of certain oils that boil at a high temperature but have a pungent and offensive odour. When drawn off, the oil remaining in the still is found to be light-coloured and nearly tasteless and odourless. It is called "odorized neutral heavy hydrocarbon oil," and is found to be a very valuable lubricating oil. The distillate above mentioned after treatment is called "mineral spirit," and is used as an illuminating oil on cars and steamboats, where a more volatile oil would be objectionable. Any of these distillates, from gasolene to the most dense lubricating oil, may be purified by filtration or by treatment with acids and alkalis. Filtration is usually applied to the different grades of naphtha to deprive them of disagreeable odour, for which purpose gravel and both wood and animal charcoal are used, either separately or together. Lubricating oils are often filtered through animal charcoal to deprive them of their odour and colour. The dense vacuum residues recently prepared under the name of osoline, vaseline, &c., are filtered through animal charcoal while hot and perfectly fluid. Oils are treated with chemicals in high cylindrical tanks of small diameter, where they are thoroughly mingled by means of air forced into the bottom of the tank under pressure. These agitators often hold 50,000 gallons. The illuminating oils are usually treated with 5 per cent of oil of vitriol of a temperature of about 80° Fahr. The acid "sludge," consisting of the oil of vitriol combined with the impurities of the oil and forming a black tarry liquid, settles to the bottom of the tank and is drawn off. The oil is then agitated with water, then treated with a solution of caustic soda, and finally washed with water containing caustic ammonia. Hydrochloric acid is used to a limited extent, and nitric and chromic acids are used to destroy fluorescence in dense oils. These illuminating oils especially those prepared by cracking are thrown after treatment, and while warm, in a thin spray into a large tank. This causes a small amount of very volatile oil produced by cracking to be evaporated, and brings the oil up to test. Finally the oil is exposed under a sky-light in large shallow tanks until it has become perfectly clear from settling of all impurities. The acid "sludge" is for the most part sold to manufacturers of commercial fertilizers or restored by evaporation and used over again. More than 45,000 tons of oil of vitriol were used in 1880 by the manufacturers of petroleum in the United States. The alkali sludge is thrown away. The following table shows the average percentage of commercial products obtained from crude petroleum of 79 (45° B) from Pennsylvania, Ohio, &c.—

	Per cent
Gasolene	1 to 15
"C" naphtha	30
"B" naphtha	31
"A" naphtha	2 to 25
	101
Illuminating oil	50 to 54
Lubricating oil	17½
Paraffin wax=4½ per cent	10
Loss	10
	100

If the oil is "cracked," the yield is—

Naphtha	16½
Illuminating oil	70
Residuum	2
	88½
Loss	11½
	100

Lubricating Oils.—Crude petroleum and the heavy distillates from petroleum, finished either by treatment or by filtration, have been slowly winning their way with consumers of lubricating oils for the last twenty years, and may now be said to have a recognized value. This result has been due to much to improved processes of manufacture, and consequently to improved quality of the products, as to a recognition of their merits. When properly prepared, and exempt from volatile matter and offensive odour, they are found to be possessed of great endurance, to be free from a tendency to gum, and to be incapable of spontaneous combustion. When mixed with animal and vegetable oils liable to spontaneous combustion, these oils prevent it. They are therefore now in large demand, a demand which is likely to increase as new applications are found for them and their quality is improved.

Illuminating Oils.—Oils of this class manufactured from petroleum have nearly superseded the use of other illuminating fluids throughout the world. They are largely sold in Great Britain under the name of "paraffin oil," in the United States they are called "kerosene," and in the European continent "refined petroleum." The different qualities are known as "water white," "standard," and "prime," and are further distinguished as "low test" and "high test" oils. The characters chiefly relied on in the trade are "colour" and "test." The colour should be as light and free from opalescence as possible. Colour is, however, a matter of little importance except as it indicates unskillful manufacture of the oil. The test is a very important one, and indicates the temperature Fahr. at which the oil will give off a sufficient amount of vapour to ignite explosively when the oil is properly tested. While the methods of testing petroleum vary greatly, the apparatuses used for that purpose may be divided into three classes. The first class is designed to ascertain the tension of the vapour given off by a given sample at a certain fixed temperature; these are chiefly used in France. The others are designed to show at what temperature a given amount of oil, usually half a pint, will give off a sufficient amount of vapour to form an explosive mixture with the air above the oil. These are divided into "open testers," in which the oil is heated in an open vessel, and "closed testers," in which the oil is heated in a closed vessel. The tester invented by Sir F. A. Abel (see PARAFFIN, p. 239) has been adopted in Great Britain and her colonies, while in the United States and on the Continent a great variety are in use. The numerous accidents, many of a frightful nature, and involving great loss of property and often of human life, that have followed the use of illuminating oils which had not been properly freed from the volatile products of the petroleum, have led in most European countries and many of the American States to the enactment of stringent laws forbidding the sale or use of oils the test of which does not come within the prescribed legal limits. Very valuable researches on the flashing of oils have been made by Dr. F. Chandler of New York, and other American chemists. Dr Chandler showed that oils burning in lamps of ordinary construction in a room the temperature of which was below 90° Fahr. failed to reach an average temperature of 100° Fahr. In metal lamps, particularly "student lamps," the average temperature was several degrees higher than in glass lamps, a fact which shows glass lamps to be safest in this respect. Dr C. B. White of New Orleans has examined illuminating oils with respect to the amount of volatile matter that, when added to good oil, will render it dangerous. He found that from 1 to 5 per cent. of the ordinary naphthas of commerce would render illuminating oil of the best quality extremely dangerous. Five per cent of crude naphtha reduced the flashing point from 118° to 70° Fahr. These researches have all demonstrated the wisdom of English legislation on this subject, but unfortunately have not been productive of equally good results in the United States. Petroleum legislation is there in a very unsatisfactory condition. The very worthless law passed by Congress in 1867 has long been repealed, and no other has been substituted for it. A number of the States (seventeen in 1880) are without legislation in reference to this subject, while legislation in other States is based upon local influence rather than fixed principles, and ranges in its

Juvenal, and Martial, who might have been expected to have taken some notice of him if he had flourished immediately before their own day, seem adverse to the generally received opinion that the *Satiræ* was a work of the age of Nero. Yet the silence of Quintilian may be explained by the fact that Petronius is not one of those writers who were capable of being turned to use in the education of an orator. The silence of Martial and Juvenal may be accidental. Even if it is to be explained on the ground of want of appreciation, this would prove nothing more than that a work so abnormal in form and substance was more highly prized by later generations than by the author's contemporaries.

But, if we pass from these faint traces of external evidence to that afforded by the style of the book and the state of manners described in it, we are led to the inference that there is no other age to which it can be assigned on better grounds than the age of Nero. If, again, we compare the impression we form of the character, genius, and habits of the writer with the elaborate picture which Tacitus paints of a man who, so far as he plays any part in history, is merely one of the victims of an abortive conspiracy, we find grounds of probability for identifying them with one another. Tacitus does not tell us that he was the author of any important work, and this has been urged as conclusive on the question. But Tacitus does not think it necessary in what he tells us of Germanicus or Claudius to mention their poetical and historical works. In introducing Silius Italicus as the witness of a particular occurrence he does not add that he was the author of the poem on the Punic War. He mentions that the poetical gifts and reputation of Lucan and Seneca were among the causes that excited Nero's jealousy, but he does not mention the *Pharsalia* of the one or the *Tragedies* of the other. The prominence which Tacitus gives to the portrait of Petronius points to his enjoyment of greater notoriety than was due to the part he played in history. He paints him with the keen and severe eye with which he fastens on the traits of character and the manner of life illustrative of the moral corruption of the time, but at the same time with that appreciation of intellectual power which forces him to do justice to men who in other respects were detestable. Such a work as the *Satiræ* he could, from a moral point of view, have regarded with no other feelings than those of detestation, yet he could not have refused his admiration to the unmistakable proof it affords of easy careless power, and of a spirit, if not courageous in any good sense, yet indifferent to death, and capable of meeting calamity with Epicurean irony.

The account he gives of C. Petronius is "that he spent his days in sleep, his nights in attending to his official duties or in amusement, that by his dissolute life he had become as famous as other men by a life of energy, and that he was regarded as no ordinary profligate, but as an accomplished voluptuary. His reckless freedom of speech, being regarded as frankness, procured him popularity. Yet during his provincial government, and later when he held the office of consul, he had shown vigour and capacity for affairs. Afterwards returning to his life of vicious indulgence, he became one of the chosen circle of Nero's intimates, and was looked upon as an absolute authority on questions of taste ('arbitrer elegantie') in connexion with the science of luxurious living." This excited the jealousy of Tigellinus, and led to his condemnation. Petronius's death is then described, which was in keeping with his mode of life and character. He selected the slow process of opening his veins and having them bled up again, while in conversing with his friends he voided the serious subjects natural at such a time, and listened to their recitation of light odes and trifling verses. He then dined luxuriously, slept for some time, and, so far from

imitating the practice of others by flattering Nero or Tigellinus in his will, he wrote, sealed, and sent to the emperor a document which professed to give, with the names of the partners of his vices, a detailed account of the scandalous life of the court.

That this portrait, drawn with such characteristic lines, and painted in such sombre colouring, is sketched from the life in Tacitus's most graphic manner is unquestionable. A fact confirmatory of its general truth is added by the elder Pliny (who calls him T. Petronius), who mentions that just before his death he destroyed a murrhine vase of great value to prevent its falling into the hands of Nero. The question arises whether there is ground for identifying the author of the fragment which we possess under the name of *Satiræ* with the person so minutely and faithfully described by Tacitus. Do the traits of this picture agree with that impression of himself which every writer of marked individuality unconsciously leaves on his work? Further, is there any reason for supposing, as some have maintained, that in this fragment we possess the actual document sent to Nero? The last question may be at once dismissed. The only fragments connected by any kind of continuity which we possess profess to be extracts of the fifteenth and sixteenth books of a work that must have extended to a great length. It would have been impossible to have composed one-tenth part even of this fragment in the time in which Petronius is said to have composed his memorial to Nero. Those who find in the representation of the vulgar, ostentations, illiterate, but tolerably good-natured Trimalchio a satire on Nero or Tigellinus are capable of finding any meaning they desire in any literary work of a past age.¹ But at the same time it is legitimate to note that the author of the banquet of Trimalchio and of the lives of Encolpius and Giton had both the experience and the literary gifts which would enable him to describe with scathing mockery the

"Luxuriam imponi veterem noctesque Neomus," and that he was not one to be restrained by any prudery from describing them in their most revolting details.

On the other hand, the arguments against identifying the writer of the fragment with the original of the portrait of Tacitus, based on the silence of the historian as to his authorship, may be explained by reference to the historian's practice in regard to the authors of other literary works. Unless these works had any bearing on the part which their authors played in history, he did not feel himself called upon to mention them; and such a work as the *Satiræ* he would have regarded as especially beneath the dignity of history, of which he had so proud a consciousness. The impression of his personality produced by the author corresponds closely with that of the Petronius of the *Annals*, not only in the evidence it affords of intimate familiarity with the vices of the age, but in the union of an immoral sensualism with a rich vein of cynical humour and an admirable taste, which we should expect to find in one who rose to favour by his social and convivial qualities, and who received the title of "elegantissimus arbiter." The Epicurean maxims, such as—

"Vivamus dum licet esse bene,"

quoted by his actors, and the frequent introduction of short poems into their conversations, are in conformity with the opinions and tastes of one who in his last hours "audiebat referentes nihil de immortalitate anime et sapientium placitis, sed levia carmina et faciles versus." Further, the name "Arbiter," by which he is mentioned in later writers, is not an ordinary Latin cognomen, but may have been bestowed on him by his contemporaries from the fact that his judgment was regarded as the criterion

¹ The supposition of M. Gaston Boissier that the individual satirized was Pallas, the freedman of Claudius, is much more probable.

of good taste, and Tacitus, in the phrase he perpetuates, may have fixed this as his designation for later writers.

The style of the work, when it does not purposely reproduce the solecism, colloquialism, and slang of the vulgar rich—for the most part freedom of foreign origin—is recognized by the most competent critics as written in the purest Latin of the Silver Age. Coincidences of expression and thought with passages in the satires of Persius are not infrequent.¹ The false taste in literature and expression fostered by the false style of education is condemned by Persius and Petronius on the same ground. When the latter speaks of the "mollitas veborum globulos" he may possibly have had Seneca in his eye. Again, there would have been no point in putting into the mouth of the old poet whom the adventurers pick up verses on the capture of Troy and the Civil War at any other era than that in which the *Troica* of Nero and the *Pharsalia* of Lucan were the fashionable poems. The pertinacity of the roasting poet, which is exposed with such quiet humour by Petronius, is a feature of the age, common to it with the age of Martial and Juvenal. But we learn from Tacitus that the luxury of the table, which appears so profuse and extravagant in the "dinner of Trimalchio," reached its highest pitch under Nero, and afterwards fell out of fashion (*Tac. Ann.* vi. 55).

The internal evidence based on the style and character of the work thus appears to favour the opinion that the book was written in the time of Nero; nor is there any one more likely to have been its author than the C. Petronius whose manner of life and whose death are so elaborately described by Tacitus.

The work, of which there have been preserved 141 sections or chapters of a narrative, in the main consecutive, although interrupted by frequent gaps, must have been one of great originality as regards form, subject-matter, and mode of treatment. The name *Satira*, by which it is designated in the best MSS., indicates that it claims to be of the type of the original "satira" or "muscally" to which Varro, in imitation of the Greek writer Menippus, had given the character of a medley of prose and verse composition. But, while in the title and form of the work it belonged to a familiar type, yet from another point of view it is to be regarded as the earliest extant specimen of an original and most important invention in Roman literature. We find in it indeed not only a medley of prose and verse composition, in which the former is much the most prominent element, but also much dosultory matter, disquisitions on art and eloquence, stories and anecdotes, &c. But the novelty of form recognized in Petronius consists in the string of fictitious narrative by which these are kept together. The original Italian *satira*, superseded by the Latin comedy, had developed into the poetical satire of Lucilius and Horace, and into the miscellaneous prose and verse essays of Varro. In the hands of Petronius it assumed a new and most important phase in its development. The careless prodigal who gave his days to sleep and his nights to pleasure was so happily inspired in his devices for amusing himself as to introduce into Roman literature, and thereby transmit to modern times, the novel

based on the ordinary experience² of contemporary life,—the precursor of such novels of adventure and character as *Cyl Blas* and *Roderick Random*. There is no evidence of the existence of a regular plot in the *Satira*, but we find one central figure, Encolpius, who professes to narrate his adventures, and to describe all that he saw and heard, while allowing various other personages to exhibit their peculiarities and express their opinions dramatically. From the nature of the adventures described there seems no reason why the book should not have gone on to an interminable length.

The fragment opens with the appearance of the hero, Encolpius, who seems to be an itinerant lecturer travelling with a companion named Ascyltus and a boy Giton, in a part of a Greek town, apparently in Campania. Encolpius delivers a lecture, full of admirable sense, on the false taste in literature, resulting from the prevailing system of education, which is replied to by a rival declaimer, Agamemno, who shifts the blame from the teachers to the parents. The central personages of the story next go through a series of questionable adventures, in the course of which they are involved in a charge of robbery. A day or two after they are present at a dinner given by a freedman of enormous wealth, Trimalchio, who had risen, as he boasted, "from a penny" and who entertained with ostentatious and grotesque extravagance a number of men of his own rank, who had not been so prosperous in life. We see actually in flesh and blood specimens of those "Cappadocean knights" to whom we have many pointed references in Martial and Juvenal. We witness their feats of gluttony, we listen to the ordinary talk of their guests about their neighbours, about the weather, about the hard times, about the public games, about the education of their children. We recognize in a fantastic and extravagant form the same kind of vulgarity and pretension which the satirist of all times delights to expose by pen or pencil in the illiterate and ostentatious millionaires of the age. Next day Encolpius separates from his companions in a fit of jealousy, and, after two or three days' sulking and brooding on his revenge, enters a picture gallery, where he meets with an old poet, who, after talking sensibly on the decay of art and the inferiority of the satirists of the age to the old masters, proceeds to recite in a public posture some verses on the capture of Troy, till his audience take to stoning him. The scene is next on board ship, where Encolpius finds he has fallen into the hands of some old enemies. They are shipwrecked, and Encolpius, Giton, and the old poet get to shore in the neighbourhood of Crotona, where, with the view of attracting the attention of the inhabitants, notorious fortune-hunters, the adventurers set up as men of fortune. The fragment ends with a new set of questionable adventures, in which prominent parts are played by a beautiful enchantress named Cyrc, a priestess of Priapus, and a certain nation who leaves them his hair, but attaches a condition to the inheritance which even Encolpius might have shrank from fulfilling.

What, then, may be said to be the purpose of the book, and what is its ethical and literary value? It can hardly be called a satire in the ordinary, and certainly not in the Roman sense of the word. There is no trace of any purpose of exposing vice with any wish to correct it. If we can suppose the author to have been animated by any other motive than the desire to amuse himself, it might be that of convincing himself that the world in general was as bad as he was himself. Juvenal and Swift are justly regarded as among the very greatest of satirists, and their estimate of human nature is perhaps nearly as unfavourable as that of Petronius; but their attitude towards human degradation is not one of contempt and amusement, but of indignant condemnation. They too, like Petronius, take pleasure in describing things most repugnant to all sense of delicacy with the coarsest realism, but theirs is the realism of disgust, not, like that of Petronius, a realism of sympathy. It might have been thought difficult to sink lower in the cynical tolerance of immorality than Martial occasionally has sunk. But there is all the difference in the world between Martial and Petronius. Martial does not gloat over the vices of which he writes with cynical frankness. He is perfectly aware that they are vices, and that the reproach of them is the worst that can be cast on any one. But further, Martial, with all his faults, is, in his affections, his tastes, his relations to others, essentially human, friendly, generous, true. There is perhaps not a single sentence in Petronius which implies any knowledge of or sympathy with the existence of affection, conscience, or honour, or even the most elementary goodness of heart, or of that amount of mutual confidence which is necessary to keep a band of big game on a circle

¹ Eg., compare Persius, vi. 9, 10—

"O quæ
Enchelit patrus, pædæum fœtus, et O
Sub navis crepet agens mihi sese deo
Hæcule!"

with *Satire* 88, "Ahus domus promissi, a propinquum divitem extulit, aliis a thesaurum effodit," &c. The "enchelit patrus" may be compared with a phrase in the dinner of Trimalchio, "homo bellus tam bonus chryseus quam amicus bellus." Persius has the phrase "Divas arat Cimbrius quantum non minus obervit," which is a close parallel to Petr. 87, "fundos habet que mihi volant." Again, both Persius and Petronius use the rare word "hæc," which occurs only two or three times elsewhere.

² In its respect the work of Petronius seems to have differed from the *div. c. romances*.

³ Omnes qui in testamento meo legata habent, præter libertos meos, hac conditione percipient que dedi, si corpus meum in partes concederit et æstivæ populo comedierit (141).

swunders together. In estimating such a work, which in its spirit is not less than in its form and its literary execution is essentially anomalous, it is necessary to bear in mind that we have reached us in so fragmentary and mutilated a shape that we may altogether have missed the key to it, and that it may have been intended by its author to be a satirical satire, written in a vein of sarcasm and powerful irony, of the type read in our modern *Joules Wild* or *Barry Lyndon*. But, if this is not the explanation, we must fall back on the more obvious but still difficult solution that, in the entire divorce of intellectual power and insight from any element of right human feeling, the work is an exceptional phenomenon in literature. From an ethical and human point of view it is valuable only as a gauge of the degeneration in which much of Roman society was sunk in the age which Petronius wrote—the work was a work pervaded by a spirit of moral perversity that any other in Latin literature—and Christianity made its first converts in Rome.

But, as a work of original power, of humorous representation, of literary invention and art, the fragment deserves all the admiration which it has received. We recognize the "a bita elegantia" in the admirable sense of the remarks scattered through it on education, on art, on poetry, and on eloquence. Though a better critic than a poet, yet he can write verses not only with good taste and simplicity, rare among the poets of that age, but with a true feeling of nature, as, for instance, in his description of a grove of plane-trees, cypresses, and pines—

"Hæc inter ludat æquæ errantibus æmæ
Spumæ, cæ quælibet vebat inter lapillos."

And in some of his shorter pieces he anticipates the terseness and elegance of Martial. The fragment on the *Phædria* War does not seem to be written so much from the view of parodying as of entering into rivalry with the poem of Lucan, but he has caught the tone and style of the author whom he censures. In the epigram extemporized by Trimalchio late on in the banquet,

"Quod non expectes, ex transverso fit—
Et supra nos Postuma negotia curat,
Quis de nobis vult Eborum, puer,

we have probably a more delicate parody of the style of verses produced by the illiterate aspirants to be in the fashion of the day. We might conjecture that the chief gift to which Petronius owed his social and his literary success was that of humorous mimicry, in which the most intellectual and at the same time sensual among the Romans—as, for instance, Sulla—took a great delight. The man who could describe the Trimalchio of Trimalchio in the talk and peculiarities of the various guests with such humorous rest was just the man to keep the table in a roar during the prolonged revels in the palace of Nero. If the old "vexata questio" of the distinction between wit and humour were to be revived, the critic who could determine by analysis what is the essence of the talent of Martial on the one hand and of Petronius on the other would go very near giving the answer. He would have, however, to abandon the theory that humour is *in se* essentially humane and sympathetic than wit. Petronius is perhaps the most strictly humorous among Latin writers, and humour is in him combined with the rare gift of conceiving and representing character. In Trimalchio and his various guests, in the old poet, in the cultivated, depraved, and moody Encolpius, in the Chrysis, Quartilla, Polyenus, &c., we recognize in living examples the play of those various appetites, passions, and tendencies which satirists deal with as abstract qualities. Another gift he possesses in a high degree, which must have availed him in society as well as in literature,—the gift of story-telling; and some of the stories which first appear in the *Satyræ*—*g*, that of the Matron of Ephesus—have enjoyed a great reputation in later times. His style, too, is that of one who must have been an excellent talker, who could talk sense when sense was wanted, who could have discussed questions of taste and literature with the most refined men of any time as well as amused the most dissolute society of any time in their most reckless revels. One phrase of his is often quoted by many who have never come upon it in its original context, "Hoc est cunctis felicitas."

Perhaps next after a day spent in the ruins of Pompeii nothing else makes us feel so near the actual daily life of the Roman world as in all its petty details in the 1st century A. D. as this fragment of Petronius. Another obvious observation that is suggested by it is that of the superiority of the refined men of any time as well as of the purpose of literally reproducing the commonplace experience of actual life in every age. Opinions may differ as to the value or interest of the literal reproduction of the customs and manners of such an age as that of Nero.

Compared with the amount of attention which was given to Petronius both by scholars and men of letters in the 17th and 18th centuries, comparatively little has been done for him in recent times. The only good critical edition of the fragments is that of Buchen. An interesting chapter is devoted to him in M. Gaston Bonnier's *L'Épigramme*. For those who wish to read him in a modern translation, the French version by M. H. De Guérin is the one to be recommended. (W. Y. S.)

PETROPAVLOVSK, a district town of western Siberia, in the government of Akmolinsk, is situated on the right bank of the Ishim river, 185 miles to the west of Omsk.

The old fort occupies a hill about 100 feet high, which slopes abruptly to the Ishim, while the wooden houses and the broad, unpaved, but regular streets of the town occupy partly the declivities of the hill and partly the (sometimes inundated) banks of the river. The fertile steppes to the east, west, and south of the town largely supply it with corn and cattle, and at the same time give great facilities for trade with the Kighiz, with Turkistan, and with Bokhara. Its exports passing through the custom-house are estimated at an annual value of about £200,000, the chief items being cottons (upwards of £100,000), woollen stuffs, corn, metals, metallic wares, and spirits. The value of the cattle imports exceeds £150,000 annually, and the aggregate value of the skins, cotton goods, furs, tea, and wool imported reaches the same figure. The town has several tallow-melting houses, tanneries, and glue and soap works; and its industries are steadily increasing. The population (7850 in 1865) now exceeds 11,500.

The small fort of Petropavlovsk, consisting of an earthen palisaded wall, was founded in 1752, and was the military centre of the Ishim line of fortifications. It became at once a place of trade with the Kighiz, and in 1771 had a population of 914 inhabitants. It received municipal institutions in 1807.

PETROPAVLOVSK is also the name of a Russian seaport in Kamchatka, on the eastern shore of the Bay of Avatcha in 58° N. lat and 158° 44' E. long. Its beautiful harbour, one of the best on the Pacific, is but little frequented, and the town consists merely of a few huts with some 500 inhabitants. Its naval institutions were transferred to Nikolaevsk after the attack of the albatross in 1854.

PETROPOLIS, a town of Brazil, in the province of Rio de Janeiro, lies at a height of 2400 feet above the sea on a beautiful and healthy plateau, surrounded by the wooded heights of the Serra da Estrella, which lie between it and the coast region. It is about 25 miles almost due north from Rio de Janeiro, and is reached by a railway (22 miles) from Maua, the last 10½ miles are on the Rigi system. Founded by the emperor of Brazil as a colony for distressed German immigrants, Petropolis has grown into an elegant and thriving town of 8000 or 10,000 inhabitants, and, besides the royal palace and park, has a number of good hotels and public buildings.

PETROVSK, a town of European Russia, in the province of Saratoff, lies on both banks of the Medvedytsa, a tributary of the Don, 64 miles north-north-west of Saratoff on the Volga by the highway to Moscow. It was founded by Peter I. in 1698 to defend the district from the encroachments of the Kuban Tatars, and by the beginning of the 19th century it had become a place of 6921 inhabitants, with ten churches and a monastery (St Nicholas). In 1864 the population was 10,128, and it has since increased to upwards of 15,000.

This Petrovsk must not be confounded with (1) Petrovsk, a seaport town of from 4000 to 5000 inhabitants in northern Daghestan, which possesses one of the best roadsteads on the west coast of the Caspian; nor (2) with the crown iron-works of this name in Transbaikalia, deserving mention for its convict establishment, where the "Desambats" were kept for several years.

PETROZAVODSK, a town of Russia, capital of the government of Olonets, lies on the western shore of Lake Onega, 300 miles to the north-east of St Petersburg. The small river Lososinka divides it into two parts,—the town proper and the iron-works. Two cathedrals built towards the end of last century, two lyceums for boys and girls, a mining school, an ecclesiastical seminary, and several primary schools are the chief public buildings and institutions. The Government cannon-foundry can turn out annually more than 5000 tons of pig-iron, and the same weight of guns, gun-carriages, and ammunition, but its actual production is subject to great fluctuations. Within the district there are a few private iron-works as well as important saw-mills. The inhabitants engage in agriculture and fishing, and there is some trade with St Petersburg,—timber, fish, and furs being exported in exchange for corn, groceries,

and manufactured wares The population (11,027 in 1865) was 11,970 in 1881.

PETI, I., who was the first to give attention to the mineral resources of Olonetz, founded an iron-works, Petrowska Zavod, on the Losenka river, in 1759, the "zavod" prepared guns and arms, and within its walls a small palace and a church were built for the czar. The iron-works continued in operation for only twenty-four years, a copper-works, and subsequently a private iron-works, founded by Frenchmen, had no better success. The Government cannon-foundry was instituted in 1774, the settlement that sprang up was called Petrowsk, and received municipal institutions in 1777. Petrowsk was the capital of the government of Olonetz in 1802.

PETTY, Sir WILLIAM (1613-1687), statistician and political economist, and author of the *Down Survey of Irish Lands*, was born on 26th May 1623. He was the son of a clothier at Romsey in Hampshire, and received his early education at the grammar-school there. About the age of fifteen he went to Caen (Normandy), taking with him a little stock of merchandise, on which he traded, and so maintained himself whilst learning French, improving himself in Latin and Greek, and studying mathematics and other sciences. On his return to England he seems to have had for a short time a place in the royal navy. He went abroad again in 1643, and remained for three years in France and the Netherlands, pursuing his studies at Utrecht, Leyden, Amsterdam, and Paris. In the last-named city he read Vesalius with the celebrated Hobbes. The philosopher was then preparing his *Treatatus Opticus*, and it is said that Petty drew the diagrams for him. In 1647 Petty obtained a patent for the invention of double writing, or, in other words, of a copying machine. In politics he espoused the side of the Parliament. His first publication was a letter to Samuel Hartlib in 1648, entitled *Advice for the Advancement of some Particular Parts of Learning*, the object of which was to recommend such a change in education as would give it a more practical character. In the same year he took up his residence at Oxford, where he was made deputy professor of anatomy, and where he gave instruction in that science and in chemistry. In 1649 he obtained the degree of doctor of physics, and was soon after elected a fellow of Brasenose College. He gained some notoriety in 1650 by restoring to life a woman who had been hanged for infanticide. In 1651 he was made professor of anatomy at Oxford, and also became professor of music at Gresham College. In 1652 he went to Ireland, having been appointed physician to the army in that country. In 1654, observing that the admeasurement and division of the lands forfeited in 1641 and granted to the soldiers had been (to use his own words) "most inefficiently and absurdly managed," he entered into a contract to execute a fresh survey, which he completed in thirteen months. By this he gained £9000, and part of the money he invested profitably in the purchase of soldiers' debentures. He thus became possessor of so large a domain in the county of Kerry that, according to Aubrey, he could behold from Mount Mangerton 50,000 acres of his own land. He set up iron-works in that neighbourhood, opened lead-mines and marble-quarries, established a pichard-fishery, and commenced a trade in timber. In Macaulay's *History of England* there is an account of the settlement which he founded at Kenmare. Besides the office of commissioner of distribution of the lands he had surveyed, he held that of secretary to the lord lieutenant, Henry Cromwell, and was also during two years clerk of the council. In January 1658 he was elected to Richard Cromwell's parliament as member for West Loos in Cornwall. He was accused by Sir Jerome Stanley before the House of Commons of malversation and fraud in the conduct of his survey; but the matter did not come to an issue in consequence of the dissolution of the parliament, and Petty afterwards published tracts in his defence. After the Restoration he returned to England

and was favourably received and knighted by Charles II, who was "much pleased with his ingenious discourses," and who, it is said, intended to create him earl of Kilmore. He obtained from the king a new patent constituting him surveyor-general of Ireland. In 1663 he attracted much notice by the success of his invention of a double-bottomed ship, which twice made the passage between Dublin and Holyhead, but was afterwards lost in a violent storm. He was one of the first members of the Royal Society, and sat on its council. He died at London on the 16th of December 1687, and was buried in the church of his native place. His will, a curious and characteristic document, is printed in Chalmers's *Biographical Dictionary*.

Petty was a man of remarkable versatility, ingenuity, and resource. Evelyn declared he had "never known such another genius," and said of him, "If I were a prince I would make him my second councillor at least." His character does not seem to have been an elevated one, though Henry Cromwell, who knew him well, appears to have esteemed him highly.

The survey executed by Petty was, somewhat whimsically, called the "Down Survey," because the results were set down in maps, it is called by that name in Petty's will. He left in MS a full account of the proceedings in connexion with it, which was edited by the late Major-General Sir Thomas A. Lacombe for the Irish Archaeological Society in 1861. The maps, some of which were injured by a fire in 1711, are preserved in the Public Record Office, Dublin. The survey "stands to this day," says Lacombe, "with the accompanying books of distribution, the legal record of the title on which half the land of Ireland is held, and for the purpose to which it was and is applied it remains sufficient." Petty's name is associated with the foundation, or, as it is safer to say, the successful prosecution of what has been somewhat too ambitiously termed "the science of political arithmetic." It is essentially the same with what is called comparative statistics. In Petty's time statistical data and expressions of social facts could seldom be directly obtained, and thus large room was left for more or less probable inference from the available data. As we might have expected from his intellectual character, the expedients to which he resorts in seeking to arrive at determinations of this kind are very ingenious, but often unsatisfactory and even delusive. Whilst, however, he sometimes makes too much of the defective materials he would command, he strongly insists on accurate and continued observation as the only safe basis.

Petty was not merely a statistician, he was also a political economist, and one of no mean rank. He is one of the first in whom we find a tendency to a view of industrial phenomena which was at variance with the then dominant mercantile ideas, and he exhibits a statesmanlike sense of the elements in which the strength of a nation really consists. Boschen names him as having, along with Locke and Dudley North, raised the English school to the highest point it attained before the time of Hume. His *Treatise of Taxes and Contributions* has been recently pronounced to be "the first great work on economic theory, which it may fairly be said to have founded." However this may be, it certainly contains a clear statement of the doctrine that price depends on the labour necessary for production. Petty is much concerned to discover a fixed unit of value, and he thinks he has found it in the necessary subsistence of a man for a day. He understands the cheapening effect of the division of labour. He states correctly the notion of "natural and true" rent as the remainder of the produce of land after payment of the cost of production, but he seems to have no idea of the "law of diminishing returns." He has much that is just on the subject of money: he sees that there may be an excess of it as well as a deficiency, and regards the prohibition of its exportation as contrary to sound policy. But he errs in attributing the fall of the rate of interest which takes place in the progress of industry to the increase in the quantity of money. He protested against the fetters imposed on the trade of Ireland, and advocated a union of that country with Great Britain. Whilst the general tendency in his day was to represent England as in a state of progressive decline—an opinion put forward particularly in the tract entitled *Britannia Langueva*—Petty declared his resources and prospects to be not inferior to those of France.

A complete list of his works is given in the *Athenæ Conenseses*. The most important are the *Treatise of Taxes and Contributions* (1662, 1667, and 1685), *Political Arithmetic*, presented in MS to Charles II, but, because it contained matter likely to be offensive to France, kept unpublished till 1801, when it was edited by Petty's son Charles, *Quantulumvisque, or a Treatise concerning Money* (1689), *Observations upon the Dublin Bill of Mortality in 1681, and the Bills of Mortality in 1689*, *Essay concerning the Multiplication of the Irish*, *Political Anatomy of Ireland* (1681). Several papers appeared in the *Philosophical Transactions*. It is much to be regretted, as MacCulloch long since remarked, that a complete and uniform edition of his writings has not been published.

PETUNIA. See HORTICULTURE, vol. xii p. 264.

PETTINGER, CONRAD (1465-1547), a prominent and

useful citizen of Augsburg, remembered for his services to the new learning. He was one of the first to publish Roman inscriptions (see vol xii p 124), and his name remains associated with the famous *Tubuli Peutingeriana* (see MAR, vol xv p 517), which was in his hands when he died, and was found again among his MSS in 1714. This important Roman itinerary table was first published as a whole by Scheyb (Vienna, 1753), the most elaborate edition is by Desjardins (Paris, 1869 and following years).

PEWTER¹ is a generic term for a variety of alloys, which all agree in this, that tin forms the predominating component. The finest pewter (sometimes called "tin and temper") is simply tin hardened by the addition of a trifle of copper. Ordinary pewter is tin alloyed with lead, which latter ingredient is added chiefly on account of its cheapness, and therefore often in excessive proportion. The law of France restricts the percentage of lead to 16.5, with a toleration of 1.5 per cent. of error, an alloy of this or a higher degree of richness in tin being, according to an old investigation by Vanquelin, as proof against sour wine or vinegar as pure tin is. Higher percentages of lead are dangerous, and besides spoil the appearance of the alloy. The composition of an alloy containing only these two components can be ascertained approximately by determining the specific gravity (see METALS, vol xvi. p. 67 sq.).

Plate pewter is a hard variety much used for plates and dishes, a good quality is composed of 100 parts of tin, 8 of antimony, 2 of bismuth, and 2 of copper. Closely allied to it is the silver-white alloy called "Britannia metal," which is much used in Great Britain for the making of tea-pots more especially. To give an idea of its very variable composition the following two analyses may be quoted. —

Tin	85.7	81.9
Antimony	10.4	16.2
Copper	1.0	0.0
Zinc	2.9	1.9
	100.0	100.0

Pewter wares are shaped chiefly in three ways. Measures and spoons are cast in moulds of brass made of two closely-fitting but detachable halves, the surface of the mould being powdered over with sandarach, or painted over with white of egg or oil, before use to prevent adhesion. Plates and dishes are made preferably by hammering. In large establishments milk-jugs and similar articles are often produced by "spinning," i.e., by pressing a flat plate of pewter against a rapidly-revolving blunt tool, and thus raising it into the desired shape (OF LEAD, vol xiv p. 378.).

PPAFF, CHRISTIAN HEINRICH (1773-1862), chemist and physicist, younger brother of J. F. Pfaff noticed below, took his degree as doctor of medicine at Stuttgart in 1793. He travelled with a noble family as physician, and practised for a time at Heidenheim, but he afterwards became professor (extraordinary in 1797, ordinary in 1801) of medicine, physics, and chemistry at the university of Kiel. He was a most prolific author of memoirs on sanitary and medical, and especially on chemical and physical, subjects. His work in chemistry was chiefly analytical and mineralogical. In physics he was distinguished as one of the earlier experimenters with the voltaic current, and had a considerable share in the experimental investigation of its properties. He also made important researches on the carrying power of magnets, more particularly on the effect of the extent of the attracting surface. Comparatively few of his memoirs are now quoted, owing to the fact that none of his results contained any capital discovery, nevertheless he deserves to be remembered as one of the energetic workmen who aided in raising the stately pile of modern experimental science.

¹ Old Fr *peutre*; Ital. *pietro*, comp. Eng. *spelter*.

PPAFF, JOHANN FRIEDRICH (1765-1825), German mathematician, was born on 22d December 1765 at Stuttgart. He received his early education at the Carlsschule, where Schiller, afterwards his life-long friend, was a school-companion. His mathematical capacity was early noticed, and after leaving school he pursued his studies in that department at Göttingen under Kastner, author of a *History of Mathematics*, and in 1787 he went to Berlin and studied practical astronomy under Bode. In 1788 Pfaff became professor of mathematics in Helmstadt, and so continued until that university was abolished in 1810. From that time till his death (20th April 1825) he held the chair of mathematics at Halle. Pfaff's researches bore chiefly on the theory of series, to which he applied the methods of the so-called Combinatorial School of German mathematicians, and on the solution of differential equations. His two principal works are *Disquisitiones analyticae maxime ad calculum integrolem et doctrinam serierum pertinentes* (4to, vol. i, Helmstadt, 1797) and "Methodus generalis, aequationes differentiarum particularum, nec non aequationes differentiales vulgares, utrasque primi ordinis inter quocunque variables, complete integrandi" in *Abh. d. Berl. Acad.* (1814-15). The former work contains Pfaff's discussion of the equation $(a + bx^2)x^2dy/dx^2 + (c + ex^2).xdy/dx + (f + gx^2)y = X$, which generally bears his name, but which had originally been treated in a less complete manner by Euler. The latter work contains an important addition to the theory of partial differential equations as it had been left by Lagrange.

An interesting review of Pfaff's memoir was published by Gauss in the *Göttingen Gelächte Anzeigen* for 1815 (published in vol. iv of his complete works). For fuller details regarding Pfaff and his work, consult Gerhardt, *Geschichte der Mathematik in Deutschland* (Munich, 1877, p. 198), and Pfaff's correspondence, edited by C. H. Pfaff.

Another brother of this family, JOHANN WILHELM ANDREAS PFAFF (1774-1835), was professor of pure and applied mathematics successively at Dorpat, Nürnberg, Würzburg, and Erlangen.

PFALZBURG, a town of German Lorraine, lies high on the west slopes of the Vosges, 25 miles to the north-north-west of Strasburg. In 1880 it contained 3379 (mainly Roman Catholic) inhabitants. The principality of Pfalz-burg, originally a part of Luxemburg, afterwards belonged in turn to the bishop of Metz, the bishop of Strasburg, and the duke of Lorraine, and passed into the possession of France in 1661. The town was of importance as commanding the passes of the Vosges, and was strongly fortified by Vauban in 1681. The works resisted the Germans for four months in 1870, but have since been razed.

PFELFER, FRANZ (1815-1868), an eminent writer on mediæval German literature and on old forms of the German language, was born at Solothurn on the 27th of February 1815. Having studied at the university of Munich, he went to Stuttgart, where in 1846 he became librarian at the royal public library. In 1857, having established his fame as one of the foremost authorities on his special subject, he was appointed professor of German literature and language at the university of Vienna, and in 1860 he was made a member of the Imperial Academy of Sciences. He died on the 29th of May 1868.

As an editor of mediæval literature Pfeiffer was unpassed among the scholars of his day, and by his work in this department he did much to foster the critical study of writers who before his time were known only to specialists. Among the many writings edited by him may be mentioned the works of the German mystics of the 14th century, the *Buch der Natur* of Conrad of Meigenberg, the *Predigten* of Berthold of Ratibon, the *Eidolden* of Ulrich Boner, the *Barlaam* and *Joseph* of Rudolf of Eins, and the poems of Walther von der Vogelweide. Of his independent writings the most important are *Zur deutschen Literaturgeschichte*, *Über Wesen und Bildung der hofischen Sprache in mittelhoch-deutscher Zeit*, *Der Dichter des Nibelungenliedes*, *Forschung und Kritik auf dem Gebiete des deutschen Alterthums*, and *Altdeutsches Übungsbuch*. Pfeiffer's style is clear and vigorous, and on every

subject which he discussed he was able to throw fresh light. A biographical sketch of him by Dartsch occurs in Uhländ's *Biographisch mit Feilen von Lassberg*, which Pfeiffer edited.

PFEIFFER, IDA LAURA (1797-1858), traveller, was born at Vienna, the daughter of a merchant named Heyer, 14th October 1797. Ida was the only sister of six brothers, and in her youth acquired masculine habits. Her training was Spartan, and accustomed her to the endurance of hardships and deprivations. On 1st May 1820 she married Dr Pfeiffer, a prosperous advocate of Lemberg, twenty-four years older than herself. Through over-zeal in denouncing abuses her husband incurred official persecution, and in a few years after his marriage was reduced to the greatest poverty. Ida, living mostly apart from her husband, underwent great drudgery, but, through her own exertions, managed to educate her two sons. After being relieved of this responsibility she resolved to indulge her intense longing to travel, and, with the most limited means, succeeded in making a series of journeys which, in extent, are probably unparalleled in the case of any other woman. In 1842 Madame Pfeiffer visited Egypt and Palestine, and, with considerable hesitation, published an account of her journey in three small volumes, *Reise einer Wienerin in das Heilige Land*, in 1845. In the same year she set out again, this time to Scandinavia and Iceland, describing her tour in two volumes, *Reise nach dem Skandinavischen Norden und der Insel Island* (Pesth, 1846). In 1846 she started on her first journey round the world, visiting Brazil, Chili, and other countries of South America, Tahiti, China, India, Persia, Asia Minor, and Greece, and reaching home in 1848. The results were published in three volumes at Vienna in 1850, under the title *Drei Frauenfahrt um die Welt*. For her next and most extensive journey she received the support of the Austrian Government to the small extent of £150. Starting in 1851, she went by London to South Africa, her purpose being to penetrate into the interior, but, this proving impracticable, she proceeded to the Malay Archipelago, spending eighteen months in the Sunda Islands and the Moluccas. After a visit to Australia, Madame Pfeiffer proceeded to California, Oregon, Peru, Ecuador, New Granada, the Missions Territory, and north again to the American lakes, reaching home in 1854. Her narrative, *Meine zweite Weltreise*, was published in four volumes at Vienna in 1856. In May of the same year Ida set out to explore Madagascar, where at first she was cordially received by the queen. Unfortunately, she unwittingly allowed herself to be involved in the plot of a Frenchman to overthrow the government, and, with brutal treatment, was expelled from the country. After being detained by her sufferings in Mauritius for some months, Ida returned by England to Vienna, where she died 27th October 1858. The *Reise nach Madagascar* was issued in 1861, with a biography by her son.

All Madame Pfeiffer's narratives have been translated into English as well as other languages, and have maintained a steady popularity up to the present time. Although Ida Pfeiffer can hardly be said to have broken up new ground in her travels, she certainly did much to increase our knowledge of countries about which our information was most meagre. Moreover, her scientific collections—for she was as good a collector as observer—were of considerable extent, and great value and novelty, and were regarded as important acquisitions by the Vienna museum. She was made an honorary member of the Berlin and Paris Geographical Societies, and received from the king of Prussia the gold medal of science and art. Her travels altogether covered 150,000 miles by sea and 20,000 by land. Ida Pfeiffer was short in stature, and latterly slightly bent, her manners were simple, unassuming, and womanly.

PFORZHEIM, one of the chief industrial towns in the grand-duchy of Baden, is pleasantly situated at the confluence of the Nagold, the Wurm, and the Enz, on the northern margin of the Black Forest, 15 miles to the south-east of Carlsruhe. The most prominent buildings are the old palace of the margraves of Baden-Durlach and

the Schlosskirche, the latter an interesting edifice of the 13th to the 15th centuries, containing the tombs and monuments of the margraves. The staple industry is the manufacture of gold and silver ware and jewellery, which gives employment to nearly 10,000 workmen, besides which there are iron and copper works, and manufactures of chemicals, paper, leather, cloth, and other articles. A brisk trade is maintained in timber, cattle, and agricultural produce. In 1880 the population was 24,037, having almost doubled itself in twenty years. Four-fifths of the inhabitants are Protestants.

Pfozheim (Pota Hecynia) is of Roman origin, and has belonged to Baden for 600 years. From about 1300 down to 1565 it was the seat of the margraves of the Baden-Durlach-Einstetten line, now extinct. The town was taken by the troops of the Catholic League in 1624, and was destroyed by the French in 1689. The story of the 400 citizens of Pfozheim who sacrificed themselves for their prince after the battle of Wimpfen (1622) has been relegated by recent historical research to the domain of legend. The humanist Reuchlin was born at Pfozheim in 1455.

PHÆDRUS, the author of five books of Latin fables in verse, lived in the reigns of Augustus, Tiberius, Caligula, and Claudius. To his literary vanity we owe most of our scanty knowledge of his life. He was born on the Pierian Mountain in Macedonia, but seems to have been brought at an early age to Italy, for he mentions that he read a verse of Ennius as a boy at school. According to the heading of the chief MS he was a slave and was freed by Augustus. He incurred the wrath of Sejanus, the powerful minister of Tiberius, but on what grounds is not known. Devoting himself to literature, he lived in poverty and died at an advanced age. The first two books of his fables were published together, the third, fourth, and fifth appeared later, each by itself. The third book is dedicated to Eutyclus, a wealthy man of business and probably a freedman, to whom the poet appeals for promised help. The fourth book is dedicated to Particulus, who seems to have dabbled in literature. From the fact that Seneca, writing in 43 or 44 A.D. (*Consol. ad Polyb.*, 27), knows of no Latin writer of fables we may infer that Phædrus published his fables after that time, but the exact date is unknown. His work shows little or no originality, he simply versified (in iambic trimeters) the fables current in his day under the name of "Æsop," interspersing them with anecdotes drawn from daily life, history, and mythology. He tells his fable and draws the moral with business-like directness and simplicity; his language is classical, neat, and clear, but thoroughly prosaic, though it occasionally attains a dignity bordering on eloquence. He is fond of abstract words. From a literary point of view Phædrus is far inferior to those masters of fable-writing, Babruus and La Fontaine; he lacks the quiet picturesqueness and pathos of the former, and the exuberant vivacity and humour of the latter. Though he frequently refers to the envy and detraction which pursued him, Phædrus seems to have attracted little attention in antiquity. He is mentioned by Martial (ii. 20, 5), who imitated some of his verses, and by Avianus. Prudentius must have read him, for he imitates one of his lines (*Prud., Cath.*, vii. 115; cp Phædrus, iv. 6, 10).

The first edition of the five books of Phædrus was published by Pithou at Troyes in 1596. But, from the gaps in the books as well as from the disproportionate shortness of some of them, it is plain that this collection is incomplete. In the beginning of the 18th century there was discovered at Parma a MS. of Perotti (1430-1480), archbishop of Siponto, containing sixty-four fables of Phædrus, of which thirty-two were new. These new fables were first published at Naples by Cassitto in 1808, and afterwards (much more correctly) by Jannelli in 1811. Both editions were superseded by the discovery of a much

better preserved MS of Perotti in the Vatican, which was published by Angelo Mai in 1831. For some time the authenticity of these new fables was disputed, but they are now generally accepted, and with justice, as genuine fables of Phaedrus. They do not form a sixth book, for we know from Aelianus that Phaedrus wrote five books only, but it is impossible to assign them to their original places in the five books. They are usually printed as an appendix. Even thus it is probable that we have not the whole of Phaedrus.

In the Middle Ages Phaedrus exercised a considerable influence through the prose versions of his fables which were current, though his own works and even his name were forgotten. Of these prose versions the oldest existing seems to be that known as the "Anonymus Nidamensis," so called because first edited by Nidant at Leyden in 1709 from a MS of the 10th or beginning of the 11th century. It approaches the text of Phaedrus so closely that it was probably made directly from it. Of the sixty-seven fables which it contains thirty are derived from lost fables of Phaedrus. But the largest and most influential of the prose versions of Phaedrus is that which bears the name of "Romulus." It contains eighty-three fables, as old as the 10th century, and seems to have been based on a still earlier prose version, which under the name of "Rufus" and attributed to one Rufus, may have been made in the Carolingian period. The surface of Romulus, in which he professes to have translated the fables from the Greek, is a mere fiction of the copyist, no such Romulus as thus ever existed, although in the Middle Ages, he was sometimes thought to have been a Roman emperor, and has still a place in the *Biographie Universelle* (1893). The collection of fables in the *Weissagung* (near Welfenbützel) MS is based on the same version (the *Ecloga ad Rufum*) as Romulus. These two prose versions contain in all one hundred distinct fables, of which fifty-six are derived from the existing and the remaining forty-four presumably from lost fables of Phaedrus. Some modern scholars, as Burmann, Driesler, and L. Müller, have tried to restore these lost fables by re-figuring the prose versions.

The collection bearing the name of Romulus became in its turn the source from which during the second half of the Middle Ages almost all the collections of Latin fables in prose and verse were wholly or partially drawn. A version of the first three books of Romulus in elegiac verse enjoyed a wide popularity, even into the Renaissance. Its author (generally referred to since the edition of Névelet in 1610 as the Anonymous of Névelet) was long unknown, but Haveneux has lately shown grounds for identifying him with Walther of England, a friend of the famous French bishop of Palaiseau. The version dates from the latter part of the 12th century. It was especially popular in Italy, where the Italian translation of Accio Zuccho (Verona, 1478) was frequently reprinted. Another version of Romulus in Latin elegiacs was made by Alexander Neckam, born at St Albans in 1157, and towards the end of his life (early part of 13th century) abbot of the Augustinian monastery at Exeter. Neckam knew and copied Walther's version, but his own never had the same popularity. Amongst the collections partly derived from Romulus the most famous is probably that in French verse by MARIE DE FRANCE (*q.v.*). About 1200 a collection of fables in Latin prose, based partly on Romulus, was made by the Cistercian monk Odo of Sherbington; they have a strong medieval and clerical tinge. In 1370 Gerard of Minden wrote a poetical version of Romulus in Low German.

Since the first edition of Phaedrus in 1605 the editors and translators have been very numerous, among the editions may especially be mentioned those of Burmann (1718 and 1747), Bentley (1726), Schwabe (1806), Bengel de Grey (1809), Orelli (1832), Eysenhardt (1837), L. Müller (1877), Haveneux, in his work *Les Fables Latines depuis le siècle d'Auguste jusqu'à la fin du moyen âge*, Paris, 1884. For the medieval versions of Phaedrus and their derivatives see L. Roth, in *Philologia*, 1 p. 628 sq.; E. Oesterley, *Romulus des Pergamonen des Phaedrus und die angebliche Fabel im Mittelalter*, 1891 (Göttingen); H. Grise, in *Archiv f. d. Philol.*, vol. cv (1873), and especially the learned work of Haveneux, who gives the Latin texts of all the medieval versions (direct and indirect) of Phaedrus, some of these texts being now edited for the first time (*J. G. F.R.*).

PHAETHON ("the shining one"), in Homer an epithet of the sun, and used by later writers as a name for the sun, is more generally known in classical mythology as a son of the Sun and the ocean nymph Clymene. He persuaded his father to let him drive the chariot of the sun across the sky, but he lost control of the horses, and driving too near the earth scorched it, mountains were set on fire, rivers and seas dried up, Libya became a desert, and the Ethiopians were blackened by the heat. To save the earth from utter destruction Zeus killed Phaethon with a thunderbolt. He fell to earth at the mouth of the Erandanus, a river of northern Europe (identified in later times with the Po), on the banks of which his weeping sisters

were transformed into poplars and their tears into amber. This part of the legend points to the mouth of the Oder or Vistula, where amber abounds. Phaethon was the subject of a drama of Euripides, of which some fragments remain. The suggestion that the legend of Phaethon is a mythical expression of vast increases of temperature produced at long intervals by changes in the relative position of the earth and the heavenly bodies was made by Plato (*Tymæus*, 22 C, D).

PHALANGER. Among the anonymous additions to Charles Pélouse's posthumous work *Curæ postervorum, seu plurimarum non ante cognitarum aut descriptarum animalium novæ descriptiones*, published at Leyden in 1611, occurs the following—

"In our third expedition, under Admual Van der Hagen, this was seen at Amboyna a rare and truly marvellous animal. The 'cousa,' as it is called by the natives, is a reddish animal, a little larger than a cat, which has under its belly a kind of pouch in which the mammae are placed, and in this the young are born, and remain there hanging firmly on until large enough to be turned out by their mother. They return, however, continually to the pouch until sufficiently developed to follow their mother and to find food for themselves. These animals live on grass, green leaves, and other vegetable food, and their flesh is eaten by the Portuguese and other native Christians, but not by the Mohammedans, who consider the cousa to be an unclean and forbidden animal, mainly on account of its want of horns."

This early account forms the first mention of any of the numerous marsupials of the eastern hemisphere, as there can be no doubt that the animal called the cousa by the natives of Amboyna nearly 300 years ago was the Grey Cuscus (*Cuscus orientalis*), a member of the only marsupial genus occurring in any Eastern land then known to Europeans. About a hundred years afterwards the same animal was seen by the Dutch traveller Valentyn, also at Amboyna, and still later Buffon gave to a pair of cuscuses examined by him the name that heads this article, "Phalanger," on account of the peculiar structure of the second and third toes of the hind feet, which are united in a common skin up to the nails, a character now known to be present in a large proportion of the Australian marsupials. Later, Captain Cook in 1770 and 1777, Governor Phillip in 1788, and J. White in 1790 discovered various different kinds of phalangers, and now we know of not less than ten genera, with about thirty-five species, forming the sub-family *Phalangerinae* of the family *Phalangeridae*, whose general characters have already been noticed in the article MAMMALIA (vol. xv. p. 382).

Phalangers as a whole are small woolly-coated animals, with long, powerful, and often prehensile tails, large claws, and, as in the American opossums, with opposable nailless great toes. Their expression seems in the day to be dull and sleepy, but by night they appear to decidedly greater advantage. They live mostly upon fruit, leaves, and blossoms, although some few feed habitually upon insects, and all relish, when in confinement, an occasional bird or other small animal. Several of the phalangers possess flying membranes stretched between their fore and hind limbs, by the help of which they can make long and sustained leaps through the air, like the flying squirrels, but it is interesting to notice that the possession of these flying membranes does not seem to be any indication of special affinity, the characters of the skull and teeth sharply dividing the flying forms, and uniting them with other species of the non-flying groups. Their skulls (see fig. 1) are as a rule broad and flattened, with the posterior part swollen out laterally, owing to the numerous air-cells situated in the substance of the squamosals. The dental formula is very variable, especially as regards the premolars, of which some at least in each genus are reduced to mere functionless rudiments, and may even vary in number on the two sides of the jaw of the same individual. The

incisors are always $\frac{3}{2}$, the lower one very large and procynous, and the canines normally $\frac{1}{2}$, of which the inferior

FIG. 1.—Skull of Naked-eared Cuscus (*Cuscus gymnotis*) After Peters.

is always minute, and in one genus generally absent. The true molars number either $\frac{1}{2}$ or $\frac{3}{2}$. The genera, of which not less than ten must be allowed as valid, may be arranged as follows.

- I. Molars with curved crests, $\frac{4}{2}$.
 - (A) Pm^1 minute or absent, pm^1 and pm^2 functional, the latter standing obliquely
 - a Canines separated from incisors, tail hairy 1 *Phalangista*
 - b Canines close to incisors, tail naked, scaly 2 *Cuscus*.
 - (B) Pm^1 functional, pm^2 forming an even series with the molars.
 - c Without a flying membrane, first two anterior toes opposable to rest, tail prehensile 3 *Pseudochirus*
 - d With a flying membrane, toes normal, tail bushy, non prehensile ... 4 *Petaurista*.
- II. Molars without round or pointed cusps
 - (C) Molars $\frac{4}{2}$ Functional premolars $\frac{2}{0}$ or 8
 - e Lower premolar row interrupted, upper $\frac{1}{1}$ directed forwards, pm^1 functional 5 *Dactylopsila*
 - f Lower premolar row continuous, upper $\frac{1}{1}$ directed downwards, pm^2 functional, a flying membrane 6 *Petaurus*
 - g No flying membrane 7 *Gymnobelideus*
 - (D) Molars $\frac{3}{2}$
 - g. Functional premolars $\frac{1}{1}$ or 0, tail round, no flying membrane ... 8 *Dromicia*
 - a Functional premolars $\frac{3}{1}$, tail distichous, no flying membrane ... 9 *Distoechirus*
 - c Functional premolars $\frac{3}{2}$, tail distichous, a flying membrane ... 10 *Acrobata*

1. *Phalangista*, Cuv.

Upper incisors forming a semicircular series. Upper 1^1 scarcely larger than the others, parallel, its anterior surface flattened, point transversely truncated. Canines some way from and shorter than incisors, in front of the premaxillary-maxillary suture.* Pm^1 small, some way separated both from canine and pm^2 , pm^2 suppressed, pm^1 large, obliquely placed. Molars large, quadrangular, their summits with distinct crescentic ridges. Lower incisors large, canines very small, but persistent, pm^1 and pm^2 small, or, commonly, absent, pm^2 large and obliquely placed; molars like the upper ones.

Dental formula.— $\frac{128}{106} \frac{1}{6} \frac{1}{1} \frac{108}{1234} \frac{1284}{1234} \times 2 = 34$ to 38

Skull low, without frontal sinuses; bullae scarcely inflated, premaxillary long; the anterior palatine foramina almost confined to the premaxilla; mandible with no trace of an external opening into the inferior dental canal.

Feet normal, tail long and bushy, only naked for a few inches along the under-side of the tip.

Range.—The whole of Australia and Tasmania; not yet found in New Guinea.

This genus, by its somewhat elongated premaxilla, restriction at the point of exit from the bone, but the roots are of course situated in the maxilla.

* In this special dental formula, necessitated by the peculiar development of the teeth of the phalangers, the numbers are those of each individual tooth,—the larger numbers representing fully-developed functional teeth, and the smaller the minute and functionless ones. An asterisk to one of the latter shows that the tooth is sometimes or commonly absent, though it should be remarked that the presence or absence of these minute teeth is not of any systematic importance.

of the palatine foramina to the latter bones, and by the shape of its upper pm^1 , shows a certain tendency towards the kangaroos (*Macropodidae*), the family to which the *Phalangistidae* are undoubtedly most nearly allied.

The true phalangers, or opossums as they are called by the Australian colonists, consist of four or five hardly separable species, of which the best known is the Vulpine Phalanger (*Ph. vulpescus*), so common in zoological gardens, whence, however, it is seldom seen, owing to its nocturnal habits. It is of about the size and general build of a small fox, whence its name, its colour is grey, with a yellowish white belly, white ears, and a black tail. It is a native of the greater part of the continent of Australia, but is replaced in Tasmania by the closely allied Brown Phalanger (*Ph. fuliginosa*). Its habits are very similar to those of the Yellow-bellied Flying-Phalanger (*Petaurus australis*) described below,—except that, of course, it is unable to take the wonderful flying leaps so characteristic of that animal. Like all the other phalangers, its flesh is freely eaten both by the natives and by the lower class of settlers.

2. *Cuscus*, Lacép.

Upper incisor low angular in front. Upper 1^1 considerably longer than the others, round, pointed. Canines close against the last incisors, longer than any of the other teeth, placed apparently on the suture. Pm^1 well developed, pm^2 minute or absent, pm^1 large, rounded, its axis slightly oblique. Molars and all the lower teeth much as in *Phalangista*, but rather larger in proportion.

Dental formula.— $\frac{128}{106} \frac{1}{6} \frac{1}{1} \frac{128}{1234} \frac{1284}{1234} \times 2 = 34$ to 40.

Frontal region of skull in adult animals markedly convex, owing to the presence of large frontal sinuses; bullae not inflated, premaxillary bones very short, palatine foramina entering the maxilla, no external opening into the inferior dental canal.

Feet normal; tail long, naked and scaly for its terminal two-thirds, prehensile.

Range.—From Celebes to the Solomon Islands, and southwards through New Guinea to North Queensland.

The cuscuses are curious sleepy-looking animals, which inhabit the various islands of the East Indian archipelago as far west as Celebes, being the only marsupials found west of New Guinea. As already noted, it was a member of this genus, the Grey Cuscus (*C. ornamentalis*), a native of Ambroma, Timor, and the Netherlands islands, which was the first Australian marsupial known to European naturalists. There are altogether about eight species known, all of about the size of a large cat, their habits resemble those of other phalangers, except that they are said to be somewhat more carnivorous.

3. *Pseudochirus*, Ogilb.

Upper incisor low angular. First upper incisor but little longer than the others, but nevertheless the longest tooth in the jaw. Canine small, behind suture. Pm^1 rather small, pm^2 and pm^1 larger, each with two roots, neither placed at all obliquely. Molars quadrangular, with very distinct crescentic ridges; all the teeth from the incisors backwards forming a nearly continuous series. Lower pm^2 only forming part of the molar series.

Dental formula.— $\frac{128}{106} \frac{1}{6} \frac{1}{1} \frac{128}{1234} \frac{1284}{1234} \times 2 = 36$ to 40

Skull without frontal sinuses; palatine foramina entering maxilla, as in all the following genera except *Dactylopsila*; bullae inflated, palate generally complete, a minute external opening into the inferior dental canal generally present in the position of the large vacancy characteristic of the *Macropodidae*.

Ears large, fore-feet with the first two toes together opposable to the remaining three; tail thinly-haired, prehensile.

Range.—Tasmania, Australia, and New Guinea.

There are about four species of this genus known, of which the commonest is Cook's Ring-tailed Phalanger (*Pseudochirus caudivivax*), an animal discovered by Captain Cook during his first voyage, at Endeavour river, North Queensland.

4. *Petaurista*, Desm.

Teeth almost exactly as in *Pseudochirus*, except that the lower canine is generally absent, as well as the minute first and second premolars.

Dental formula.— $\frac{128}{106} \frac{1}{6} \frac{1}{1} \frac{128}{1234} \frac{1284}{1234} \times 2 = 34$ to 40

Bullae inflated, but small; palate generally incomplete from the level of the second molar, a distinct external opening into the inferior dental canal.

Sides of the body with a broad flying membrane stretching from the elbow to just below the knee, ears large and hairy, claws long and sharp, tail bushy, round, and non-prehensile.

Range.—New South Wales.

The only species belonging to this genus is the large black Tasmanian Flying Phalanger (*P. volans*), an animal very similar to certain of the large Indian flying squirrels, and which fully agrees in its habits with the Yellow-bellied Flying-Phalanger described below. In its affinities it seems to be, so to speak, a highly-specialized

Pseudochirus, in which the teeth have become somewhat further diminished and the flying membrane has been developed.

5. *Dactylopsilla*, Gray.

Upper 1^1 very long, directed forwards. Canine shorter than 1^2 , close to it. pm^2 minute or absent; pm^3 oval, in line with molars. Molars square-sided, forming a straight line, the third as long as the second. All lower premolars small and deciduous.

Dental formula.— $1 \frac{1.2.3}{1.0.0} c. \frac{1}{1} pm. \frac{1.2.3.4}{1.2.3.4} \times 2 = 32$ to 40.

Palatal foramen in premaxilla; palate complete; bullae small; no external opening into inferior dental canal.

Form normal; fourth fore-toe very much longer than the others; tail bushy, rounded.

Range.—From the Arru Islands through New Guinea to North Queensland.

Of this genus two closely-allied species are described. They are beautifully striped down the back with white and grey, and are said to be insectivorous in their habits.

6. *Petaurus*, Slaw.

Upper 1^1 very long, directed downwards. Canine intermediate in length between 1^1 and 1^2 . pm^2 the smallest, but yet functional. Molars much rounded, as are those of all the succeeding genera; m^3 much smaller than m^2 . Lower premolars, though small, yet permanent and forming an uninterrupted series.

Dental formula.— $1 \frac{1.2.3}{1.0.0} c. \frac{1}{1} pm. \frac{1.2.3.4}{1.2.3.4} \times 2 = 40$.

Palatal foramen entering maxilla; bullae inflated; a small external opening into the inferior dental canal.

Sides of body with a flying membrane stretching from the outside of the tip of the anterior fifth toe to the ankle; tail bushy; ears large and nearly naked.

Range.—From New Ireland to South Australia, but not Tasmania. This genus contains about five species, the largest of which is the Yellow-bellied Flying-Phalanger (*P. australis*), whose habits are recorded by Mr Gould as follows. "This animal is common in all the brushes of New South Wales, particularly those which stretch along the coast from Port Phillip to Moreton Bay. In these vast forests trees of one kind or another are perpetually flowering, and thus offer a never-failing supply of the blossoms upon which it feeds; the flowers of the various kinds of gums, some of which are of great magnitude, are the principal favourites. Like the rest of the genus, it is nocturnal in its habits, dwelling in holes and in the spouts of the larger branches during the day, and displaying the greatest activity at night while running over the small leafy branches, frequently even to their very extremities, in search of insects and the honey of the newly-opened blossoms. Its structure being ill adapted for terrestrial habits, it seldom descends to the ground except for the purpose of passing to a tree too distant to be

chased or forced to flight it ascends to the highest branch and performs the most enormous leaps, sweeping from tree to tree with wonderful address; a slight elevation gives its body an impetus which with the expansion of its membrane enables it to pass to a considerable distance, always ascending a little at the extremity of the leap; by this ascent the animal is prevented from receiving the shock which it would otherwise sustain."

A second species, *P. sciuurus*, in some ways one of the most beautiful of all mammals, has been chosen for the accompanying cut (see fig. 2).

7. *Gynnodideus*, M'Coy.

Like *Petaurus* in every respect, but without any trace of a flying membrane.

Habitat.—Victoria.

8. *Dracoin*, Gray.

First upper incisor and canine very long. pm^1 and pm^2 very minute; pm^3 large. Molars rounded; their series bowed inwards. Lower canine and first two premolars very small but persistent; pm^3 either large and functional or minute.

Dental formula.— $1 \frac{1.2.3}{1.0.0} c. \frac{1}{1} pm. \frac{1.2.3}{1.2.3} \times 2 = 32$ to 36.

Palate incomplete; bullae very large and inflated. No flying membrane; claws short, exceeded in length by the pads under them; toes subequal; tail thinly haired, prehensile.

Five species of Dormouse Phalangers are recorded, ranging from New Guinea to Tasmania.

9. *Distichon*, Peters.

Upper teeth much as in *Acrobata*, but pm^3 reduced, shorter than molars, and crowded obliquely out of the molar series. Lower teeth also as in *Acrobata*, but pm^3 is entirely suppressed.

Dental formula.— $1 \frac{1.2.3}{1.0.0} c. \frac{1}{1} pm. \frac{1.2.3}{1.2.3} \times 2 = 34$.

Skull as in *Acrobata*.

No flying membrane; tail distichous; ears very short; claws well developed.

Habitat.—New Guinea only, whence a single species is known.

10. *Acrobata*, Deam.

Upper 1^1 long. Canine proportionally more developed than in any other phalanger, pressed close against last incisor. Premolars all long, narrow, sharply pointed, and two-rooted. Lower pm^1 minute, but always present; pm^2 and pm^3 functional, shaped like the upper ones.

Dental formula.— $1 \frac{1.2.3}{1.0.0} c. \frac{1}{1} pm. \frac{1.2.3}{1.2.3} \times 2 = 36$.

Palate incomplete; bullae low and small; palatal foramen nearly all in the maxillary; a well-marked external opening into the inferior dental canal; aquanals but little swollen by air-cells.

A flying membrane present, stretching from the elbow to the knee, but very narrow in its centre; tail distichous, probably slightly prehensile; toes subequal; claws small and far surpassed by the very remarkable toe-pads, which are broad and ribbed, resembling those of a gecko, and evidently have a very definite adhesive power.

Range.—South and eastern Australia.

There is only one species in this genus, the beautiful little Pigmy Flying-Phalanger, not so big as a mouse, which feeds on the honey it can abstract from flowers, and on insects. Its agility and powers of leaping are exceedingly great, and it is said by Mr Gould to make a most charming little pet. (O. T.)

PHALARIS, a Greek tyrant, who ruled Agrigentum (Acragas) in Sicily for sixteen years (probably between c. 571 and 549 B.C.). He was the son of Laodamas, and his family belonged to the Dorian island of Astypalaea, near Cnidus. As a leading man in the new city (for Agrigentum had been founded by the neighbouring city of Gela only a few years before, 582 B.C.) Phalaris was entrusted with the building of the temple of Zeus Atabyrius on the citadel, and he took advantage of his position to make himself master of the city. Under his rule Agrigentum seems to have attained a considerable pitch of external prosperity. He supplied the city with water, adorned it with fine buildings, and strengthened it with walls. His influence reached to the northern coast of the island, where the people of Himera elected him general, with absolute power, in spite of the warnings of the poet Stesichorus. Eastward on the coast he had fortified posts at Encomus and Phalarium, and he is said to have conquered Leontini; but that he ruled the whole of Sicily, as Suidas asserts, is unlikely. He was at last overthrown, apparently by a combination of the noble families, headed by the rich and distinguished Telemachus, and he was burned, along with his mother

FIG. 2.—Squirrel Flying-Phalanger (*Petaurus sciuurus*)

attained by springing from the one it wishes to leave. The tops of the trees are traversed by this animal with as much ease as the most level ground is by such as are destined for terra firma. If

and friends, in the brazen bull. A decree was carried that no one should thereafter wear a blue dress, as blue had been the tyrant's livery.

After ages have held up Phalaris to infamy for his excessive cruelty. In his brazen bull, invented, it is said, by Perikles of Athens, and presented by him to Phalaris, the tyrant's victims were shut up and, a fire being kindled beneath, were roasted alive, while their shrieks, conveyed through pipes in the beast's nostrils, represented the bellowing of the bull. Phalaris himself is said to have been the first victim. There is hardly room to doubt that we have here a tradition of human sacrifice in connexion with the worship of the Phrygian Baal, such as prevailed at Rhodes, where Zeus Atabyrius was no other than Baal, when in his time the threatened Rhodians the brazen bulls in his temple bellowed. The Rhodians brought this worship to Gela, which they founded conjointly with the Cretans, and from Gela it passed to Agrigento. Human sacrifices to Baal were common and, though in Phoenicia proper there is no proof that the victims were burned alive (see MOLOCH), the Carthaginians had a brazen image of Baal, from whose down-turned hands the children slid into a pit of fire, and the story that Minos had a brazen man who pressed people to his glowing breast points to similar rites in Crete, whence the children of Minos were certainly to be considered as victims to Baal and the votive sacrifice to him of children. So, too, we have the fire-putting bull of Mautia which burned Aithyogens. The stories that Phalaris threw men into boiling cauldrons, and vessels filled with fire, and that he devoured sucklings, all tell the same tale. From this point of view we may perhaps reconcile with history the apparently contradictory tradition which seems to have prevailed later, namely, that Phalaris was a naturally humane man and a patron of philosophy and literature. This is the view of his character which we find in the declamations ascribed to Lucian, and in the letters which bear Phalaris's own name. Plutarch, too, though he takes the unfavorable view, mentions that the Sicilians gave to the severity of Phalaris the name of justice and a hatred of crime. It is recorded that he once pardoned two men who had conspired against him. Phalaris, however, was not a humane man, not unknown in history, who combine justice and even humanity with a religious fanaticism which shrinks from no horrors believed to be demanded by the cause of God.

The letters, bearing the name of Phalaris (118 in number) are now chiefly remembered for the crushing exposure they received at the hands of Bentley in his controversy with the Hon. Charles Boyle, who had published them in 1696. The first edition of Bentley's *Dissertation on Phalaris* appeared in 1697, and the second edition, replying to the answer which Boyle published in 1698, came out in 1699. From the mention in the letters of towns (Phintia, Alesa, and Tauromenium) which did not exist in the time of Phalaris, from the imitations of authors (Herodotus, Democritus, Empiricus, Callimachus) who wrote long after he was dead, from the reference to tagelites, though tagelids was not yet invented in the lifetime of Phalaris, from the dialect, which is not Dorian but Attic, nay, New or Late Attic, as well as from absurdities in the matter, and the entire absence of any reference to them by any writer before Stobæus (who lived apparently about 500 A.D.), Bentley sufficiently proved that the letters were written by a sophist or rhetorician hundreds of years after the death of Phalaris. Suidas admitted the letters, which he thought genuine, and in modern times, before they were exposed by Bentley, they were admired by some, e.g., by Sir William Temple, though others, as Politian and Erasmus, perceived that they were not by Phalaris.

There are editions of the epistles of Phalaris by Lennep and Valckenner, Groningen, 1777 (revised, with corrections and additions, by Schneider, Leipzig, 1823), and by R. Henrich, in *Epistolæ Græcæ*, Paris, 1873. The latest edition of Bentley's *Dissertation* is that with introduction and notes by W. Watson, 1883.

PHARAOH (פַּרְאֹה; *Pharao*), which the Old Testament often uses as if it were a proper name, applicable to any king of Egypt, though sometimes such a distinguishing name as Hophia (Apries, Jer. xlv. 30) or Nechoh (Nekos) (2 Kings xxiii. 29) is added, is really an Egyptian title of the monarch (Perâa or Phuro), often found on the monuments. Apart from Hophia and Necho the Biblical Pharaohs cannot, in the present state of Hebrew and Egyptian chronology, be identified with any certainty.

PHARISEES (פְּרִישִׁי, *Pharisæai*), the Jewish party of the scribes, the opponents of the Sadducees. See ISRAEL, vol. xii. p. 423 *seq.*, and MESSIAH.

PHARMACOPŒIA (lit the art of the *pharmakopoi*ús, or drug-compounder) in its modern technical sense denotes a book containing directions for the identification of simples and the preparation of compound medicines, and

published by the authority of a Government or of a medical or pharmaceutical society. The name has also been applied to similar compendiums issued by private individuals. The first work of the kind published under Government authority appears to have been that of Nuremberg in 1542; a passing student named Valerius Cordus showed a collection of medical receipts, which he had selected from the writings of the most eminent medical authorities, to the physicians of the town, who urged him to print it for the benefit of the apothecaries, and obtained for his work the sanction of the senatus. An earlier work, known as the *Antidotarium Florentinum*, had been published, but only under the authority of the college of medicine of Florence. The term "pharmacopœia" first appears as a distinct title in a work published at Basel in 1561 by Dr. A. Foes, but does not appear to have come into general use until the beginning of the 16th century. Before 1542 the works principally used by apothecaries were the treatises on simples by Avicenna and Serapion, the *De Synonymis* and *Quid pro Quo* of Simon Jannensis, the *Libri Servitoris* of Bulchasim Ben Abetazerim, which described the preparations made from plants, animals, and minerals, and was the type of the chemical portion of modern pharmacopœias, and the *Antidotarium* of Nicolaus de Salerno, containing Galenic compounds arranged alphabetically. Of this last work there were two editions in use,—Nicolaus magnus and Nicolaus parvus, in the latter, several of the compounds described in the larger edition were omitted and the formulae given on a smaller scale.

Until 1617 such drugs and medicines as were in common use were sold in England by the apothecaries and grocers. In that year the apothecaries obtained a separate charter, and it was enacted at the same time that no grocer should keep an apothecary's shop. The preparation of physicians' prescriptions was thus confined to the apothecaries, upon whom pressure was brought to bear, in order to make them dispense accurately, by the issue of a pharmacopœia in May 1618 by the College of Physicians, and by the power which the venders of the apothecaries received in common with the censors of the College of Physicians of examining the shops of apothecaries within 7 miles of London and destroying all the compounds which they found unfaithfully prepared. This, which was the first authorized *London Pharmacopœia*, was selected chiefly from the works of Mezuze and Nicolaus de Salerno, with a few additions from those of other authors then in repute, but it was found to be so full of errors that the whole edition was cancelled, and a fresh one was published in the following December. At this period the compounds employed in medicine were often heterogeneous mixtures, some of which contained from 20 to 70, or more ingredients, while a large number of simples were used in consequence of the same substance being supposed to possess different qualities according to the source from which it was derived. Thus crabs' eyes, pearls, oyster-shells, and coral were supposed to have different properties. Among other disgusting ingredients entering into some of these formulae were the excrements of human beings, dogs, mice, geese, and other animals, calculi, human skull and moss growing on it, blind puppies, earthworms, &c. Although other editions of the *London Pharmacopœia* were issued in 1621, 1632, 1639, and 1677, it was not until the edition of 1721, published under the auspices of Sir Hans Sloane, that any important alterations were made. In this issue many of the ridiculous remedies previously in use were omitted, although a good number were still retained, such as dog's excrement, earthworms, and moss from the human skull; the botanical names of herbal remedies were for the first time added to the official ones; the simple distilled waters were ordered.

of a uniform strength, sweetened spirits, cordials, and radishes were omitted as well as several compounds no longer used in London, although still in vogue elsewhere. A great improvement was effected in the edition published in 1740, in which only those preparations were retained which had received the approval of the majority of the pharmacopœia committee, to these was added a list of those drugs only which were supposed to be the most efficacious. An attempt was made to simplify further the older formulae by the rejection of the superfluous ingredients which had been introduced during a succession of ages, and by retention of the known active ingredients. In the edition published in 1788 the tendency to simplify was carried out to a much greater extent, and the extremely compound medicines which had formed the principal remedies of physicians for 2000 years were discarded, while a few powerful drugs which had been considered too dangerous to be included in the *Pharmacopœia* of 1765 were restored to their previous position. In 1809 the French chemical nomenclature was adopted, and in 1815 a corrected impression of the same was issued. Subsequent editions were published in 1824, 1836, and 1851.

The first *Edinburgh Pharmacopœia* was published in 1699 and the last in 1841, the first *Dublin Pharmacopœia* in 1807 and the last in 1850.

The preparations contained in these three pharmacopœias were not all uniform in strength, a source of much inconvenience and danger to the public, when powerful preparations such as dilute hydrocyanic acid were ordered in the one country and dispensed according to the national pharmacopœia in another. This inconvenience led to the insertion of a provision in the Medical Act of 1858, by which it was ordained that the General Medical Council should cause to be published under their direction a book containing a list of medicines and compounds, and such other matters and things relating thereto, as the General Council should think fit, to be called the *British Pharmacopœia*, which should for all purposes be deemed to be a substitute throughout Great Britain and Ireland for the several above-mentioned pharmacopœias. Hitherto these had been published in Latin. The first *British Pharmacopœia* was published in the English language in 1864, but gave such general dissatisfaction both to the medical profession and to chemists and druggists that the General Medical Council brought out a new and amended edition in 1867. This dissatisfaction was probably owing partly to the difficulty met with in selecting a due proportion of formulae from each pharmacopœia so as to avoid giving offence to national susceptibilities, and partly to the fact that the majority of the compilers of the work were men not engaged in the actual practice of pharmacy, and therefore competent rather to decide upon the kind of preparations required than upon the method of their manufacture. The necessity for this element in the construction of a pharmacopœia is now fully recognized in other countries, in most of which pharmaceutical chemists are duly represented on the committee for the preparation of the legally recognized manuals.

National pharmacopœias now exist in the following countries—Austria, Belgium, Denmark, France, Germany, Great Britain, Greece, Holland, Hungary, India, Mexico, Norway, Portugal, Russia, Spain, Sweden, and the United States of America. The Argentine Republic, Chili, and Japan have each a pharmacopœia in preparation. All the above-mentioned were issued under the authority of Government, and their instructions have the force of law in their respective countries, except those of the United States and Mexico, which were prepared by commissioners appointed by medical or pharmaceutical societies, and have no other authority, although generally accepted as the national text-books. Italy has no national pharmacopœia, the authorities used in the different states prior to the unification being still retained. Sardinia, for example, has a pharmacopœia dating from 1853, Modena, Parma, and Piacenza have one in common, published in 1839, in the State

of the Church as well as in Tuscany and Lucca an unofficial compilation is in use entitled *Osservazioni Farmacologia tecnica pratica o sia Farmacologia Italiana*, Naples has its *Raccolta di Farmaceutico Napoletano* (1859), and Lombardy and Venice use the Austrian pharmacopœia. Although Switzerland has a national pharmacopœia, this does not possess Government authority, the French *Code* being recognized in Geneva, and the canton of Thurgau having a pharmacopœia of its own.

The French *Code* has probably a more extended use than any other pharmacopœia outside the limits of its own country, being, in connexion with Davy's *L'Opium*, the standard for druggists in a large portion of Central and South America, it is also official in Turkey. The sum-total of the drugs and preparations it contains is about 2000, or more than double the average of other modern pharmacopœias. The progress of medical knowledge during the last two hundred years has led to a gradual but very perceptible alteration in the contents of the various pharmacopœias. The original very complex formulae have been gradually simplified until only the most active ingredients have been retained, and in many cases the active principles have to a large extent replaced the crude drugs from which they were derived. From time to time such secret remedies of druggists or physicians as have met with popular or professional approval have been inserted by superior official preparations.

International Pharmacopœia.—The increased facilities for travel during the last fifty years have brought into greater prominence the importance of an approach to uniformity in the formulae of the more powerful remedies, such as the tinctures of aconite, opium, and mus vomica, in order to avoid danger to patients when a prescription is dispensed in a different country from that in which it was written. Attempts have been made during the last few years by international pharmaceutical and medical conferences to settle a basis on which an international pharmacopœia could be prepared, but, owing to national jealousies and the attempt to include too many preparations in such a work, it has not as yet been produced. At the fifth International Pharmaceutical Congress held in London in 1881, however, a resolution was passed to the effect that it was necessary that such a pharmacopœia should be prepared, and a commission consisting of two delegates from each of the countries represented was recommended to be appointed in order to prepare within the shortest possible time a compilation in which the strength of all potent drugs and their preparations should be equalized, the work, when complete, to be handed over to their respective Governments or to their pharmaceutical societies. It appears probable that such a work will be presented for consideration by the commission at the forthcoming meeting of the congress at Brussels in 1885.

Several unofficial universal pharmacopœias have been published from time to time in England and in France, which serve to show the comparative strength of parallel preparations in different countries, but the results of discussions which have taken place at the international conference above alluded to indicate that the production and acceptance of an international pharmacopœia will be a work of time, and that in such a work the numerous drugs and preparations intended to meet an unprofessional demand rather than the wants of physicians will have to be omitted. The advances that have been made in this direction are as follows. The metric or decimal mode of calculation and the centigrade scale of temperature are adopted in all pharmacopœias except those of Great Britain, of India, and in some instances of Greece. The majority omit chemical formulae. An alphabetical arrangement is followed in all except the French, Spanish, and Greek. The great increase of medical literature and international exchange of medical journals has led to the adoption in almost every country of all the really valuable remedial agents, and the more extended use of active principles has given rise to the appearance of many of their solutions. The difficulty of nomenclature could probably be overcome by a list of synonyms being given with each article, and that of language by the use of Latin. The greatest stumbling-block in the way of uniformity are the tinctures and extracts, a class of preparations containing many very powerful drugs, but in which the same name does not always indicate the same thing, thus, extract of aconite signifies an extract of the root in the pharmacopœia of the United States, an extract of the root and an extract of the leaves in the Danish and Portuguese, unspiced juice of the fresh leaves in the British, Indian, Spanish, and Greek, and dry extract of the leaves with sugar of milk in the Norwegian pharmacopœia. It appears probable, however, that the growth of pharmaceutical chemistry will indicate clearly, in course of time, which of those in use form the most active and reliable preparations, while the general adoption of a metric system will lead to very great approximation of strength than hitherto. The method adopted by the Portuguese pharmacopœia comes nearest to that uniformity which is so desirable in such preparations, as the tinctures of the fresh plants are all prepared with equal parts of the drug and alcoholic menstruum; simple tinctures in general, with unfortunately a few exceptions, with one part of the drug in five parts of alcohol of given

strength, ethereal tinctures are in the proportion of one part in ten, and the tinctures of the alkaloids and their salts contain one part of the alkaloid in ninety-nine of menstruum.

Homeopathic and eclectic practitioners as well as dentists have also their special pharmacopœias.

PHEASANT, Middle-English *Pesant* and *Pescant*, German *Fasan* and anciently *Fasunt*, French *Fasian*—all from the Latin *Phasianus* or *Phasianæ* (sc. *avis*), the Bird brought from the banks of the river Phasis, now the Rioni, in Colchis, where it is still abundant, and introduced by the Argonauts, it is said, in what passes for history, into Europe. As a matter of fact nothing is known on this point; and, judging from the recognition of the remains of several species referred to the genus *Phasianus* both in Greece and in France,¹ it seems not impossible that the ordinary Pheasant, the *P. colchicus* of ornithologists, may have been indigenous to this quarter of the globe. If it was introduced into England, it must almost certainly have been brought either by the Romans, for, setting aside several earlier records of doubtful authority,² Bishop Stubbs has shown that by the regulations of King Harold in 1039 "*avis phasianus*" is described as the alternative of two Partridges or other birds among the "*pitantæ*" (ratons or commons, as we might now say) of the canons of Waltham Abbey, and, as Prof. Dawkins has remarked (*Iris*, 1869, p. 358), neither Anglo-Saxons nor Danes were likely to have introduced it into England. It seems to have been early under legal protection, for, according to Dugdale, a licence was granted in the reign of Henry I. to the abbot of Amesbury to kill hares and pheasants, and from the price at which the latter are reckoned, in various documents that have come down to us, we may conclude that they were not very abundant for some centuries, and also that they were occasionally artificially reared and fattened, as appears from Upton,³ who wrote about the middle of the 15th century, while Henry VIII. seems from his privy purse expenses to have had in his household in 1532 a French priest as a regular "*fesaunt breder*," and in the accounts of the Kytons of Hengrave in Suffolk for 1607 mention is made of woad to feed Pheasants, Partridges, and Quails.

Within recent years the practice of bringing up Pheasants by hand has been extensively followed, and the numbers so reared vastly exceed those that are bred at large. The eggs are collected from birds that are either running wild or kept in a mew,⁴ and are placed under domestic Hens, but, though these prove most attentive foster-mothers, much additional care on the part of their keepers is needed

to ensure the arrival at maturity of the poults, for, being necessarily crowded in a comparatively small space, they are subject to several diseases which often carry off a large proportion, to say nothing of the risk they run by not being provided with proper food, or by meeting an early death from various predatory animals attracted by the assemblage of so many helpless victims. As they advance in age the young Pheasants readily take to a wild life, and indeed can only be kept from wandering in every direction by being plentifully supplied with food, which has to be scattered for them in the coverts in which it is desired that they should stay. Of the proportion of Pheasants artificially bred that "come to the gun" when the shooting season arrives it is impossible to form any estimate, for it would seem to vary enormously, not only irregularly according to the weather, but regularly according to the district. In the eastern counties of England, and some other favourable localities, perhaps three-fourths of those that are hatched may be satisfactorily accounted for; but in many of the western counties, though they are the objects of equally unremitting or even greater care, it would seem that more than half of the number that live to grow then feathers disappear inexplicably before the coverts are beaten. The various effects of the modern system of Pheasant-breeding and Pheasant-shooting need here be treated but briefly. It is commonly condemned as giving encouragement to poaching, and, especially under ignorant management, as substituting slaughter for sport. Undoubtedly there is much to be said on this score, but in reply to the first objection it has been urged that as a rule the poacher does not like visiting coverts that he knows to be effectively preserved, and that coverts containing a great stock of Pheasants, whose rearing has cost a considerable sum of money, are probably the most effectively preserved. As to the second objection it is to be observed that what constitutes sport is in great measure a matter of individual taste, and that the reasonable limit of a sportsman's "bag" is practically an unknown quantity. One man likes shooting a Pheasant rising at his feet or sprung by his spaniels, as it flies away from him through the trees and is still labouring to attain its full speed, another prefers shooting one that has mounted to its greatest height, and, assisted perhaps by the wind, is traversing the sky at a pace that almost passes calculation. If skill has to be considered in the definition of sport there can be no doubt as to which of these cases most requires it. In regard to cruelty—that is, the proportion of birds wounded to those killed—there seems to be little difference, for the temptation to take "long shots" is about equal in either case. The Pheasant whose wing is broken by the charge, if at a great height, is often killed outright by the fall, whereas, if nearer the ground, it will often make good its escape by running, possibly to recover, or more possibly to die after lingering in pain for a longer or shorter time. On the other hand, high-flying Pheasants, having their vital parts more exposed, are often hit in the body, but not hard enough to bring them down, though the wound they have received proves mortal, and the velocity at which they are travelling takes them beyond reach of retrieval.

Formerly Pheasants were taken in snares or nets, and by hawking; but the crossbow was also used, and the better to obtain a "sitting shot," for with that weapon men had not learnt to "shoot flying"; dogs appear to have been employed in the way indicated by the lines under an engraving by Hollar, who died in 1677:—

"The Pheasant Cocke the woods doth most frequent,
Where Spaniels spring and perche him by the sent."⁵

⁵ Quoted by the writer (Broderop?) of the article "Spaniel" in the *Penny Cyclopædia*. The lines throw light on the asserted Welsh practice mentioned in a former note.

¹ These are *P. archicus* from Piskermi, *P. alius* and *P. medius* from the lacustrine beds of Sausan, and *P. desnoyersi* from Touraine, see A. Milne-Edwards, *Os. foss. de la France* (n. p. 229, 239-243).

² Among these perhaps that worthy of most attention is in Probert's translation of *The Juvenal Letter of Cambrinus* (ed. 1823, pp. 387, 363), wherein extracts are given from Welsh tracts, presumably of the age of Howell the Good, who died in 948. One of them is "There are three barking huns: a bear, a squirrel, and a pheasant." The explanation is "A pheasant is called a barking hunt, because when the pointers come upon it, and chase it, it takes to a tree, where it is hunted by baying."

The present writer has not been able to trace the manuscript containing these remarkable statements so as to find out what is the original word rendered "Pheasant" by the translator; but a reference to what is probably the same passage with the same meaning is given by Ray (*Synops. Meth. Animalium*, pp. 213, 214) on the authority of Llwyd or Lloyd, though there is no mention of it in Wotton and Clarke's *Leges Vallicæ* (1730). A charter (Kemble, *Cod. Diplom.*, iv p. 236), professing of Edward the Confessor, granting the wardenship of certain forests in Essex to Ralph Peperking, speaks of "fesaunt huns" and "fesaunt cockes," but is now known to be spurious.

³ In his *De studio militari* (not printed till 1654) he states (p. 199) that the Pheasant was brought from the West by "Palladius amercora."

⁴ The writer is informed that, in 1883, 134,000 Pheasants' eggs were sold from one estate in Suffolk.

The use of firearms has put an end to the older practices, and the gun is now the only mode of taking Pheasants recognized as legitimate.

Of the many other species of the genus *Phasianus*, two only can be dwelt upon here. These are the Ring-necked Pheasant of China, *P. torquatus*, easily known by the broad white collar, whence it has its name, as well as by the pale greyish-blue of its upper wing-coverts and the light buff of its flanks, and the *P. versicolor* of Japan, often called the Green Pheasant from the beautiful tinge of that colour that in certain lights pervades almost the whole of its plumage, and, deepening into dark emerald, occupies all the breast and lower surface that in the common and Chinese birds is bay barred with glossy black scallops. Both of these species have been to a considerable extent introduced into England, and cross freely with *P. colchicus*, while the hybrids of each with the oldest inhabitants of the woods are not only perfectly fertile *inter se*, but cross as freely with the other hybrids, so that birds are frequently found in which the blood of the three species is mingled. The hybrids of the first cross are generally larger than either of their parents, but the superiority of size does not seem to be maintained by their descendants. White and pied varieties of the common Pheasant, as of most birds, often occur, and with a little care a race or breed of each can be perpetuated. A much rarer variety is sometimes seen; this is known as the Bohemian Pheasant, not that there is the least reason to suppose it has any right to such an epithet, for it appears, as it were, accidentally among a stock of the pure *P. colchicus*, and offers an example analogous to that of the Japanese Peafowl already noticed (Peacock, *supra*, p. 443), being, like that breed, capable of perpetuation by selection. To a small extent two other species of Pheasant have been introduced to the coverts of England—*P. reevesi* from China, remarkable for its very long tail, white with black bars,¹ and the Copper Pheasant, *P. semmerringi*, from Japan. The well-known Gold and Silver Pheasants, *P. pictus* and *P. nycthemerus*, each the type of a distinct section or sub-genus, are both from China and have long been introduced into Europe, but are only fitted for the aviary. To the former is allied the still more beautiful *P. amherstiae* and to the latter about a dozen more species, most of them known to Indian sportsmen by the general name of "Kaleegs." The comparatively plain Pucras Pheasants, *Pucrasia*, the magnificent Monals, *Lophophorus*, and the fine Snow-Pheasants, *Crossoptilon*—of each of which genera there are several species—must, for want of space, be only mentioned here. All the species known at the time are beautifully figured from drawings by Mr Wolf in Mr Elliot's grand *Monograph of the Phasianids* (3 vols., fol., 1870-72)—the last term being used in a somewhat general sense. With a more precise scope Mr Tegetmeier's *Pheasants: their Natural History and Practical Management* (4to, ed. 2, 1881) is to be commended as a very useful work. (A. N.)

PHENOL. See CARBOLIC ACID, vol v p. 85

PHERECRATES, one of the chief poets of the Old Attic Comedy, was a contemporary of Cratinus, Crates, and Aristophanes, being older than the last and younger than the two former. At first an actor, he seems to have gained a prize for a play in 438 B.C. The only other ascertained date in his life is 420, when he produced his play *The Wild Men*. Like Crates, whom he imitated, he abandoned personal satire for more general themes. Still in some of the fragments of his plays we find him attacking Alcibiades and others. He was especially famed for his inventive imagination, and the elegance and purity

of his diction are attested by the epithet ἀννῶστος ("most Attic") applied to him by Athenæus and the sophist Phrynichus. However, Meineke has shown from his remains that his language deviated considerably from the standard observed by the other comic poets of the day. There is genuine feeling in his address to old age (preserved by Stolz, *Flor*, 116, 12). He was the inventor of a new metre, which was called, after him, Pherecratesian,² and frequently occurs in the choruses of Greek tragedies and in Horace.

Pherecrates is variously stated by ancient authorities to have composed eighteen and sixteen plays, Meineke reduces the list of his undoubted plays to thirteen. None of them are extant, but a considerable number of fragments have been preserved. These are given in Meineke, *Fragmenta Comidarum Græcorum*, vol i (1839), and in Bothe, *Fragmenta Comidarum Græcorum*, vol i (1855).

PHERECYDES OF SYROS, one of the earliest Greek philosophers, was the son of Babus and a native of the island of Syros. The dates of his life are variously stated, but there seems to be no doubt that he lived in the 6th century B.C., amongst his contemporaries were Thales and Anaximander. He was sometimes reckoned one of the Seven Wise Men, and a very uniform tradition represented him as the teacher of Pythagoras. Many wonderful tales were told of him, e.g., that from drinking water drawn from a well he was able to predict an earthquake three days before it took place. The accounts of his death are very discrepant, but the commonest was that he died of the morbus pediculosus. But, if the minute description which Hippocrates gives of the death of Pherecydes refers to the philosopher, he would seem to have died of a virulent fever, perhaps spotted typhus. He is said to have been the first Greek author who wrote in prose, but perhaps the chronicler Cadmus of Miletus preceded him. The statements of late writers, that he drew his philosophy from secret writings of the Phœnicians, and that he was a disciple of the Egyptians and Chaldeans, deserve little attention, made as they were at a time when it was the fashion to regard all wisdom as derived from the East. He was credited with having originated the doctrine of metempsychosis, while Cicero and Augustine even assert that he was the first to teach the immortality of the soul. Of his astronomical studies he left a proof in the "heliotropion," a cave at Syros which served to determine the annual turning-point of the sun, like the grotto of Posillipo at Naples.

In his book, to which Suidas gives the name of ἐπιδύχων ἡρώς θεοπατρία ή θεογονία, he enumerated a system in which philosophy and mythology were blended. In the beginning, according to Pherecydes, were Zeus, Chronos (Time) or Cronus, and Chthon (Earth); Chronos begot Fire, Wind, and Water, and these three begot numerous other gods.

Another PHERECYDES of Athens, an early Greek historian, was a native of the island of Leos, and lived in the former half of the 5th century B.C. Amongst his contemporaries were Hecæatus and Herodotus. Of his works "On Leos," "On Iphigenia," "On the festivals of Dionysus" nothing remains, but numerous fragments of his great work on mythology, in ten books, have been preserved, and are collected by C. Müller in his *Fr. Hist. Gr.*, vol i.

PHIDIAS (Φειδίας), the most famous of Greek sculptors, was born about 500 B.C., and began his artistic career, probably under the guidance of his father, Charmides of Athens, with the study of painting, an art which at that time had attained a singular largeness and dignity of style, while in sculpture these qualities were as yet being sought for with only a somewhat bold and rude result, as may be seen from the remains of it now at Olympia. To do justice to the art of sculpture in this direction there was need of a far greater mastery of technical methods, and we may suppose it to have been with this end in view that Phidias, when he had determined to

¹ The introduction of this species by Lord Tweedmouth near Gussachan in Inverness-shire is said to have been remarkably successful.

² — — — — — or, as it may be otherwise divided,
— — — — —

devote himself to sculpture, became a pupil of Ageladas of Argos. It is tempting to believe that it was still under the influence of this master that he executed (between 469 and 463) the Athenian monument at Delphi commemorating the battle of Marathon; for Ageladas had sculptured at Delphi also a monumental group serving a similar purpose. In the group of Phidias was a portrait statue of Miltiades, and from this circumstance it is rightly inferred that the work had been commissioned at the time when Cimon, the son of Miltiades, was at the head of affairs in Athens. It was apparently at this same period that Phidias was employed to execute for the acropolis of Athens a statue of Athena. This statue, known in after times as "the Lemnian," and also as "the beauty," seems to have represented the goddess in the attitude of standing at rest, helmet in hand, as in a terra-cotta statuette from Cyprus in the British Museum.¹ When Pericles succeeded to the administration of affairs, and it was determined to erect new temples and other public buildings worthy of the new glory which Athens had acquired in the Persian wars, it was to Phidias that the supervision of all these works was entrusted, with an army of artists and skilled workmen under him. By 438 the Parthenon was completed, with its colossal statue of Athena in gold and ivory by Phidias himself, and with its vast extent of sculpture in marble, executed at least under his direction and reflecting in most parts his genius.² Meantime the enormous expense of these undertakings had involved Phidias in the public discontent which was growing up round Pericles (Aristoph., *Peace*, 605). The story related by Plutarch (*Pericles*, 31) is that Menon, a former assistant of Phidias, had brought a charge against him of having appropriated part of the gold and ivory allowed him for the statue of Athena, and that, being acquitted on this charge, he was next denounced for introducing portraits of himself and of Pericles on the shield of Athena, and in consequence of this charge died in prison, either a natural death or by poison. But these statements cannot be reconciled with the tradition that, after completing his Athena, he was invited to undertake at Olympia what proved to be the grandest work of his life, the colossal gold and ivory statue of Zeus in the newly-erected temple. According to this same tradition he died at Olympia, and it may be inferred that he died much honoured there from the fact that his workshop was preserved in after times as a show-place for visitors, and that his descendants obtained an hereditary right to look after the great statue of Zeus. As a means of reconciling these conflicting statements it has been supposed that the charge of appropriating the gold had been made before he went to Olympia, and the charge of sacrilege when he had returned thence to Athens. Others again prefer to accept the story of Plutarch as it stands, and to assign the stay of Phidias in Olympia to an early period of his life—previous to 455. As to the charge of theft, it could never have reached a public trial, because every one acquainted with the management of the public treasures knew that the gold of the Athena was so sculptured that it could be removed annually and weighed by the officials of the treasuries. Pericles told the Athenians (Thuc., ii. 13) that it could be removed and utilized for the war. The other charge of having placed portraits of himself as a bald-headed old man (438) and of Pericles on the shield of Athena is incredible. Pericles with the helmet which he always wore was almost an ideal Greek in appearance. Among the Greeks fighting with the

Amazons on the shield of Athena it was probably easy to find a figure not unlike him. The same may be said of the bald-headed old man who was identified with Phidias. But there is a wide difference between idle gossip and a criminal charge. It is true that there is in the British Museum a marble fragment of what professes to be a copy of the shield, and on it there are portraits of Phidias and of Pericles; but these portraits answer so minutely to the description of Plutarch that there can hardly be a doubt of their having been produced subsequently to illustrate some current story on which that description was founded. The workmanship is several centuries later than Phidias, and it would be strange if the portraits for which he had paid with his life had been left for so long a time on the shield, or had even been allowed at any moment to be perpetuated in a copy. In answer to this objection it was fabled that the portraits had been so fixed on the shield that they could not be removed without bringing down the whole work!

To obtain something like a fair judgment of the style of Phidias it is to the sculptures of the Parthenon now in the British Museum that we must turn (see *Archæologia*, vol. ii. p. 356). Though executed in what was to him an inferior material, marble, it yet happened that the elevated position which these sculptures were to occupy on the temple was such as to give scope for the highest powers of composition, and so far they may be regarded as a worthy monument of his genius. Like in the frieze, the metopes, and the remaining figures of the pediments we have the same perfect rendering of the true effects of light and shade, which above all reveals the artist who can compose his figures and his groups so as to make the spectator feel that nature would not have done otherwise had nature been a sculptor. For composition of this kind there was necessary a most complete knowledge of form in all its details, since no part was so minute as not to affect the aspect of the whole. In this respect Phidias was famed in antiquity, and the Parthenon sculptures justify that fame. He must, however, have found fine opportunities in the colossal statues of gold and ivory, where the greater difficulty of duly distributing light and shade was rewarded with greater splendour of effect. In these statues the nude parts, such as the face, hands, and feet, were of ivory, the drapery of gold, and in the statue of Zeus at Olympia the gold was enriched with enamelled colours, and the impression of the whole is described by ancient writers with unbounded praise (see vol. ii. p. 355, and A. S. Murray, *Gr. Sculpt.*, ii. p. 123). Of the Athena in the Parthenon there exist two small copies in marble found in Athens, but so rude in execution as to be of no service in conveying a notion of the style of the original. On the acropolis, and not far from the Parthenon, stood a colossal bronze statue of Athena Promachos by Phidias, the attitude and to some extent the type of which may be gathered from the small bronze found at Athens, and figured in vol. ii. p. 355. In Elis he executed a statue of Aphrodite in gold and ivory, and at Plataeæ a colossal Athena of wood gilt, with the face, hands, and feet of Pentelic marble. Bright but simple colours had been traditional in art before the time of Phidias. It is not supposed that he had sought to refine upon them as a colorist. What he did was to combine with their simplicity and brightness the ideal largeness and dignity of conception which he shared with the great painters of his day, and the perfection of execution which he shared with the greatest of contemporary sculptors. (A. S. M.)

¹ See A. S. Murray, *Greek Sculpt.*, ii. pl. 17; compare the Greek inscription from the base of a statue of Athena in Cyprus, which says that she was made after the Phidian model, and had laid aside her arms, Hirschfeld, *Titus statueur*, No. 178, or *C. I. Gr.*, No. 2073.

² See A. S. Murray, *op. cit.*, ii. p. 98 sq.

PHIGALIA (Φυγάλεια, also called Φαλία), a city in the south-west angle of Arcadia, situated on an elevated rocky site, among some of the highest mountains in the Peloponnese,—the most conspicuous being Mount Coty-

of the cornice and architrave. The various groups are skillfully united together by some dominant line or action, so that the whole subject forms one unbroken composition.

The relief is very high, more than 3½ inches in the most salient parts, and the whole treatment is quite opposite to that of the Parthenon frieze, which is a very superior work of art to that at Bassæ. Many of the figures are quite detached from the ground, the drill has been largely used to emphasize certain shadows, and in many places, for want of the calculation, the sculptor has had to cut into the flat background behind the figures. From this it would appear that no finished clay-model was prepared, but that the relief was sculptured with only the help of a drawing. The point of sight, more than 20 feet below the bottom of the frieze, and the direction in which the light fell on it have evidently been carefully considered. Many parts, visible from below, are left comparatively rough. The workmanship throughout is unequal, and the hands of several sculptors can be detected. On the whole, it must be admitted that the execution is not equal to the beauty of the design, and the whole frieze is somewhat marred by an evident desire to produce the maximum of effect with the least possible amount of labour,—very different from the almost gem-like finish of the Parthenon frieze. Even the design is inferior to the Athenian one, most of the figures are unacceptably short in their proportions, and there is a great want of refined beauty in many of the female hands and faces. It is in the fire of its varied action and its subtlety of expression that this sculpture most excels. The noble movements of the heroic Greeks form a striking contrast to the feminine weakness of the wounded Amazons, or the struggles with teeth and hoof of the brutish Centaurs, the group of Apollo and Artemis in their chariot is full of grace and dignified power. The marble in which this frieze is sculptured is somewhat coarse and crystalline, the slabs appear not to have been built into their place but fixed afterwards, with the aid of two bronze bolts driven through the face of each.

Of the metopes, which were 2 feet 8 inches square, only one exists nearly complete, with eleven fragments, the one almost perfect has a relief of a nude warrior, with floating daimon, even, carrying a long haired bearded man, who sinks vanquished at his feet. The relief of these is rather less than that of the frieze figures, and the work is nobler in character and superior in execution. The other pieces are too fragmentary to show what were their subjects.

No modern Greek village exists now on the site either of Bassæ or of Phigalia.

In addition to the works mentioned in the text the following may be consulted:—Lesko, *Mores* (vol. p. 400, and p. 310); Curtius, *Polypionasos* (p. 610); Ross, *Basen zu Polypionasos*; Stackelberg, *Der Apollo-Tempel zu Bassæ* (1838); Leuzmann, *Der relief des Parthenon et de Phigale* (1853); and Friedländer, *Geschichte der griechischen Kunst* (1868) (p. 118).

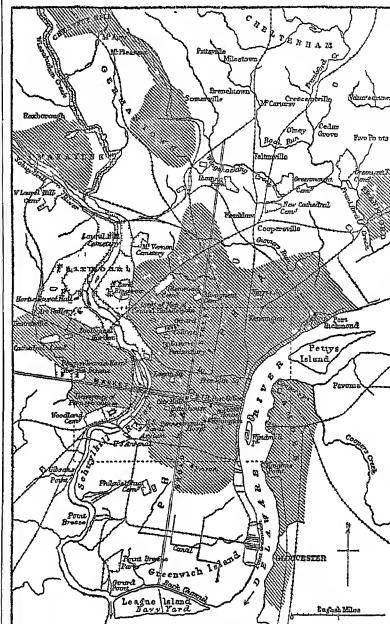

PHILADELPHIA, the name of several cities of antiquity, of which the two most important have been noticed under ALA-SHEER, vol. i. p. 443, and AMMONITES, vol. i. p. 743.

Plate X.

PHILADELPHIA, the chief city of Pennsylvania, and the second city in the United States of America, is situated (39° 57' 7" N. lat., 75° 9' 23" W. long.) on the west bank of the Delaware river, 96 miles from the Atlantic and in a direct line 125 miles north-east of Washington, D.C., and 85 miles south-west of the city of New York. Its greatest length north-north-east is 22 miles, its breadth from 5 to 10 miles, and its area 82,603 acres, or about 129 square miles (greater than that of any other city in America). The surface of the city between the rivers Delaware and Schuylkill—the latter running parallel with the Delaware and dividing the city about in half, east and west—is remarkably level. It varies, however, in elevation from 24½ feet above the sea to 440 feet, the latter in the northern and suburban sections. The eastern and western sections of the city are connected by eight bridges. The length of river-front on the Delaware is nearly 20 miles, and the length of wharves 5 miles. On both sides of the Schuylkill, to Fairmount dam, the front is 16 miles and the length of wharves 4 miles. The mean low-water mark of the Delaware is 24 feet, and the tide rises 6 feet, while the average depth of water at the city wharves is 50 feet. The wharf-line, which varies from 14 feet to 68 feet, gives extraordinary accommodation for shipping. The Delaware is navigable at all seasons of the year for vessels of the heaviest burden, and Philadelphia affords one of the best protected harbours in the country. The

substratum of the city is a clay soil mixed with more or less sand and gravel.

The site of the present Philadelphia was originally settled by the Swedes, and so Penn found it when he came to lay

General Plan of Philadelphia

out the city; and many of the original patentees for town lots under him were descendants of these first settlers. The original city limits were from east to west 10,922 feet 5 inches, and from north to south 5370 feet 8 inches, or more than 2 square miles. The boundaries were Vine street on the N, Cedar (now South) street on the S, the Delaware river on the E, and the Schuylkill river on the W. And this was the city of Philadelphia from its foundation until the 2d day of February 1854, when what is known as the Consolidation Act was passed by the legislature of the State, and the old limits of the city proper were extended to take in all the territory embraced within the then county of Philadelphia. This legislation abolished the districts of Southwark, Northern Liberties, Kensington, Spring Garden, Moyamensing, Penn, Richmond, West Philadelphia, and Belmont; the boroughs of Frankford, Germantown, Manayunk, White-Hall, Bridesburg, and Aramingo; and the townships of Passunk, Blockley, Kingsessing, Roxborough, Germantown, Bristol, Oxford, Lower Dublin, Moreland, Byberry, Delaware, and Penn; and it transferred all their franchises and property to the consolidated city of Philadelphia under one municipal government. The present boundaries of the city are: on the E. the Delaware, on the N.E. Bucks county, on the N.W. and W. Montgomery county, and on the W. and S. Delaware county and the Delaware. The greater part is laid out in parallelograms, with streets at right angles to each other. Each main parallelogram contains about 4 acres, or is 400 feet on each

of its sides, divided by one or more small thoroughfares. Upon the city plans there are plotted 191,928 separate town lots. The main streets running north and south are numbered from First on Front to Sixty-third streets, and those running east and west were formerly named after the trees and shrubs found in the province. Thus, while the principal street in the city is named Market street, other main streets are named Chestnut, Walnut, Spruce, Pine, &c.¹ The main streets of Philadelphia are 50 feet wide, with some few exceptions: Broad or Fourteenth street is 113 feet wide, and Market street is 100 feet wide. The streets are generally paved with rubble stone, although square or Belgian blocks of granite are being extensively introduced. There are laid down on the city plans upwards of 2000 miles of streets, but at present (1884) only 1060½ miles are opened, of which 573 54 miles are paved and 44 28 macadamized. The pavements are chiefly of brick, but some of the more prominent streets have flagstone sidewalks. Market street and Chestnut street, below Eighth street, and Front street are the localities where the main wholesale business of the city is conducted. Most of the retail stores are situated in the upper part of Chestnut street and Eighth street. The principal banking institutions are in Chestnut street, between Second and Fifth streets, and in Third street between Walnut and Chestnut streets. Walnut street in the southern section of the city, and Spring Garden and Broad streets in the northern section of the city, are the chief streets for large and luxurious private residences. There is not a street of any consequence which has not a tramway along it, and the tramway system has done a great deal to increase building, until now Philadelphia is emphatically "the city of homes." There are upwards of 160,000 dwelling-houses, of which at least 110,000 are owned by the occupants. According to the returns for the census of 1880, there were 146,412 dwelling-houses in the city, which, taking the population as given by that census, 847,170, gave 7 79 persons to each house, while the number of dwellings in New York to the population gave 16 37 to each house. On the original plan of the city five squares, equidistant, were reserved for public parks. One of these, called Centre square, situated at the intersection of Broad and Market streets, has been taken for the erection of the city-hall, and the remaining four, situated at Sixth and Walnut, Sixth and Race, Eighth and Walnut, and Eighteenth and Race, and named respectively Washington, Franklin, Rittenhouse, and Logan, have a combined area of 29 06 acres. There are six other public squares in the city, with a total area of 18 90 acres. In addition to these public squares, Fairmount Park, with an area of 2791½ acres, including 373 acres of the water-surface of the Schuylkill river, is the most extensive public park in the United States. It lies in the north-western section of the city, and the Schuylkill river and Wissahickon creek wind through the greater portion of it.² In the park Horticultural Hall and Memorial Hall remain

¹ The geometrical laying out of the city into parallelograms made easy the adoption of the decimal system of numbering for the houses, which is readily understood and greatly helps strangers and citizens in finding their way about the streets. The houses in streets running east and west are numbered by hundreds, beginning at the Delaware and going west. Thus, from Delaware river to Front street the houses are numbered from 1 to 100, from Front street to Second street from 100 to 200, above Second street 200; above Third street 300, and so on. The even numbers are placed on the south side of the street and the odd numbers on the north side of the street. Market street is taken as a dividing line between north and south, and all the main streets stretching north and south, which lie north of Market street, are in the same way numbered running northerly, and those which lie south of Market street are numbered running southerly. The west side is given the even numbers and the east side the odd numbers.

² There are 34 27 miles of footwalk, 30 46 miles of carriage-drives, and 7 82 miles of bridle-paths within the boundaries of the park.

as mementoes of the Centennial Exhibition held there in 1876. The garden of the Zoological Society, covering 33 acres, on the outskirts of the park, was opened 1st July 1874, as the pioneer of such enterprises in the United States.³ Until within the last score of years the buildings in Philadelphia bore a singular resemblance to each other, especially the dwelling-houses. The predominant material for building was, and is, red brick, the soil affording the finest clay for brick found in the United States. The desire for uniformity in buildings, both in style and material, has happily undergone a change in recent years, although the danger now is of running to the other extreme, and thus giving the streets a decidedly lizarte appearance. There are 238½ miles of sewers in Philadelphia, but the drainage of the city is wholly inadequate. The streets are lighted by 12,805 gas-lamps, and Chestnut street by the electric light. There are 748 miles of gas main, and the average daily consumption is 10,624,000 cubic feet.

Buildings.—The old brick Swedes Church in Swanson street in the extreme south-eastern section, dedicated on the first Sunday after Trinity 1700, is the oldest building of character now standing in the city. When it was completed it was looked upon as a great masterpiece, and nothing was then equal to it in the town. The four other colonial buildings of importance still standing are Christ (Protestant Episcopal) Church, the old State House (Independence Hall), the Pennsylvania Hospital, and Carpenter's Hall, all of them built of red brick with black glazed headers. Dr. John Kearsley, a physician, was the architect of the first-mentioned, and Andrew Hamilton, a lawyer, the architect of the second. Christ Church stands on the west side of Second street between Market and Arch streets, and its erection was begun in 1727, but it was not finished, as it now appears with tower and spire, until 1754. It was built on the site of a still older Christ Church, which was also of brick, erected in 1695. Queen Anne in 1708 presented a set of communion plate to the church, which is now used on great occasions. During his presidency Washington worshipped at this church, and his pew is still preserved, as is also that of Franklin. In 1882 the interior of the church was restored to its ancient character at an expense of about \$10,000. The nave is 75 feet long by 61 feet in width and 47 feet high, the chancel is 15 feet by 24, and the spire is 196 feet 9 inches high. The old State House or Independence Hall, on the south side of Chestnut street between Fifth and Sixth streets, was commenced in 1731, and was ready for occupancy by the Assembly towards the close of 1735. It was the scene of almost all the great civil events of the Revolutionary War. It is 100 feet in length on Chestnut street by 44 feet in depth; and prior to the centennial celebration its exterior and interior were restored as nearly as possible to their original appearance. The Pennsylvania Hospital occupies the square of ground bounded by Spruce, Pine, Eighth, and Ninth streets, and the corner-stone of the building was laid on 28th May 1755. Carpenter's Hall, where the first Congress met, stands back from Chestnut street, east of Fourth street, and was begun in January 1770. These four buildings are all very simple in their construction, but substantial and imposing, and are interesting specimens of colonial architecture. Among the notably fine buildings in Philadelphia are the old United States bank, now the United States custom-house, the Grand bank, the United States mint, and the Girard College, all of which, with the exception of the last-named, were built more than half a century ago. They are all of white marble and of the different orders of Grecian architecture, with porticos and high fluted columns. Other fine build-

³ The collection numbers 678 specimens,—mammals 261, birds 372, reptiles and batrachians 50, valued at \$46,726.

ings are the Masonic Temple, the Ridgway branch of the Philadelphia library, the Pennsylvania Academy of Fine Arts, and the Academy of Natural Sciences. There are also very many beautiful churches. The two newest buildings of magnitude are the new United States post-office, at the corner of Ninth and Chestnut streets, which is just completed (1884) at a cost of \$8,000,000, and the new municipal buildings for the city of Philadelphia at the intersection of Broad and Market streets, which are in course of construction. The post-office, which is Romanesque, is of granite, and was more than ten years in building, from October 1873 to March 1884. It has a frontage of 435 feet, a depth of 175 feet, and a height of 164 feet. The carrier delivery of the Philadelphia post-office covers the greatest territory of any city in the world, excepting London, it employs 900 men, of whom 448 are letter-carriers. The annual sales of stamps amount to \$1,600,000. About half a million of letters, &c., pass through the post-office each day. The new public buildings, as they are called, or city-hall, were begun in August 1871, and when completed will be the largest single building in America. It covers an area, including courtyards, of nearly $\frac{1}{2}$ acres, the dimensions being 470 feet east and west and 486 feet north and south. The building will contain 520 rooms, and the topmost point of the dome, on the tower, will be 537 feet 4 inches above the courtyard, or the highest artificial construction in the world. The exterior structure is now roofed in and completed, with the exception of the tower. The total amount expended on this building to 31st December 1883 was \$9,731,488 81, and the estimated total cost is \$13,000,000. The architecture is rather rococo in character.

Population.—Previous to the census of 1830 Philadelphia was the most populous American city, but since then New York has taken the first place. In 1833 it was estimated that Philadelphia had 80 houses and 500 inhabitants. The next year the population increased 2000, and by the beginning of the last century there were 700 dwelling-houses and 4500 people. In 1800 there were 9888 dwellings and 81,009 inhabitants, and in 1820, the last census when Philadelphia stood first, she had a population of 119,325. By the census of 1880 the population of the city is placed at 847,170 (males 405,989, females 441,181), while in 1870 it was 674,023, and in 1860 565,529. About one-third of the population in 1880 were foreign born. In 1883 there were 21,237 births, of which 11,102 were males and 10,135 females. The number of emigrants landed in the year at Philadelphia was 23,473, of whom 13,599 were males and 9574 females,—a decrease of 9778 from 1882. Of these emigrants 7304 were from England, 6023 from Ireland, 5232 from Sweden and Norway, and 2991 from Germany. The mayor of Philadelphia in his annual message to councils in April 1884 places the population of the city at 1,023,000, while the Board of Health estimate it at 907,041. The death-rate of the city in 1883 was 22.13 per thousand. By the census of 1880 41 per cent. of the population were engaged in gainful occupations. In 1884 there were in Philadelphia 1394 lawyers and 1637 physicians. The city has 622 places of worship, viz., Baptist 83, Hebrew 11, Lutheran 32, Methodist 131, Moravian 5, Presbyterian 110, Protestant Episcopal 96, Quaker 15, Reformed Dutch 20, Reformed Episcopal 10, Roman Catholic 47, Swedenborgian 3, Unitarian 3, Universalist 4, and 52 among 23 other different denominations. There are 63 cemeteries and burial-grounds in the city.

Municipal Government.—By Penn's charter of 25th October 1701 Philadelphia was first created a borough city with a government of its own, separate from that of the province and county. Under this charter, with many modifications, the city was governed until the Act of the legislature of the State incorporating the city was

passed, 11th March 1789. This is the fundamental law governing the city to-day, but with such changes as have become necessary by the altered condition of affairs and the development of the entire country. The most important change was the Consolidation Act of 3d February 1854, already mentioned, whereby the old county of Philadelphia became the city of Philadelphia, the county of Philadelphia being at the same time continued as one of the counties of the State. The city is divided territorially and politically into thirty-one wards, and is governed by a mayor, elected by the people for three years, and by two bodies, called the select and common council. The upper branch is composed of one member from each ward elected for three years, who must have attained the age of twenty-five years and have been a citizen and inhabitant of the State for four years next before his election, and the last year thereof in abatement of the ward for which he shall be chosen. Each ward has a member of common council, elected for two years, for every 2000 taxable inhabitants, he must be twenty-one years of age and have the other qualifications required for the upper body. The mayor is the executive head of the city and the councils are the law-making power. The mayor has the right of veto upon the acts of the councils. Councils in joint meeting appoint all heads of departments not elected, establish the rate at which all taxes shall be levied that are authorized by law, and fix the salaries of all municipal officers elected by the people, as well as those they appoint. The city can make no binding contract or incur any debt unless authorized by law or ordinance and an appropriation sufficient to pay the same be previously made by councils. The sanitary care of the city is vested in a board of health composed of nine members appointed by the judges of the city and the last year thereof in abatement of the county, who have charge of the sanitary condition of the city and citizens. Among the duties of the board is that of keeping an accurate record of all births, marriages, and deaths. The poor of the city are under the charge of a board of twelve guardians elected by councils. These several bodies, councils, board of health, and guardians of the poor all serve without pecuniary compensation. Edward Shippen was named in the charter of 1701 as first mayor of the city. The last mayor under the English crown was Samuel Powel, elected 3d October 1775, and he was also the first mayor under the United States, being re-elected 18th April 1789. During the interim of the Revolutionary War the municipal government was suspended, and the affairs of the city were carried on by the councils of safety and other local bodies.

Police, Fire, Water.—The mayor is the nominal head of the police of the city, and the appointment and removal of his assistants. The force consists of 1415 men, of whom 1225 are patrolmen. There are four captains and one chief of police, and the fire marshal is attached to the police department. The number of arrests made in 1883 was 45,612, and the number of commitments to the county prison 23,245.

The fire department is governed by a board of fire commissioners elected by the city, and consists of three members, an assistant engineers, and four hundred men. They are divided into twenty-nine steam-engine companies and five hook and ladder companies, with the addition of hose and hose-carriage to each. In 1883 there were 804 fires.

The largest portion of Philadelphia is supplied with water from the Schuylkill, and it was in great part for the preservation of the purity of this water-supply that Fairmount Park was created. The park has not, however, served its purpose in this respect, and the water supplied to the city is most impure. The supply also is hardly adequate to the demand, and many other sources have been suggested. The capacity of the present waterworks allows a daily average pumpage of 90,000,000 gallons, and the seven reservoirs have a total capacity of 191,224,560 gallons. The total number of gallons of water pumped in 1883 was 26,182,776,841, or a daily average of about 59,000,000. There are 784 miles of pipe under ground to supply at least 170,000 buildings, of which 157,098 are (January 1884) dwelling-houses. The dwellings are charged for water according to the number and character of appliances in use, irrespective of the amount of water used, or the number of the occupants of the house. The streets have a number of fountains, erected by the Philadelphia Fountain Society, for the use of horses, dogs, and men, and there are also 5762 hydrants for the use of the fire department, but these are when needed, supplied by the city.

Finance.—On 1st January 1884 the funded debt of the city of Philadelphia was \$68,365,691 24, and the floating debt \$639,355 86 or a total indebtedness of \$67,054,946 60. The city assets at the same period were \$28,096,394 75, so that the excess over assets was \$38,958,551 85. This is a reduction of the city's debt from its highest point, 1st January 1880, when it amounted to \$72,264,696 76. The assessed valuation of real estate in the city of Philadelphia, 1st January 1884, was \$68,613,683, and the annual tax for the year amounted to \$10,383,851 84. In 1883 the receipts from all sources for municipal purposes were \$18,682,842 38. The various trust funds of the city are under the control of a board of directors of city trusts, composed of twelve prominent citizens appointed by the judges of the Courts of Common Pleas. The board has charge of the

Grand Fund, the Wills Hospital Fund, for the relief of indigent blind and lame, the Franklin Fund, for aiding young married at the other and sundry funds for furnishing the poor with fuel and other purposes,—amounting in the aggregate, on 31st December 1883, to \$11,606,820 92.

There are thirty-two national banks in Philadelphia with an aggregate capital of \$17,678,000 and for the week ending 30th June 1884 then loans and discounts were \$73,625,895, deposits \$64,486,411, and circulation \$8,416,013. Their surplus on 31st December 1883 was \$3,712,803. In addition to the national banks there are six banks chartered by the State with an aggregate capital of \$714,600, eight trust and safe deposit companies, whose deposits are received and a *guaranty* banking business done, with a total capital of \$8,625,000, and a surplus on 31st December 1883 of \$4,569,422, and three saving funds without any capital, but where all the deposits are interested in the profits, with total deposits on 31st December 1883 of \$28,503,200 98. Philadelphia has fourteen joint-stock fire insurance companies, with a capital of \$3,960,000, five joint-stock life and marine companies, with a capital of \$4,860,000, six mutual life insurance companies, and six life insurance companies. In addition to these there are a coal and gas life insurance company and a plate-glass insurance company, their objects being expressed in their titles.

Commerce.—Until within the last sixty years Philadelphia was the commercial emporium of the United States, but since that time her commerce has been gradually declining, until now she ranks fifth in the order of ports, being preceded by New York, Boston, San Francisco, and New Orleans. At the same time her manufactures have been steadily increasing, until she has become the great manufacturing centre of the country. On 30th June 1884 there were registered as belonging to the port of Philadelphia 854 vessels, having a tonnage of 197,491 tons, 295 being steamers. For the year ending 31st December 1883 724 coast-wise vessels having a tonnage of 418,628 tons entered, and 1218 with a tonnage of 576,719 tons cleared. During the same period there entered 1066 foreign vessels with a tonnage of 318,708 tons, and 943 cleared with a tonnage of 732,383 tons. For the six months ending 30th June 1884 there entered 290 American vessels with a tonnage of 134,807 tons, and 199 cleared with a tonnage of 101,908 tons. In the same period 285 foreign vessels entered with a tonnage of 263,577 tons, and 246 cleared with a tonnage of 238,929 tons. Statistics of the exports and imports of the city have been kept since 1821, and they show that the greatest amount of goods was exported in 1874, the centennial year, when they amounted to \$50,689,450. The greatest imports (\$38,938,882) were in 1880. For 1883 the exports were \$38,662,434 and the imports \$38,311,045. For the six months ending 30th June 1884 the exports were \$17,605,271, and the imports \$18,245,738. The total receipts for duties at this port for the year 1883 were \$11,384,014 56, and for the six months ending 30th June 1884 \$6,917,876 71. Lines of steamers run to Liverpool, Glasgow, New York, Boston, Baltimore, Savannah, Charleston, and other ports. Philadelphia is also the centre of the three great internal carrying lines of the State, the Pennsylvania Railroad, the Lehigh Valley Railroad, and the Reading Railroad. The last two are principally coal-roads from the great anthracite coal-fields of Pennsylvania, while the first, with its numerous branches, is the main artery from the west for the transportation of its agricultural products. The gross receipts for 1883 of the Pennsylvania Railroad, from all lines connecting directly with Philadelphia, were \$57,512,766 88. The total tonnage moved over these same lines was 57,879,115 tons, and the number of passengers for the same period was 36,584,485, and the pieces of baggage 1,774,192. The tonnage of the other two roads is proportionately large.

Industries.—The largest single classes of manufactures are the iron and steel and the textile industries. The first-named, which includes all forms of machinery and of iron and steel articles, employed in 1883 31,917 persons in 712 establishments, producing articles valued at \$58,608,781. The manufactures of wool, cotton, silk, &c., employed 60,897 persons in 1018 establishments, producing textile fabrics to the value of \$102,087,128, and these figures are rather below than above the actual facts. In the carpet manufacture alone, for which there are 216 establishments, there are 36,000,000 yards of carpet made annually. In 1880 gave Philadelphia 8567 manufacturing establishments, with a capital of \$187,148,857, employing 158,527 hands and producing articles valued at \$34,342,985 per annum. The seven classes producing over \$10,000,000 a year were—sugar-refineries (11), \$24,294,920, factories of woollen goods (89), \$21,349,810, men's clothing manufactures (426), \$18,506,748, cotton-mills (145), \$14,268,696, carpet manufactures (170), \$14,263,510; foundry and machine shops (232), \$13,648,088, drugs and chemicals manufactures (54), \$11,864,793. Since then, however, Philadelphia has made great strides, and the close of 1882 showed 19,063 manufacturing establishments, employing 147,187 men, 67,050 women, and 28,296 children under sixteen years of age, or a total of 242,488, and yielding products of the value of \$481,226,809. The large and important industry of brick-making, for which there are 63 yards,

produces annually about 350,000,000 bricks, of a market value of at least \$3,600,000. The fine "pressed brick" of Philadelphia is used in all parts of the country, and of late years moulded bricks of various designs and of any size have been extensively and successfully made.

Charities.—There are not less than 300 charities proper in Philadelphia, leaving out institutions of learning which come within the legal definition of the word. A few of them are municipal, but the majority are wholly private in their origin and conduct. Among the former may be classed the Blockley Almshouse for the care of the indigent poor of the city, and the house of correction, employment, and reformation at Holmesburg. This last is a mixed institution, being a workhouse both for criminals and paupers, and in 1883 there were received into it 7290 men, women, and children. On 31st December 1883 there were 1236 inmates, of whom 187 were females. The city bath-houses are another important municipal charity. There are twenty-two hospitals in Philadelphia, the most important being the Pennsylvania Hospital, projected in 1751 by Benjamin Franklin and Dr Thomas Bond. It is governed principally by the Quakers, and is supported wholly by voluntary contributions. It has a capacity for 250 patients, and recent accident cases are always admitted. The insane department of this hospital is located on Haverford road, and was opened in 1841, since which time to January 1884 there have been 8852 patients. In addition to this hospital for the insane there is an insane department attached to the City Hospital at the Almshouse, and a Friends' Asylum for the Insane at Frankford. Other important charities are the Philadelphia Dispensary, Home for Consumptives, Home for Incurables, Prison Retreat (Quaker), Orphan Asylum, Philadelphia Working Home for Blind Men, Sheltering Asylum for Infants, the Sick Diet Kitchen, and the House of Refuge for Juvenile Delinquents. This last receives children committed by the court of Orphans and Terminer upon conviction of a criminal offence, also vagrant, incorrigible, or vicious children committed by magistrates on complaint of the parent or any other person that the parent or guardian is incapable or unwilling to control and educate.

Education.—Penn in its frame of government provided that a committee of manners, education, and art should be appointed, so that all "wicked and scandalous living may be prevented, and that youth may be trained up in virtue, and useful arts and knowledge." The first school in Philadelphia of which we have knowledge was opened the year following the foundation of the colony. At a meeting of the Board of Education, held on the 29th of June, 1682, the 10th month 1683 the governor and council, "having taken into serious consideration the great necessity there is of a schoolmaster for the instruction—and sober instruction—of youth in the town of Philadelphia, sent for Enoch Flower, an inhabitant of the said town, who for twenty years past hath been exercised in that care and employment in England," and engaged him to instruct the youth of the city. The year 1688 the first school in Pennsylvania was established at Philadelphia under the care of the celebrated George Keith. It was incorporated by the provincial council 12th February 1698, and was entitled "The Orphans of the Public Schools founded in Philadelphia at the request, costs, and charges of the people of God called Quakers," and in 1711 received a charter from Penn. This school, although supported by the Quakers, was open to all, and for more than sixty years continued to be the only public place for instruction in the province. It thrived and was held in high estimation, and its legitimate successor is still in operation in Philadelphia, where it maintains its ancient reputation. In 1749 Franklin published his *Proposals Relative to the Education of Youth in Pennsylvania*, which resulted the next year in the establishment of the academy and charitable school, which became a college in 1756, and in 1779 was incorporated as the university of Pennsylvania. The year 1783 the college removed to Woodland avenue, in what was formerly West Philadelphia, and gives instruction in ten departments (Arts, Music, Medicine, Law, Dentistry, Philosophy, Auxiliary of Medicine, Veterinary Medicine, Towne Scientific School, and Wharton School of Finance and Economy). The faculty consists of 132 professors, lecturers, and instructors in the various departments, and for the college year 1883-84 there were 1000 students.

The public school system of Pennsylvania was not really firmly fixed until 1818, when by an Act of the legislature Philadelphia was made the first school district of Pennsylvania with a distinct educational system from that of the State in general. This district is governed by a board of public education composed of 31 members, one from each ward of the city, who are appointed, one-third each year for three years, by the judges of the Courts of Common Pleas of the county. These members have the final control and general supervision of schools, the selection of the books to be used, the oversight of the teachers, and the building of the schoolhouses. In addition to this board there are the directors of the public schools, twelve from each ward, who have the local supervision of the schools in their respective sections. They are elected by the people, one primary, secondary, and grammar schools, in addition to which

there is a central high school, a finishing school for boys, and a normal school which is a finishing school for girls, and where they can also be qualified to become teachers. There are 465 public schools in Philadelphia and 236 school-buildings of a value of \$1,846,200. In 1883 the city appropriated \$1,637,661.04 to education. During the same period 105,424 children attended the public schools, at an average cost per pupil of \$15.35, and 82 male and 2034 female teachers are employed in their instruction. Another notable educational institution in Philadelphia is the Girard College for orphans, endowed by Stephen Girard in 1831 for the benefit of poor white male orphan children. By the will a preference is given first to orphans born in Philadelphia, second to those born in Pennsylvania, third to those born in New York city, and fourth to those born in the United States. To be qualified for admission the orphans must be between six and ten years of age, and a child without a father, while the mother is living, is held to be an orphan entitled to admission. The buildings cost \$1,933,821.78, and were formally opened in January 1848. The total value of the estate applicable to the purposes of the college was on 31st December 1887 \$10,138,268.10, and the gross receipts of income for the year 1888 were \$976,961.06. During the same period there were 1105 boys inmates of the college. At Philadelphia are also the Pennsylvania Institution for the Instruction of the Deaf and Dumb, the Pennsylvania Institution for the Instruction of the Blind, the Pennsylvania Academy of the Fine Arts, founded in 1805, and the first art school in America; the School of Design for Women, the Pennsylvania Museum and School of Industrial Art, and the Jefferson Medical College.

Literature.—Philadelphia was for many years also the first city commercial in the country, but it was not the seat of letters. When the poet Moore visited America in 1804 he wrote to his mother, of Philadelphia, "it is the only place in America that can boast of a literary society." Unfortunately it has much degenerated in this respect in eighty years, and to-day but little attention is paid by its people to letters and literature. To Franklin, again, its first library is due. It grew out of the funds, and in 1781 the Library Company of Philadelphia was established. In 1789 it absorbed the Union Library Company, which had been formed some few years before, and in 1792 the Loggians Library, a valuable collection of classical and other works provided for under the will of James Logan, a friend of Penn, was transferred to the Philadelphia Library. It subsequently acquired, by bequest, the libraries of the Rev. Samuel Preston of London and of William Mackenzie of Philadelphia. Among the treasures in the latter is a copy of Cassin's *Ordnis Leydeni*, 1456. In 1805 it was made the beneficiary, under the will of Dr. James Rush, of an estate valued at over a million dollars. It has two library buildings and possesses about 145,000 volumes, as well as valuable manuscripts and broadsides. The Mercantile Library Association is the popular circulating library of the city, and contains 149,000 volumes. Other libraries are the Athenaeum, Apprentices' Library, Library of the Law Association, and Friends' Library.

Learned Societies.—The American Philosophical Society is the oldest organized body for the pursuit of philosophical investigation in its broadest sense in America. It was founded also by Franklin, 25th May 1743, and incorporated 15th March 1780, with its founder as president. It began the publication of its transactions in 1773, and the 22d volume has been recently issued. The publication of the proceedings of this society was begun in 1808, and it still continues. Its library contains about 23,000 volumes, and the society also possesses valuable manuscript correspondence of Franklin. The Academy of Natural Sciences was organized in 1812, and its ornithological collection, which contains over 25,000 specimens, is claimed to be the finest in the world. It has a fine library of works on the natural sciences, and publishes a journal and its proceedings. The Franklin Institute for the promotion of the mechanic arts started in 1824. It has a valuable library of over 20,000 volumes devoted to mechanics and kindred subjects, and has ever since its organization published a monthly journal. The Historical Society of Pennsylvania was founded in 1824, and is devoted to the preservation of material relating to the history of the State. Its collections are of great historical value, and its library contains more than 20,000 volumes. The Numismatic and Antiquarian Society of Philadelphia was founded in 1858, with the organization on the American continent to engage in the pursuit of numismatic science. It has a fine collection of coins and a good library. Another notable body is the College of Physicians and Surgeons, with a medical library of 28,000 volumes and a fine museum of prepared specimens.

Newspapers.—The *American Weekly Mercury* was the first newspaper published in Philadelphia and the third in the colonies. It was started on 29th December 1719 by Andrew Bradford, a son of William Bradford, the first printer in the middle colonies, and this paper was the first newspaper in the same section. On 21st September 1764 the first daily newspaper in the United States was issued at Philadelphia. It was the *American Daily Advertiser*, subsequently published as *Poulson's Daily Advertiser*, and later

merged into the *North American and United States Gazette*, which is thus by succession the oldest daily newspaper in the United States. There are at present (July 1884) twenty daily newspapers published in Philadelphia, eight of them being afternoon papers, with an average circulation of 375,000, and seventy-seven weekly newspapers, chiefly religious and Sunday secular papers.

Social Life.—Among Philadelphia's claims to priority she has in her midst one of the oldest purely social clubs in existence,—the Colony or State in Schuylkill, which was formed in 1732. The other purely social clubs in the city are the Philadelphia Club, Social Art Club, and University Club. The Union League (Republican) and Commonwealth (Democratic) are mixed social and political clubs. There are some organizations of a mixed social and charitable character, such as the St George's Society (1772), the St David Society (1729), the St Andrew's Society (1749), and the Sons of St Patrick or Hibernian Society (1771). The First Troop of Philadelphia City Cavalry, formed in 1774, is a military organization of high social standing. There are also a gentlemen's driving park or racetrack and unnumerable cricket and boat clubs. There is an open-house capable of accommodating 8600 persons, and five first-class theatres, but Philadelphia as a community seems not to be a theatre-going people.

History.—Down to the War of Independence the history of Philadelphia is virtually that of PENNSYLVANIA (*q.v.*). The patent granted to William Penn (see PENN, p. 495) for the territory embraced within the present Commonwealth of Pennsylvania was signed by Charles II on the 24th of March 1681, and in the autumn of that year Penn appointed three commissioners to proceed to the new province and lay out a great city. His secretary had been his chief thought in settling the province, and his instructions to his commissioners were to select a site on the Delaware where "it is most navigable, high, dry, and healthy, that is where most ships can best ride, of deepest draught of water, it possible to load or unload at the bank or key side without boating or lightening of it." These commissioners were William Chispen, Nathaniel Allen, John Beaz, and William Heage. Chispen, who was a kinsman of the proprietor, died on the voyage out, and the remaining commissioners arrived toward the close of the year. They had been preceded by Penn's cousin, Captain William Markham, as deputy-governor, and were soon followed by the surveyor-general of the province, Thomas Holme, who, as may be understood from his office, was one of the most important men in the early history of the city and State. The site of the city was speedily determined upon, and Holme proceeded to lay it out according to the modified instructions of Penn, and his house, and the *Province of Pennsylvania in America* was published and sold by Andrew Sowle in Shoeloth, London, in 1683. This plan shows the old part of the city as it is to-day, covering between 1200 and 1300 acres. Unfortunately no date can be fixed, even approximately, for the founding of the city, nor is the date known of Penn's first visit to the capital of his province. He landed at Newcastle on the Delawares on 27th October 1682, and two days later came up as far as Upland, now Chester, 18 miles south of Philadelphia. He doubtless did not remain long so near his pet scheme without viewing it, but when he did first come to Philadelphia is now unknown.

The seat of government was fixed in Philadelphia by the meeting of the governor and council on the 10th of March 1683, and the General Assembly met two days later. For 117 years the city continued to be the capital of Pennsylvania, and was the most important town, commercially, politically, and socially, in the colonies during nearly the whole of this period. In October 1685 the first printing press established in the middle colonies was set up here by William Bradford, the earliest specimen of his work which has survived to our day is his *Kalendarium Pennsylvaniae* or *America's Messenger*, being an Almanack for the year of Grace 1686. The printing press was followed in 1690 by a paper-mill, erected by William Rittenhouse, at Monaca, near the mouth of Wissahickon creek, a locality which has ever since remained a favorite for the manufacture of paper. The one man, next to William Penn, whose influence was most deeply impressed upon Philadelphia as upon the affairs of the colony, was Benjamin Franklin, whose power was felt almost on his first landing in October 1723, when in his eighteenth year, and its impress is seen to this day. Four years after he settled here he formed a club for mutual improvement, which he called the " Junto," out of which the subsequently grew the American Philosophical Society for the promotion of useful knowledge and the Library Company of Philadelphia. He also originated the present university of Pennsylvania, organized the first fire-engine company in the city, and was instrumental in founding the Pennsylvania Hospital. In March 1763

In Philadelphia for many years stood a famous elm tree, known as the twenty tree, and when it was blown down in 1810 a stone was placed to mark the spot. Tradition had it that under this tree Penn, on his first visit to Philadelphia, held a treaty of amity and friendship with the Indians,—a treaty sworn to and never broken. The light of investigation has dispelled this tradition and relegated it to the category of mythology, along with the stories of William Tell and Captain Smith and Frobenius.

the first Arctic expedition ever sent out from America sailed from Philadelphia. The vessel, called the "Aigo," was commanded by Captain Swaine, but her voyage accomplished nothing of importance. In 1770 the first factory for the manufacture of fine porcelain in the colonies was established at Philadelphia by a Swede and an Englishman, but the difficulty of obtaining competent workmen forced its abandonment two years later. During the war of the revolution Philadelphia was the virtual capital of the colonies and the scene of all the prominent civil events of those stirring times. The first Congress met at Carpenter's Hall on 4th September 1774; on 24th May 1775 Congress reconvened in the old State House and here continued its sittings, except when the city was threatened by the enemy and in his possession. On 21 July 1776 the "resolutions respecting independence" were passed, and on the 4th July 1776 Philadelphia was the scene of the adoption of the Declaration of Independence, and the old State House became ever afterwards Independence Hall. On 9th July 1778 "the articles of confederation and perpetual union between the independent States of America" were here adopted and signed, and in the same place the convention to frame a constitution for the United States of America met on 14th May 1787, with Washington as presiding officer, and continued its sessions until 17th September, when the work was finished and the fundamental law of the land given to the world. The affairs of state were thus placed on a firm foundation, while the affairs of the church had received the attention of the people the previous year. In June 1786 the clerical and lay delegates from the Protestant Episcopal churches in the United States met in Philadelphia and formally organized "the Protestant Episcopal Church in North America." The Congress of the United States had held its opening session in New York, but in December 1790 it reassembled at Philadelphia, and for ten years the seat of government was at Philadelphia, until it was permanently removed to the District of Columbia. Here Washington delivered his farewell address to the people of the United States, and here he retired from public life. As in Philadelphia the first bank in the colonies had been opened—the bank of North America in 1781—so in Philadelphia the first mint for the coinage of the moneys of the United States was established in 1792. Both of these institutions are still in full operation. In April 1816 Congress incorporated the bank of the United States, which was the second banking institution of that name chartered by the Government, and fixed it at Philadelphia. The affairs of this institution form a very important chapter in the history of the city, as indeed in the history of the whole country. It had an untried existence, until the final blow came from President Jackson, towards the close of his first term of office, in 1833. Being opposed to the continuance of the bank, he withdrew the public deposits, amounting to about \$8,000,000, the result of which was widespread ruin and business depression, not only in Philadelphia but elsewhere.

The two events of greatest note which have taken place in the city in recent years have been the centennial celebration of the independence of the colonies in 1876, and the bi-centennial celebration of the landing of William Penn in 1832. The centennial celebration was of the greatest moment, owing to the Exposition of the Industries of All Nations, which was open from 10th May to 10th November, the total admissions reached the number of 9,910,966 persons (O. H. H.).

PHILEMON. See EGYPT, vol vii p. 783 sq.

PHILEMON, the oldest poet of the New Attic Comedy, was the son of Damon, and was born at Soli in Cilicia, or, according to others, at Syracuse, but early in life he settled at Athens. Since he died in 262 B.C. at an age variously stated at from 96 to 101 years, he must have been born somewhere about 360 B.C. He was thus older than his contemporary and great rival Menander, whom he frequently vanquished in poetical contests, and whom he long survived. Posterity, however, reversed the judgment of their contemporaries and assigned the palm to Menander. Philemon's first play was put on the stage about 330, while Menander did not exhibit until 321. It appears that, once being worsted in a poetical competition, Philemon went into exile. He certainly made a journey to the East, but whether on the occasion of his exile or in compliance with the invitation of Ptolemy, king of Egypt, we cannot say. On this journey, being driven by a storm to the coast of Cyrene, he was treated with cool contempt by Magas, king of Cyrene, whom he had satirized. From the various legends told about his death he would seem to have died in the full enjoyment and use of his poetical powers. Of the ninety-seven plays which he is said to have composed none are extant; the titles of fifty-three

have been preserved, but some of these may have been the work of his son, the younger Philemon, who is said to have composed fifty-four comedies. *The Merchant* and *The Treasure* of Philemon were the originals respectively of the *Merchant* and *Trinummus* of Plautus. The New Attic Comedy, of which Philemon was in a sense the founder, dealt mainly with subjects drawn from private life, which were worked up in elaborate plots and treated in a prosaic style, to the exclusion, on the whole, of the poetical tendency, stinging personal satire, and warm poetical colouring, which had marked the Old Attic Comedy. These characteristics of the New Comedy had already appeared, though in a less degree, in the Middle and even in the Old Attic Comedy, so that to Philemon belongs the credit, not of inventing, but of developing a style which had occasionally been employed before. In its absence of poetical idealism and restriction to the prosaic realism of daily life the New Comedy stands to the Old somewhat as the comedies of Molière or Sheridan stand to those of Shakespeare. Its repertoire was limited to a few stock characters—the imprudent lover, the designing fair, the stingy father, the greedy parasite, the blustering swashbuckler—and its plots rang the changes on the well-worn theme of thwarted but faithful love, rescued from its difficulties by the discovery of a long-lost relative and ending in marriage. In the many fragments of Philemon preserved by Stobæus, Athenæus, and other writers there is much wit and good sense.

The fragments have been collected and edited by Memcke, *Memcke's Philemonis Reliquiæ*, Berlin, 1839, and again in his *Fragmenta Comædiorum Græcorum*, vol. iv., Berlin, 1841. They are also appended to the Diotet edition of Aristophanes (Paris, 1869).

PHILEMON, EPISTLE TO. This, which is the shortest of the extant epistles of St Paul, stands to the other books of the New Testament in a relation similar to that of the book of Ruth to the other books of the Old Testament. It is an idyl of domestic life. Onesimus, the slave of one of Paul's converts in Asia Minor, had run away from his master, probably, as was often the case with runaways, after stealing some of his money. He had come to Paul, more probably at Rome than, as some have thought, at Caesarea, and Paul had converted him. Paul sends him back to his master, begging that he may be kindly treated as being now a brother Christian, and formally undertaking to repay what he owed. The epistle is addressed not only to Philemon but to Apphia, who was probably his wife, to Archippus (possibly the head of the community at Colossæ or Laodiceæ, Col. iv. 17), and to the community which either, like some of the Roman *collegia*, consisted of Philemon's household or held its meetings in his house. It has sometimes been regarded as an appendix to the epistle to the Colossians on the grounds (1) that Onesimus was sent with both letters (Col. iv. 9; Philem. 10-12), (2) that in both letters salutations are sent to Archippus (Col. iv. 17; Philem. 2), and (3) that the same persons are mentioned in both letters as being with Paul at the time of writing (Col. i. 1, iv. 7-14; Philem. 1, 23, 24). This apparent connexion with the epistle to the Colossians is the basis of the chief arguments which have been used against its genuineness. Baur (*Paul*, E. T., vol. ii. p. 84) thinks that this "attractive, graceful, and friendly letter" is merely a practical commentary, in the form of a fiction, on the general conception of the relations of masters to Christian slaves which is set forth in Col. iv. 1. But this view has few supporters. The genuineness of the epistle is almost universally admitted. The best modern works upon it are Bishop Lightfoot's *Colossians and Philemon* (3d ed., London, 1879) and Holtzmann's essay, "Der Brief an Philemon," in the *Zeitschr. f. wissenschaftl. Theol.*, 1873, p. 428.

PHILETAS, a distinguished poet and critic of the Alexandrian school, was the son of Telephus and a native of the island of Cos. He lived in the reigns of Philip, Alexander the Great, and Ptolemy I. of Egypt, the last of whom appointed him tutor to his son Ptolemy Philadelphus. His life thus fell in the latter part of the 4th and early part of the 3d century B.C. He was a contemporary of Menander, a friend of the poet Hermesianax of Cos, and lived into the time of Aratus. Amongst his pupils were Theocritus and Zenodotus. He was sickly and so thin that he was said to carry lead in his shoes to keep himself from being blown away. The story runs that he died from the excessive assiduity with which he sought the answer to the sophistical problem called "The Liar."¹ A bronze statue of him was erected in Cos.

The fame of Philetas rested chiefly on his elegiac verses, in which, however, he was esteemed inferior to the younger poet Callimachus. He is frequently mentioned by the Latin elegiac poets Propertius and Ovid. From Hermesianax and Ovid we gather that his verses were amatory and celebrated the praises of the fair Bittis or Battis, but her name does not occur in the existing fragments, which are of a melancholy rather than an amatory tone. In one of his poems (*Deinde*), he depicted the grief of Demeter to the loss of Persephone, in another (*Hierone*) the love of Polyneke for Ulysses. The latter poem appears from the fragments to have been composed in hexameter verse. Further, he wrote epigrams and poems called *Halpura*. There is no evidence that he wrote bucolic poems, for the passage in Moschus formerly quoted to prove this is an interpolation of Moschus. Some iambic verses are attributed to him, probably by a mistake arising from a common confusion between names beginning with *Phi*. Besides his poems, Philetas was the author of a vocabulary explaining the meanings of rare and obscure words, including words peculiar to certain dialects. He also wrote notes on Homer. The work on Naxos (*Naxiada*), sometimes attributed to him, was perhaps rather by Philetas. The fragments of Philetas have been edited by Kayser, Göttingen, 1798, and by Beach, Halle, 1829.

PHILIDOR, FRANÇOIS ANDRÉ DANTON (1726-1795). See **CHESS**, vol. v p. 601.

PHILIP, one of the twelve apostles, mentioned fifth in all the lists (Matt x 3, Mark in 18, Luke vi 14; Acts i 13), is a mere name in the Synoptists, but a figure of some prominence in the Fourth Gospel. There he is said to have been "of Bethsaida, the city of Andrew and Peter," and to have received his call to follow Jesus at Bethany, having previously been, it would seem, a disciple of the Baptist (John i 43, 44). Philip was at that time the means of bringing Nathanael to Jesus (John i 45), and at a later date he, along with Andrew, carried the request of the inquiring Greeks to the Master (John xii 22). Philip and Andrew alone are mentioned by name in connexion with the feeding of the five thousand (John vi 5, 7), and Philip is also one of the few interlocutors in John xiv. After the resurrection he was present at the election of Matthias as successor to Judas, but he does not again appear in the New Testament history, it is, however, implied that he still continued in Jerusalem after the outbreak of the first persecution.

According to Polyaeus, bishop of Ephesus, in his controversial letter written to Victor of Rome towards the end of the 2d century (ap. Euseb. *H. E.*, iii 21, v 24), the graves of Philip, "one of the twelve," and of his wife, "the daughter who was in the Phrygian Hierapolis, a third daughter," who had lived in the Holy Ghost, "was buried at Ephesus." Proclus, one of the interlocutors in the "Dialogue of Caima," a writing of somewhat later date than the letter of Polyaeus, mentions (ap. Euseb. *H. E.*, iii 31) "four prophetesses, the daughters of Philip at Hierapolis in Asia, whose tomb and that of their father are to be seen there." But Eusebius himself proceeds expressly to identify this Philip with the Philip mentioned in the Acts of the Apostles as living in Caesarea, and in another place he alludes to Philip "the apostle," as having preached the gospel to the Ethiopian eunuch (*H. E.*, iii 1). Clement of Alexandria also (*Strom.*, iii 6 [52]) incidentally speaks of "Philip the apostle" as having begotten children and as having given daughters in marriage. In another place (*Strom.*, iv 9 [78]) Clement quotes, with concurrence, a passage from the Gnostic

¹ The problem was this: If a man says he is telling a lie, does he speak truly or falsely?

Heaaleon, in which it is expressly said that Matthew, Philip, Thomas, and others died without "confession of the voice," or, in other words, were not, properly speaking, confessors or martyrs. A later stage of the tradition regarding Philip appears in various late apocryphal writings which have been edited by Tischendorf in his *Acta Apostolorum apocrypha*, and in his *Apocryphes apocryphae*. According to the *Acta Philippi*, this apostle, along with Bartholomew and Matanania, the sister of the latter, came to Ophiomyia or Hierapolis, where the success of their preaching, and more particularly the conversion and miraculous healing of Nicanor, the wife of the governor, provoked bitter hostility. Philip was crucified head downwards, and invoked curses on his persecutors. His imprecations were heard, but the Lord Jesus immediately afterwards appeared to him and rebuked him for his want of meekness, further announcing his approaching death, and that on account of his sin he would be kept back forty days from the gates of paradise. The *Acta Philippi in Heliade* (c. 6, "in the city of Athens, called Hellas") are still more fantastical. An apocryphal book, under the title *Actus Philippi*, is condemned in the canon of Gelasius. Since the 6th century Philip has been commemorated in the West, along with St. James the Less, on 1st May, their relics being deposited in the same church in Rome, in the Eastern Church Philip's day is 14th November, and that of James the Less 23rd October.

PHILIP, "the evangelist," is first mentioned in the Acts (vi 5) as one of "the seven" who were chosen to attend to certain temporal affairs of the church in Jerusalem in consequence of the murmurings of the Hellenists against the Hebrews. After the martyrdom of Stephen he went to Samaria, where he preached with much success, Simon Magus being one of his converts. He afterwards instructed and baptized the Ethiopian eunuch on the road between Jerusalem and Gaza, next he was "caught away" by the Spirit and "found at Azotus" (Ashdod), whence "passing through he preached in all the cities till he came to Caesarea" (Acts viii.). Here some years afterwards, according to Acts xxi. 8, 9, he entertained Paul and his companion on their way to Jerusalem, at that time "he had four daughters which did prophesy." At a very early period he came to be confounded with the subject of the preceding notice (*qv*), the confusion was all the more easy because, while he undoubtedly could in a certain well-understood sense of the word be called an "apostle," writers naturally refrained from applying to him the more ambiguous designation of "evangelist." "Philip the deacon" is commemorated on 6th June.

PHILIP, tetrarch of Iturea. See **HEROD PHILIP**, vol. xi. p. 755.

PHILIP, the name of five kings of Macedon. The greatest of these was **PHILIP II.** (382-336 B.C.), the first founder of the **MACEDONIAN EMPIRE** (*qv*). After the death of Alexander the Great, Arrhidaeus, a bastard of Philip II., reigned as **PHILIP III.**, till he was put to death by Olympias in 317. **PHILIP IV.**, son of Cassander, reigned only for a few months in 296. **PHILIP V.**, the last but one of the kings of Macedon and son of Demetrius II., was born in 237, and came to the throne on the death of his uncle, Antigonus Doson, in 220. In the course of the next three years he acquired a brilliant reputation by his exploits against the **Ætolians** and their allies in the Peloponnese in the Social War, but after this, though his whole career was marked by military and even political ability, the bad sides of his character became predominant, and he appeared more and more as a perfidious, morose, and cruel tyrant, thus alienating the affections of the Greeks and ultimately even of his own subjects. His life was full of ambitious schemes, but he made the cardinal error of siding with Carthage against Rome. His character made it easy for the Romans to raise against him a powerful coalition of his neighbours, but Philip held his ground with vigour till the armies of the republic themselves appeared on the field. How he was finally driven out of Greece has been related under **FLAMINIUS**. After 196 Philip for some time accepted his reverses and sought the friendship of Rome, helping the republic against Antiochus,

but his ambition and the jealousy of the senate gradually led to fresh complications, and a new war was imminent when Philip died in 179, mainly of remorse for the death of his younger son Demetrius, the favourite of Rome, whom he had executed on an accusation forged by his elder son and heir Persens.

PHILIP I (1052-1108), king of France, was the son of Henry I and Anne of Russia, and was born in 1052. He was associated with his father on the throne in 1059, the consecration taking place at Rheims (23d May), and he succeeded to the undivided sovereignty in the following year (4th August 1060), first under the regency of his mother, and afterwards, from 1062 to 1067, under that of Baldwin V, count of Flanders. In 1072 he married Bertha, daughter of Robert the Fisian, at whose hands he had sustained a shameful defeat at Cassel in the preceding year. His jealousy of William the Conqueror led him into an act of overt hostility in 1075, when his troops raised the siege of Dol, and a state of war, interrupted by inconsiderable intervals, continued thenceforward to subsist until the death of William. Philip afterwards supported, but ineffectually, the pretensions of Robert of Normandy against William Rufus. In 1092 he brought himself into collision with the church by shutting up his wife Bertha with her three children in the castle of Montreuil, and espousing Bertrada of Montfort, whom he had induced to leave her husband, Fulk of Anjou. The marriage was indeed sanctioned after Bertha's death by a subservient council at Rheims in 1094, but led to the king's excommunication by the council of Autun in the same year—a censure which was renewed by Pope Urban II at Clermont in 1095. Having dismissed Bertrada early in 1097, he was forthwith absolved, but on a repetition of the offence three years afterwards the sentence was renewed, at Poitiers, and only removed by Paschal II after Philip had once more submitted himself to the church. In 1100 he made his son Louis (afterwards Louis VI.) joint king, and his death took place at Melun on 29th July 1108. See FRANCE, vol. ix pp. 537-539.

PHILIP II (1165-1223), surnamed "Augustus," king of France, was the son of Louis VII, and was born in August 1165. When fifteen years old he was crowned joint king at Rheims on 1st November 1179. In the following year he was again crowned along with his newly-wedded wife, Margaret of Hainault, at St Denis (29th May 1180), the death of his father took place a few months afterwards. For an account of Philip II's character and of the leading events of his reign the reader is referred to FRANCE, vol. ix pp. 540-542. He died at Mantes on 14th July 1233.

PHILIP III (1245-1285), surnamed "the Rash," king of France, was born in 1245 and succeeded his father Louis IX on 25th August 1270, at Tunis, where, after continuing the siege for some time, he made a truce of ten years and embarked for France in the following November. He was twice married, first to Isabella of Aragon in 1258, and subsequently to Mary of Brabant. He died at Perpignan on 5th October 1285. See FRANCE, vol. ix p. 544.

PHILIP IV. (1268-1314), surnamed "the Fair," son of the preceding, was born at Fontainebleau in 1268, was married to Joanna, queen of Navarre, in 1284, accompanied his father into Aragon in 1285, and was proclaimed king of France at Perpignan on 6th October of that year. See FRANCE, vol. ix pp. 544-545. He died at Fontainebleau on 29th November 1314.

PHILIP V (1293-1322), surnamed "the Tall," second son of the preceding, succeeded his elder brother, Louis X, in January 1317, and was succeeded by his younger brother Charles IV in January 1322.

PHILIP VI (1293-1350) was the eldest son of Charles, count of Valois, the younger brother of Philip IV., and

was born in 1293. He succeeded his cousin Charles IV. in 1328, and died at Nogent-le-Roi near Chartres on 22d August 1350. See FRANCE, vol. ix pp. 545-546.

PHILIP I (1478-1506), of Castile and Aragon, surnamed "the Handsome," was the son of the emperor Maximilian I and Mary, the only child of Charles the Bold, last prince of the house of Burgundy, and was born at Bruges on 22d July 1478. He succeeded his mother in 1482, Maximilian being recognized as governor and guardian during the minority by all the provinces, except Flanders, the burghers of which took possession of Philip, and carried on the government in his name. This arrangement subsisted until 1489, when a long struggle resulted in the triumph of Maximilian, who henceforth had the guardianship uncontrolled. In 1494 Philip received the homage of the various states of the Netherlands, and in 1496 he was married to Joanna (Juana la Loca), second daughter of Ferdinand and Isabella of Castile and Aragon. On the early death of the other children of these sovereigns the succession vested in Joanna, and Philip as her husband proceeded to Spain, where he was recognized as heir-presumptive by the cortes of Toledo and Saragossa (representing Castile and Aragon respectively) in 1502. He returned, however, to Flanders before the close of the year, and was still absent when, on the death of Isabella in November 1504, Ferdinand caused Joanna and Philip to be proclaimed sovereigns of Castile, but at the same time assumed the regency to himself. It was only with difficulty that Ferdinand was induced to retire to Aragon and so make way for the new king in June 1506. Philip died three months afterwards (25th September 1506) at Burgos. His children by Joanna were Charles V, emperor, and king of Spain, Ferdinand I, emperor, Isabella, queen of Denmark; Leonora, queen of Portugal and afterwards of France; Mary, queen of Hungary and governor of the Netherlands, and Catharine, queen of Portugal.

PHILIP II (1527-1598), king of Spain, was the son of the emperor Charles V. and Isabella of Portugal, and was born at Valladolid on 21st May 1527. He was brought up in Castile under the care of his mother, who died when he was twelve years old. As Philip grew up, his father, though he rarely saw his son, watched carefully over his education and strove to fit him for political life. In 1543 Philip married Mary of Portugal, who died in 1545, soon after the birth of a son, Don Carlos. In 1548 Charles V summoned Philip to Brussels, that he might gain some experience of the peoples whom he would be called upon to rule. He was not, however, popular with his future subjects. He had already formed his character upon the model of Spanish haughtiness. He was cold, reserved, punctilious about decorum, and wanting in geniality. The Italians did not care for him; the Flemings disliked him; the Germans hated him. His appearance and manner did not further his father's plan of securing his election to the empire. The scheme failed, and Philip's presence was in no way helpful. In 1551 he returned to the more congenial task of governing Spain.

The death of Edward VI of England opened out to Charles V. new prospects for his son. Queen Mary regarded the emperor as her only friend, and submitted herself entirely to his guidance. She received with joy a proposal for her marriage with Philip. The English opposition broke down with the failure of Wyatt's rebellion, and in 1554 Philip came to England to claim his bride. Charles V resigned to him Naples and Sicily that he might not come as a needy prince. Philip was well supplied with Spanish gold, and was charged by his father to spare no pains in conciliating the English. He tried his best; but his cold, ungenial manner was a hopeless obstacle to his success. Mary was devotedly attached to her hus-

band, who exercised a moderating influence over the queen's zeal for the re-establishment of Catholicism. Charles V wished to secure England as an ally, and subordinated religious to political considerations. Philip was not naturally fitted for conciliatory action, and was not happy in England. He found that his wife was destined to be childless and that he had no prospect of succeeding to the English crown. At the end of 1555 he joyfully obeyed his father's summons to go to Brussels. Charles V, worn out by the fatigue of a long reign, resolved to abdicate in favour of his son, and thus he did on 16th January 1556.

Philip II. was now king of Spain, Naples, and Sicily, duke of Milan, lord of Franche Comté and the Netherlands, ruler of Tunis and the Barbary coast, the Canaries and Cape de Veid Islands, the Philippines and Spice Islands, large colonies in the West Indies, and the vast territories of Mexico and Peru. These great dominions had fallen into his father's hands and were united only by their dependence on their ruler. It was Philip's task to give them an organic unity and combine them into a system. First he had to face a threatening league against his power. Pope Paul IV., a Neapolitan, was imbued with hatred of the Spanish rule, and formed an alliance with Henry II. of France. Philip sent the duke of Alva, who speedily reduced the intractable pope. But Philip was too good a Catholic to press his victory. He was content to leave the pope powerless, and Alva on his knees asked pardon for bearing arms against the church. The war against France was pursued with equal success and greater results. Philip's army, led by Philibert of Savoy, entered Picardy and besieged St Quentin. The French were defeated in an attempt to relieve the city, and St Quentin was stormed. The French retaliated by seizing Calais from England, and thence advanced into Flanders, where they were again defeated in the bloody battle of Gravelines. Both Philip II. and Henry II. were destitute of resources and wished for peace; but Philip II. was the better diplomatist. The treaty of Cateau Cambresis in 1559 restored to him all that France had won by its long warfare against Charles V. in Italy and the Netherlands.

Thus Philip began his reign with glory, and Europe saw that Charles V. had no unworthy successor. Yet Philip was not anxious for military glory. His finances were embarrassed and he felt the need of a period of peace. For the purpose of maintaining his political supremacy he proposed to continue his English alliance by marrying Elizabeth when she succeeded Mary on the English throne. Elizabeth did not at once reject the proposal, but she gradually entered upon a religious policy which made marriage with Philip impossible. The Spanish king rapidly changed his plans and cemented his alliance with France by a union (24th June 1559) with Isabella, daughter of Henry II. He made arrangements for the government of the Netherlands, and at the end of 1559 returned to Spain, where he remained for the rest of his life.

The policy of Philip was steadily directed towards welding his dominions together in dependence on himself and extending his influence over Europe. The power of Charles V. had had no definite centre. The emperor had recognized the claims of his separate dominions upon him, and had striven to be neither German, Spanish, Flemish, nor Italian. Philip identified himself entirely with Spain. Castile was to be the seat of his monarchy, and that monarchy was to be absolute. He was devoted to Catholicism, and during his reign superseded the pope as the head of the Catholic party in Europe. But the interests of Catholicism were in his mind identified with his own personal interests, and under the cover of zeal for the church he pursued the aggrandizement of Spain. In Spain itself his care for the maintenance of the Catholic

faith accorded with the temper of the people. The long continuance of war against the Moors had identified orthodoxy with purity of race, and heresy was regarded as a taint in the blood. The rigour of the Inquisition preserved the national honour, the auto-da-fé was a means of ridding the land of dangerous elements. This uncompromising spirit of Spain in religious matters its king wished to extend to the rest of his dominions.

Philip had none of his father's personal activity. Though his mind was always engaged in the business of the state, he did not care for the excitement of personal conflict. He was no warrior, and never took the field. He felt himself best qualified to direct his policy from afar. He was resolved to make the fullest use of others, yet to keep the guidance of affairs in his own hands. He increased the number of councils for the management of the business of the different provinces of his realm, and in these councils natives of the various provinces had seats. But the general direction of affairs was in the hands of a privy council, entirely composed of Spaniards. At first this council consisted chiefly of the members of Philip's household, the men whom he had known in early days. Foremost amongst them were the duke of Alva and Ruy Gomez de Silva, prince of Eboli. Alva was a general, Gomez a courtier, and the two men were in permanent opposition. This exactly suited Philip's views. He was never present in person at the sittings of the council. All questions on which he wished for its opinion were reduced to writing and laid before it. Its recommendations were similarly submitted to the king in writing. There was no initiative except by his pleasure, no decision which was not due to his personal approval. He gained all the advantages of opposing views amongst his ministers without identifying himself with any. No minister could become a necessity to him, and he could withdraw his favour at will. Philip's regents and ministers in the several provinces had large authority, but were never allowed to forget their dependence on the central power. Every land was submissive except the Netherlands, where the nobles resented their exclusion from the government, and saw with alarm the steady advance of Philip's system. A new ecclesiastical organization increased the number of bishops, who were all dependent on the king, and diminished the revenues of the monasteries, which furnished provisions for the younger members of the noble families. The introduction of the Spanish Inquisition threatened to destroy entirely the political importance of the nobles. In the general discontent the Protestant feeling of the towns made common cause with the national jealousy of the nobles. A strong opposition was formed, and in 1566 the Netherlands were in revolt. For a time Philip wavered between a policy of conciliation and a policy of repression. At last he listened to the advice of the duke of Alva, and sent him to reduce the rebels. Alva treated the revolted provinces with merciless severity; he crushed, but he could not subdue. The Netherlands were still unpacified, while Alva's cruelty destroyed their commerce. Their wealth had been the chief source of revenue to Charles V.; Philip II. no longer found it flow into his coffers. For seven years Alva resolutely tried his policy of repression; but the spirit of the Netherlands remained unbroken, and round their slumbering revolt all the enemies of the Spanish monarchy began to gather. Alva was recalled and fell into disgrace. A more pacific successor, Don Luis de Requesens, was sent to try a more conciliatory policy.

In domestic life, meanwhile, Philip was unhappy. His son Don Carlos developed an ungovernable temper, and did not hesitate to condemn his father's caution as unworthy of the traditions of his house. He wished to distinguish himself, and was on the point of quitting

Spain when his father, as a measure of precaution, had him imprisoned. In prison Don Carlos yielded to sullen despair, and gave way to excesses, which Philip did not try to check. In consequence of this unwholesome life Don Carlos died in 1568, and it was a bitter blow to the haughty king to inform foreign princes of the facts. It would seem that Philip was glad to be rid of one whom he could not manage, he did not hasten the death of Don Carlos, but he took no steps to prevent it. A few months later died Queen Isabella, leaving Philip without a male heir. In 1570 he married his fourth wife, Anne of Austria, his niece, who died in 1580. Only one of her sons survived to manhood, and he succeeded his father as Philip III.

Meanwhile the hopes of Spain were fixed on Philip's half-brother, Don John of Austria, who first showed his military skill by putting down a serious revolt of the Moiscos in the Alpujarras, and was then sent to command the Spanish fleet in the joint expedition of the Mediterranean powers against the Turk. He commanded at the decisive battle of Lepanto in 1571, which stemmed the tide of Turkish conquest. Brave and ambitious, Don John longed for a kingdom, and offered to undertake the conquest of the African coast. But Philip did not wish his brother to gain too much military glory. He sent him in 1576 to succeed Requesens in the Netherlands. Don John was full of great schemes,—to pacify the Netherlands, invade England, release Mary Queen of Scots, and become her husband. But the Spanish treasury was exhausted. Philip would send no more supplies, and left Don John to temporize with the Netherlands, a task for which he was entirely unfit. Overwhelmed with disappointment and the sense of failure, Don John died in 1578, leaving the work which he could not accomplish to be undertaken by the patient genius of Alexander Farnese.

Don John had had the art of impressing his great schemes on those around him. He sent his secretary, Escovedo, to urge his wishes on Philip, whose jealous mind was filled with suspicion. Escovedo awakened the personal dislike of Antonio Perez, and was murdered by that minister's instrumentality (see PEREZ). The fall of the old parties in the council brought forward new men and inaugurated a new policy. Cardinal Granvella, Juan Idiaquez, and Christoval de Moura became the king's chief advisers. They were men who depended solely on his favour, and were not connected with the old nobility of Castile. Hitherto Philip's policy had been in the main pacific. He had aimed at the internal consolidation of the monarchy, and had striven by every means to overcome the revolt of the Netherlands. But the resolute temper of the Netherlands was encouraged by hopes of foreign help. England, France, and even Austria in turn displayed their jealousy of Philip's power by helping to keep alive the insurrection. Round the revolt of the Netherlands centred the chief questions of European politics. Philip at length determined to make the subjection of the rebellious provinces part of a great scheme to extend the power of Spain over Europe. In the second period of his reign he came forward as the disturber of European peace, determined to reduce western Christendom to religious unity under his own rule. He interfered in the internal politics of every country and seized on every opportunity for pursuing his own schemes. His first step in the career of aggrandizement was taken in 1580 by the reduction of Portugal, when he claimed the vacant crown by right of his mother. The duke of Alva overran the country before any other power had time to interfere. The last of the great Spanish nobles, who had already felt the weight of the king's displeasure, was still a willing instrument in extending the royal despotism. Philip succeeded in impressing on Spain an unreasoning loyalty, which took

the place of its old chivalrous patriotism. In the Netherlands he put William of Orange under the ban, and the assassination of William was the first sign of the fanatical bitterness which Philip was ready to encourage and to use. In France he resolved to check the power of the court and obtain an influence over French affairs. The strongly Catholic party resented the favour shown by Henry III. to the Huguenots, and was anxious about the succession to the crown. Headed by the Guises, they formed a league with Philip in January 1585, which plunged France into long and bitter warfare. The rapid advance of the League in France and the successes of Alexander Farnese in the Netherlands awakened the alarm of England. Troops were sent to the Netherlands, and the English privateers redoubled their attacks upon the treasure-ships of the Indies in the Spanish Main. Resolved to remove all hindrances from his path, Philip undertook the reduction of England. He trusted to the strength of the Spanish navy, the military skill of Alexander Farnese, and the discontent of the English Catholics. In 1588 the French king had become a more instrument of the League, and Philip sent against England the "Invincible Armada." Its failure involved the failure of all his schemes, though this fact was not at first obvious. Philip bore his loss with resignation. "I sent my ships," he said, "against men, not against the billows. I thank God that I can place another fleet upon the sea." But he was never able to renew his attack upon England. The murder of Henry III. of France raised the question of the succession to the French crown, and Philip's protectorate over the titular Charles X. was admitted. On the death of Charles the Catholic party were willing to recognize Philip's daughter Isabella as their queen. But the resolute bearing of Henry of Navarre kindled anew the national feeling, and the discussions about Isabella's future husband brought political questions into the foreground and weakened the cohesion of the League. The death of Alexander Farnese in 1592 deprived Philip of the great general who alone could hold in check Henry of Navarre, and Henry's change of religion and absolution by the pope in 1593 did much to remove the religious difficulty to his recognition by all parties in France. Philip's schemes for a general European ascendancy entirely failed. He could not even recover the Netherlands for the Spanish monarchy. The northern provinces, banded together as the United Netherlands, made good their independence. The southern provinces returned to their obedience, but were ceded by Philip to his daughter Isabella and her husband Albert of Austria. The English cruisers became more and more dangerous in the Spanish Main, and in 1596 the English fleet sacked Cadiz. Philip II.'s reign ended in general failure. His resources were exhausted, and in 1597 he repudiated his debts. His economic policy was disastrous. He checked commerce by unwise taxes, trusted unduly to the wealth of the Indies, and encouraged the indolent haughtiness of the Castilians. He raised Spain to a high position, but left it with a ruinous system of government, which could only end in financial decay. Yet he was resolute and persevering to the end. He bore with constancy a painful and lingering illness, and his last words were, "I die like a good Catholic, in faith and obedience to the Holy Roman Church." But he knew that he left a feeble successor. His jealous temper showed itself in the narrow education and secluded life which he prescribed for his son, and thereby intensified the boy's natural timidity. "God has not been pleased," he sadly said at the last, "to grant me a successor capable of ruling my great realm." He died at the Escorial in September 1598.

Philip II.'s character is impressed on the great archi-

tectural monument of his reign, the Escorial, built in the solitude of the Guadarrama hills. The mighty mass of buildings contained a monastery, a burying-place for the royal house, and a palace for the king. It was built in consequence of a vow made at the battle of St Quentin. The battle was fought on St Lawrence's day 1557, and this fact was commemorated by arranging the building in the form of a gulfiron. The cloister of the monastery supplied the bars, and the royal palace projected like the handle. Philip loved solitude. It harmonized with his habits of quiet industry. He governed his dominions by means of despatches, as a merchant seated in his office transacts commercial business in different quarters of the globe. All that could be done by patient industry, without political might, Philip II did. His strength lay in his steady persistency. During his reign he was the foremost figure in European history, but the only work which he accomplished was the formation of the Spanish character into the definite shape in which it influenced European culture.

(M.C.)

PHILIP III (1578-1621), king of Spain, son of Philip II by his fourth wife, Anne of Austria, was born at Madrid on 14th April 1678, succeeded his father on 13th September 1598, married Margaret of Austria on 18th April 1599, and died at Madrid on 31st March 1621. In personal character he was weak and indolent, and his time was mostly spent at the Escorial in hunting and other pursuits of a private country gentleman, while the conduct of public affairs was left almost entirely in the hands of the duke of Lerma, who held the office of first minister from the king's accession until October 1618. See SPAIN.

PHILIP IV (1605-1665), king of Spain, son of Philip III, was born at Valladolid on 8th April 1605, was married to Isabella of France on 25th November 1615, succeeded his father on 31st March 1621, and died on 17th September 1665. From 1621 to 1643 the well-known duke of Olivares held the reins of real power in the Peninsula; he was afterwards succeeded by the duke of Carpio. See SPAIN.

PHILIP V (1683-1746), king of Spain, was the second son of the French dauphin, Louis, by his wife Maria Anna of Bavaria, and was born at Versailles on 19th December 1683. In 1700 Philip, at that time duke of Anjou, was called by the testament of the childless Charles II to the throne of Spain. Quitting Versailles to take possession of his inheritance on 4th December, he arrived at the Buen-Retiro palace in Madrid on 18th February of the following year. At their parting his grandfather, Louis XIV, who a few months previously had concluded with England and Holland a treaty for the partition of the Spanish dominions, exhorted him to be a good Spaniard, but never to forget that he had been born a Frenchman, it was on the same occasion that he uttered the famous motto, "Mon fils, il n'y a plus de Pyrénées." Philip's recognition as king by the other European powers did not take place until the war of the Spanish succession was brought to an end by the treaty of Utrecht in 1713. In 1709 he married Maria Louisa, daughter of Victor Amadeus, duke of Savoy, shortly after her death in February 1714, which he felt deeply, he married Elizabeth Farnese (December), a step to which he was advised by the then

all-powerful princesse des Ursins. The disgrace of the princess immediately followed, and her place in the royal counsels was taken by ALBERONI (q.v.), who remained in power till December 1719. In 1724 Philip, under the influence of a profound melancholy which had seized him, resigned the crown by royal decree, dated 14th January 1724, in favour of his eldest son, Louis, who, however, died after a short reign of only seven months. Philip died on 9th July 1746 and was succeeded by his son, Ferdinand VI. See SPAIN.

PHILIP. For the dukes of Burgundy of this name, surnamed respectively "the Bold" (1342-1404) and "the Good" (1396-1467), see BURGUNDY, vol. iv. p. 536, and FRANCE, vol. ix. p. 548. For Archduke Philip, "the Handsome," see PHILIP I. of Castile and Aragon (p. 743).

PHILIP OF SWABIA (c. 1170-1208), rival of the emperor OTTO IV. (q.v.), younger son of the emperor Frederick I., was born about 1170. He was originally intended for the church, and, after being provost of Aix-la-Chapelle, was chosen bishop of Würzburg in 1191, but in 1195 his elder brother brought about his marriage with a Byzantine princess, Irene, on which occasion he was named duke of Tuscany and Spoleto. In the following year he received also the duchy of Swabia. On the death of his elder brother he was elected king by a large body of princes and prelates at Mühlhausen (March 1198), this, however, was not acquiesced in by those opposed to the continuance of the imperial crown in the house of Hohenstaufen, whose choice fell on Otto. The coronation of the latter at Aix-la-Chapelle in July was soon followed by that of his rival at Mainz, and a civil war ensued, which, carried on with varying fortunes for ten years, was only brought to an end by the murder of Philip by Otto of Wittelsbach at Bamberg on 21st June 1208.

PHILIPPI, a city of ancient Macedonia, on a steep hill near the river Gangites (now the Angista), overlooking an extensive plain and at no great distance from the coast of the Aegean, on the highway between Neapolis (Kavalla) and Thessalonica. Originally called Crenides, or "Fountains," it took the name by which it has become famous from Philip of Macedon, who made himself master of the neighbouring gold-mines of the Hill of Dionysus, and fortified the city as one of his frontier-towns. Octavius and Antony having in 43 B.C. gained a great victory over Brutus and Cassius in the plain of Philippus, the place received a Roman colony, *Coleman Julia Philippensis*, which was probably increased after the battle of Actium (*Col Aug Julia Phil*). The inhabitants received the Jus Italicum, and Philippus was one of the cities specially designated as "first cities" (πρώται . . . πόλεις, Acts xvi. 12, see Marquardt, *Röm. Staatsverwaltung*, vol. i. p. 187). It was the scene of a striking incident in the life of St Paul, and it was to his converts here that he addressed the epistle noticed below. The site of the city, now altogether uninhabited, is marked by a number of ruins—the substractions of an amphitheatre, parts of a great temple of Claudius, &c.—which have furnished a variety of interesting inscriptions. At a little distance to the east is a huge stone monument, known to the Turks as Dikilitash and to the Greeks as the Manger of Bucephalus.

See Clarke's *Travels*, iii., Hackert, in *Bible Union Quarterly*, 1860; Heuzey, *Mission arch. en Macedoine*, and *C I L*, iii. 1.

PHILIPPIANS, EPISTLE TO THE. This is one of the most characteristic of the letters of St Paul. It was addressed to the community at Philippi (see above), the first important European city which St Paul had visited, where he had formed a community with the apparently new organization of "bishops" and "deacons," and with which he had relations of especial intimacy. The immediate occasion of his writing the letter was his receipt of money

which the Philippians had sent by Epaphroditus to supply St Paul's personal wants. They were probably wealthier than some of the other communities which he had founded, and consequently he had not the reluctance which he felt elsewhere to receive money from them, the money so sent was no doubt part of the offerings of the community which constituted the Christian sacrifice (iv 18),—a fund which was administered by the officers of administration, *i.e.*, the bishops and deacons. It was consequently to those officers that he specially addressed his acknowledgment of it.

He begins by a warm recognition of their steadfastness in the faith and of their sympathy with him (i 3-7), and, as he is certain that their steadfastness will continue, so he prays that their love may abound more and more in enlightened well-doing (i 9-11). He proceeds to tell them about himself and about other preachers of the gospel at Rome, as for himself, he is full of hope because his imprisonment has tended to make the gospel known, and has emboldened others to "speak the word of God without fear", as for other preachers (probably the Jewish Christians who denied his apostleship and disparaged his special teaching), though some of them preach insincerely and controversially, yet, whatever be their motive, "Christ is proclaimed," and therein he finds cause of rejoicing (i 12-18). His position is critical, for he may be condemned to death, but, whether he lives or dies, Christ will be glorified through him, so that he cannot tell which he would prefer; for himself it would be far better "to depart and to be with Christ," but for the Philippians it is better that he should "abide in the flesh" (i 19-24). Hence he feels confident that he will live, and that he will see the Philippians again, and hence also he exhorts them not to be discouraged by persecutions, and to be at unity among themselves (i 25, ii 2). The reason for this second exhortation is uncertain. It may be that the differences of race at Philippi, the mingling of Romans and Greeks, of Europeans and Asiatics, had led to the factious assertion by each race of its own superiority, or it may be, though less probably, that there as elsewhere the feud raged between Gentile and Jewish Christians. And, since faction comes of self-assertion, he urges as its antidote the cultivation of a "lowliness of mind," which he enforces by the great example of Jesus Christ, who, so far from asserting the divinity which belonged to Him, emptied Himself of it and took the form of a bond-servant, to this St Paul adds a strong appeal on his own account, that his work among them may not seem to have been in vain (ii 3-18). He then, with an expression of regret that some of his fellow-workers are no longer with him, announces that he hopes to send Timothy to them as soon as he knows the issue of his coming trial, and he is hopeful that he may be able to go himself, however that may be, he sends back their own messenger, Epaphroditus, who after coming to Rome had almost sacrificed his life in the energy of his work (ii 19-30). Then follows an abrupt transition to another subject, which has sometimes been thought to mark the commencement of a new letter. He suddenly begins to warn the Philippians in strong terms against false teachers, either Judaizing Christians, or, more probably, Jews, who were preaching the necessity of circumcision (Holsten thinks that there is a reference to the murder of James the Just), he maintains that, although he was himself a "Hebrew of Hebrews," and therefore possessed whatever "confidence in the flesh" such a one might claim, yet he counted it all as "loss" in order that he might gain "the righteousness which is of God by faith"; and borrowing a metaphor from the Greek games he regards this as a prize which has to be won by a continuous effort (iii 2-16). He urges the Philippians to follow him in this struggle towards moral perfection, in contrast

either to the Christians who had lapsed into Epicureanism or, as some think, to the antinomian Jews (ii 17, iv 1). He then gives some personal messages to Euodia and Syntyche (whom Schwieger considers to be personifications of the Jewish and heathen Christian parties respectively), and to Synzygus (or, if the word be not a proper name, an anonymous "yoke-fellow" who has been variously supposed to be Paul's wife, Clement of Rome, St Peter, Lydia the purple-seller, or Epaphroditus), and mentions "Clement," about whom it has been much discussed, but to little purpose, whether he was a Philiphian or a Roman, and, if the latter, whether he was the same person who figures in early legends as bishop of Rome, or whether, as Baur thinks, the name is really that of the Flavius Clemens who was condemned under Domitian for "atheism." The personal messages are followed by general exhortations to joyfulness, forbearance, trustfulness, and steadfastness in Christian virtue, and then comes that which was probably the special occasion of writing, an acknowledgment of the money which they had sent to him (iv 4-20).

It is the more probable opinion that the epistle was written from Rome, and not from Caesarea, whether it was written in the earlier or the later period of his stay there is a question which has been much discussed, but which the scantiness of the evidence respecting that stay does not allow of being satisfactorily answered, most writers (De Wette, Wieseler, Wiesinger, Meyer) place it in the later period, others (Bleek, Ewald, Beysslag, Lightfoot) in the earlier, the latter view is more probable on account of the general agreement of this epistle with the epistle to the Romans. It throws an interesting light on St Paul's external relations. He was a prisoner, probably in charge of the prefect of the praetorian guard, and consequently with opportunities of making the gospel known among the soldiers; and the mention of Caesar's household, though no doubt that term covered a large number of scattered individuals, makes it possible that he was lodged near the imperial palace on the Palatine.

The genuineness of the epistle was attacked by Baur on three grounds, which he himself states to be (1) the appearance of gnostic ideas in ii. 6-11, (2) the want of anything distinctively Pauline, (3) the questionableness of some of the historical data.¹ The attack has been renewed by one section of his followers, but it is generally admitted even by critics who reject the epistles to the Ephesians and Colossians² that the attack upon this epistle has failed. The supposed gnosticism of ii. 6-11 is not proved, the supposed identification of Clement (iv 3) with Flavius Clemens, the cousin of Domitian, is merely an arbitrary guess; and the list of expressions which are not found in other epistles of St Paul is not greater than may reasonably be expected from the differences in the subject-matter.³

The doctrinal importance of the epistle is considerable, for it contains a passage which, if it could be certainly understood, would be at once the key and the summary of St Paul's Christology. In 2 Corinthians vii 9 he had

¹ Paul, *B. T.*, vol. ii p. 45, *Theol. Jahrb.*, 1849, 501, which is partly reprinted as an addendum in Paul, *B. T.*, vol. ii p. 64.

² *E.g.*, Hilgenfeld, *Evangelium*, p. 333, Renan, *St. Paul*, p. 6; Pfleiderer, *Paulinismus*, *B. T.*, vol. i p. 29.

³ Baur was followed in this attack by Schwieger (*Das nachapost. Zeitalter*, vol. i p. 138) and Volkmar (in *Theol. Jahrb.*, 1856, p. 309), and he was answered by Lunemann (*Pauli ad Philipp. Epist. I. Befunde*, Göttingen, 1847), Bruckner (*Epist. ad Philipp. . . vindicata*, Leipzig, 1848), Hilgenfeld (in *the Zeitschr. f. wissenschaftl. Theol.*, 1871, p. 809). A new attack was made by Hirsch in the same *Zeitschrift*, 1873, p. 59 (criticized by Hilgenfeld, *ibid.*, p. 176), and by Holsten in the *Jahrb. f. prot. Theol.* (1876, p. 425; 1876, p. 58), which has been met by the important treatise of P. W. Schmidt, *Neutestamentliche Hyperkritik*, Berlin, 1880.

said of Christ that "though He was rich yet for your sakes He became poor", in Philippians ii 5-7 this is expanded into the explicit declaration that "being in the form of God He counted it not a prize (?) to be equal with God, but emptied Himself, taking the form of a servant, being made in the likeness of men." Each phrase of the passage is of great significance, but it is also of great uncertainty of meaning the main points of uncertainty are (1) whether the subject of the sentence is the incarnate or the pre-incarnate Christ, (2) what is implied by the phrase "in the form of God," and what is its relation to the phrase "to be equal with God," some thinking that it implies an identity, others an inferiority of status, (3) what is meant by the word here rendered "prize" (*ἀπραγμὸν*), some thinking that this is the right rendering, and that the meaning is "He did not tenaciously cling to His divinity but surrendered it," others thinking that it should be rendered "an act of robbery," and that the meaning is "He did not think it a humiliation to assert His divinity", (4) what is meant by "emptied Himself," whether He only divested Himself of the outward semblance of divinity, or whether He reduced Himself to the bare consciousness of personality in becoming incarnate, this last question, that of the nature of the *kenosis*, has bearings of especial importance on the general doctrine of the Person of Christ.

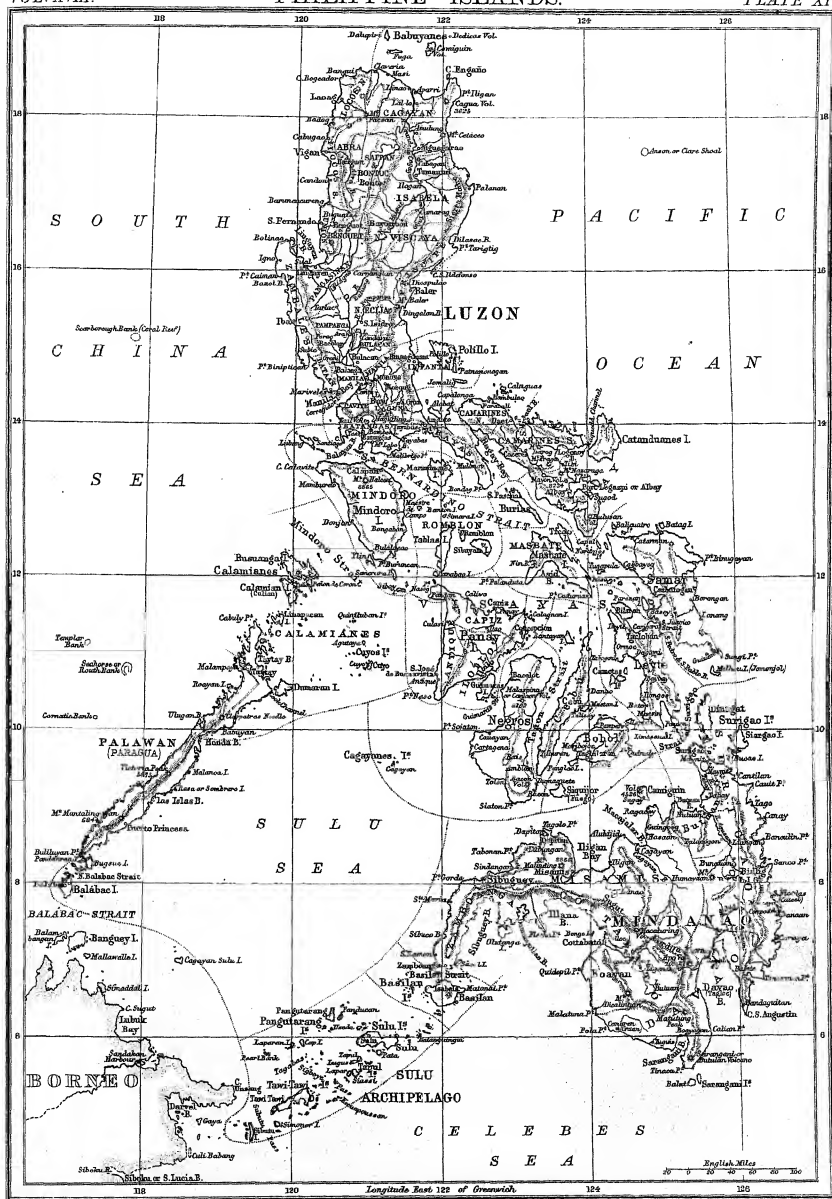

Discussions of these questions from various points of view will be found not only in commentaries on the passage (e.g. Lightfoot) and works on New Testament theology (e.g. Weiss), but more particularly in Baur, *Faith, E. T.*, vol. ii. p. 45 (who thinks that the conceptions are gnostic and un-Pauline), Ernesti, in *Studien u. Kritiken*, 1818, p. 889, and 1851, p. 602 (who thinks that *ἀπραγμὸν* refers by way of contrast to the first Adam, who tried to seize what was not his own), Hilgenfeld, in the *Zeitschr. f. wissenschaftl. Theol.*, 1871, p. 192, and *ibid.*, 1873, p. 178, Gummi, *ibid.*, 1873, p. 33, Henschel, *ibid.*, 1878, p. 59, R. Schmidt, *Paulinische Christologie*, 1870, p. 163 (whose explanation deserves especial consideration), Pfeiler, *Paulinismus*, E. T., vol. i. p. 146, and more recently Weissenhahn, *Zur Auslegung der Stelle Phil.*, i. 5-11, Karlsruhe, 1884.

For the question as to the nature of the *kenosis*, see Gess, *Die Lehre von der Person Christi*, Berlin, 1856, pp. 81, 82. The best modern editions of the epistle are those of B. Weiss, *Der Philippbrief ausgelegt*, Leipzig, 1859, and Lightfoot, *The Epistle to the Philippians*, 8d ed., London, 1873. (E. H. A.)

PHILIPPICUS, or PHILEPICUS, emperor of Constantinople from December 711 to June 713, was the son of the patrician Nicophorus, and became distinguished as a soldier under Justinian II. His proper name was Bardanes. Relying on the support of the Monothelite party, he made some pretensions to the throne on the outbreak of the first great rebellion against Justinian; these led to his relegation to Cephallonia by Tiborius Absimaros, and subsequently to his banishment, by order of Justinian, to Cherson. Here Bardanes, taking the name of Philippius, successfully incited the inhabitants to revolt against a prince who had made them the objects of one of his most vindictive expeditions, and on the assassination of Justinian in Asia Minor he at once assumed the purple. Among his first acts were the deposition of Cyrus, the orthodox patriarch of Constantinople, in favour of John, a member of his own sect, and the summoning of a "conciliabulum" of Eastern bishops which abolished the canons of the sixth general council, and restored to the diptychs the names of Sergius and Honorius. Meanwhile Tiberius, king of the Bulgarians, attacked Constantinople, burning some of its suburbs and carrying off many prisoners and much booty, while shortly afterwards the Saracens made similar incursions from the Asiatic side. The short reign of Philippius was brought to a close through a conspiracy headed by two of his generals, who caused him to be blinded in the hippodrome in June 713. Of the remainder of his life nothing is known. He was succeeded by his secretary, Artemius, known as Anastasius II.

PHILIPPINE ISLANDS (Span *Islas Filipinas*), or PHILIPPINES, an archipelago in the south-east of Asia, extending from 4° 40' to 20° N lat., and from 116° 40' to 126° 30' E long. On the west and north-west it is separated by the China Sea from China and the Indo-Chinese peninsula; towards the east lies the Pacific, on the north a number of smaller islands stretch out towards Formosa, and on the south, while a double connexion with Borneo is formed by the lines of the Palawan and Balabac and the Sulu Islands, the basin of the Celebes Sea, with a central depth of from 1000 to 3600 fathoms, extends, for a distance of 300 miles, between its southernmost island (Mindanao) and Celebes. As the number of the Philippines is believed to exceed 1400, and the larger islands are in several cases only beginning to be properly explored, it is impossible to give a definitive statement of their aggregate land-area. A measurement on Domann's map (1882) resulted in 114,356 square miles. Nor is it in regard to the area alone that our knowledge is defective. Though for three centuries the greater part of the territory has been nominally in Spanish possession, the interior of some of the larger islands has never been surveyed, several of the native tribes, especially in Mindanao, are altogether independent; the geology of Luzon, the best known of all the archipelago, is to a large extent matter of conjecture, and the visit of a passing botanist or naturalist is enough to add facts of primary importance to the register of flora and fauna. While none of the summits, with the exception perhaps of Apo¹ in Mindanao, exceeds 9000 feet—the loftiest probably being Halcón in Mindoro (8865 feet), Malindang in Mindanao (8685 feet), Mayon in Luzon (8275 feet), and Malaspina in Negros (8190 feet)—all the islands may be described in general as mountainous and hilly. The principal ranges have a tendency to run north and south, with a certain amount of deflexion east or west, as the case may be, so that the orographic diagram of the archipelago as a whole would have a certain similarity to a fan with northern Luzon as its centre of radiation. The geologist finds his task in the Philippines exceptionally difficult, owing to so much of the surface being covered with a dense vegetation, which often obliges him to be contented with no better indication than the pebbles of the alluvium. Nowhere, almost, are there cuttings or excavations to open up the records of the rocks. It seems certain, from the frequency not only of large tracts of coral reef along the coasts but of raised beaches at a considerable distance and elevation inland, containing shells similar to those of the adjacent seas, that much of the archipelago has been heaved from below the sea-level within comparatively recent times. As the neck of land between the Bay of Sogod and the Bay of Ragay or Guinayangan and that between this latter bay and the Bay of San Miguel consist of alluvium, tuffs, and marls, with modern shells, it appears probable that the southern parts of Luzon were at no very distant date separate islands. According to Drasche, southern and central Luzon comprises (1) a group of chloritic slates and gneiss; (2) diabases and gabbros; (3) Eocene limestones; (4) volcanic minerals and tuffs; (5) recent formations with marine fossils—tuffs, limestones, clays, and marls and fluvial alluviums. In his travels through the more northern parts of the island the same geologist verified the existence of (1) diorite, gneiss, protogine and chloritic slates, (2) an extensive system of stratified conglomerates and sandstones; (3) modern volcanic rocks (quartzose trachyte, amphiboliferous and sandineine

¹ According to the Spanish hydrographic maps, the height of this mountain is 8813 feet, but the barometer of Riquel and Montano's expedition (which ascended to the top in 1880) indicated 10,270 feet, and that used by Schadenberg and Koch in 1882 no less than 10,827 (see *Bull. Soc. de Géogr.*, Paris, 1881, p. 566).

trachyte, amphiboliferous andesite and dolerite), (4) tuffs and tuffaceous sandstones, with banks of limestone and marl, (5) banks of coral and breccia of coralliferous limestone, and recent volcanic products. The late origin of the coralliferous limestone is shown by the corals belonging to genera still existing in the Indian Ocean—*Galarea*, *Favia*, *Merula*, *Porites*, and *Astracopora*—and being specifically similar, though not identical. A remarkable feature is the stratification of the limestone.

Volcanic forces, as has been already implied, have had a great share in shaping the archipelago, and a large number of the mountains bear the stamp of their former activity. But those that still have the credit of being working volcanoes are comparatively few.

Monte Cagua (3910 feet), discovered by Claudio Montano on the north-eastern promontory of Luzon, appears to discharge smoke continually, and the Babuyan group (to the north of Luzon) contains several orifices belonging to the same centre of eruption,—a regular volcano in Babuyan Claro, a solitaire in the Dulua rocks, and a volcano island thrown up in 1856. Of greater importance are the three burning mountains of southern Luzon,—Taal, Albay, and Bulusan. Taal lies 45 miles almost due south of Manila. Being only 850 feet high, it is remarkable as one of the lowest volcanoes in the world. The present crater is situated in a small triangular island in the middle of Lake Bombon or Dongbong. A tradition exists (and has been accepted without question by many writers) that this lake, covering an area of 100 square miles, and having in the south and east a depth of 109 fathoms, was formed in 1700 on occasion of a terrible eruption, which undermined the whole mass of a gigantic mountain, 8000 or 9000 feet high, and, whether (for this is extremely doubtful) the event took place within historic times or not, the vast deposits of porous tuff in all the surrounding country appear to show that such a volcano must have existed. The water in the lake is now sweet, but tradition again asserts that it was at one time salt, possibly through volcanic communication with the sea. As it is exposed to the wind, evaporates, and discharges into the sea by the Panait, without being recaptured by any considerable affluent, it is probably fed by subterranean sources. To the east of Lake Bombon stands the extinct volcano of Maymay, at whose foot are the hot springs of Los Baños, and about 15 miles farther east is Mayajay (7020 feet), of which the last eruption was in 1730. Away in the south-east of Luzon there is quite a series of high volcanoes,—Igorog, Iraya, and Marikina. The latter, the last, and one of the most active volcanoes in the archipelago, is extremely regular in form, rising gradually from a base about 50 miles in circuit. The first partial ascent was made by Esteban Solt in 1692, and the first complete ascent by Paton and Stewart, two young Scotchmen, in 1858. A terrible eruption on 1st February 1814 partially destroyed Camalig, Budao, Albay, Gubatoban, and Dauga, and proved fatal to 12,000 persons, the matter thrown out forming vast deposits deep enough in some places near the mountain to bury the loftiest trees.

A similar fate befell the same district during the eruptions that occurred between 20th July and 24th October 1867. On 31st October 1876 one of the terrible storms for which the Philippines are notorious burst on the mountain, the floods, pouring down the sides of Mayon and sweeping along with them the loose volcanic debris, brought destruction on Manille, Camalig, Gubatoban, Ligao, Oas, Polangin, Libon, and other places, filling up the roads, in sinking down the bridges, and completely ruining upwards of 6000 houses. During 1881 and 1882 the eruptive forces were again exceedingly active. Still farther to the south, in the very extremity of Luzon, stands the volcano of Bulusan, which, after being for a long time apparently extinct, began again to smoke in 1862. According to Jagor (*Research*, p. 66), it repeats in striking fashion the forms of Vesuvius, having two peaks, one rising a hill, and down the side the eruption cone, and in the east a high ridge similar to Monte Somma, probably the remains of a great cinder crater. As in Vesuvius, the present crater is in the centre of the extinct one. In the island of Negros, 150 miles south-west of Bulusan, there is the volcano of Malaspina or Canlaon (8190 feet), the island of Fuego probably takes its name from its volcanic phenomenon, and about 90 miles farther to the south-east a new volcano burst out in 1876 in the island of Camarines, not to be confounded with the volcano, with Camungon off the north coast of Luzon, near the village of Catarman. In the great island of Mindanao we have the three volcanoes of Macatung (Sugut, Polloc, or Cottabato), inland from Piana Bay, and Apo and Sangul (Sarangani or Butulan), both in the central cordillera and the latter almost at its southern terminus. Though the last great eruption of Cottabato was in 1866, it is still active at intervals, and in 1871 the town of the same name was

¹ It was supposed till quite recently that there were two mountains in this district, one being Macatung, the other Sugut, Polloc, or Cottabato.

partially destroyed by earthquakes. Apo, according to Schadenberg and Koch, has three summits, in the midst of which has the great crater, now extinct and filled with water. Considerable energy is still displayed by the solitaires and boiling springs lower down.

It is difficult to say how these various volcanoes are related to each other, José Centeno suggests with considerable probability that they form two lines of activity, an eastern comprising Isaoig, Albay, Bulusan, Camungun, Apo, and Butulan, and a western Buguanas (extinct), Arayat (extinct), Taal, Canlaon, Macatung. Three only of the larger islands, it will be observed, contain actual centres of eruption, and some of the larger volcanoes appear to be in the later stages of their activity,—Albay generally discharging an incoherent foam of lava, whilst Taal and others discharge nothing but ashes. Other phenomena usually associated with volcanic activity are common enough throughout the archipelago: there is a great deposit of sulphur in the middle of the island of Leyte, inflammable gas bursts out in the middle of Panay, and there are hot springs at Buguanas, at Los Baños or Maynat, already mentioned, at Pagsangan, at San Luis or Maynat in Batangas, in the Tayasan Mountains, at Tibi or Tivi, &c. At Los Baños there was a regular bathing establishment erected by the Franciscans in 1871; but it was burned down in 1727, and, though rebuilt by public subscription in 1880, may be said to be in a chronic state of decay. The Tibi springs, described in detail by Jagor (*Research*, pp. 114, 115), are remarkable for beautiful cones produced by the deposit of siliceous material. The water in some cases is hot enough to cook food. They are situated on the east coast of Luzon on Lagonoy Bay.

Earthquakes.—Earthquakes are sufficiently frequent and violent in the Philippines to affect the style adopted in the erection of buildings; in 1874, for instance, they were very numerous throughout the archipelago, and in Manila and the adjacent provinces shocks were felt daily for several weeks. The most violent earthquakes on record in the Philippines occurred in July 1880, when the destruction of property was immense, both in the capital and in other important towns of central Luzon.

Minerals.—Though hitherto little advantage has been taken of its existence, there appears to be in several of the islands a fair amount of mineral wealth. Two coal-fields are known to exist, one beginning in Caranran in the south of Luzon, and probably extending southwards across the Strait of San Bernardino to Catablongan in Samar, and another occupying the western slopes of Cebu and the eastern slopes of Negros, and thus probably passing under the Strait of Taton. In the first basin there is a bed from 10 to 20 feet thick cropping out at Gato, which has given good results as a fuel for steamboats; in the second Centeno reports at least five beds of varying thickness and quality. The first discovery of the mineral was made in Cebu in 1827. Hitherto little success has attended the schemes of exploitation. Iron-ore of excellent purity occurs in various parts of Luzon, in Laguna, Bulacan, Pampanga, Camarines Norte, and notably in the Camachin Mountains between the Bulacan and the Carlan; but, with the exception of a few small foundries in Bulacan province, there are no iron-works in the country. In this department there was actually more activity a century ago. Copper-mines are worked at Mancayan, Syuc, Bumucum, and Agbao in the province of Lepanto, by the Cantabro-Philippine Company, founded in 1862, and the heathen natives of that region (perhaps having learned the art from Chinese or Japanese strangers) appear to have long been accustomed to manufacture copper utensils for their own use and for sale in the Christian settlements. The ore at Mancayan contains upwards of 16 per cent. of copper, 24 of sulphur, 5 of antimony, and 5 of arsenic. For a short time after 1847 copper-mines were worked

at Assit in the island of Masbate, and it is known that copper ores exist in the provinces of Tayabas and Camarines Sur (Luzon), Antique (Panay), and the island of Capul. Gold is very generally distributed throughout the archipelago, but mostly in insignificant quantities. From the deposits in Camarines Norte (in Paracale, Mambulao, Labo), where it occurs in places and in quartz and other rocks, about 30 oz per month are obtained. Much more important are the gold-washings of Misamis and Surigao in Mindanao, the former of which yield about 150 oz. per month. Neither the mercury nor lead veins discovered at different times have proved of economic value.¹

Climate.—As the north part of Luzon is as far from the south of the Sulu Islands as the north of England from the south of Italy, and as the archipelago is divided by the line of the equator, the climate of one region differs considerably from that of another, though the general characteristics are everywhere tropical. The northern islands lie in the region of the typhoons. Three seasons are usually recognized,—a cold, a hot, and a wet. The first extends from November to February or March, the winds are northerly, and, though there is no need for fire, woollen garments can be worn with comfort in the mornings; the sky is for the most part clear and the atmosphere bracing, and Europeans look forward to this period as the most enjoyable of the year. The hot season lasts from March to June, and the heat becomes very oppressive before the beginning of the southerly monsoon. Thunderstorms, often of terrific violence, are of frequent occurrence in May and June. The wet season is usually ushered in by the heavy rains locally known as "collas." During July, August, September, and October the rain comes down in torrents and large tracts of the lower country are flooded. According to the observations of the Jesuits at Manila during the eight years 1870 to 1877 the total rainfall (distributed over 115 days) amounted to 66.6 inches.

		Cold	Hot	Wet
Manila	Mean temperature	72° 32	87° 26	84° 56
	Rainfall	8.95	10.47	36.01
Cebu	Mean temperature	75° 02	88° 28	75° 88
	Rainfall	12.54	9.29	26.90
Davao	Mean temperature	86° 90	88° 70	87° 11
	Rainfall	16.53	39.27	52.15
Sulu	Mean temperature	81° 98	82° 37	83° 03
	Rainfall	15.74	33.85	35.43

Fauna.—The mammals of the Philippines are strikingly few, especially when contrasted with those of such an island as Java, but their number may yet be slightly increased, and nine-tenths of them are peculiar species. Since *Cynopithecus niger* was struck out of the list, the only monkey known to science is *Macacus cynomolgus* (chongo of the Tagals), found in all the islands; but there are also pure white monkeys (not albinos) in Mindanao, and specimens are occasionally sold at Manila. The lemuroids are represented by the strange little *Tarsius spectrum*, the insectivora proper by *Galeopterus philippensis* and a "tupaia," or squirrel-shrew. Of carnivora there are three species, two civets and a wild cat, as well as the ordinary domestic animal. The rodents comprise only a few squirrels, *Scurus philippensis*, &c., a porcupine, and two or three rats. Of bats there are between twenty and thirty species. The wild boar is regularly hunted in all the islands; the natives throughout the archipelago keep large numbers of black

pigs, and the Babuyanes group take their name from *babuy*, "a pig." Of deer there are three species, *Cervus marianus*, *C. philippensis*, and *C. Alfreddi*, and a chevrotin or mouse-deer (*Tragulus*) is found, more especially in Bataan. Tapa, or sun-dried deer's flesh, is a favourite food with the natives. The statement that the horse has become wild in the interior of several islands is founded on a mistake. The ordinary domestic variety, probably of Spanish, Chinese, and Japanese origin, is "generally small, but well-shaped and hardy, the largest and best breeds coming from Batangas, Albay, and Camarines, the smallest and probably the hardest from Iloos" (D. M. Forbes). For all kinds of field work the buffalo ("caibao") is employed, ordinary cattle and goats are common enough, and some of the former are of great excellence. As there is a Tagalog name for it, it has been supposed that the elephant was at one time to be met with in the Philippines, and in the Sulu Islands, at least, it is said to have existed in the 17th century.

The birds of the Philippines proper show the isolated character of the group by the absence of a large number of ordinary Malayan forms, and at the same time there is a considerable proportion of genera from Australia, India, and China. Viscount Walden (*Trans Zool Soc*, vol. ix, 1877) found the known species numbered 219, and R. B. Sharpe, by the assistance of Professor Steere's collections, brought the total up to 287 species, of which 151 were peculiar to the Philippines. To these must be added several species hitherto only found in the Sulu Islands. Palawan has a strong Bornean element. It is enough here to mention a number of peculiar woodpeckers, beautiful little parakeets (*Loriculus*), a number of pigeons (including at least one peculiar genus, *Phapitreron*), cockatoos, mound-builders, and a peculiar hornbill, *Penelopides*, known from its note as "calao" to the natives, who frequently tame it. The principal game bird is the jungle-fowl (*Gallus bankiva*).²

Alligators abound in some of the lakes and rivers; and turtles, tortoises, and various kinds of lizards are familiar enough forms, one of the last, the "chacon," is believed by the natives to be a defence against earthquakes. The beauty and variety of the butterflies and the destructiveness of the termites are obtrusive features of the insect life; the land-shells are peculiar, numerous, and remarkable for delicacy of form and colour. Some of the molluscs attain gigantic dimensions, the "taciobo" shell sometimes weighs 200 lb, and is used for baptismal fonts. One of the most valuable kinds of fish is the "dalag" (*Ophiocephalus vagus*), and one of the most peculiar the *Hemirhamphus unipinna*.

Flora.—The flora of the Philippines is essentially Malayan, intermixed with a Chinese element, but with sufficient individuality to constitute a sub-region. According to Llanos's edition of Manuel Blanco's *Flora de Filipinas*,³ 4479 species are known belonging to 1223 genera and 155 orders. Among the dicotyledons the orders most abundantly represented are: *Leguminosae* (77 genera), *Rubiaceae* and *Compositae* (each 41), *Euphorbiaceae* (32), *Urticaceae* (25), *Acanthaceae* (28), *Apocynaceae* (22), *Asteriaceae* (20), *Supradaceae* (20); and among the monocotyledons *Orchidaceae* (80), *Palmæ* (28), *Araceae* (27), *Gramineae* (72). Of ferns there are 50 genera. The forests contain more than 200 kinds of wood thought worthy of trial in the arsenal at Manila. Among them may be mentioned the teak-like molave (*Vitex altissima* and *genuiculata*), the dongon (*Sterculia cymbiformis*), the ipel (*Eperua decandra*), greatly prized for its hardness; the lauan or lawaan (*Dypterocarpus thurifer*), a light stringy wood, often used by the Malays for their canoes, the bolongeta (*Diospyros pilosanthera*), employed for fine kinds of furniture.

² See Wallace, *Geogr. Distr. of Animals, and Island Life*.

¹ The best résumé of geological facts in regard to the Philippines is J. Roth, "Ueber die geologische Beschaffenheit der Philippinen," published as an appendix to Jager's *Reisen*, but, like the other appendices, left out in the trustworthy English translation. Druse gives a good deal of fresh material in *Fragments zu einer Geologie der Insel Luzon*, reproduced in *Boletín de la Comisión del Mapa Geológico de España*, vol. viii, 1881. Perrey has collected information about the Philippine earthquakes in *Mém. de l'Acad. de Lyon*, 1880, &c.

³ First ed., Manila, 1837; second ed., 1845; Llanos's ed., 4 vols., 1877-80 (summary in vol. ii.).

Products—Mangoes, plantains, mangosteen, jack-fruit, medlar, and in general most of the Malayan fruits are to be met with, the lanzon occurs in the north, and the durian in the south, more especially in the Sulu Islands. Rice is the staple food of the natives, but, though it is extensively cultivated, the supply is not always equal to the demand. Sweet potatoes (cassava), a kind of yam (pachyranthus), the ground-nut, and gourds are pretty generally grown, as well as occasionally peas, potatoes, and in the higher regions even wheat. The plants which are of primary commercial importance are tobacco, Manila-hemp, sugar-cane, coffee, and cocoa.

Tobacco was made a Government monopoly by Captain General José Basco y Vargas in 1781, and remained so till 1st July 1889. Though it was free to any one to grow the plant to any extent he pleased, the Government has only purchased, fixed its own price, and, paying its debts according to its own convenience, was sometimes three or four years in arrear. Besides, certain districts were bound to furnish a certain quantity of the leaf, and the peasant was thus often forced under severe penalties to devote himself to the tobacco crop when he would have obtained better results from something else. The best tobacco comes from the provinces of Isabela and Cagayan, and it is there that the cultivation is most systematically carried on, but the plant is also grown in other provinces of Luzon (Union, Ilocos, Lepanto, &c.) as well as in the Visayas Islands. The average production in the ten years 1872-81 was 214,400 quintals (each 101 43 English lb), of which 114,400 were from Isabela and Cagayan. About 25,000 quintals were sent to Spain as tribute, and another portion was sold by public auction for foreign export. For the tobacco of Cagayan and Isabela the Government paid in recent years between 10 and 14 dollars per quintal, for the second class between 10 and 11, for the third between 7 and 8, and for the fourth between 6 and 7. About 280 million cigars were manufactured annually in six factories employing 20,000 hands, 95 millions for foreign export and the rest for home consumption. Of the foreign cigars 60 millions went to Singapore, Java, the Moluccas, and India, 30 millions to China and Japan, 4 millions to the United States, and 11 millions to Europe. Hitherto tobacco-planting has been carried on (with few exceptions) only by people of small means, but since the abolition of the monopoly several companies have been started, and the whole condition of the industry will probably soon be greatly modified.

Abaca or MANILA-HEMP (*q v*) is best grown in the south-east of Luzon, in Samar, Leyte, and Bohol. Its cultivation requires little trouble, and the plantations, especially on the property of a native farmer, are managed by a few simple machines of native construction as all that is required in the preparation of the fibre. The abaca districts are generally very poor. Coffee was introduced, probably from Brazil, in the latter part of the 18th century, but the first plantation on a large scale was formed only in 1826. The cultivation is now pretty extensive. Philippine coffee appears in the European markets as Manila or Zamboanga coffee. The former, which comes from Batangas, Cavite, and Laguna to the amount of 70,000 piculs (a Spanish picul=140 lb) per annum, is a small but well-flavoured berry; the latter, principally grown in Mindanao and Sulu, which send a good deal of their produce direct to Singapore, is in less repute, because, while the berry is larger, less care is bestowed on the gathering and sorting. France was at one time the only great purchaser of Philippine coffee, but about two-thirds of the crop now finds its way to Spain, England, the Netherlands, and Australia. In general far too little care is given to the plantations. Sugar is extensively cultivated, and the export has increased from 1,399,434 piculs in 1871 to 3,889,664 in 1881. About a third of the whole is produced by Pampanga, and Cavite, Laguna, Pangasinan, Bulacan, and Batavia also contribute. About 1,200,000 piculs are exported from Iloilo, which collects from Panay and Negros, &c. The finest is probably that from Capiz in Panay, where, as in the Philippine sugar-cane, is generally, the violet-coloured cane grown. Most of the larger plantations (some exceeding 1000 acres) are monastic property, and are less sold to Chinese half-breeds, who are said to succeed better than Europeans. The smaller are cultivated by the proprietors with the assistance of their families and relatives, and less frequently of bond or hired labourers. A tendency has shown itself since 1870 to create larger estates, and to import better machinery; but it will be some time before the Philippine sugar-cane is generally treated according to scientific methods. The finest Manila quality is sent to Spain, and the secondary qualities to England; for the Iloilo sugars the United States are the principal destination.

Trade—Before the conquest there was considerable commercial intercourse between the Philippines and China and Japan, but this, which would naturally have developed enormously if the Spanish trade between Manila and America (see under *Asagao*) had been left free, was interrupted, and at times almost completely stopped, by a series of absurd restrictions, devised on the supposed interest of the trade between Spain and America. For a long period only a single galleon, under Government supervision, was allowed to proceed yearly from Manila to Acapulco, the value of the cargo each way being bound not to exceed a certain sum. Direct trade

with Europe *via* the Cape was commenced in 1764, but, as if the exclusion of all except Spanish ships was not sufficient, a practical monopoly of this field of enterprise was in 1785 bestowed on the Royal Company of the Philippines. With the close of the 18th century a certain amount of liberty began to be conceded to foreign vessels, the first English commercial house was established at Manila in 1809, and in 1834 the monopoly of the Royal Company expired. Manila remained the only port for foreign trade till 1842, when Cebu was also opened, Zamboanga (Mindanao), Iloilo (Panay), Sual (Luzon), Legazpi or Albay (Luzon), and Tacloban (Leyte) are now in the same category, but only Manila, Iloilo, and Cebu have proved of real importance, as they are the only ports where foreign-bound vessels have hitherto loaded. The following table shows how rapidly the trade of the country has recently developed.

	Entered		Cleared		Spanish		British	
	Vessels	Tons	Vessels	Tons	Vessels	Tons	Vessels	Tons
1871	341	253,438	311	222,611	232	87,005	245	186,083
1876	311	216,783	311	222,442	194	86,001	241	186,631
1877	376	251,437	351	249,049	268	104,314	290	187,355
1878	445	263,489	446	305,108	409	178,401	414	212,061
1879	478	317,065	478	325,095	302	231,492	318	212,061
1880	642	449,597	624	400,115	354	871,312	428	201,906

The American trade increased in this period from 101 vessels (129,459 tons) to 164 (202,665). The value of the imports rose from \$11,987,192 to \$26,498,812, and the exports from \$14,837,796 to \$28,450,285. In 1888 833 vessels (270,000 tons) entered at Manila alone, the Spanish numbering 110 (93,000 tons) and the British 132 (92,000 tons), the exports in the same year were valued at \$29,998,000.

The manufactures of the Philippines consist of a variety of textile fabrics (pina fibres, silk, cotton), some of great excellence and beauty, hats, mats, baskets, ropes, furniture, coarse pottery, carriages, and musical instruments.

Islands and Provinces—The *Datanas* and *Abaynays*, the most northerly of the Philippines, have an area of only 280 square miles, with 8700 inhabitants, who pay no tribute. The rearing of horses is the principal occupation. The chief settlement is San José de Ibana in the island of Batan. Camiguin, the southernmost of the *Abaynays*, is about 30 miles from the coast of Luzon.

Luzon covers an area of 40,000 square miles, is the largest island in the whole archipelago, and as the seat of the Government at Manila it is the most important. The northern trunk, so to speak, extends north and south for 840 miles. From the mountains known as *Cabalalos* of Balai or Nueva Ecija two ranges bifurcate and stretch northward—the *Sierra Oriental*, skirting the eastern coast till it ends at Cape Engño, and the *Sierra Occidental*, keeping all the way at a distance of 25 or 30 miles from the eastern base. Between these ranges lies the basin of the Rio Grande de Cagayan, which with its numerous affluents (Banga, Nayan, Mayat, Pongul, Ibulao, &c., from the east, Calao, Calagan, Pmacananauang, and Tulay from the west) forms the largest river-system in the whole archipelago. On the western slopes of the *Sierra Occidental* rise two other large rivers—the *Abra*, which reaches the sea at Vigan or Villa Fernandina, and the *Agno*, which after a winding course falls into the Gulf of Lingayen. To the south-west of the mountains extends a comparatively flat region, which continues southwards to the Bay of Manila and forms one of the richest agricultural districts in the island. It is watered by the lower part of the *Agno* and its lower tributaries, and the Rio Grande de Pampanga with its affluents, which ultimately discharges into Manila Bay, and thus forms a convenient way-way for conveying produce to the capital. There are also in this region a number of extensive lagoons, such as that of Candava. To the west of the flat region the country rises in the considerable Cordillera de Zambales, which contains a number of peaks 5000 or 6000 feet high, and terminates northwards in a great peninsula forming the Gulf of Lingayen and southwards in a similar promontory (*Sierra de Mariveles*) which helps to form the Bay of Manila. To the east and south of this bay the general level of the country gradually and even monotonously, but in a large area of 350 square miles is occupied by the Laguna de Bay, connected with Manila by the Pasig, on which small steamers ply. The depth of this basin, though the southern side is bordered by a semicircular range of extinct volcanoes 6000 or 7000 feet high, seldom exceeds 4 fathoms. Two long capes project from the northern side, the western one being continued by the island of Tuluin. From the south-east corner of the trunk of Luzon there extends for a distance of 150 miles a very irregular peninsula formed by a series of cordilleras running in a north-westerly and south-easterly direction. The following are the provinces and districts into which Luzon is divided, with their chief towns: *Manila* (258,274 inhabitants in 1877), *Manila*; *Bulacan* (262,149), *Bulacan*, *Pampanga* (226,309), *Bacolor*, *Prinsep* (4158),

¹ The figures of the censuses may be trusted for the provinces of Luzon, &c., but often give no idea of the actual native population of the remote districts.

Palen, *Dutroa* (19,000), Balanga, *Zambal* (94,551), Iba, *Panay* (294,291), Languan, *Uman* (113,470), S. Fernando, *Pocos* (201,049), Visayan, *Baros Nabr* (156,715), Lanoag, *Abra* (12,947), Bangued, *Cagayan* (71,307), Tuguegaio, *Luzon* (38,616), Tamaun, *Alcala* (15,107), Bayombing, *Nueva Ecija* (123,771), San Isidro, *Leyte* (132,501), Santa Cruz, *Cebu* (132,061), Cavite, *Manila* (275,075), Batangas, *Palawan* (58,068), *Nueva Caceres* (30,561), Albay, *Chinitas* (156,400).

To the south-west of Luzon lie the Visayas—Samar, Leyte, Bohol, Cebu, Negros, and Panay, with various smaller islands.

Samar (area, 1367 square miles) is separated from the Albay peninsula by the Strait of San Bernardino, 10 miles across. From north-west to south-east it is 120 miles long, its greatest breadth is 60 miles. The provincial capital is Catbalogan on the west coast, a considerable stream—the Catibog, Loguoloucan on Ulit, Sanibao, etc. At Nipa-Nipa on the south-west coast there is a remarkable series of rock-caves in which the people were wont to deposit their dead in coffins.¹ The narrow but extremely beautiful Strait of S. Juanico separates Samar from the island of Leyte. The lesser islands of Butat, Panason, etc., are included in the province of Samar (178,890 inhabitants). *Leyte* (2710 square miles) is 100 miles long and 30 miles wide. The chief town and port, Tacloban, lies at the eastern entrance of the Strait of S. Juanico. Sulphur for the Manila powder-factory is obtained from the solfatara at Monte Limacagan. According to Jago, the east coast is rising and the west is suffering from the encroachments of the sea at Ormoc to the extent of fifty yards in six years. South-west of Leyte is *Bohol* (1496 square miles), the chief town is Tagbilaran at the south-west corner. The province contains (328,674 inhabitants) comprises Siquay and other islands. The important island of *Cebu* (2413 square miles), provincial population, 408,405 is 135 miles long from north to south, but only 30 miles broad at the most. The chief town, Cebu, is the capital of the Visayas group and is next to Iloilo in the matter of commerce. It is only along the coast that cultivation is easy, and none of the villages lie far inland. The island with Cebu and separated from it by a narrow channel, is *Negros* (4870 square miles), population, 504,669, with large sugar plantations, but only one large town, Zamboanga, and no good ports. Bacolod is the administrative centre. North-west of Negros lies *Panay* (4638 square miles), which is divided into the three provinces of Antique (124,103), Iloilo (41,480), and Capuz (249,244), in accordance with its physical conformation. Iloilo is the chief town and the seat of the *aso de Jato*. Off the north-east coast of Panay lies the island of *Guam* (215 square miles).

In line with the peninsula of *Palawan* (Luzon) and the island of *Leyte* is *Buruas* (180 square miles), which forms a province by itself (128 inhabitants), and *Malaboa* (1211 square miles) and *Taco* (121 square miles), which, comparatively sterile and thinly peopled (17,170), are united together. West of these islands lies a considerable cluster, 1, de Tablas (327 square miles), Sibuyan (159 square miles), Romblon, etc., constituting the province of *Zambales* (23,154), *Palawan* (3694 square miles), one of the largest of the Philippines, lies only 10 miles south of Luzon, but its interior, peopled by about 30,000 Mangruanes, a race of doubtful affinity, is practically unexplored, and its eighteen "Spanish" villages are scattered along the coast at great distances from each other and with no proper means of communication. The principal settlement is Calapan, on the north-east coast. *Manila* (348 square miles), situated in the province of *Manila* (68,128), is a flourishing island with 48,000 inhabitants exporting various staples. South-west of Mindoro are the *Calamianes* (17,041 inhabitants), a great cluster of very small islands, the two largest being *Busuanga* (116 square miles) and *Calamian*, and beyond these extends for 230 miles in a south-westerly direction the island *Palawan* or *Paragua* (4676 square miles), which nowhere exceeds a width of 36 miles and sometimes narrows to 10. It is the largest island in the Philippines, and the chief town (578 inhabitants), there are few Spanish posts. *The Sulu or Jolo Archipelago* (948 square miles, about 100,000 inhabitants), annexed by Spain in 1878, consists of about 150 islands divided into the Balanguigan, Sulu, Tapul, Kecapoussan, Tawi-Tawi, Tagbabas, and Pangantaran groups. Many of the smaller islands are uninhabited, but the larger are occupied by an industrious Mohammedan population. They formerly constituted, along with a portion of northern Borneo, an independent state with a hereditary sultan and a regular nobility of great political influence. The highest hill in the principal island, Bunt Timantapan, or Hill of Teas, is so called because it is the last point visible to the natives as they sail away from their native land. Sulu, the present capital, lies on the north coast of the island of Sulu.²

The whole chain of the Sulus is practically a continuation of the south-western promontory of *Mindanao* or *Maguindanao* (37,266 square miles), the second largest island of the archipelago, containing the Spanish provinces of Surigao (58,346), Misamis (38,876), Zamboanga (14,144), Davao (1695), Cotabato (1282). Since about 1876 much light has been thrown on this interesting island³ by the Jesuit missionaries. It is remarkably mountainous, and appears to be divided by the Rangaya or Sugut Cordillera, which runs north-west and south-east, and is continued throughout the great western peninsula of Zamboanga, and, at the other extremity, bends south to form the peninsula of Butatuan. Between the Rangaya range and that of the Tunaay lies the valley of the Grande, a river navigable as far as Matangoghan (70 or 80 miles) and connected with gable as far as Matangoghan. The Rangaya range, which during the rainy season merge, or nearly merge, into one. On the north side of the Rangaya range and connected with the sea by the river Iigan is the great crater-lake of Lanao, which with its little group of secondary crater-lakes probably gave rise to the name of the island, *Maguindanao*, "Land of Lakes." Towards the east and sloping northwards extend the valleys of the Cagayan, the Tagulogan, and the Agusan. This last is the largest river in the whole island. Rising in the Kinabahan Mountains in the south-east, it pursues a very sinuous course for more than 200 miles and falls into Butuan Bay, in the lower regions it is navigable for craft of considerable burden. Mindanao is throughout well peopled, much of it being occupied by independent Mohammedan sultans.

Administration.—The Philippines are subject to a general government with supreme power, assisted by (1) a "council of authorities" instituted in 1850, and consisting of the archbishop, the commander of the forces, the admiral, the president of the supreme court, &c., (2) a central junta of agriculture, industry, and commerce (dating from 1866), and (3) a council of administration. In the provinces and districts the chief power is in the hands of alcaldes mayores and civic-military governors. The chief magistrate of a community is known as the gobernadorcillo or capitan, the native who is responsible for the collection of the tribute of a certain group of families is the cabeza de barangay. Every Indian between the ages of 16 and 60 subject to Spain has to pay tribute to the amount of \$17—descendants of the first Christians of Cebu, now converts, gobernadorcillos, &c., being exempted. Chinese are subject to special taxes, and by a law of 1888 Europeans and Spanish half-castes are required to pay a poll-tax of \$2 50.

Ecclesiastically the Philippines comprise the archbishopric of Manila and the suffragan bishoprics of Nueva-Caceres, Nueva-Segovia, Cebu, and Santa Isabel de Jaro, which were all constituted by the bull of Clement VIII., 14th August 1595, with the exception of the last, whose separation from Cebu dates only from the bull of Pius IX., 27th May 1865. The Augustines Calzados were established in the Philippines in the year 1655, the first being brothers Andueza Udaneta, and they have convents in Manila, Cebu, and Zamboanga. The Franciscans date from 1577, and have convents at Manila and San Francisco del Monte, the Dominicans (1587) at Manila and San Juan del Monte, the Recollects or Strict Franciscans (1606) at Manila, Cavite, and Cebu. The Jesuits, restored in 1859, maintain the missions of Mindanao and Sulu, and they have charge in Manila of the municipal atheneum, the normal school for primary teachers, and an excellent meteorological observatory. There are also sisters of charity, and nuns of the royal monastery of Santa Clara, founded in 1621.

Education.—A good deal has been done for the diffusion of primary education among the natives (every pueblo is bound to have a school), but the standard is not a high one. The press is under strict civil and ecclesiastical control, and all discussion of Spanish or general European politics is forbidden. Several daily papers, however, are published at Manila, *El Diario de Manila* dating from 1848.

Population.—As far as is known, the original inhabitants of the Philippines were the Aetas or Negritos,⁴ so called from their dark complexion. They still exist sporadically, though in limited numbers (perhaps 25,000), throughout most of the archipelago, the Batanes, Babuyan, Samar, Leyte, Bohol, and Sulu excepted. Their headquarters are the northern part of Nueva Ecija, the provinces of Principe, Isabela, and Cagayan. To their presence in Isla de Negros the island owed its name. They are dwarfish (4 feet 8 inches, being the average stature of the full-grown man), thin and spindle-legged, have a head like a Negro's, with flatish nose, full lips, and thick furred black hair, and possess an extraordinary prehensile power in their toes. They tattoo themselves, and wear very little clothing. Cigars they often smoke with the burning end between the teeth—a practice occasionally observed among the civilized Indians. They have no fixed abodes. Honey, game, fish, wild fruits, palm-cabbages, and roots of agave, &c., constitute their food, they sell wax to Christians and Chinese, and exchange for betel and tobacco. The dog is their only domestic animal.

⁵ In Mindanao they appear as *Mamunau*.

destroyed by an earthquake, and in 1846 it suffered from a severe conflagration. During the war of 1877-78 the city was occupied by the Russians.

PHILIPPSBURG, a small town of the grand-duchy of Baden, situated on a sluggish arm of the Rhine, 15 miles to the north of Karlsruhe, was formerly an important fortress of the German empire, and played a somewhat conspicuous part in the wars of the 17th century. It originally belonged to the ecclesiastical principality of Spire, and was named Udenheim, but in 1618 it was fortified and re-christened by Bishop Philip von Sotern. At the peace of Westphalia (1648) the French remained in military possession of Philippsburg, but in 1679 it was restored to Germany, and though again captured by the French in 1688 it was once more restored in 1697. In 1734 the dilapidated fortress fell an easy prey to the French under Marshal Daun, who, however, lost his life beneath its walls, and in 1800 the works were razed. The town was assigned to Baden in 1803. The population in 1880 was 2549.

PHILIPS, AMBROSE (1671-1749), English man of letters, was born of a good Leicester family in 1671. While at St John's College, Cambridge, he gave evidence of literary taste and skill, in verses forming part of a memorial tribute from the university on the death of Queen Mary. Going to London on the completion of his studies, Philips speedily became "one of the wits at Button's," and thereby a friend of Steele and Addison. He began to write for Tonson, working at such heterogeneous subjects as translated "Persian Tales" and a summary of Hackett's *Life of Archbishop Williams*. The first product really characteristic of the author, after his settlement in London, is the series of *Pastorals* which opened the sixth volume of Tonson's *Miscellanies* (1709). Pope's *Pastorals*, curiously enough, closed the same volume, and the emphatic preference expressed in the *Guardian*, in 1713, for Philips's pastoral style over all other successors to Spenser gave rise to Pope's trenchant ironical paper in No. 40 of the same periodical. The breach between those two wits speedily widened, and Philips was at length concerned in the great quarrel between Pope and Addison. He had come to be a man of some note both for literary work and political activity. The *Spectator* had loaded with praises the drama of *The Distressed Mother*, which Philips adapted from Racine's *Andromaque* and brought upon the stage in 1712, and he was thus a recognized member of Addison's following. There is some doubt as to the particular part he played in the notorious contest of the two chiefs, but, whether he threatened to beat Pope or not (with the rod which he is said to have hung up at Button's for that purpose), there is ample evidence to show that both Pope and his friends had a bitter feeling towards him. Not only is he honoured with two separate lines in the *Dunciad*, but he figures for illustrative purposes in *Martinus Scriblerus*, and he receives considerable attention in the letters of both Pope and Swift. The latter found occasion for special allusion to Philips during Philips's stay in Ireland, whither he had gone as secretary to Archbishop Boulter. He had done good work in the *Freethinker* (1711) along with Boulter, whose services to the Government in that paper gained him preferment from his position as clergyman in Southwark, first to the bishopric of Bristol and then to the primacy of Ireland. Up to this time Philips had shown disinterested zeal in the Hanoverian cause, though he had received no greater reward than the positions of justice of peace and commissioner of the lottery (1717). He had also written some of his best epistles, while in 1722 he published two more dramatic works—*The Briton* and *Humphry, Duke of Gloucester*—neither of which has had the fortune, like their predecessors, to be immortalized by

romantic criticism. It was, no doubt, a grateful change for Philips to go to Ireland under the patronage of Archbishop Boulter, and to represent, through the same influence, the county of Armagh in the Irish Parliament, while his sense of his own political worth must have been flattered when he became secretary to the lord chancellor in 1726, and in 1733 judge of the prerogative court. After the archbishop's death he by and by returned to London, and dedicated a collected edition of his works to the duke of Newcastle. He died in 1749.

While it can hardly be said that Philips's *Pastorals* show poetic quality of a high order, they must be commended—and perhaps the third in particular—for ease and fluency and rhetorical vigour in these features they are not surpassed by the pastorals in *The Shepherd's Week*, which Gay wrote, at Pope's instigation, as a burlesque on Philips's work, but the grasp of rustic simplicity and the exquisite play of fancy possessed by Gay are manifest advantages in his performance. The six epistles evince dexterous management of the heroic couplet, an energetic directness of purpose, and (particularly the "winter piece" addressed to the earl of Dorset) a noticeable approximation of natural beauty. Similar felicitous diction and sympathetic observation, together with a determined bias towards weakness of sentiment, are characteristic of the poet's odes, some of which—addressed to children—gave occasion for various shafts from both Swift and Pope, as well as for the nickname of "Nanny-Pamby," coined by Henry Carey as a derogatory epithet for Philips. The epigrams, and the translations from Pindar, Anacreon, and Sappho, need merely be named as completing the list of the author's works.

See Johnson's *Lives of the Poets*, Spenser's *Anecdotes*, the *Spectator*, the *Works* (especially the correspondence) of Pope and Swift; Stephen's *Pope and Contemporary Addison*, in *English Men of Letters*.

PHILIPS, JOHN (1676-1708), English man of letters, son of Dr Stephen Philips, archdeacon of Salop, was born at Bampton in Oxfordshire in 1676. After receiving private education at home, he went to Winchester School, and in due course became a student of Christ Church, Oxford. At school he showed special aptitude for exact scholarship, and at the university, under Dean Aldrich, he became one of the most remarkable men of his time. He was an ardent and successful student of the ancient classics, and took special pleasure in making himself thoroughly familiar with Virgil. At the same time he was diligent in his scientific pursuits preparatory to the medical profession he intended to follow, and, although the botany and other branches he made himself familiar with were never actually tuned to account in the business of life, his acquired knowledge gave him material for literary purposes. But, over and above these studies, Philips was a careful and critical reader of the English poets that fell in with his tastes, and devoted much time to Chaucer, Spenser, and Milton. When he began to write, the influence of the two former told to some extent on his diction, and he was so enamoured of the strenuous movement and the resonant harmonies of Milton's blank verse that he adapted the form of all his original English writings to that supreme model. Were it for nothing else, John Philips will be remembered as the first to have a genuine literary appreciation of Milton. He was well known in his college for scholarship, taste, and literary resource long before publishing any of his writings, but the appearance of *The Splendid Shilling*, about the year 1703, at once brought him under the favourable notice of critics and readers of poetry. The *Tatler* (No. 280) hailed the poet as the writer of "the best burlesque poem in the British language," nor will the modern reader care to detract much from this verdict, even granting that the model and the imitation, mutually constituting a great revelation to the literary dictators of the period, would cause them considerable surprise. Philips in this poem showed the dexterous ease that comes of long study and perfect familiarity, combined with fertility of resource and humorous ingenuity of application. One important result of the work was the interested notice of the earl of Oxford and Lord Bolingbroke. The poet went to London, and

was asked to celebrate the victory of Blenheim, which he did in his favourite manner, but without conspicuous success. *The Blenheim*, published in 1705, lacks, of course, the element of burlesque, and it is difficult to resist the impression that the poet must have felt himself restrained and hampered by the stern necessity of being seriously sublime. A year later (1706) Philips published, in two books, his didactic poem entitled *Cydel*, which is his most ambitious work and is written in imitation of Virgil's *Georgics*. While there is no denying the poet's admirable familiarity with his original, or his skilful employment of the Miltonic blank verse, or the sustained energy and grace of some of the episodes in the second part, or even his intimate knowledge of the minute details connected with the management of fruit, it cannot be said that the work is a notable contribution to English poetry. It is streaked with genius, but, like the Latin *Ode to St John* (and, for that matter, the author's other works as well), it is little more than the expression of a poetical scholar feeling his way outwards into life. Philips never got beyond the enjoyment of his pipe and his study, both of which figure prominently in all his poems. He was meditating a still further work on the Last Day, when he was cut off by consumption, in 1708, at the early age of thirty-two. His friend Edmund Smith, himself a distinguished scholar and poet, wrote an elegy on the occasion, which Johnson says "justice must place among the best elegies which our language can show." Philips was buried at Hereford, and a monument to his memory, with an inscription from the pen of Atterbury, was erected between those of Chaucer and Drayton in Westminster Abbey.

See Johnson's *Lives of the Poets*, including Smith's *Prefatory Discourse*; Sewall's *Life of Mr John Philips*; the *Tattler*, etc.

PHILIPPUS, M. JULIUS, Roman emperor from 244 to 249 A.D., often called "Philip the Arab," was a native of Bostra or the Trachonitis, who, exchanging the predatory life of the Arabs who hung on the desert borders of the empire for Roman military service, rose to be praetorian prefect in the Persian campaign of Gordian III, and, inspiring the soldiers to mutiny and to slay the young emperor, was raised by them to the purple (244). Of his reign little is known except that he celebrated the secular games with great pomp in 248. A rebellion broke out among the legions of Moesia, and Decius, who was sent to quell it, was forced by the troops to put himself at their head. Philip was defeated near Verona and perished in or after the battle, leaving a very evil reputation. Eusebius knows a current opinion that Philip was a Christian, Jerome and later writers state this as a fact. But at best his Christianity must have been merely nominal and had no effect on his life or reign. With Philip perished his son and colleague, then a boy of twelve, who is known as Philip the Arab.

PHILISTINES (פְּלִשְׁתִּים), the name of a people which, in the latter part of the age of the Judges and up to the time of David, disputed the sovereignty of Canaan with the Israelites (see ISRAELI, vol. xiii. p. 402 sq.). The Philistine country (פְּלִשְׁתִּים), Palestine; the authorized version still uses the word in this its original sense as equivalent to Philistia) embraced the rich lowlands on the Mediterranean coast (the Shephelah) from somewhere near Joppa to the Egyptian desert south of Gaza, and was divided between five chief cities, Ashdod or AZOTUS (גִּזְרִי), GAZA (גִּזְרִי), and Askelon (Ashkelon, ASQALON, גִּזְרִי) on or near the coast, and GATH (גִּזְרִי) and EKRON (גִּזְרִי) inland. The five cities, of all of which except Gath the sites are known,¹ formed a confederation under five "lords" (Seranim).²

¹ Their modern names are Azdūd, Ghazza, 'Askalān, 'Akir.

² The word *seren*, pl. *seranim*, means an axle, and seems to be applied metaphorically like the Arabic *kolb*.

Ashdod was probably the foremost city of the confederation in the time of Philistine supremacy, for it heads the list in 1 Sam vi 17, and it was to the temple of Dagon in Ashdod that the ark was brought after the battle of Aphek or Ebenezer (1 Sam v 1). Hebrew tradition recognizes the Philistines as immigrants into Canaan within historical times, like the Israelites and the Aramaeans (Amos ix 7), but unlike the Canaanites. They came, according to Amos, from Caphtor (comp. Jer. xlv. 4), and Deut. ii 23 relates that the Caphtorim from Caphtor displaced an earlier race, the 'Avvim, who were not city-dwellers like the Canaanites, but lived in scattered villages. The very name of Philistines probably comes from a Semitic root meaning "to wander", the Septuagint calls them 'Αλλόφυλοι, "aliens". The date of their immigration cannot be determined with certainty.³ We are scarcely entitled to take Gen. xxi, xxvi, as proving that the inhabitants of Gath in patriarchal times were identical with the later Philistines, and the other references in the Pentateuch and Joshua are equally inconclusive. The first real sign of the presence of the Philistines is when the Danites, who in the time of Deborah were seated on the sea-coast (Judges v. 17), were compelled—obviously by the pressure of a new enemy—to seek another home far north at the base of Mount Hermon (Judges xviii). This marks the commencement of the period of Philistine aggression, when the foreigners penetrated into the heart of the Israelite country, broke up the old hegemony of Ephraim at the battle of Ebenezer, and again at the battle of Mount Gilboa destroyed the first attempt at a kingdom of all Israel. The highest power of the Philistines was after the death of Saul, when David, who still held Ziklag, and so was still the vassal of Gath, reigned in Hebron, and the house of Saul was driven across the Jordan. But these successes were mainly due to want of union and discipline in Israel, and when David had united the tribes under a new sceptre the Philistines were soon humbled. After the division of the kingdom the house of Ephraim appears to have laid claim to the suzerainty over Philistia, for we twice read of a siege of the border fortress of Gibeon by the northern Israelites (1 Kings xv. 27, xvi. 15), but the Philistines, though now put on the defensive, were able to maintain their independence. Philistia was never part of the land of Israel (2 Kings i 3, vii 2; Amos vi. 2), and its relations with the Hebrews were embittered by the slave trade, for which the merchants of Gaza carried on forays among the Israelite villages (Amos i 6). On the other hand, the trading relations between Gaza and Edom (Amos, *ut sup.*) probably imply that in the 8th century Judah, which lay between the two, was open to Philistine commerce (comp. Isa. ii. 6); Judah under Uzziah had reopened the Red Sea trade, of which the Philistine ports were the natural outlet.⁴ Soon, however, all the Palestinian states fell under the great empire of Assyria, and Tiglath-Pileser, in 734 B.C., subdued the Philistines as far as Gaza. But the spirit of the race was not easily broken, they were constantly engaged in intrigues with Egypt, and had a share in every conspiracy and revolt against the great king. Of two of these revolts, first against Sargon in 711, and afterwards against Sennacherib on Sargon's death (705), a memorial is preserved in Isa. xx., xiv. 29 sq. In the latter revolt Hezekiah of Judah was also engaged; it was to him that

³ For some Egyptian evidence, see PHENICIA.

⁴ The Chronicle, who represents the relations of Judah and Philistia as generally unfriendly, makes Uzziah subdue the latter country as well as Edom, assuming perhaps that he was the fulfiller of the prophecy in Amos i, in which, however, it is the Assyrians who are really pointed to as the ministers of divine justice. The old history has no trace of pretensions of Judah to sovereignty in Philistia till the time of Hezekiah. Comp. Wellhausen, *Prolegomena*, p. 217.

Padl, kinglet of Ekron and a partisan of Assyria, was delivered for custody by the rebels. In 701 Sennacherib marched westward and reduced the rebel cities of Ascalon and Ekron, kinglets faithful to his cause were established in both places, and the territories of these Philistine princes and of those of Gaza and Ashdod were enlarged at the cost of Judah. The Philistine war of Hezekiah spoken of in 2 Kings xviii 8 was probably undertaken to regain the lost territory after the disaster of Sennacherib's army. Under Esarhaddon and Assurbanipal the inscriptions still speak of the cities of Philistia as governed by kinglets tributary to Assyria, and, as the power of Nineveh declined and the monarchs of Egypt began to form plans of aggrandizement in Syria, the Philistine fortresses were the first that opposed their advance. According to Herodotus (ii 157) Psammetichus besieged Ashdod for twenty-nine years, from which we may at least conclude that the Shephelah was the scene of a protracted conflict between the two great powers. The prophecy of Zephaniah ii 4 *sg* has by some been held to point to these events, but most recent writers prefer to connect it with the invasion of the Scythians, who in the reign of Psammetichus ravaged the Phœnician coast and plundered the famous temple of Aphrodite Urania (Astarte) at Ascalon (Herod., i 105). The next king of Egypt, Necho, also made war in the Philistine country and smote Gaza (Jer. xliii 9), an event recorded also by Herodotus, who gives to Gaza (Ghazzat, Assyrian Khazti) the name of Cadyas (Herod., ii 159, comp. ii 5). Amidst all these calamities Philistia, like the other countries of Syria in the Assyrio-Babylonian period, must have lost great part of its old individuality. The Philistine towns continued to be important, and Gaza in particular became a great seat of international commerce—Herodotus estimates Cadyas as being almost as large as Sardis—but we can hardly speak further of a Philistine people. After the captivity Nehemiah speaks not of Philistines but of Ashdodites (vi 7), speaking an "Ashdodite" dialect (xiii 24), just as Strabo regards the Jews, the Idumeans, the Gazans, and the Ashdodites as four cognate peoples having the common characteristic of combining agriculture with commerce. In southern Philistia at least the population was modified by Arabian immigration. In the time of Cambyses the Arabs touched the sea immediately south of Gaza (Herod., ii 5), and this perhaps had something to do with the fact that Gaza was the only Syrian city that resisted Cyrus, just as the Persian and Arab garrison of Gaza offered to Alexander the only resistance that he found on his march from Tyre to Egypt.

We have still to consider the much-vexed question of the origin of the Philistines. That they were a Semitic or at least a thoroughly Semitized people can now hardly be made matter of dispute. The short list of proper names derived from the Bible has been considerably enlarged from the Assyrian monuments, and suffices to prove that before as after the captivity their language was only dialectically different from that of the Israelites. The religion too was Semitic, and of that older type when the gods were not yet reduced to mere astral powers, but had individual types and special relations to certain animals. Thus Ekron had its local "Fly-Baal" (Baal-Zebub, 2 Kings i 2 *sg*), the fame of whose oracle in the 9th century B.C. extended as far as Samaria. The more famous Dagon, who had temples at Ashdod (1 Sam. v., 1 Mac. x. 83) and Gaza (Judges xvi. 21 *sg*), seems to have been more than a mere local deity; there was a place called Beth-Dagon in Judaea (Josh. xv 41) and another on the borders of Asher (Josh. xix 27). The name Dagon seems to come from 17, "fish," and

that his idol was half-man half-fish is pretty clear from 1 Sam. v. 4, where, however, the text is hardly sound, and we ought probably to read, omitting one of two consecutive *nuns*, "only his fish-part was left to him."

There are two other views about Dagon (1) Philo Byblus (Müller, *Fr. Hist. Græc.*, ii 567 *sg*) makes Dagon the inventor of corn and the plough, whence he was called *Zeus Ἀσπότης*. This implies an etymology of a very improbable kind from the Hebrew and Phœnician 17, "corn." But it is probable that, at least in later times, Dagon had in place of, or in addition to, his old character that of the god who presided over agriculture, for in the last days of paganism, as we learn from Marcus Diaconus in the *Life of Porphyry of Gaza* (§ 10), the great god of Gaza, now known as Marina (our Lord), was regarded as the god of rains and invoked against famine. That Marina was lineally descended from Dagon is probable in every way, and it is therefore interesting to note that he gave oracles, that he had a circular temple, where he was sometimes worshipped by human sacrifices, that there were wells in the sacred precinct, and that there was also a place of adoration to him situated, in old Semitic fashion, outside the town. Certain "maimota" in the temple, which might not be approached, especially by women, may perhaps be connected with the threshold which the priests of Dagon would not touch with their feet (1 Sam. v. 5, Zeph. i 9). (2) Schrader (*K. A. T.*, 2d ed., p. 181 *sg*) identifies Dagon with the Assyrian god Dakan, and believes that the word is Accadian. We are here in a region of pure conjecture, the attributes of Dakan are unknown, save only that Beosis speaks of an Assyrian worm-god *Daka-ur*.

To the male god Dagon answers in the Bible the female deity Ashtoreth, whose temple spoken of in 1 Sam. xxxi. 10 is probably the ancient temple at Ascalon, which Herodotus regarded as the oldest seat of the worship of Aphrodite Urania. This Ashtoreth is the Derketo of Diodorus (ii. 4) and Lucian (*De Dea Syr.*, 14), the Atargatis of Xanthus (*Fr. Hist. Græc.*, i 155), whose sacred enclosure and pool were near Ascalon, and whose image had a human head, but was continued in the form of a fish.² The association of Ashtoreth with sacred pools and fish was common in Syria, and the sacred doves of Ascalon mentioned by Philo (ed. Mangey, ii 646) belong to the same worship.³ Of the details of Philistine religion in the Biblical period we know almost nothing.⁴ Their gods were carried into battle (2 Sam. v. 21), a usage found among other Semites, their skill in divination is alluded to in Isa. ii. 6, and we have already seen that oracles were a feature in their shrines. The whole record shows a religion characteristically Semitic in type, and it is also noteworthy that at the earliest date when the Philistines appear in history the great sanctuaries are all on the coast with deities of a marine type. This raises a presumption that the Philistines came from over the sea, and that Caphtor, their original home, was an island or maritime country.⁵ In point of fact the Philistines must have entered their later seats either by sea or from the desert between Canaan and Egypt. In the latter case they come from Egypt, for a city-building people, which supplanted a race of villagers, cannot have been a tribe of Arabs. And so the theories about the origin of the Philistines reduce themselves to two, one class of writers holding that Caphtor must be sought across the Mediterranean, another placing it in the

² The name Atargatis is a later compound, of which the first half is the Aramaean form of Ashtar ('Attar'), and the second is 𐤀𐤓𐤕𐤕.

³ The Aphrodite of Gaza in Marcus, *Vit. Porph.*, § 59, is rather Aphrodite Pandemos. She gave oracles by dreams in matters relating to marriage.

⁴ Schrader thinks that traces of Jehovah (Jahveh) worship among the Philistines are to be found in the Philistine names Padl, Mimiti, Sidka, &c., on the Assyrian inscriptions (see also Friedrich Delitzsch, *Was lag das Paradies?* p. 162 *sg*). It is probable enough that Sidka at least is a shortened form of a name in which the second element was that of a god; but such Phœnician names as Kalbā (aid by side with Kalbālim), Hanno, Abdi or Bodo, &c., show that the shortening does not in the least imply that the divine name was Jahveh.

⁵ The expression "isla" (an coastland, Heb. 𐤓𐤕) of Caphtor in Jer. xlv. is generally used as conclusive to this effect, but in the context it is by no means clear that it means anything more than the coastland of Philistia.

¹ The reference to Necho and Gaza is not in the Septuagint of Jer. xliii. 1, and it would be more natural to think of Chaldaea as the enemy from the north whom Jeremiah describes.

Delta. Ancient tradition gives no help, for it takes Caphtor to be Cappadocia, led, it would seem, merely by a superficial similarity of the names. Of the two main theories the former is that which has recently found most support, and it has a definite point of attachment in the fact that the Philistines, or a part of them, are also called in the Bible Cherethites (1 Sam. xxx. 14, Ezek. xxv. 16, Zeph. i. 5), while David's Philistine guards are in like manner called the Cherethites and Pelethites (2 Sam. viii. 18, xv. 18, &c.). Cherethites (Kērim) can hardly be anything but Cretans, as the LXX actually renders it in Ezekiel and Zephaniah, and Caphtor would thus be the island of Crete, —an identification which seems to satisfy the conditions of a reasonable hypothesis. For, though the points of contact between Crete or Cretan religion and the Philistine coast which have been sought in Greek and Latin writers (chiefly in Steph. Byzant., s.v. "Gaza") are very shadowy, there is no doubt that Crete had an early connexion with Phœnicia and received many Semitic inhabitants and a Semitic civilization before the Greeks gradually asserted themselves in the Ægean and forced back the tide of Semitic influence (for details, see the article ΠΡΩΙΝΙΚΙΑ). These facts give a reasonable explanation of the settlement on the Philistine coast within historical times of a maritime people, cognate to the Phœnicians in so many points and yet having certain distinct characters, such as would naturally be produced in a place like Crete by the grafting of a Semitic stock and culture on ruder races not Semitic (the Eteocretans).¹ The opposite view, which places Caphtor in the Delta, rests on more complicated but less satisfactory arguments. There were certainly many Semites in the Delta of Egypt, and so long as the history of the Hyksos (who were no doubt Semites) remains in its present obscurity it is always possible to suppose that their expulsion from Egypt explains the settlement of the Philistines in Canaan. But it is very questionable if the dates will fit, the name Caphtor is connected with the Delta by no historical testimony, but only by elaborate hypotheses, as that Caphtor may mean in Egyptian Great Phœnicia, and that this again may have been a name for the Egyptian coast, where there was a large Semitic population,² and the characteristic Philistine peculiarity of uncircumcision, intelligible enough on the Cretan theory, is scarcely conceivable in a race which had been long settled in Egypt. The mainstay of the Egyptian hypothesis is found in Gen. x. 13, 14,—verses which belong to the older part of the chapter (see NOAH), and reckon in the very obscure list of descendants of Mizraim or Egypt "Casulim" (whence came forth Philistim) and Caphtorim." This account places Caphtorim in some relation to Egypt, but not necessarily in a very close relation, for the Ludim, who are also made descendants of Egypt, are scarcely different from Lud or Lydia, which appears at ver. 22, in the later part of the chapter, in another connexion. But further, if the text as it stands is sound, it gives a new account of the origin of the Philistines, which can be reconciled with the other Biblical evidence only by making Casulim a halting-place of the Philistines on their way from Caphtor to Canaan. Accordingly the advocates of the Egyptian theory propose to identify Casulim with the arid district of Mount Casius on the coast of the Egyptian desert. But this is false etymology. Mount Casius is named from the temple of Jupiter Casius, that is, the well-known Semitic

God ʾAsp,³ whose name as written in Semitic letters has no possible affinity to Casulim. And in truth the statement that the Philistines came from Casulim, presented without a hint as to their connexion with Caphtorim, which is mentioned immediately afterwards, lies under strong suspicion of being a gloss, originally set on the margin by a copyist who meant it to refer to Caphtorim.⁴ In this case the original author will have meant Caphtorim to denote, or at least include, the Philistines (who, as they are not Canaanites, and had close relations with Egypt in historical times, fall readily enough under the Egyptian group), and tells us nothing about the origin of the race.

Literature—Hitzig, *Urgeschichte* . . . der *Philistæi*, 1846, where the now untenable hypothesis of a Pelasgic origin of the Philistines is maintained, Ewald, *Gesch. des 17. Israhel*, i. 348 sq., and in general the books on Hebrew history and commentaries on Gen. x. and on Amos. A useful monograph is Stark's *Gaza und die philistäische Küste*, Jena, 1859. For the Assyrian evidence see especially Schaefer, *Kleinarchäologie und Altes Testament*, 2d ed., Gießen, 1883. (V R 8.)

PHILLIP, JOHN (1817-1867), subject and portrait painter, was born at Aberdeen, Scotland, on 19th April 1817. His father, an old soldier, was in humble circumstances, and the son became an errand-boy to a tinsmith of the place, and was then apprenticed to a painter and glazier. Meanwhile he was employing in the pursuit of art all the time he could spare from his daily duties, and, having received some technical instruction from a local artist named William Meice, he began, at the age of about fifteen, to paint portraits. In 1834 he was enabled to make a very brief visit to London, where he studied with delighted interest in the Royal Academy Exhibition and the National Gallery. At this time, or shortly afterwards, he became assistant to James Forbes, an Aberdeen portrait-painter, under whose tuition he made considerable progress. Previously, however, he had gained a valuable patron. Having been sent to repair a window in the house of Major P. L. Gordon, his interest in the works of art which hung on the walls attracted the attention of their owner. He brought the young artist under the notice of Lord Panmure, who bought several of his productions, and in 1836 sent the lad to London, promising to bear the cost of his art-education. At first Philip was placed under T. M. Joy, but he soon entered the schools of the Royal Academy, where he worked diligently, but with no exceptional promise or success, for two years. In 1839 he figured for the first time in the Royal Academy Exhibition with a portrait and a landscape, and in the following year he was represented by a more ambitious figure-picture of Tasso in Disguise relating his Persecutions to his Sister. For the next ten years he supported himself mainly by portraiture and by painting subjects of national incident, such as Presbyterian Catechizing, Baptism in Scotland, and the Spaewife. His productions of this period, as well as his earlier subject-pictures, are reminiscent of the practice and methods of Wilkie and the Scottish genre-painters of his time, often possessing considerable grace of form, executed in a thin delicate style of painting, inclining to brownish tones of colour, and with the more powerful pigments introduced cautiously and with reserve. The Letter-writer of Seville, shown in the Royal Academy of 1854, marks a distinct change of both style and subject. Three years previously the artist's health had shown signs of decay, and his medical advisers had recommended a residence in a warmer climate. Spain was selected, and a fresh potency came to his art as well as to his physical frame. He was brought face to face for the first time with the brilliant sunshine and the splendid colour of the South, and it was in coping

¹ In 2 Sam. xx. 23, Kērim, and 2 Kings xi. 4, 19, the foreign mercenaries are called not Kērim but Kārī, perhaps Carians. The Carian seamen and pirates had also a strong Semitic strain, and were at bottom the same race with the Eteocretans.

² So Ebers, *Ägypten und die Bucher Mose*, where the theory is supported by a very long and complex argument. Another etymology in support of the theory is given by Dietrich in *Meyer's Archiv*, i. 313 sq.

³ See De Vogüé, *Syrie Centrale*—*Inscr. Sem.*, p. 108 sq.

⁴ So Olshausen, and Budde, *Biblische Urgeschichte*, p. 381, note. A mere transposition (so Ewald, Tuch, &c.) is much less probable.

with these that he first manifested his artistic individuality and finally displayed his full powers. In the Letter-writer, commissioned by the Queen at the suggestion of Sir Edwin Landseer, who had been greatly impressed by some of Philip's Spanish sketches, we see the change of method in its initial stages rather than in its complete triumph. The artist is struggling with new difficulties in the portrayal of unwonted splendours of colour and light, the draperies are somewhat cude and textureless, and the picture may justly be charged with a want of complete harmony and of a due sense of the finer gradations of nature. In 1857 Philip was elected an associate of the Royal Academy, and in 1859 a full member. In 1855 and in 1860 other two visits to Spain were made, and in each case the painter returned with fresh materials to be embodied with increasing power and subtlety in the long series of works with which his name is exclusively associated in the popular mind, and which has won for him the title of "Spanish Philip." His highest point of execution is probably reached in the *La Gloria* of 1864 and a smaller single-figure painting of the same period entitled *El Cigarillo*. These Spanish subjects were varied in 1860 by a rendering of the Marriage of the Princess Royal with the Crown Prince of Germany, executed by command of the Queen, and in 1863 by a picture of the House of Commons, subjects presenting extreme artistic difficulties, but treated with much skill and dexterity. During his last visit to Spain Philip occupied himself in a careful study of the art of Velazquez, and the copies which he made after that artist fetched large prices after his death, examples having been secured by the Royal and the Royal Scottish Academies. The year before his death he visited Italy and devoted much attention to the works of Titian. The results of this study of the old masters are visible in such of Philip's works as *La Loteria Nacional*, left uncompleted at his death. This and several other of his later works exhibit symptoms of a fresh change of method, and show signs that his art was again about to take a fresh departure. During this period he resided much in the Highlands, and seemed to be returning to his first love for Scottish subjects, painting several national scenes, and planning others that were never completed. His health had been always delicate, and his strength had been taxed by severe domestic affliction and by the very exceptional rapidity and quantity of his artistic production. In the end of 1866 his excessive application to work for the next year's exhibition induced an attack of bilious fever, which was succeeded by paralysis, and the genial and talented artist expired at London on 27th February 1867 at the age of fifty.

In execution Philip was singularly direct, forcible, and rapid. He was a noble colourist, a painter in the first and simplest sense of the word, concerning himself mainly with the visible and sensuous beauties of his subjects, their purely artistic problems of colour, tone, lighting, and texture. His art dealt with the appearances of things, a sufficiently legitimate sphere for the painter, and was seldom permeated with any very deep human or dramatic interest. His works were collected in the International Exhibition of 1873, and many of them have been excellently reproduced by the engravings of T. Oldham Barlow. In addition to the paintings which we have already specified the following are among the more important:—*Life among the Gipsies of Seville* (1853), *El Paseo* (1856), *Collection of the Olfactory in a Scotch Kirk* (1855), a *Gipsy Water-carrier in Seville* (1855), the *Prayer of Faith shall save the Sick* (1856), the *Dying Contrabandist* (1856), the *Pison Window* (1857), a *Huff* (1859), *Early Career of Murillo* (1865), a *Chat room in the Braserio* (1866).

PHILLIPS, JOHN (1800-1874), one of the foremost of the early geologists of England, was born 25th December 1800 at Marden in Wiltshire. His father belonged to an old Welsh family, but settled in England as an officer of excise and married the sister of William Smith, the "Father of English Geology." Both parents dying when

he was a child, Phillips passed into the care of his uncle. Before his tenth year he had attended four schools, until he entered the old school at Holt Spa, Wiltshire, where he remained for five years, gaining among other acquisitions that taste for classical learning which remained one of his distinguishing traits to the end. From school he went to the house of the Rev B. Richardson, an accomplished naturalist, in whose charge he remained a year, and from whom he obtained not only much knowledge but the strong bent towards the study of nature which thenceforth became the master-pursuit of his life. His uncle, "Strata Smith," at that time lived in London, where he exercised the profession of a civil and mining engineer, though a very large part of his time and earnings was given to the preparation of those maps of England and the English counties on which his fame now rests. In his zeal for geological pursuits Smith often neglected his proper professional work, until, as his nephew said, "he had thrown into the gulf of the Strata all his patrimony and all his little gains." Eventually he gave up his London house and wandered about the country, as the requirements of his maps led him. From the time that young Phillips joined his uncle in London he remained constantly with him, sharing in every piece of professional work, in the preparation of every book and map, and in every tour for fresh geological information. A youth so trained could not fail to become a geologist. In the spring of 1824 Smith went to York to deliver a course of lectures on geology, and his nephew accompanied him. This was the starting-point in Phillips's career. His extensive knowledge of natural science and especially of fossils was now turned to account. He accepted engagements in the principal Yorkshire towns to arrange their museums and give courses of lectures on the collections contained therein. York became his residence, where he obtained the situation of keeper of the Yorkshire Museum and secretary of the Yorkshire Philosophical Society. From that centre he extended his operations to other towns beyond the county, and in 1831 he included University College, London, in the sphere of his activity. In that year the British Association for the Advancement of Science was founded at York, and Phillips was one of the active minds who organized its machinery. He became the assistant general secretary, a post of great labour and proportionate usefulness, which he held for upwards of thirty years. In 1834 he accepted the professorship of geology at King's College, London, but retained his post at York, coming up to London every year to give a course of lectures there. This arrangement lasted for six years, until, in 1840, he resigned his charge of the York Museum and was appointed one of the staff of the Geological Survey of Great Britain under De la Beche. In this connexion he spent some time in studying the Palaeozoic fossils of Devon, Cornwall, and west Somerset, of which he published descriptions and illustrations. Thereafter he made a detailed survey of the region of the Malvern Hills, of which he prepared the elaborate account that appears in vol. ii. of the *Memoirs* of the Survey. His direct connexion with the National Survey was but of short duration, for in 1844 he accepted the professorship of geology in the university of Dublin. Nine years later, on the death of Stickleland, who had acted as substitute for Dr Buckland in the readership of geology in the university of Oxford, Phillips succeeded to the post of deputy, and eventually, at the dean's death, became himself reader, a post singularly congenial to him, and which he held up to the time of his own death, which was almost tragic in its suddenness. He died at All Souls' College on 28d April 1874, but in retiring slipped and fell headlong down a flight of stairs. Paralysis at once ensued, and he expired on the afternoon

of the next day. In 1864 he had been elected president of the British Association.

Phillips was distinguished among his contemporaries for the sweetness and bright cheerfulness of his nature. He had great fluency as a speaker, and always spoke in so pleasant and interesting a manner as to make him a welcome and indeed indispensable intellectual at the annual gatherings of the British Association. His social gifts were not less conspicuous than his attainments in science. But he was not a mere geologist. His sympathies went actively forth into the whole domain of science, and he himself contributed largely to astronomical literature as well as to meteorology.

From the time when he wrote his first paper in 1828 "On the Direction of the Diluvial Currents in Yorkshire" down to the last days of his life Phillips continued a constant contributor to the literature of his science. The pages of the *Journal of the Geological Society*, the *Geological Magazine*, and other publications of the day are full of valuable essays by him. He was also the author of numerous separate works, some of which had an extensive sale and were of great benefit in extending a sound knowledge of geology. Among these may be specially mentioned *Mistakenness of the Geology of Yorkshire* (1835), *A Treatise on Geology* (1837-39), *Memoirs of William Smith, the Father of English Geology* (1844), *The Rivers, Mountains, and Sea-Coast of Yorkshire* (1853), *Manual of Geology, Practical and Theoretical* (1855), *Life on the Earth: its Origin and Succession* (1860), *Fossils* (1869), *Geology of Oxford and the Thames Valley* (1871). To these should be added his monographs in the *Memoirs of the Geological Survey* and the publications of the Palaeontographical Society, and his geological sections and maps.

PHILLIPS, SAMUEL (1815-1864), an industrious and successful *littérateur*, was the son of a Jewish tradesman in Regent Street, London, and was born in 1815. A somewhat precocious talent for mimicry and recitation had disposed his parents to train him for the stage, but they were afterwards induced, through the advice of the duke of Sussex, to send the lad to University College, London. After remaining a year at that institution Phillips proceeded to the university of Göttingen. Having renounced the Jewish faith, he returned shortly afterwards to England and entered Sidney Sussex College, Cambridge, with the design of taking orders. His father's death, however, altered his plans, and, after an unsuccessful attempt, in conjunction with his brother, to carry on his father's business, he in 1841 took to literature as a profession. His first work, the novel of *Caleb Stokely*, appeared originally in the pages of *Blackwood's Magazine*, and he subsequently contributed other anonymous tales to that and to other periodicals. In 1845 he began, through the interest of Lord Stanley, to write political leaders for the *Morning Herald*, and about the same time he obtained an appointment as literary critic on the staff of the *Times*. In the following year he purchased the *John Bull* newspaper, which he edited for only a year; for, finding his strength, which was slowly wasting under the influence of confirmed consumption, quite unequal to such laborious work, he was constrained to abandon the undertaking. From that period till his death Phillips worked cheerfully and courageously as literary critic for the *Times*, and also wrote an occasional review for the *Literary Gazette*. Two anonymous volumes of *Essays from the Times* were published by him in 1852 and 1864. They are written in a light, dashing, picturesque style, sometimes eloquent, frequently bitter, and with a tolerable show of fairness. Phillips took an active part in the formation of the Crystal Palace Company. He was appointed their literary director; he wrote their *Guide to the Crystal Palace and Park*, and the *Portrait Gallery of the Crystal Palace*. In 1852 the university of Göttingen conferred upon him the honorary degree of LL.D. He died at Brighton on the 14th of October 1864.

PHILLIPS, THOMAS (1770-1845), portrait and subject painter, was born at Dudley in Warwickshire on 18th October 1770. Having acquired the art of glass-painting at Birmingham, he visited London in 1790 with an intro-

duction to Benjamin West, who found him employment on the windows in St George's chapel at Windsor. In 1793 Phillips painted a view of Windsor Castle, and ere the two succeeding years had passed he exhibited the Death of Talbot, Earl of Shrewsbury, at the Battle of Castillon, Ruth and Naomi, Elijah restoring the Widow's Son, Cypriod disarmed by Euphrosyne, and other pictures of that class. From the year 1796, however, he seems to have mainly confined himself to portrait-painting, and it was in this walk that he was destined to acquire his reputation as an artist. It was not long before he became the chosen painter of men of genius and talent, notwithstanding the rivalry of Hoppner, Owen, Jackson, and Lawrence; and he has left behind him portraits of nearly all the illustrious characters of his day. His works of this kind are distinguished by simplicity, careful and finished handling, and truth of portraiture, but in colour they are commonly cold and feeble. In 1804 he was elected associate and four years later member of the Royal Academy. In 1824 Phillips succeeded Fuseli as professor of painting to the Royal Academy, an office which he held till 1832. During this period he delivered ten *Lectures on the History and Principles of Painting*, which were published in 1833. He likewise wrote a large number of the articles on the fine arts in Rees's *Cyclopædia*. He died on the 20th of April 1845.

PHILLIPS, WILLIAM (1775-1828), an able mineralogist and geologist, who did much to foster in Britain the study of the sciences to which he was devoted, was born in May 1775. His *Outline of Mineralogy and Geology* was published in 1815 and passed through several editions. His *Introduction to the Knowledge of Mineralogy*, published in 1816, was for upwards of forty years one of the standard text-books in that science. Successive editions of it were brought out under different editors after his death. It was specially distinguished by its elaborate crystallographic details, based upon measurements with Wollaston's reflecting goniometer. But it is chiefly the services rendered by Phillips to the science of geology, then in its infancy, that entitle his name to grateful recollection. In addition to the first work above-named, he published in 1818 a most useful digest of English geology, under the title of *A Selection of Facts, from the best Authorities, arranged so as to form an Outline of the Geology of England and Wales*. This little volume contained a geological map of the country, based on that of W. Smith and some horizontal sections. Its importance in geological literature is to be found mainly in the fact that it formed the foundation of the larger work undertaken by Phillips in conjunction with W. Conybeare, of which only the first part was published, entitled *Outlines of the Geology of England and Wales; and comparative Views of the Structure of Foreign Countries* (1822). This volume made an era in geology. As a model of careful original observation, of judicious compilation, of succinct description, and of luminous arrangement it has been of the utmost service in the development of geology in Britain. Phillips was a member of the Society of Friends. He was a Fellow of the Royal, Geological, and other learned societies. He died in 1828.

PHILO, often called PHILLO JUDEUS, Jewish philosopher, appears to have spent his whole life at Alexandria, where he was probably born c. 30-10 B.C. His brother Alexander was alabarch or arabarch (that is, probably, chief farmer of taxes on the Arabic side of the Nile), from which it may be concluded that the family was influential and wealthy (Jos., *Ant.*, xviii. 8. 1). Jerome's statement (*De Vir. Ill.*, 11) that he was of priestly race is confirmed by no older authority. The only event of his life which can be exactly dated belongs to 40 A.D., when Philo, then a man of advanced years, went from Alexandria to Rome,

at the head of a Jewish embassy, to persuade the emperor Claudius to abstain from claiming divine honour of the Jews. Of this embassy Philo has left a full and vivid account (*De Legatione ad Caesarem*). Various fathers and theologians of the church state that in the time of Claudius he met St Peter in Rome,¹ but this legend has no historic value, and probably arose because the book *De vita contemplativa*, falsely ascribed to Philo, in which Eusebius already recognized a glorification of Christian monasticism, seemed to indicate a disposition towards Christianity.

Though we know so little of Philo's own life, his numerous extant writings give the fullest information as to his views of the universe and of life, and his religious and scientific aims, and so enable us adequately to estimate his position and importance in the history of thought. He is quite the most important representative of Hellenistic Judaism, and his writings give us the clearest view of what this development of Judaism was and aimed at. Since the time of Alexander many Jews had been led to settle beyond Palestine either with commercial objects or attracted by the privileges conferred by the *diadochi* on the inhabitants of the cities they founded. In the great towns of Syria, Asia Minor, and Egypt there were Jewish communities many thousands strong, but the Jews were most numerous in Alexandria, where from its first foundation they formed a considerable part of the population. The development of Judaism in the diaspora differed in important points from that in Palestine, where, since the successful opposition of the Maccabees to the Hellenization which Antiochus Epiphanes had sought to carry through by force, the attitude of the nation to Greek culture had been essentially negative. In the diaspora, on the other hand, the Jews had been deeply influenced by the Greeks; they soon more or less forgot their Semitic mother-tongue, and with the language of Hellas they appropriated much of Hellenic culture. They were deeply impressed by that irresistible force which was blending all races and nations into one great cosmopolitan unity, and so the Jews too on their dispersion became in speech and nationality Greeks, or rather "Hellenists." Now the distinguishing character of Hellenism is not the absolute disappearance of the Oriental civilizations before that of Greece, but the combination of the two with a preponderance of the Greek element. So it was with the Jews, but in their case the old religion had much more persistence than in other Hellenistic circles, though in other respects they too yielded to the superior force of Greek civilization. Thus we must hold to have been the case not only in Alexandria but throughout the diaspora from the commencement of the Hellenistic period down to the later Roman empire. It was only after ancient civilization gave way before the barbarian immigrations and the rising force of Christianity that rabbinism became supreme even among the Jews of the diaspora. This Hellenistic-Judaic phase of culture is sometimes called "Alexandrian," and the expression is justifiable if it only means that in Alexandria it attained its highest development and flourished most. For here the Jews began to busy themselves with Greek literature even under their clement rulers, the first Ptolemies, and here the law and other Scriptures were first translated into Greek; here the process of fusion began earliest and proceeded with greatest rapidity, here, therefore, also the Jews first engaged in a scientific study of Greek philosophy and transplanted that philosophy to the soil of Judaism. We read of a Jewish philosopher, Aristobolus in the time of Ptolemy VI. Philometor, in the middle of the 2d century B.C., of whose philosophical commentary on the Pentateuch fragments

have been preserved by Clement of Alexandria and Eusebius. So far as we can judge from these, his aim was to put upon the sacred text a sense which should appeal even to Greek readers, and in particular to get rid of all anthropomorphic utterances about God. Eusebius regards him as a *Patristic*. We may suppose that this philosophical line of thought had its representatives in Alexandria between the times of Aristobolus and Philo, but we are not acquainted with the names of any such. Philo certainly, to judge by his historical influence, was the greatest of all these Jewish philosophers, and in his case we can follow in detail the methods by which Greek culture was harmonized with Jewish faith. On one side he is quite a Greek, on the other quite a Jew. His language is formed on the best classical models, especially Plato. He knows and often cites the great Greek poets, particularly Homer and the tragedians, but his chief studies had been in Greek philosophy, and he speaks of Heraclitus, Plato, the Stoics, and the Pythagoreans in terms of the highest veneration. He had appropriated their doctrines so completely that he must himself be reckoned among the Greek philosophers; his system was eclectic, but the borrowed elements are combined into a new unity with so much originality that at the same time he may fairly be regarded as representing a philosophy of his own, which has for its characteristic feature the constant prominence of a fundamental religious idea. Philo's closest affinities are with Plato, the later Pythagoreans, and the Stoics.² Yet with all this Philo remained a Jew, and a great part of his writings is expressly directed to recommend Judaism to the respect and, if possible, the acceptance of the Greeks. He was not a stranger to the specifically Jewish culture that prevailed in Palestine, in Hebrew he was not proficient, but the numerous *stymologues* he gives show that he had made some study of that language.³ His method of exegesis is in point of form identical with that of the Palestinian scribes, and in point of matter coincidences are not absolutely rare.⁴ But above all his whole works prove on every page that he felt himself to be thoroughly a Jew, and desired to be nothing else. Jewish "philosophy" is to him the true and highest wisdom, the knowledge of God and of things divine and human which is contained in the Mosaic Scriptures is to him the deepest and the purest.

If now we ask wherein Philo's Judaism consisted, we must answer that it lies mainly in the formal claim that the Jewish people, in virtue of the divine revelation given to Moses, possesses the true knowledge in things religious. Thoroughly Jewish is his recognition that the Mosaic Scriptures of the Pentateuch are of absolute divine authority, and that everything they contain is valuable and significant because divinely revealed. The other Jewish Scriptures are also recognized as prophetic, i.e., as the writings of inspired men, but he does not place them on the same line with the law, and he quotes them so seldom that we cannot determine the compass of his canon. The decisive and normative authority is to him the "holy laws" of Moses, and this not only in the sense that everything they contain is true but that all truth is contained in them. Everything that is right and good in the

¹ The fathers of the church have especially noticed his Platonism and Pythagoreanism, an old proverb even says, with some exaggeration, *ἡ Ἰδαίαν φιλοσοφίαν ἢ Φίλων πλάττωσιν* (Jerome, Photius, and Suidas, *ut supra*). Clement of Alexandria directly calls him a Pythagorean. Eusebius (*II. B.*, ii. 4, 8) observes both tendencies. Recent writers, especially Zeller, lay weight also on his Stoic affinities, and with justice, for the elements which he borrows from Stoicism are as numerous and important as those derived from the other two schools.

² See the list of these in Vallentyne's edition of Jerome (ii. 781-784), and compare Siegfried, "Philonische Studien," in *Memoirs of the Acad.*, ii. 143-163 (1872).

³ See Siegfried, *Philo*, pp. 142-159.

⁴ Euseb., *H. B.*, ii. 17, 1; Jer., *ut supra*; Phot., *Bibl.*, Cod. 106, Suid., s.v. "Φίλων."

doctrines of the Greek philosophers had already been quite as well, or even better, taught by Moses. Thus, since Philo had been deeply influenced by the teachings of Greek philosophy, he actually finds in the Pentateuch everything which he had learned from the Greeks. From those premises he assumes as requiring no proof that the Greek philosophers must in some way have drawn from Moses,—a view indeed which is already expressed by Aristobolus. To carry out these presuppositions called for an exegetical method which seems very strange to us, that, namely, of the allegorical interpretation of Scripture. The allegorical method had been practised before Philo's date in the rabbinical schools of Palestine, and he himself expressly refers to its use by his predecessors, nor does he feel that any further justification is requisite. With its aid he discovers indications of the profoundest doctrines of philosophy in the simplest stories of the Pentateuch.¹

Thus merely formal principle of the absolute authority of Moses is really the one point in which Philo still holds to genuinely Jewish conceptions. In the whole substance of his philosophy the Jewish point of view is more or less completely modified—sometimes almost extinguished—by what he has learned from the Greeks. Comparatively speaking, he is most truly a Jew in his conception of God. The doctrine of monotheism, the stress laid on the absolute majesty and sovereignty of God above the world, the principle that He is to be worshipped without images, are all points in which Philo justly feels his superiority as a Jew over popular heathenism. But only over popular heathenism, for the Greek philosophers had long since arrived at least at a theoretical monotheism, and their influence on Philo is nowhere more strongly seen than in the detailed development of his doctrine of God. The specifically Jewish (i.e., particularistic) conception of the election of Israel, the obligation of the Mosaic law, the future glory of the chosen nation, have almost disappeared; he is really a cosmopolitan and praises the Mosaic law just because he deems it cosmopolitan. The true sage who follows the law of Moses is the citizen not of a particular state but of the world. A certain attachment which Philo still manifests to the particularistic conceptions of his race is meant only "in majorem Judeorum gloriam." The Jewish people has received a certain preference from God, but only because it has the most virtuous ancestry and is itself distinguished for virtue. The Mosaic law is binding, but only because it is the most righteous, humane, and rational of laws, and even its outward ceremonies always disclose rational ideas and aims. And lastly, outward prosperity is promised to the pious, even on earth, but the promise belongs to all who turn from idols to the true God. Thus, in the whole substance of his view of the universe, Philo occupies the standpoint of Greek philosophy rather than of national Judaism, and his philosophy of the world and of life can be completely set forth without any reference to conceptions specifically Jewish.

His doctrine of God starts from the idea that God is Being absolutely bare of quality. All quality in finite beings has limitation, and no limitation can be predicated of God, who is eternal, unchangeable, simple substance, free, self-sufficient, better than the good and the beautiful. To predicate any quality (*ποιότης*) of God would be to reduce Him to the sphere of finite existence. Of Him we can say only that He is, not *what* He is, and such purely negative predications as to His being appear to Philo, as to the later Pythagoreans and the Neo-Platonists, the only way of securing His absolute elevation above the world. At bottom, no doubt, the meaning of these negations is that God is the most perfect being, and so, con-

versely, we are told that God contains all perfection, that He fills and encompasses all things with His being.

A consistent application of Philo's abstract conception of God would exclude the possibility of any active relation of God to the world, and therefore of religion, for a Being absolutely without quality and movement cannot be conceived as actively concerned with the multiplicity of individual things. And so in fact Philo does teach that the absolute perfection, purity, and loftiness of God would be violated by direct contact with imperfect, impure, and finite things. But the possibility of a connexion between God and the world is reached through a distinction which forms the most important point in his theology and cosmology; the proper being of God is distinguished from the infinite multiplicity of divine Ideas or Forces. God himself is without quality, but He disposes of an infinite variety of divine Forces, through whose mediation an active relation of God to the world is brought about. In the details of his teaching as to these mediating entities Philo is guided partly by Plato and partly by the Stoics, but at the same time he makes use of the concrete religious conceptions of heathenism and Judaism. Following Plato, he first calls them Ideas or ideal patterns of all things, they are thoughts of God, yet possess a real existence, and were produced before the creation of the sensible world, of which they are the types. But, in distinction from Plato, Philo's ideas are at the same time efficient causes or Forces (*δυνάμεις*), which bring unformed matter into order conformably to the patterns within themselves, and are in fact the media of all God's activity in the world. This modification of the Platonic Ideas is due to Stoic influence, which appears also when Philo gives to the *idéas* or *δυνάμεις* the name of *λόγοι*, i.e., operative ideas,—parts, as it were, of the operative Reason. For, when Philo calls his mediating entities *λόγοι*, the sense designed is analogous to that of the Stoics when they call God the *Logos*, i.e., the Reason which operates in the world. But at the same time Philo maintains that the divine Forces are identical with the "demons" of the Greeks, and the "angels" of the Jews, i.e., servants and messengers of God by means of which He communicates with the finite world. All this shows how uncertain was Philo's conception of the nature of these mediating Forces. On the one hand, they are nothing else than Ideas of individual things conceived in the mind of God, and as such ought to have no other reality than that of immanent existence in God, and so Philo says expressly that the totality of Ideas, the *κόσμος νοητός*, is simply the Reason of God as Creator (*ὁ θεὸς λόγος ἡδὲ κοσμοποιεῖντος*). Yet, on the other hand, they are represented as hypostases distinct from God, individual entities existing independently and apart from Him. This vacillation, however, as Zeller and other recent writers have justly remarked, is necessarily involved in Philo's premises, for, on the one hand, it is God who works in the world through His Ideas, and therefore they must be identical with God, but, on the other hand, God is not to come into direct contact with the world, and therefore the Forces through which He works must be distinct from Him. The same inevitable amphiboly dominates in what is taught as to the supreme Idea or Logos. Philo regards all individual Ideas as comprehended in one highest and most general Idea or Force—the unity of the individual Ideas—which he calls the Logos or Reason of God, and which is again regarded as operative Reason. The Logos, therefore, is the highest mediator between God and the world, the firstborn son of God, the archangel who is the vehicle of all revelation, and the high priest who stands before God on behalf of the world. Through him the world was created, and so he is identified with the creative Word of God in Genesis (the Greek *λόγος* meaning both "reason"

¹ For details, see Grotzer, *Philo*, 1 68 ff.; Zeller, *Phil der Gr*, 3d ed., vol. III, pt. 1 349-352; Siegfried, *Philo*, 160 sq.

and "word") Here again, we see, the philosopher is unable to escape from the difficulty that the Logos is at once the immanent Reason of God, and yet also an hypostasis standing between God and the world. The whole doctrine of this mediatorial hypostasis is a strange intertwining of very dissimilar threads, on one side the way was prepared for it by the older Jewish distinction between the Wisdom of God and God Himself, of which we find the beginnings even in the Old Testament (Job xxviii 12 sq., Prov viii, ix), and the fuller development in the books of Ecclesiastes and Wisdom, the latter of which comes very near to Philo's idea if we substitute for the term "wisdom" that of (divine) "Reason" In Greek philosophy, again, Philo, as we have seen, chiefly follows the Platonic doctrines of Ideas and the Soul of the World, and the Stoic doctrine of God as the λόγος or Reason operative in the world. In its Stoic form the latter doctrine was pantheistic, but Philo could adapt it to his purpose simply by drawing a sharper distinction between the Logos and the world.

Like his doctrine of God, Philo's doctrine of the world and creation rests on the presupposition of an absolute metaphysical contrast between God and the world. The world can be ascribed to God only in so far as it is a cosmos or orderly world, its material substratum is not even indirectly inferable to God. Matter (ἔλας, or, as the Stoics said, σποία) is a second principle, but in itself an empty one, its essence being a mere negation of all true being. It is a lifeless, unmoved, shapeless mass, out of which God formed the actual world by means of the Logos and divine Forces. Strictly speaking, the world is only formed, not created, since matter did not originate with God.

Philo's doctrine of man is also strictly dualistic, and is mainly derived from Plato. Man is a twofold being, with a higher and a lower origin. Of the pure souls which fill airy space, those nearest the earth are attracted by the sensible and descend into sensible bodies, these souls are the Godward side of man. But on his other side man is a creature of sense, and so has in him a fountain of sin and all evil. The body, therefore, is a prison, a coffin, or a grave for the soul which seeks to rise again to God. From this anthropology the principles of Philo's ethics are derived, its highest maxim necessarily being deliverance from the world of sense and the mortification of all the impulses of sense. In carrying out this thought, as in many other details of his ethical teaching, Philo closely follows the Stoics. But he is separated from Stoical ethics by his strong religious interests, which carry him to very different views of the means and aim of ethical development. The Stoics cast man upon his own resources, Philo points him to the assistance of God, without whom man, a captive to sense, could never raise himself to walk in the ways of true wisdom and virtue. And as moral effort can bear fruit only with God's help, so too God Himself is the goal of that effort. Even in this life the truly wise and virtuous is lifted above his sensible existence, and enjoys in ecstacy the vision of God, his own consciousness sinking and disappearing in the divine light. Beyond this ecstacy there lies but one further step, viz., entire liberation from the body of sense and the return of the soul to its original condition, it came from God and must rise to Him again. But natural death brings this consummation only to those who, while they lived on earth, kept themselves free from attachment to the things of sense, all others must at death pass into another body, transmigration of souls is in fact the necessary consequence of Philo's premises, though he seldom speaks of it expressly.

Philo's literary labours have a twofold object, being directed either to expound the true sense of the Mosaic law, or, the philosophy which we have just described, to his Jewish brethren, or to convince

heathen readers of the excellence, the supreme purity and truth, of the Jewish religion whose holy records contain the deepest and most perfect philosophy, the best and most humane legislation. Thus as a literary figure Philo, in conformity with his education and views of life, stands between the Greeks and the Jews, seeing to gain the Jews for Hellenism and the Greeks for Judaism, yet always, taking it for granted that his standpoint really is Jewish, and just on that account truly philosophical and cosmopolitan.

The titles of the numerous extant writings of Philo present at first sight a most confusing multiplicity. More than three-fourths of them, however, are really mere sections of a small number of larger works. Three such great works on the Pentateuch can be distinguished.

(1) The smallest of these is the *ἑρμηνεία καὶ λόγος* (*Questions et solutions*), a short exposition of Genesis and Exodus, in the form of question and answer. The work is cited under this title by Eusebius (*H. E.*, ii 18, 1, 5; *Præp. Ev.*, vii 13), and by later writers, but the Greek text is now almost wholly lost, and only about one-half preserved in an Armenian translation. Genesis seems to have occupied six books.¹ Eusebius tells us that Exodus filled five books. In the Armenian translation, first published by the learned Maclerianus Ancher in 1826, are preserved four books on Genesis and two on Exodus, but with lacunae. A Latin fragment, about half of the fourth book on Genesis (*Phil. Jud. Clif. quest.* *super Gen.*), was first printed at Paris in 1520. Of the Greek we have numerous but short fragments in various Florilegia.² The interpretations in this work are partly literal and partly allegorical.

(2) Philo's most important work is the *Νόμος λέγων ἀλλήλογρα* (Euseb., *H. E.*, ii 18, 1, Phot., *Bibl.*, Cod. 103), a vast and copious allegorical commentary on Genesis, dealing with chaps. ii-iv, verse by verse, and with select passages in the later chapters. The readers in view are mainly Jews, for the form is modelled on the rabbinic Midrash. The main idea is that the characters which appear in Genesis are properly allegories of states of the soul (*ἑρμηνεία τῶν γυγμῶν*). All persons and actions being interpreted in this sense, the work as a whole is a very extensive body of psychology and ethics. It begins with Gen. ii 1, for the *De mundi origines*, which treats of the creation according to Gen. i, ii, does not belong to this series of allegorical commentaries, but deals with the actual history of creation, and that under a quite different literary form. With this exception, however, the *Νόμος ἀλλήλογρα* includes all the treatises in the first volume of Mangey's edition, viz.:

Νόμος λέγων ἀλλήλογρα πρόβατον ἑρμηνεία καὶ ἀποκρίσεις (apocryphum, lib. i, M. i 44-63), on Gen. i 1-17 (3) *Νόμος ἐπὶ ἀδὰμ* (*De Adam*, lib. ii, M. i 66-86), on Gen. ii 1-18 (4) *Νόμος ἐπὶ ἀβὴλ* (*De Abel*, lib. iii, M. i 87-137), on Gen. iii 8-10. The commentaries on Gen. iii 11-24, 20-23 are lost. (5) *Περὶ τῶν χειρῶν καὶ τῆς φωνῆς τοῦ θεοῦ* (*De manibus et voce dei*), on Gen. iii 24 and iv 1. (6) *Περὶ τοῦ ἱεροῦ* (*De templo*, lib. iv, M. i 138-153), on Gen. ii 2 and iii 1. (7) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. v, M. i 154-163), on Gen. iv 2-4. The commentaries on Gen. iv 5-7 are lost. (8) *Περὶ τοῦ τῶν χειρῶν τῶν κρείττων φύδιν ἐντίθεσθαι* (*Quod datus sit rationi sapientia et scientia*, M. i 201-225), on Gen. iv 8-15. (9) *Περὶ τοῦ τοῦ θεοῦ ἀποκρίσεων* (*De responsionibus dei*), on Gen. iv 15-25. (10) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. vi, M. i 226-261), on Gen. iv 26-28. This book, which is wanting in editions prior to Mangey's, is incorrectly given by him, but much more correctly by Tischendorf, *Philos.*, pp. 94-142. None of the preceding is mentioned by its special title by Euseb., *H. E.*, ii 18, while he cites all that follow by their titles. The reason must be that all up to this point, and so far, as included by him in the *Νόμος λέγων ἀλλήλογρα*, agreeing with what we find that these and these only are cited under that general title in the Florilegia, especially the so-called *Joannes Monachus medietas medietas* (Mangey's notes below each book). We may then safely conclude with confidence that Philo published the continuous commentaries on Gen. ii under the title *Allegories of the Sacred Laws*, and the following commentaries on select passages, under special titles, though the identity of literary character entitles us to regard the latter as part of the same great literary work. (11) *Περὶ τῶν χειρῶν τῶν κρείττων φύδιν ἐντίθεσθαι* (M. i 201-225), on Gen. iv 1-4. (12) *Περὶ τοῦ θεοῦ* (*Quod datus sit rationi sapientia et scientia*, M. i 226-261), on Gen. iv 1-18. (13) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. v, M. i 154-163), on Gen. iv 2-4. (14) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. vi, M. i 226-261), on Gen. iv 26-28. (15) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. vii, M. i 262-272), on Gen. iv 26-28. (16) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. viii, M. i 273-300), on Gen. iv 26-28. (17) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. ix, M. i 301-328), on Gen. iv 26-28. (18) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. x, M. i 329-356), on Gen. iv 26-28. (19) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xi, M. i 357-381), on Gen. iv 26-28. (20) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xii, M. i 382-408), on Gen. iv 26-28. (21) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xiii, M. i 409-435), on Gen. iv 26-28. (22) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xiv, M. i 436-462), on Gen. iv 26-28. (23) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xv, M. i 463-489), on Gen. iv 26-28. (24) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xvi, M. i 490-516), on Gen. iv 26-28. (25) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xvii, M. i 517-543), on Gen. iv 26-28. (26) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xviii, M. i 544-570), on Gen. iv 26-28. (27) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xix, M. i 571-597), on Gen. iv 26-28. (28) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xx, M. i 598-624), on Gen. iv 26-28. (29) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxi, M. i 625-651), on Gen. iv 26-28. (30) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxii, M. i 652-678), on Gen. iv 26-28. (31) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxiii, M. i 679-705), on Gen. iv 26-28. (32) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxiv, M. i 706-732), on Gen. iv 26-28. (33) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxv, M. i 733-759), on Gen. iv 26-28. (34) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxvi, M. i 760-786), on Gen. iv 26-28. (35) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxvii, M. i 787-813), on Gen. iv 26-28. (36) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxviii, M. i 814-840), on Gen. iv 26-28. (37) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxix, M. i 841-867), on Gen. iv 26-28. (38) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxx, M. i 868-894), on Gen. iv 26-28. (39) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxi, M. i 895-921), on Gen. iv 26-28. (40) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxii, M. i 922-948), on Gen. iv 26-28. (41) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxiii, M. i 949-975), on Gen. iv 26-28. (42) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxiv, M. i 976-1002), on Gen. iv 26-28. (43) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxv, M. i 1003-1029), on Gen. iv 26-28. (44) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxvi, M. i 1030-1056), on Gen. iv 26-28. (45) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxvii, M. i 1057-1083), on Gen. iv 26-28. (46) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxviii, M. i 1084-1110), on Gen. iv 26-28. (47) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xxxix, M. i 1111-1137), on Gen. iv 26-28. (48) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xl, M. i 1138-1164), on Gen. iv 26-28. (49) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xli, M. i 1165-1191), on Gen. iv 26-28. (50) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlii, M. i 1192-1218), on Gen. iv 26-28. (51) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xliii, M. i 1219-1245), on Gen. iv 26-28. (52) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xliiii, M. i 1246-1272), on Gen. iv 26-28. (53) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlv, M. i 1273-1300), on Gen. iv 26-28. (54) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1301-1327), on Gen. iv 26-28. (55) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1328-1354), on Gen. iv 26-28. (56) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1355-1381), on Gen. iv 26-28. (57) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1382-1408), on Gen. iv 26-28. (58) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1409-1435), on Gen. iv 26-28. (59) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1436-1462), on Gen. iv 26-28. (60) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1463-1489), on Gen. iv 26-28. (61) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1490-1516), on Gen. iv 26-28. (62) *Περὶ τοῦ ἀβελ* (*De Abel*, lib. xlvi, M. i 1517-1543), on Gen. iv 26-28. written two books, now wholly lost, *Περὶ διαθήκων* (M 1 386) (20) *Περὶ τοῦ θεοπέμπτου εἶναι τοῦ δούλου* (He sonuus, hb 1, M 1 620 653), on the two dreams of Jacob, Gen xxviii and xxxi (21) Book ii of the same (M 1 629-677), on the dreams of Joseph, the chief butler, the chief baker, and Pharaoh, Gen xxxviii and xl, xl. Eusebius makes Philo the author of five books on dreams, three, therefore, are lost

(III.) A work of a very different kind is the group of writings, which we may call "An Exposition of the Mosiac law for Gentiles," which, in spite of their very various contents, present on nearer examination innumerable marks of close connexion. In them Philo seeks to give an orderly view of the chief points of the Mosiac legislation, and to show how they are to be applied, or valuable to those who follow it. The method of exposition is somewhat more popular than in the allegorical commentaries, for, though the method of interpretation is not wholly excluded, the main object is to give such a view of the legislation as Philo accepted as historical. This work has three main divisions: (a) An Account of the Creation (*κρησις*), which Moser puts first, to show that the Jews were the first to receive the law, and that the transformations of those who followed it were true cosmopolitans; (b) The Biography of the Virtuous,—being, so to speak, the living unwritten laws, which, unlike written laws, present the general types of moral life and conduct; (c) Legislation Proper, in two subdivisions—(α) the ten principal chapters of the law, (β) the special laws belonging to agriculture, domestic economy, and the like. The laws, as they do not fall under the rubric of the decalogus, arranged under the headings of certain cardinal virtues.

The treatise which belong to this walk are the following (1) *Περὶ τῆς Μένουςας κοσμητικῆς* (De mundi ornatu, M. 1-19) This work does not fall within the number of the allegorical commentaries. On the other hand, the introduction to the treatise De *Abrahamo* makes clear its importance as the head of the allegorical commentaries, which it represents in the editions, seems indeed to go back to a very early date, for even Eusebius (H. E. 3. 19, 13 ff., ed. Gaesfior) The group of the *Bios sofōn* is headed by (2) *Βίος σοφῶν τοῦ κατὰ διδασκαλίαν τελευτήσαντος ἡ περὶ τῶν ἀρχαίων* [4], ὁ ὅστις περὶ Ἀβραάμ (De antiquis, M. 1-140) *Abraham* is here set forth as the type of διδασκαλική ἀρετή, i. e. of virtue as a thing learned. This biography of Abraham was followed by that of Isaac as a type of ἀρετὴ κατὰ φύσιν, i. e. of virtue as a thing innate. The third in the series is the treatise by Elias of Jacob as representing ἀρετὴν κατὰ ἀρετή, i. e. virtue acquired by practice, but both these are now lost. Hence in the editions the next treatise is (3) *Βίος πολυτάκτου περ ἀπὸ περὶ περὶ ἱερῆς* [ἱερῆς De iocunda, M. 1-41-70] whereas the fourth is the *Βίος σοφῶν* (De sapientibus, M. 41-70) which is the last of the *Bios sofōn*. The *Βios sofōn* is followed by (4) *Περὶ τῶν δόκων καὶ ἀρεθῶν καὶ νόμων τοῦ Θεοῦ* (De deo, M. 71-200) and (5) *Περὶ τῶν ἀναφαινομένων καὶ ἐκείνων ἐκ τῶν συντάξεων κεφάλαιον τῶν δόκων* [ἱερῶν De premissis legibus, the sub-title is not given by Eusebius, M. 2, 18. 5]. Here under the name of the *De deo* is included the treatise De *Abrahamo* and the laws of the Mosiac economy is given, for example, under the first and second commandments, (divine worship) a survey is taken of the entire legislation relating to public worship, and under the third, the section on the *ἱερὰ* (the sacred) Philo's reckoning there is a survey of all the laws about feasts, under the sixth (edificary) an account of matrimonial law, and so on. According to the arrangement of the editions, the *De deo* is followed by the treatise on the entire, that in the separate have been previously broken up into a considerable number of editions tractates (6) The first book (on the first and second commandments) contains 10 tractates (M. 215-252), *De sanctificatione*, lib. 1. (215-232), 2. *De pietatis* (232-252), 3. *De pietatis* (252-259), 4. *De pietatis* (259-266), 5. *De pietatis* (266-273), 6. *De pietatis* (273-280) (7) The second book (on the third, fourth, and fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The third book (on the sixth and seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fourth book (on the eighth and ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fifth book (on the tenth and eleventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The sixth book (on the twelfth and thirteenth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The seventh book (on the fourteenth and fifteenth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The eighth book (on the sixteenth and seventeenth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The ninth book (on the eighteenth and nineteenth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The tenth book (on the twentieth and twenty-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The eleventh book (on the twenty-second and twenty-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twelfth book (on the twenty-fourth and twenty-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirteenth book (on the twenty-sixth and twenty-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fourteenth book (on the twenty-eighth and twenty-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fifteenth book (on the thirtieth and thirty-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The sixteenth book (on the thirty-second and thirty-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The seventeenth book (on the thirty-fourth and thirty-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The eighteenth book (on the thirty-sixth and thirty-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The nineteenth book (on the thirty-eighth and thirty-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twentieth book (on the fortieth and forty-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-first book (on the forty-second and forty-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-second book (on the forty-fourth and forty-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-third book (on the forty-sixth and forty-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-fourth book (on the forty-eighth and forty-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-fifth book (on the fiftieth and fifty-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-sixth book (on the fifty-second and fifty-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-seventh book (on the fifty-fourth and fifty-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-eighth book (on the fifty-sixth and fifty-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The twenty-ninth book (on the fifty-eighth and fifty-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirtieth book (on the sixtieth and sixty-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-first book (on the sixty-second and sixty-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-second book (on the sixty-fourth and sixty-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-third book (on the sixty-sixth and sixty-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-fourth book (on the sixty-eighth and sixty-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-fifth book (on the seventieth and seventy-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-sixth book (on the seventy-second and seventy-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-seventh book (on the seventy-fourth and seventy-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-eighth book (on the seventy-sixth and seventy-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The thirty-ninth book (on the seventy-eighth and seventy-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fortieth book (on the eightieth and eighty-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-first book (on the eighty-second and eighty-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-second book (on the eighty-fourth and eighty-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-third book (on the eighty-sixth and eighty-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-fourth book (on the eighty-eighth and eighty-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-fifth book (on the ninetieth and ninety-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-sixth book (on the ninety-second and ninety-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-seventh book (on the ninety-fourth and ninety-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-eighth book (on the ninety-sixth and ninety-seventh commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The forty-ninth book (on the ninety-eighth and ninety-ninth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fiftieth book (on the hundredth and hundred-first commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fifty-first book (on the hundred-second and hundred-third commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fifty-second book (on the hundred-fourth and hundred-fifth commandments, i. e. on piety, Sabbath observance, and filial piety) is incomplete in Maseius (p. 270-283), the section on the Sabbath is missing. The fifty-third book (on the hundred-six

(IV) Besides the above-named three great works on the Pentateuch, Philo was the author of a number of isolated writings, of which the following have reached us either in their entirety or in fragments. (1) *Ilepi Slav Bwrtwos* (*Vita Mosi*, lib. 1-11, M. II, 80-179). It is usual to group this, as being biographical in its character, with the *Bia cwofw*, and thus to incorporate it immediately after the *De Josepho* with the large work on the Mosaic legislation. But, as has been seen, the *Bia cwofw* are intended to represent the general types of morality, while *Mosis* is by no means so dealt with but as a unique individual. All that can be said is

[illegible]

(V) *Yoursuipus* works ascribed to Philo: (1) *Πηφι Φλω Βεωρημυρς η ιερως αφερως* (*De vita contemplativa*, M. n. 471-486). That the Therapeutic life here praised is that of Christian monks was seen by Euseb, *H. E.*, n. 17 (who, however, accepted the book as Philo's of the same and the same view was long prevalent in the church. ⁴ But, if the Therapeutic is monks, the book cannot be genuine; see especially Lucius, *Die Therapeuten und ihre Stellung in der Gesch. der Askese*, Straßburg, 1879. There is, however, so many other objections to its genuineness that the book is now given up even by such as do not admit that the Therapeutics are monks ⁵ (2) *Πηφι εδωρατων κερουω* (*De monachis habitantibus in deserto*, M. n. 487-516). Bernays, who first showed that the received text is corrupted by a later hand, published a corrected text with German version in *Abh. Berl. Acad.*, 1876. An unfinished commentary of the same orator was posthumously published in the *Beiln. Abhandlungen*, 1882. (3) *Πηφι κερουω* (*De mundo*, M. n. 601-624). That this collection of extracts from Philo, and especially from the *De incor.* mundus, is spurious has been long recognized. (4) Two orations, *De Sapphore* and *De Ionia*, pub-

PHILOLOGY

PART I—SCIENCE OF LANGUAGE IN GENERAL.

Divi-
sions

PHILOLOGY is the generally accepted comprehensive name for the study of the word; it designates that branch of knowledge which deals with human speech, and with all that speech discloses as to the nature and history of man. Philology has two principal divisions, corresponding to the two uses of "word" or "speech," as signifying either what is said or the language in which it is said, as either the thought expressed—which, when recorded, takes the form of literature—or the instrumentality of its expression. these divisions are the literary and the linguistic. Not all study of literature, indeed, is philological as when, for example, the records of the ancient Chinese are ransacked for notices of astronomical or meteorological phenomena, or the principles of geometry are learned from the text-book of a Greek sage, while, on the other hand, to study Ptolemy and Euclid for the history of the sciences represented by them is philological more than scientific. Again, the study of language itself has its literary side as when the vocabulary of a community (say of the ancient Indo-Europeans or Aryans) is taken as a document from which to infer the range and grade of knowledge of its speakers, their circumstances, and their institutions. The two divisions thus do not admit of absolute distinction and separation, though for some time past tending toward greater independence. The literary is the older of the two, it even occupied until recently the whole field, since the scientific study of language itself has arisen only within the present century. Till then, literary philology included linguistics, as a merely subordinate and auxiliary part, the knowledge of a language being the necessary key to a knowledge of the literature written in that language. When, therefore, instead of studying each language by itself for the sake of its own literature, men began to compare one language with another, in order to bring to light their relationships, their structures, their histories, the name "comparative philology" naturally enough suggested itself and came into use for the new method, and this name, awkward and trivial though it may be, has become so firmly fixed in English usage that it can be only slowly, if at all, displaced. Continental usage (especially German) tends more strongly than English to restrict the name philology to its older office, and to employ for the recent branch of knowledge a specific term, like those that have gained more or less currency with us also: as glottic, glossology, linguistics, linguistic science, science of language, and the like. It is not a question of absolute propriety or correctness, since the word philology is in its nature wide enough to imply all language-study, of whatever kind, it is one, rather, of the convenient distinction of methods that have grown too independent and important to be any longer well included under a common name.

Nature
of the
science.

Philology, in all its departments, began and grew up as classical; the history of our civilization made the study of Greek and Latin long the exclusive, still longer the predominant and regulating, occupation of secular scholarship. The Hebrew and its literature were held apart, as something of a different order, as sacred. It was not imagined that any tongue to which culture and literature did not lend importance was worthy of serious attention from scholars. The first essays in comparison, likewise, were made upon the classical tongues, and were as erroneous in method and fertile in false conclusions as was to be expected, considering the narrowness of view and the controlling prejudices of those who made them, and the

admission of Hebrew to the comparison only added to the confusion. The change which this century has seen has been a part of the general scientific movement of the age, which has brought about the establishment of so many new branches of knowledge, both historical and physical, by the abandonment of shackling prejudices, the freedom of inquiry, the recognition of the dignity of all knowledge, the wide-reaching assemblage of facts and their objective comparison, and the resulting constant improvement of method. Literary philology has had its full share of advantage from this movement; but linguistic philology has been actually created by it out of the crude observations and wild deductions of earlier times, as truly as chemistry out of alchemy, or geology out of diluvianism. It is unnecessary here to follow out the details of the development; but we may well refer to the decisive influence of one discovery, the decisive action of one scholar. It was the discovery of the special relationship of the Aryan or Indo-European languages, depending in great measure upon the introduction of the Sanskrit as a term in their comparison, and demonstrated and worked out by the German scholar Bopp, that founded the science of linguistic philology. While there is abundant room for further improvement, it yet appears that the grand features of philologic study, in all its departments, are now so distinctly drawn that no revolution of its methods, but only their modification in minor respects, is henceforth probable. How and for what purposes to investigate the literature of any people (philology in the more proper sense), combining the knowledge thus obtained with that derived from other sources, how to study and set forth the material and structure and combinations of a language (grammar), or of a body of related languages (comparative grammar), how to co-ordinate and interpret the general phenomena of language, as variously illustrated in the infinitely varying facts of different tongues, so as to exhibit its nature as a factor in human history, and its methods of life and growth (linguistic science),—these are what philology teaches. The first two subjects are mainly disposed of in this work in the various articles devoted to countries and races, with their literatures and dialects; the last was briefly touched upon in the article ANTHROPOLOGY, but requires fuller treatment here, along with a general view of the classification of languages, as thus far effected.

The study of language is a division of the general Relation science of anthropology, and is akin to all the rest in to anthropo-logy. respect of its objects and its methods. Man as we now see him is a twofold being: in part the child of nature, as to his capacities and desires, his endowments of mind and body; in part the creature of education, by training in the knowledge, the arts, the social conduct, of which his predecessors have gained possession. And the problem of anthropology is this: how natural man has become cultivated man; how a being thus endowed by nature should have begun and carried on the processes of acquisition which have brought him to his present state. The results of his predecessors' labours are not transmuted for his benefit into natural instincts, in language or in anything else. The child of the most civilized race, if isolated and left wholly to his own resources, aided by neither the example nor the instruction of his fellows, would no more speak the speech of his ancestors than he would build their houses, fashion their clothes, practise any of their arts, inherit their knowledge or wealth. In fact, he would

possess no language, no arts, no wealth, but would have to go to work to acquire them, by the same processes which began to win them for the first human beings. One advantage he would doubtless enjoy—the descendant of a cultivated race has an enhanced aptitude for the reception of cultivation, he is more cultivable, and this is an element that has to be allowed for in comparing present conditions with past, as influencing the rate of progress, but nothing more. In all other respects, it is man with the endowments which we now find him possessed of, but destitute of the gradually accumulated results of the exercise of his faculties, whose progress we have to explain. And it is, as a matter of necessity, by studying recent observable modes of acquisition, and transferring them, with due allowance for different circumstances, to the more primitive periods, that the question of first acquisition or origin is to be solved, for language as for tools, for arts, for family and social organization, and the rest. There is just as much, and just as little, reason for assuming miraculous interference and aid in one of these departments as in another. If men have been left to themselves to make and improve instruments, to form and perfect modes of social organization, by implanted powers directed by natural desires, and under the pressure of circumstances, then also to make and change the signs that constitute their speech. All expressions, as all instruments, are at present, and have been through the known past, made and changed by the men who use them, the same will have been the case in the unknown or prehistoric past. And we command now enough of the history of language, with the processes of its life and growth, to determine with confidence its mode of origin—within certain limits, as will appear below.

Cause of
language-
making.

It is beyond all question, in the first place, that the desire of communication was the only force directly impelling men to the production of language. Man's sociality, his disposition to band together with his fellows, for lower and for higher purposes, for mutual help and for sympathy, is one of his most fundamental characteristics. To understand those about one and to be understood by them is now, and must have been from the very beginning, a prime necessity of human existence, we cannot conceive of man, even in his most undeveloped state, as without the recognition of it. Communication is still the universally recognized office of speech, and to the immense majority of speakers the only one, the common man knows no other, and can only with difficulty and imperfectly be brought to see that there is any other; of the added distinctness and reach of mental action which the possession of such an instrumentality gives him, he is wholly unconscious and it is obvious that what the comparatively cultivated being of to-day can hardly be made to realize, can never have acted upon the first men as a motive to action. It may perhaps be made a question which of the two uses of speech, communication or the facilitation of thought, is the higher; there can be no question, at any rate, that the former is the broader and the more fundamental. That the kind and degree of thinking which we do nowadays would be impossible without language-signs is true enough, but so also it would be impossible without written signs. That there was a time when men had to do what mental work they could without the help of writing, as an art not yet devised, we have no difficulty in realizing, because the art is of comparatively recent date, and there are still communities enough that are working without it, it is much harder to realize that there was a time when speaking also was an art not yet attained, and that men had to carry on their rude and rudimentary thinking without it. Writing too was devised for conscious purposes of communication only; its esoteric uses, like

those of speech, were at first unsuspected, and incapable of acting as an inducement, they were not noticed until made experience of, and then only by those who look beneath the surface of things. There is no analogy closer and more instructive than this, between speech and writing. But analogies are abundant elsewhere in the history of human development. Everywhere it is the lower and more obvious inducements that are first effective, and that lead gradually to the possession of what serves and stimulates higher wants. All the arts and industries have grown out of men's effort to get enough to eat and protection against cold and heat—just as language, with all its uses, out of men's effort to communicate with their fellows. As a solitary man now would never form even the beginnings of speech, as one separated from society unlearns his speech by disuse and becomes virtually dumb, so early man, with all his powers, would never have acquired speech, save as to those powers was added sociality with the needs it brought. We might conceive of a solitary man as housing and dressing himself, devising rude tools, and thus lifting himself a step from wildness toward cultivation, but we cannot conceive of him as ever learning to talk. Recognition of the impulse to communication as the efficient cause of language-making is an element of primary importance in the theory of the origin of language. No one who either leaves it out of account or denies it will, however ingenious and entertaining his speculations, cast any real light on the earliest history of speech. To inquire under what peculiar circumstances, in connexion with what mode of individual or combined action, a first outburst of oral expression may have taken place, is, on the other hand, quite futile. The needed circumstances were always present when human beings were in one another's society, there was an incessant drawing-on to attempts at mutual understanding which met with occasional, and then ever more frequent and complete success. There inheres in most reasoning upon this subject the rooted assumption, governing opinion even when not openly upheld or consciously made, that conceptions have real natural names, and that in a state of nature these will somehow break forth and reveal themselves under favouring circumstances. The falsity of such a view is shown by our whole further discussion.

The character of the motive force to speech determined the character of the beginnings of speech. That was first ^{signs of} signified which was most capable of intelligible significance, not that which was first in order of importance, as judged by any standard which we can apply to it, or first in order of conceptual development. All attempts to determine the first spoken signs by asking what should have most impressed the mind of primitive man are and must be failures. It was the exigencies and possibilities of practical life, in conditions quite out of reach of our distinct conception, that prescribed the earliest signs of communication. So, by a true and instructive analogy, the beginnings of writing are rude depictions of visible objects; it is now thoroughly recognized that no alphabet, of whatever present character, can have originated in any other way, everything else is gradually arrived at from that—as, indeed, in the ingeniously shaping hands of man, from any central body of signs, though but of small extent, all else is attainable by processes of analogy and adaptation and transfer. Now what is it that is directly significant in the world about us? Evidently, the separate acts and qualities of sensible objects, and nothing else. In writing, or signification to the eye, the first element is the rude depiction of the outline of an object, or of that one of the sum of its characteristic qualities which the eye takes note of and the hand is capable of intelligibly reproducing; from that the mind understands the whole

complex object itself, and then whatever further may in the circumstances of its use be suggested by it. So, for example, the picture of a tree signifies primarily a tree, then perhaps wood, something made of wood, and so on, that of a pair of outstretched wings signifies secondarily flight, then soaring, height, and whatever else these may lead to. No concrete thing is significant in its totality, or otherwise than by a facile analysis of its constituent qualities, and a selection of the one which is both sufficiently characteristic in itself and capable of being called up by a sign before the mind addressed.

Instrumental-
ities of expres-
sion

And what quality shall be selected depends in great measure upon the instrumentality used for its signification. Of such instrumentalities, men are possessed of a considerable variety. We must leave out of account that of depiction, as just instanced, because its employment belongs to a much more advanced state of cultivation, and leads the way to the invention not of speech but of the analogous and auxiliary art of writing. There remain gesture, or changes of position of the various parts of the body, especially of the most mobile parts, the arms and hands, grimace, or the changes of expression of the features of the countenance (in strictness, a variety of the preceding), and utterance, or the production of audible sound. It cannot be doubted that, in the first stages of communicative expression, all these three were used together, each for the particular purposes which it was best calculated to serve. The nearest approach to such action that is now possible is when two persons, wholly ignorant of one another's speech, meet and need to communicate—an imperfect correspondence, because each is trained to habits of expression, and works consciously, and with the advantage of long experience, towards making himself understood, yet it is good for its main purpose. What they do, to reach mutual comprehension, is like what the first speechless men, unconsciously and infinitely more slowly, learned to do: face, hands, body, voice, are all put to use. It is altogether probable that gesture at first performed the principal part, even to such extent that the earliest human language may be said to have been a language of gesture-signs, indeed, there exist at the present day such gesture-languages, as those in use between roving tribes of different speech that from time to time meet one another (the most noted example is that of the gesture-language, of a very considerable degree of development, of the prairie tribes of American Indians), or such signs as are the natural resort of those who by deafness are cut off from ordinary spoken intercourse with their fellows. Yet there never can have been a stage or period in which all the three instrumentalities were not put to use together. In fact, they are still all used together, that is even now an ineffective speaking to which grimace and gesture ("action," as Demosthenes called them) are not added as enforcers; and the lower the grade of development and culture of a language, the more important, even for intelligibility, is their addition. But voice has won to itself the chief and almost exclusive part in communication, inasmuch that we call all communication "language" (i.e., "tonguiness") just as a race of mutes might call it "handiness," and talk (by gesture) of a handiness of grimace. This is not in the least because of any closer connexion of the thinking apparatus with the muscles that act to produce audible sounds than with those that act to produce visible motions, not because there are natural uttered names for conceptions, any more than natural gestured names. It is simply a case of "survival of the fittest," or analogous to the process by which iron has become the exclusive material of swords, and gold and silver of money: because, namely, experience has shown this to be the material best adapted to this special use. The advantages of voice are numerous

The
voice

and obvious. There is first its economy, as employing a mechanism that is available for little else, and leaving free for other purposes those indispensable instruments the hands. Then there is its superior perceptibility: its nice differences impress themselves upon the sense at a distance at which visible motions become indistinct; they are not hidden by intervening objects, they allow the eyes of the listener as well as the hands of the speaker to be employed in other useful work, they are as plain in the dark as in the light, and they are able to catch and command the attention of one who is not to be reached in any other way. We might add as the third advantage a superior capability of variation and combination on the part of spoken sounds, but this is not to be insisted on, inasmuch as we hardly know what a gesture-language might have become if men's ingenuity in expression had been expended through all time upon its elaboration, and the superiority, however real, can hardly have been obvious enough to serve as a motive. Certainly, there are spoken languages now existing whose abundance of resources falls short of what is attainable by gesture. One utterance is the form which expression has inevitably taken, the sum of man's endowments being what it is, but it would be a mistake to suppose that a necessity of any other kind is involved in their relation. The fundamental conditions of speech are man's grade of intellectual power and his social instinct; these being given, his expression follows, availing itself of what means it finds best suited to its purpose, if voice had been wanting, it would have taken the next best. So, in certain well-known cases, a marked artistic gift, on the part of individuals deprived of the use of hands, has found means of exercise in the feet instead. But men in general have hands, instruments of exquisite tact and power, to serve the needs of their intellect; and so voice also, to provide and use the tools of thought; there is no error in maintaining that the voice is given us for speech, if only we do not proceed to draw from such a *dictum* false conclusions as to the relation between thought and utterance. Man is created with bodily instruments suited to do the work prescribed by his mental capacities, therein lies the harmony of his endowment.

It is through imitation that all signification becomes immediately suggestive. The first written signs are (as already ^{been} noticed) the depictions of visible objects, and could be nothing else; and, by the same necessity, the first uttered signs were the imitations of audible sounds. To reproduce any sound of which the originating cause or the circumstances of production are known, brings up of course before the conception that sound, along with the originator, or circumstances of origination, or whatever else may be naturally associated with it. There are two special directions in which this mode of sign-making is fruitful: imitation of the sounds of external nature (as the cries of animals, and the noises of inanimate objects when in motion or acted on by other objects) and imitation of human sounds. The two are essentially one in principle, although by some held apart, or even opposed to each other, as respectively the imitative or onomatopoeitic and the exclamatory or interjectional beginnings of speech, they differ only in their spheres of significance, the one being especially suggestive of external objects, the other of inward feelings. There are natural human tones, indicative of feeling, as there are natural gestures, poses, modes of facial expression, which either are immediately intelligible to us (as is the warning cry of the hen to the day-old chicken), or have their value taught us by our earliest experiences. If we hear a cry of joy or a shriek of pain, a laugh or a groan, we need no explanation in words to tell us what it signifies, any more than when we see a sad face or a drooping attitude. So also the characteristic cry

or act of anything outside ourselves, if even rudely imitated, is to us an effective reminder and awakener of conception. We have no reason to question that such were the suggestions of the beginnings of uttered expression. The same means have made their contributions to language even down to our own day; we call words so produced "onomatopoeic" (i.e., "name-making"), after the example of the Greeks, who could not conceive that actually new additions to language should be made in any other way. What and how wide the range of the imitative principle, and what amount of language-signs it was capable of yielding, is a subject for special investigation—or rather, of speculation, since anything like exact knowledge in regard to it will never be attained, and the matter is one of altogether secondary consequence; it is sufficient for our purpose that enough could certainly be won in this way to serve as the effective germs of speech.

All the natural means of expression are still at our command, and are put to more or less use by us, and their products are as intelligible to us as they have been to any generation of our ancestors, back to the very first. They are analogous also to the means of communication of the lower animals, this, so far as we know, consists in observing and interpreting one another's movements and natural sounds (where there are such). But language is a step beyond this, and different from it. To make language, the intent to signify must be present. A cry wrung out by pain, or a laugh of amusement, though intelligible, is not language; either of them, if consciously reproduced in order to signify to another pain or pleasure, is language. So a cough within hearing of any one attracts his attention; but to cough, or to produce any other sound, articulate or inarticulate, for the purpose of attracting another's attention, is to commit an act of language-making, such as in human history preceded in abundance the establishment of definite traditional signs for conceptions. Here begins to appear the division between human language and all brute expression; since we do not know that any animal but man ever definitely took this step. It would be highly interesting to find out just how near any come to it; and to this point ought to be especially directed the attention of those who are investigating the communication of the lower animals in its relation to human communication. Among the animals of highest intelligence that associate with man and learn something of his ways, a certain amount of sign-making expressly for communication is not to be denied, the dog that barks at a door because he knows that somebody will come and let him in is an instance of it, perhaps, in wild life, the throwing out of sentinel birds from a flock, whose warning cry shall advertise their fellows of the threat of danger, is as near an approach to it as is anywhere made.

But the actual permanent beginnings of speech are only reached when the natural basis is still further abandoned, and signs begin to be used, not because their natural suggestiveness is seen in them, but by imitation, from the example of others who have been observed to use the same sign for the same purpose. Then for the first time the means of communication becomes something to be handed down, rather than made anew by each individual; it takes on that traditional character which is the essential character of all human institutions, which appears not less in the forms of social organization, the details of religious ceremonial, the methods of art and the arts, than in language. That all existing speech, and all known recorded speech, is purely traditional, cannot at all be questioned. It is proved even by the single fact that for any given conception there are as many different spoken signs as there are languages—say a thousand (this number is rather far within than beyond the truth), each of them intelli-

gible to him who has learned to use it and to associate it with the conception to which it belongs, but unintelligible to the users of the nine hundred and ninety-nine other signs, as these are all unintelligible to him, unless, indeed, he learn a few of them also, even as at the beginning he learned the one that he calls his own. What single sign, and what set of signs, any individual shall use, depends upon the community into the midst of which he is cast, by birth or other circumstances, during his first years. That it does not depend upon his race is demonstrated by facts the most numerous and various, the African whose purity of descent is attested by every feature is found all over the world speaking just that language, or jargon, into the midst of which the fates of present or former slavery have brought his parents; every civilized community contains elements of various lineage, combined into one by unity of speech, and instances are frequent enough where whole nations speak a tongue of which their ancestors knew nothing for example, the Celtic Gauls and the Germanic Normans of France speak the dialect of a geographically insignificant district in central Italy, while we ourselves can hardly utter a sentence or write a line without bringing in more or less of that same dialect. There is not an item of any tongue of which we know anything that is "natural" expression, or to the possession of which its speaker is brought by birth instead of by education; there is even very little that is traceably founded on such natural expression, everywhere *θεός* or human attribution reigns supreme, and the original *φύσις* or natural significance has disappeared, and is only to be found by theoretic induction (as we have found it above). It seems to some as if a name like *κυκλός* (one of the most striking available cases of onomatopoeia) were a "natural" one, but there is just as much *θεός* in it as in any other name; it implies the observation of an aggregate of qualities in a certain bird, and the selection of one among them as the convenient basis of a mutual understanding when the bird is in question, every animal conspicuous to us must have its designation, won in one way or another, and in this case, to imitate the characteristic cry is the most available way. If anything but convenience and availability were involved, all our names for animals would have to be and to remain imitations of the sounds they make. That the name of *κυρλός* is applied also to the female and young, and at other than the singing season, and then to related species which do not make the same sound—all helps to show the essentially conventional character of even this name. An analogous process of elimination of original meaning, and reduction to the value of conventional designation merely, is to be seen in every part of language, throughout its whole history. Since men ceased to derive their names from signs having a natural suggestiveness, and began to make them from other names already in use with an understood value, every new name has had its etymology and its historical occasion—as, for example, the name *quarantine* from the two-score (*quarantaine*) of days of precautionary confinement, or *volume* from its being rolled up, or *book* from a beech-wood staff, or *copper* from Cyprus, or *lunacy* from a fancied influence of the moon, or *priest* from being an older (*πρεσβύτερος*) person, or *butterfly* from the butter-yellow colour of a certain common species: every part of our language, as of every other, is full of such examples—but, when once the name is applied, it belongs to that to which it is applied, and no longer to its relatives by etymology; its origin is neglected, and its form may be gradually changed beyond recognition, or its meaning so far altered that comparison with the original shall seem a joke or an absurdity. This is a regular and essential part of the process of name-making in all human speech, and from

Language

Language
conven-
tional.

the very beginning of the history of speech in fact (as pointed out above), the latter can only be said to have begun when this process was successfully initiated, when uttered signs began to be, what they have ever since continued to be, conventional, or dependent only on a mutual understanding. Thus alone did language gain the capacity of unlimited growth and development. The sphere and scope of natural expression are narrowly bounded, but there is no end to the resources of conventional sign-making.

Brute
speech
and
human
speech

It is well to point out here that this change of the basis of men's communication from natural suggestiveness to mutual understanding, and the consequent purely conventional character of all human language, in its every part and particle, puts an absolute line of demarcation between the latter and the means of communication of all the lower animals. The two are not of the same kind, any more than human society in its variety of organization is of the same kind with the instinctive herding of wild cattle or swarming of insects, any more than human architecture with the instinctive burrowing of the fox and nest-building of the bird, any more than human industry and accumulation of capital with the instinctive hoarding of bees and beavers. In all these cases alike, the action of men is a result of the adaptation of means at hand to the satisfaction of felt needs, or of purposes dimly perceived at first, but growing clearer with gradually acquired experience. Man is the only being that has established institutions—gradually accumulated and perfected results of the exercise of powers analogous in kind to, but greatly differing in degree from, those of the lower animals. The difference in degree of endowment does not constitute the difference in language, it only leads to it. There was a time when all existing human beings were as destitute of language as the dog, and that time would come again for any number of human beings who should be cut off (if that were practicable) from all instruction by their fellows: only they would at once proceed to re-create language, society, and arts, by the same steps by which their own remote ancestors created those which we now possess; while the dog would remain what he and his ancestors have always been, a creature of very superior intelligence, indeed, as compared with most, of infinite intelligence as compared with many, yet incapable of rising by the acquisition of culture, through the formation and development of traditional institutions. There is just the same *causa* existent in the difference between man's conventional speech and the natural communication of the lower races as in that between men's forms of society and the instinctive associations of the lower races, but it is no greater and no other, it is neither more absolute and characteristic nor more difficult to explain. Hence those who put forward language as the distinction between man and the lower animals, and those who look upon our language as the same in kind with the means of communication of the lower animals, only much more complete and perfect, fail alike to comprehend the true nature of language, and are alike wrong in their arguments and conclusions. No addition to or multiplication of brute speech would make anything like human speech; the two are separated by a step which no animal below man has ever taken; and, on the other hand, language is only the most conspicuous among those institutions the development of which has constituted human progress, while their possession constitutes human culture.

With the question of the origin of man, whether or not developed out of lower animal forms, intermediate to the anthropoid apes, language has nothing to do, nor can its study ever be made to contribute anything to the solution of that question. If there once existed creatures above the apes and below man, who were extirpated by primitive

man as his especial rivals in the struggle for existence, or became extinct in any other way, there is no difficulty in supposing them to have possessed forms of speech, more rudimentary and imperfect than ours. At any rate, all existing human speech is one in the essential characteristics which we have thus far noted or shall hereafter have to consider, even as humanity is one in its distinction from the lower animals; the differences are in non-essentials. All speech is one in the sense that every human being, of whatever race he may be, is capable of acquiring any existing tongue, and of using it for the same purposes for which its present possessors use it, with such power and effect as his individual capacity allows, and without any essential change in the mental operations carried on by means of speech—even as he may acquire any other of the items of culture belonging to a race not his own. The difference between employing one language and another is like that between employing one instrument and another in mechanical arts; one instrument may be better than another, and may enable its user to turn out better work, but the human ingenuity behind both is the same, and works in the same way. Nor has the making of language anything whatever to do with making man what he is, as an animal species having a certain physical form and intellectual endowment. Being what he is by nature, man has by the development of language and other institutions become what he is by culture. His acquired culture is the necessary result of his native endowment, not the contrary. The acquisition of the first stumbling beginnings of a superior means of communication had no more influence to raise him from a simian to a human being than the present high culture and perfected speech of certain races has to lift them up to something more than human, and specifically different from the races of inferior culture. It cannot be too absolutely laid down that differences of language, down to the possession of language at all, are differences only in respect to education and culture.

How long man, after he came into being such as he now Development of language-signs
is, physically and intellectually, continued to communicate with imitative signs of direct significance, when the production of traditional signs began, how rapidly they were accumulated, and how long any traces of their imitative origin clung to them—these and the like questions it is at present idle to try to answer even conjecturally. Just as it is to seek to determine when the first instruments were used, how soon they were shaped instead of being left crude, at what epoch fire was reduced to service, and so on. The stages of development and their succession are clear enough; to fix their chronology will doubtless never be found practicable. There is much reason for holding, as some do, that the very first items of culture were hardest to win and cost most time, the rate of accumulation (as in the case of capital) increasing with the amount accumulated. Beyond all reasonable question, however, there was a positively long period of purely imitative signs, and a longer one of mixed imitative and traditional ones, the latter gradually gaining upon the former, before the present condition of things was reached, when the production of new signs by imitation is only sporadic and of the utmost rarity, and all language-signs besides are traditional, their increase in any community being solely by variation and combination, and by borrowing from other communities.

Of what nature, in various respects, this earliest Theorist
language-material was is sufficiently clear. The signs, in stage
the first place, were of the sort that we call "roots." By this is only meant that they were integral signs, significant in their entirety, not divisible into parts, of which one signified one thing and another another thing, or of which one gave the main significance, while another was an added sign of kind or relation. In a language of

developed structure like our own, we arrive at such "roots," mainly by an artificial stripping-off of the signs of relation which almost every word still has, or can be shown to have once had. In *in-cos-tle-ness*, for example, *cost* is the centrally significant element, so far as English is concerned, it is a root, about which cluster a whole body of forms and derivatives, if we could follow its history no farther, it would be to us an ultimate root, as much so as *bird* or *sing* or *man*. But we can follow it up, to the Latin compound *con-sta*, a root *sta* with a prefixed formative element *con*. Then *sta*, which in slightly varied forms we find in a whole body of related tongues called "Aryan," having in them all the same significance "stand," is an Aryan root, and to us an ultimate one, because we can follow its history no farther, but there always remains the possibility that it is as far from being actually original as is the English root *cost* that is to say, it is not within our power ever to get back to the really primitive elements of speech, and to demonstrate their character by positive evidence. The reason for accepting a primitive root-stage of language is in great part theoretical: because nothing else is reconcilable with any acceptable view of the origin of language. The law of the simplicity of beginnings is an absolute one for everything of the nature of an institution, for every gradually developed product of the exercise of human faculties. That an original speech-sign should be of double character, one part of it meaning this and another part that, or one part radical and the other formative, is as inconceivable as that the first instruments should have had handles, or the first shelters a front room and a back one. But this theoretical reason finds all the historical support which it needs in the fact that, through all the observable periods of language-history, we see formative elements coming from words originally independent, and not from anything else. Thus, in the example just taken, the *-i-* of *costliness* is a suffix of so recent growth that its whole history is distinctly traceable, it is simply our adjective *like*, worn down in both form and meaning to a subordinate value in combination with certain words to which it was appended, and then added freely as a suffix to any word from which it was desired to make a derivative adjective—or, later but more often, a derivative adverb. The *ness* is much older (though only Germanic), and its history obscure, it contains, in fact, two parts, neither of them of demonstrable origin, but there are equivalent later suffixes, as *ship* in *hurdship* and *dom* in *wisdom*, whose derivation from independent words (*shape, doom*) is beyond question. The *un-* of *uncostliness* is still more ancient (being Aryan), and its probably pronominal origin hardly available as an illustration; but the comparatively modern prefix *be-*, of *become, belie*, &c., comes from the independent preposition *by*, by the same process as *-ly* or *-ly-* from *like*. And the *con* which has contributed its part to the making of the quasi-root *cost* is also in origin identical with the Latin preposition *cum* "with." By all the known facts of later language-growth, we are driven to the opinion that every formative element goes back to some previously existing independent word; and hence that in analysing our present words we are retracing the steps of an earlier synthesis, or following up the history of our formed words toward the unformed roots out of which they have grown. The doctrine of the historical growth of language-structure leads by a logical necessity to that of a root-stage in the history of all language; the only means of avoiding the latter is the assumption of a miraculous element in the former.

Earliest
phonetic
forms.

Of what phonetic form were the earliest traditional speech-signs is, so far as essentials are concerned, to be inferred with reasonable certainty. They were doubtless

articulate: that is to say, composed of alternating consonant and vowel sounds, like our present speech, and they probably contained a part of the same sounds which we now use. All human language is of this character; there are no sounds in any tongue which are not learned and reproduced as easily by children of one race as of another, all dialects admit a like phonetic analysis, and are representable by alphabetic signs; and the leading sounds, consonant and vowel, are even practically the same in all, though every dialect has its own (for the most part, readily definable and imitable) moieties of its pronunciation, while certain sounds are rare, or even met with only in a single group of languages, or in a single language. Articulate sounds are such as are capable of being combined with others into that succession of distinct yet connectable syllables which is the characteristic of human speech-utterance. The name "articulate" belongs to this utterance, as distinguished from inarticulate human sounds and cries, and from the sounds made by the lower animals. The word itself is Latin, by translation from the Greek, and, though very widely misunderstood, and even deliberately misapplied in some languages to designate all sound, of whatever kind, uttered by any living creature, is a most happily chosen and truly descriptive term. It signifies "jointed," or broken up into successive parts, like a limb or stem, the joints are the syllables, and the syllabic structure is mainly effected by the alternation of closer or consonant sounds with opener or vowel sounds. The simplest syllabic combination (as the facts of language show) is that of a single consonant with a following vowel; and there are languages even now existing which reject any other. Hence there is much plausibility in the view that the first speech-signs will have had this phonetic form, and been monosyllabic, or dissyllabic only by repetition (reduplication) of one syllable, such as the speech of very young children shows to have a peculiar ease and naturalness. The point, however, is one of only secondary importance, and may be left to the further progress of phonetic study to settle, if it can, the root-theory, at any rate, is not bound to any definite form or extent of root, but only deems that there can have been any grammatical structure in language except by development in connexion with experience in the use of language. What particular sounds, and how many, made up the first spoken alphabet, is also a matter of conjecture merely, they are likely to have been the closest consonants and the openest vowels, medial utterances being of later development.

As regards their significant value, the first language-Cha- signs must have denoted those physical acts and qualities ^{actor of} which are directly apprehensible by the senses, both ^{early} because these alone are directly significant, and because it was only they that untrained human beings had the power to deal with or the occasion to use. Such signs would then be applied to more intellectual uses as fast as there was occasion for it. The whole history of language, down to our own day, is full of examples of the reduction of physical terms and phrases to the expression of non-physical conceptions and relations; we can hardly write a line without giving illustrations of this kind of linguistic growth. So pervading is it, that we never regard ourselves as having read the history of any intellectual or moral term till we have traced it back to a physical origin. And we are still all the time drawing figurative comparisons between material and moral things and processes, and calling the latter by the names of the former. There has never been any difficulty in providing for new knowledge and more refined thought by putting to new uses the earlier and grosser materials of speech.

As a matter of course, whatever we now signify by our simple expressions for simple acts, wants, and the like,

was intended to be signified through the first speech-signs by the users of them. But to us, with our elaborated apparatus of speech, the sentence, composed of subject and predicate, with a verb or special predicative word to signify the predication, is established as the norm of expression, and we regard everything else as an abbreviated sentence, or as involving a virtual sentence. With a view to this, we must have "parts of speech" that is, words held apart in office from one another, each usable for such and such a purpose and no other, and answering a due variety of purposes, so that when they are combined they fit together, as parts composing a whole, and the desired meaning is made clear. Inflections, too, lend their aid; or else auxiliary words of various kinds answering the same purpose—namely, of determining the relations of the members of the sentence. But all our success in understanding the earliest stages of language depends upon our power to conceive a state of things where none of these distinctions were established, where one speech-sign was like another, calling up a conception in its indefinite entirety, and leaving the circumstances of the case to limit its application. Such a language is far below ours in explicitness; but it would suffice for a great deal of successful communication, indeed (as will be shown farther on), there are many languages even now in existence which are little better off. So a look of approval or disgust, a gesture of beckoning or repulsion, a grunt of assent or inquiry, is as significant as a sentence, means a sentence, is translatable into a sentence, and hence may even in a certain way be called a sentence, and in the same way, but only so, the original roots of language may be said to have been sentences. In point of fact, between the holophrastic gesture or uttered sign and the sentence which we can now substitute for it—for example, between the sign of beckoning and the equivalent sentence, "I want you to come here"—lies the whole history of development of inflective speech.

What has been this history of development, how the first scanty and formless signs have been changed into the immense variety and fullness of existing speech, it is of course impossible to point out in detail, or by demonstration of facts, because nearly the whole process is hidden in the darkness of an impenetrable past. The only way to cast any light upon it is by careful induction from the change and growth which we see to have been going on in the recent periods for which we have recorded evidence, or which are going on at the present time. Of some groups of related languages we can read the life for three or four thousand years back, and by comparison can infer it much farther, and the knowledge thus won is what we have to apply to the explanation of periods and languages otherwise unknown. Nothing has a right to be admitted as a factor in language-growth of which the action is not demonstrable in recorded language. Our own family of languages is the one of whose development most is known, by observation and well-warranted inference, and it may be well here to sketch the most important features of its history, by way of general illustration.

Apparently the earliest class-distinction traceable in Aryan speech is that of pronominal roots, or signs of position, from the more general mass of roots. It is not a formal distinction, marked by a structural difference, but, so far as can be seen, is founded only on the assignment by usage of certain elements to certain offices. Formal distinction began with combination, the addition of one element to another, their fusion into a single word, and the reduction of the one part to a subordinate value, as sign of a certain modification of meaning of the other. Thus, doubtless by endings of pronominal origin, were made the first verb-forms, or words used only when predication was intended (since that is all that makes a verb),

conveying at first a distinction of persons only, then of persons and numbers, while the further distinctions of tense and mode were by degrees added. To the nouns, which became nouns by the setting up of the separate and special class of verbs, were added in like manner distinctions of case, of number, and of gender. With the separation of noun and verb, and the establishment of their respective inflexion, the creative work of language-making is virtually done, the rest is a matter of differentiation of uses. For the noun (noun substantive) and the adjective (noun adjective) become two pairs of speech only by a gradually deepened separation of use, there is no original or formal distinction between them; the pronouns merely add the noun-inflexion to a special set of stems, adverbs are a part of the same formation as noun-cases, prepositions are adverbs with a specialized construction, of secondary growth; conjunctions are the products of a like specialization, articles, where found at all, are merely weakened demonstratives and numerals.

To the process of form-making, as exhibited in this history, belong two parts. The one external, consisting in the addition of one existing element of speech to another and their combination into a single word, the other internal, consisting in the adaptation of the compound to its special use and involving the subordination of one element to the other. Both parts appear also abundantly in other departments of language-change, and throughout the whole history of our languages, nothing has to be assumed for the earliest formations which is not plainly illustrated in the latest. For example, the last important addition to the formative apparatus of English is the common adverb-making suffix *-ly*, coming, as already pointed out, from the independent adjective *like*. There was nothing at first to distinguish a compound like *godly* (*godlike*) from one like *storm-tossed*, save that the former was more adaptable than the other to wider uses; resemblance is an idea easily generalized into appearance and the like, and the conversion of *godlike* to *godly* is a simple result of the processes of phonetic change described farther on. The extension of the same element to combination with adjectives instead of nouns, and its conversion to adverb-making value, is a much more striking case of adaptation, and is nearly limited to English, among the Germanic languages that have turned *like* into a suffix. A similar striking case, of combination and adaptation, is seen in the Romance adverb-making suffix *mente* or *ment*, coming from the Latin ablative *mente*, "with mind." So, to make a Romance future like *donnerai*, "I shall give," there was needed in the first place the pre-existing elements *donner*, "to give," and *ai*, "I have," and their combination; but this is only a part; the other indispensable part is the gradual adaptation of a phrase meaning "I have [something before me] for giving" to the expression of simple futurity, "*donnerai*." So far as the adaptation is concerned, the case is quite parallel to that of *j'ai donné*, "I have given," &c. (equivalent phrases or combinations are found in many languages), where the expression of possession of something that is acted on has been in like manner modified into the expression of past action. Parallel in both combination and adaptation is the past tense *loved*, from *love-did*, while we have again the same adaptation without combination in the equivalent phrase *did love*.

That these are examples of the process by which the whole inflective structure of Aryan language was built up admits of no reasonable question. Our belief that it is so rests upon the solid foundation that we can demonstrate no other process, and that this one is sufficient. It is true that we can prove such an origin for our formative elements in only a small minority of instances, but this is just what was to be expected, considering what we know

of the disguising processes of language-growth. No one would guess in the mere *y* of *ably* (for *abily*) the presence of the adjective *hile*, any more than in the altered final of *sent* and the shortened vowel of *led* the effect of a *did* once addit to *seul* and *lead*. The true history of these forms can be shown, because there happen to be other facts left in existence to show it; where such facts are not within reach, we are left to infer by analogy from the known to the unknown. The validity of our inference can only be shaken by showing that there are forms incapable of having been made in this way, or that there are and have been other ways of making forms. Of the former there is evidently but small chance, if a noun-form meaning "with mind" can become the means of conveyance of all the adjectives of a language into adverbs, and a verb meaning "have" (and, yet earlier, "seize") of signifying both future and past time, there is obviously nothing that is impossible of attainment by such means. As regards the latter, no one appears to have even attempted to demonstrate the genesis of formative elements in any other way during the historical periods of language, it is simply assumed that the early methods of language-making will have been something different from and superior in spontaneity and fruitfulness to the later ones; that certain forms, or forms at certain periods, were made out-and-out, as forms, that signs of formal distinction somehow exuded from roots and stems, that original words were many-membered, and that a formative value settled in some member of them—and the like. Such doctrines are purely fanciful, and so opposed to the teachings both of observation and of sound theory that the epithet absurd is hardly too strong to apply to them. If the later races, of developed intelligence, and trained in the methods of a fuller expression, can only win a new form by a long and gradual process of combination and adaptation, why should the earlier and comparatively untrained generations have been able to do any better? The advantage ought to be, if anywhere, on our side. The progress of language in every department, accompanying and representing the advance of the race, on the whole, in the art of speaking as in other arts, is from the grosser to the more refined, from the physical to the moral and intellectual, from the material to the formal. The conversion of compounds into forms, by the reduction of one of their elements to formative value, is simply a part of the general process which also creates auxiliaries and form-words and connectives, all the vocabulary of mind, and all the figurative phraseology that gives life and vigour to our speech. If a copula, expressive of the grammatical relation of predication, could be won only by attenuation of the meaning of verbs signifying "grow," "breathe," "stand," and the like, if our auxiliaries of tense and mode all go traceably back to words of physical meaning (as *have* to "seize," *may* to "be great or strong," *shall* to "be under penalty," and so on), if of comes from the comparatively physical *off*, and *for* from "before, forward," if relative pronouns are specialized demonstratives and interrogatives; if *right* means etymologically "straight," and *wrong* means "twisted"; if *spirit* is "blowing," and *intellect* a "peking out among," and *understanding* a "getting beneath," and *development* an "unfolding," if an event *takes place* or *comes to pass*, and then *drops out* of mind and is *forgotten* (opposite of *gotten*)—then it is of no avail to object to the grossness of any of the processes by which, in earlier language or in later, the expression of formal relations is won. The mental sense of the relation expressed is entirely superior to and independent of the means of its expression. He who, to express the plural of *man*, says what is equivalent to *man-man* or *heap-men* (devices which are met with in not a few languages) has just as good a sense of plurality

as he who says *men* or *homines*, that sense is no more degraded in him by the coarseness of the phrase he uses to signify it than is our own sense of eventuality and of pastness by the undisguised coarseness of *take place* and *have been*. In short, it is to be laid down with the utmost distinctness and confidence, as a law of language-growth, that there is nothing formal anywhere in language which was not once material, that the formal is made out of the material, by processes which began in the earliest history of language and are still in action.

We have dropped here the restriction to our own or Laws of Aryan language with which we began, because it is evident that what is true of this family of speech, one of the most highly organized that exist, may also be true of the rest—must be true of them, unless some valid evidence be found to the contrary. The unity of human nature makes human speech alike in the character of its beginnings and in the general features of its after-history. Everywhere among men, a certain store of expression, body of traditional signs of thought, being given, as used by a certain community, it is capable of increase on certain accordant lines, and only on them. In some languages, and under peculiar circumstances, borrowing is a great means of increase, but it is the most external and least organically important of all. Out-and-out invention (which, so far as we can see, must be of the kind called by us onomatopoeic) is found to play only a very insignificant part in the historical periods of language,—clearly because there are other and easier modes of gaining new expression for what needs to be expressed. In the course of phonetic change, a word sometimes varies into two (or more) forms, and makes so many words, which are differently turned to account. Everything beyond this must be the product of combination, there is no other way, so far as concerns the externals of speech. Then, partly as accompanying and aiding this external growth, partly as separate from and supplementing it, there is in all language an internal growth, making no appearance in the audible part of speech, consisting in multiplication of meanings, their modification in the way of precision or comprehension or correctness, the restriction of words to certain uses, and so on. Along with these, too, a constant change of phonetic form constitutes an inseparable part of the life of language. Speech is no more stable with respect to the sounds of which it is composed than with respect to its grammatical forms, its vocabulary, or the body of conceptions signified by it. Even nearly related languages differ as much in their spoken alphabets and the combinations of sounds they admit, and in their uttered forms of words historically the same, as in any other part, and the same is true of local dialects, and of class dialects within the same community. Phonetic change has nothing whatever to do with change of meaning; the two are the product of wholly independent tendencies. Sometimes, indeed, they chance to coincide, as in the distinction of *minute* "small," and *minute* "moment," but it is only by chance, as the spoken accordance of *second* in its two meanings ("next" and "sixtieth of a minute") shows, words that maintain their identity of value most obstinately, like the numerals, are liable to vary indefinitely in form (so *four*, *fidvor*, *quatuor*, *tétrap-es*, &c., from an original *kattuor*; *five*, *quinque*, *vétre*, *coc*, &c., from *penla*—while, on the other hand, *two* and *three* show as striking an accordance of form as of meaning through all the same languages); what is far the most common is that the word becomes very unlike its former self in both respects, like *presbyter* from the Greek *πρεσβύτερος* (*presbyter*), literally "older man." Human convenience is, to be sure, the governing motive in both changes; but it is convenience of two different kinds: the one mental, depending on the fact

All
formal
elements
once
material

(pointed out above) that a name when once applied belongs to the thing to which it is applied, to the disregard of its etymological connexions, does not need to be changed when the thing changes, and is ready for new application to anything that can be brought into one class with the latter; and the other physical, depending on the organs of speech and their successive movements, by which the sounds that make up the word are produced. Phonetic convenience is economy of effort on the part of those organs, and to no other law than that of economy of utterance have any of the phenomena of phonetic change been found traceable (though it is also to be noted that some phenomena have not hitherto been successfully brought under it, and that the way of effecting this is still unclear). "Euphony," which used to be appealed to as explanation, is a false principle, except so far as the term may be made an idealized synonym of economy. The ear finds that agreeable which the organs of utterance find facile. Economy in utterance is no isolated tendency; it is the same that plays its part in all other kinds of human action, and in language appears equally in the abbreviation of the sentence by leaving out parts that can be spared without loss of intelligibility. It is an insidious tendency, always lying in wait, like gravitation, to pull down what is not sufficiently held up,—the holding-up force in language being the faithfulness of tradition, or accurate reproduction by the learner and user of the signs which he has acquired. No generation of men has any intention to speak otherwise than as its predecessor has spoken, or any consciousness that it is doing so, and yet, from generation to generation, words are shortened, sounds are assimilated to one another, and one element passes out of use while a new one is introduced. Abbreviation and assimilation are the most conspicuous departments of phonetic change, and those in which the nature of the governing tendency is most plainly seen. Taken by itself, one sound is as easy as another to the person who has accustomed himself to it from childhood; and those which the young child most easily acquires are not those which in the history of speech are least liable to alteration; it is especially in the combinations and transitions of rapid speaking that the tongue, as it were, finds out for itself easier ways of performing its task, by dropping and slurring and adapting. To trace out the infinitely varied items of this change, to co-ordinate and compare them and discover their reasons, constitutes a special department of language-study, which is treated under the head of *SPEECH SOUNDS*. It only needs to be pointed out here that phonetic change plays a necessary part in the structural development of language, by integrating compound words through fusion and loss of identity of their component parts, and, what is of yet more importance, by converting them into forms, through disguise of identity of one of the parts and its phonetic subordination to the other part. It is thus that turns, for example, the compound *god-like* into the derivative *godly*, the compound *love-did* into the verbal form *loved*. And yet one further result sometimes follows: an internal change is wrought by phonetic influence in the body of a word, which change then may in the further history of the word be left as the sole means of distinction between one form and another. It is thus that, in the most recent period, the distinction of *led* from *lead* and *set* from *meet* and so on has been made, the added auxiliary which originally made these preterites induced a shortening of the root-vowel, and this was left behind when the auxiliary disappeared by the usual process of abbreviation. It is in the same way that the distinctions of *men* from *man*, of *were* from *was*, of *set* from *sit*, with all their analogues, were brought about: by a modification of vowel-sound (Ger. *Umlaut*) occasioned by the presence

in the following syllable of an *i*-vowel, which in the older stages of the language is still to be seen there. And the distinctions of *any*, *sang*, *sung*, and *song*, of *bind*, *bound*, *bend*, and *bond*, are certainly of the same kind, though they go back so far in the history of our family of languages that their beginnings are not yet clearly demonstrable, they were in their origin phonetic accidents, inorganic, mere accompaniments and results of external combinations which bore the office of distinction of meaning and were sufficient to it, in some of our languages they have been disregarded and effaced, in others they have risen to prominent importance. To regard these internal changes as primary and organic is parallel with assuming the primariness of the formative apparatus of language in general, like this, it ignores the positive evidence we have of the secondary production of such differences, they are, like everything else in linguistic structure, the outcome of combination and adaptation.

Borrowing, or the taking-in of material out of another language, has been more than once referred to above as sometimes an important element in language-history, though less deep-reaching and organic than the rest. There is nothing anomalous about borrowing; it is rather in essential accordance with the whole process of language-acquisition. All our names were adopted by us because they were already in use by others, and a community is in the same way capable of taking a new name from a community with which it comes in contact as an individual from individuals. Not that it seeks or admits in this way new names for old things, but it accepts new things along with the names that seem to belong to them. Hence any degree of intercourse between one community and another, leading to exchange of products or of knowledge, is sure to lead also to some borrowing of names, and there is hardly a language in the world, except of races occupying peculiarly isolated positions, that does not contain a certain amount of foreign material thus won, even as our English has elements in its vocabulary from half the other tongues in the world. The scale of borrowing is greatly increased when one people becomes the pupil of another in respect of its civilization: hence the abundant classical elements in all the European tongues, even the non-Romance; hence the Arabic material in Persian and Turkish and Malay; hence the Chinese in Japanese and Korean, and, as a further result, even dead languages, like the Greek and Latin and the Sanskrit, become stores to be drawn upon in that learned and conscious quest of new expression which in the school-stage of culture supplements or even in a measure replaces the unconscious growth of natural speech. So, in mixture of communities, which is a highly-intensified form of contact and intercourse, there follows such mixture of speech as the conditions of the case determine; yet not a mixture on equal terms, through all the departments of vocabulary and grammar, the resulting speech (just as when two individuals learn to speak alike) is essentially that of the one constituent of the new community, with more or less material borrowed from that of the other. What is most easily taken in out of another language is the names of concrete things, every degree of removal from this involves additional difficulty—names of abstract things, epithets, verbs, connectives, forms. Indeed, the borrowing of forms in the highest sense, or forms of inflexion, is well-nigh or quite impossible; no example of it has been demonstrated in any of the historical periods of language, though it is sometimes adventurously assumed as a part of prehistoric growth. How nearly it may be approached is instanced by the presence in English of such learned plurals as *phenomena* and *strata*. This extreme resistance to mixture in the department of inflexion is the ground on which some deny the possibility of mixture in

language, and hence the existence of such a thing as a mixed language. The difference is mainly a verbal one, but it would seem almost as reasonable to deny that a region is inundated so long as the tops of its highest mountains are above water. According to the simple and natural meaning of the term, nearly all languages are mixed, in varying degrees and within varying limits, which the circumstances of each case must explain.

These are the leading processes of change seen at work in all present speech and in all known past speech, and hence to be regarded as having worked through the whole history of speech. By their operation, every existing tongue has been developed out of its rudimentary radical condition to that in which we now see it. The variety of existing languages is well-nigh infinite, not only in their material but in their degree of development and the kind of resulting structure. Just as the earlier stages in the history of the use of tools are exemplified even at the present day by races which have never advanced beyond them, so is it in regard to language also—and, of course, in the latter case as in the former, this state of things strengthens and establishes the theory of a gradual development. There is not an element of linguistic structure possessed by some languages which is not wanting in others, and there are even tongues which have no formal structure, and which cannot be shown ever to have advanced out of the radical stage. The most noted example of such a rudimentary tongue is the Chinese, which in its present condition lacks all formal distinction of the parts of speech, all inflexion, all derivation, each of its words (all of them monosyllables) as an integral sign, not divisible into parts of separate significance, and each in general is usable wherever the radical idea is wanted, with the value of one part of speech or another, as determined by the connexion in which it stands; a condition parallel with that in which Aryan speech may be regarded as existing prior to the beginnings of its career of formal development briefly sketched above. And there are other tongues, related and unrelated to Chinese, of which the same description, or one nearly like it, might be given. To call such languages radical is by no means to maintain that they exhibit the primal roots of human speech, unchanged or only phonetically changed, or that they have known nothing of the combination of element with element. Of some of them, the roots are in greater or less part dissyllable, and we do not yet know that all dissyllabism, and even that all complexity of syllable beyond a single consonant with following vowel, is not the result of combination or reduplication. But all combination is not form-making, it needs a whole class of combinations, with a recognized common element in them producing a recognized common modification of meaning, to make a form. The same elements which (in Latin, and even to some extent in English also) are of formal value in *constant* and *pre-dict* lack that character in *cost* and *presch*, the same like which makes adverbs in *truly* and *rightly* is present without any such value in *such* and *which* (from *so-like* and *reho-like*); *rust* and *preach*, and *sark* and *ulark*, are as purely radical in English as other words of which we do not happen to be able to demonstrate the composite character. And so a Chinese monosyllable or an Egyptian or Papyrus dissyllable is radical, unless there can be demonstrated in some part of it a formative value; and a language wholly composed of such words is a root-language.

Neither is the possibility to be denied that a language like Chinese may have had at some period of its history the weak beginnings of a formal development, since extinguished by the same processes of phonetic decay which in English have wiped out so many signs of a formal character, and brought back so considerable a part of the

vocabulary to monosyllabism; but it remains thus far a possibility merely, and the development would need to have been of the scantiest character to be so totally destroyed by phonetic influences. In languages thus constituted, the only possible external alteration is that phonetic change to which all human speech, from the very beginning of its traditional life, is liable, the only growth is internal, by that multiplication and adaptation and improvement of meanings which is equally an inseparable part of all language-history. This may include the reduction of certain elements to the value of auxiliaries, particles, form-words, such as play an important part in analytical tongues like English, and are perhaps also instanced in prehistoric Aryan speech by the class of pronominal roots. Phrases take the place of compounds and of inflexions, and the same element may have an auxiliary value in certain connexions while retaining its full force in others, like, for instance, our own *have*. It is not easy to define the distinction between such phrase-collocations and the beginnings of agglutination, yet the distinction itself is in general clearly enough to be drawn (like that in French between *donnerai* and *as donné*), when the whole habit of the language is well understood.

Such languages, constituting the small minority of human tongues, are wont to be called "isolating," i.e., using each element by itself, in its integral form. All besides are "agglutinative," or more or less compounded into words containing a formal part, an indicator of classificatory value. Here the differences, in kind and degree, are very great; the variety ranges from a scantiness hardly superior to Chinese isolation up to an intricacy compared with which Aryan structure is hardly fuller than Chinese. Some brief characterization of the various families of language in this respect will be given farther on, in connexion with their classification. The attempt is also made to classify the great mass of agglutinative tongues under different heads, those are ranked as simply "agglutinative" in which there is a general conservation of the separate identity of root or stem on the one hand, and of formative element, suffix or prefix, on the other, while the name "inflective," used in a higher and pregnant sense, is given fullest to those that admit a superior fusion and integration of the two parts, to the disguise and loss of separate identity, and, yet more, with the development of an internal change as auxiliary to or as substitute for the original agglutination. But there is no term in linguistic science so uncertain of meaning, so arbitrary of application, so dependent on the idiosyncrasy of its user, as the term "inflective." Any language ought to have the right to be called inflective that has inflexion: that is, that not merely distinguishes parts of speech and roots and stems formally from one another, but also conjugates its verbs and declines its nouns; and the name is sometimes so used. If, again, it be strictly limited to signify the possession of *numerical* forms of roots and stems (as if simply agglutinated forms could be called "effective"); it marks only a difference of degree of agglutination, and should be carefully used as so doing. As describing the fundamental and predominant character of language-structure, it belongs to only one family of languages, the Semitic, where most of the work of grammatical distinction is done by internal changes of vowel, the origin of which thus far eludes all attempts at explanation. By perhaps the majority of students of language it is, as a generally descriptive title, restricted to that family and one other, the Indo-European or Aryan; but such a classification is not to be approved, for, in respect to this characteristic, Aryan speech ranks not with Semitic but with the great body of agglutinative tongues. To few of these can the name be altogether denied, since there is hardly a body of related dialects in existence that does

Isolating
languages

Agglu-
tative
lan-
guages

not exhibit some item of "inflective" structure, the Aryan is only the one among them that has most to show. Outside the Semitic, at any rate, one should not speak of inflective and non-inflective languages, but only of languages more inflective and less inflective.

Value of
structure

To account for the great and striking differences of structure among human languages is beyond the power of the linguistic student, and will doubtless always continue so.

We are not likely to be able even to demonstrate a correlation of capacities, saying that a race which has done this and that in other departments of human activity might have been expected to form such and such a language. Every tongue represents the general outcome of the capacity of a race as exerted in this particular direction, under the influence of historical circumstances which we can have no hope of tracing. There are striking apparent anomalies to be noted. The Chinese and the Egyptians have shown themselves to be among the most gifted races the earth has known, but the Chinese tongue is of unsurpassed juvenescence, and the Egyptian, in point of structure, little better, while among the wild tribes of Africa and America we find tongues of every grade, up to a high one, or to the highest. This shows clearly enough that mental power is not measured by language-structure. But any other linguistic test would prove equally insufficient. On the whole, the value and rank of a language are determined by what its users have made it do. The reflex action of its speech on the mind and culture of a people is a theme of high interest, but of extreme difficulty, and apt to lead its investigators away into empty declamation, taking everything together, its amount, as is shown by the instances already referred to, is but small. The question is simply one of the facilitation of work by the use of one set of tools rather than another, and a poor tool in skilful hands can do vastly better work than the best tool in unskilful hands—even as the ancient Egyptians, without steel or steam, turned out products which, both for colossal grandeur and for exquisite finish, are the despair of modern engineers and artists. In such a history of development as that of human speech a fortunate turn may lead to results of unforeseen value; the earlier steps determine the later in a degree quite beyond their own intrinsic importance. Everything in language depends upon habit and analogy, and the formation of habit is a slow process, while the habit once formed exercises a constraining as well as a guiding influence. Hence the persistency of language-structure: when a certain sum and kind of expression is produced, and made to answer the purposes of expression, it remains the same by inertia; a shift of direction becomes of extreme difficulty. No other reason can at present be given why in historical time there has been no marked development out of one grade of structure into another, but the fact no more shakes the linguistic scholar's belief in the growth of structure than the absence of new animal species worked out under his eyes shakes the confidence of the believer in animal development. The modifying causes and their modes of action are clearly seen, and there is no limit to the results of their action except what is imposed by circumstances.

It is in vain to attempt to use dates in language-history, to say when this or that step in development was taken, and how long a period it cost, especially now that the changed views as to the antiquity of man are making it probable that only a small part of the whole history is brought within the reach even of our deductions from the Unity of most ancient recorded dialects. At any rate, for aught
origin of
speech.

that we know or have reason to believe, all existing dialects are equally old, every one alike has the whole immeasurable past of language-life behind it, has reached its present condition by advance along its own line of growth and

change from the first beginnings of human expression. Many of these separate lines we clearly see to converge and unite, as we follow them back into the past; but whether they all ultimately converge to one point is a question quite beyond our power to answer. If in this immensity of time many languages have won so little, if everywhere language-growth has been so slow, then we can only differ as to whether it is reasonably certain, or probable, or only possible, that there should have been a considerable first period of human existence without traditional speech, and a yet more considerable one before the fixation of so much as should leave abiding traces in its descendants, and that meanwhile the race should have multiplied and scattered into independent communities. And the mere possibility is enough to exclude all dogmatic assertion of the unity of origin of human speech, even assuming unity of origin of the human race. For to prove that identity by the still existing facts of language is utterly out of the question, the metamorphosing effect of constant change has been too great to allow it. In point of fact, taking languages as they now exist, only those have been shown related which possess a common structure, or have together grown out of the more primitive radical stage, since structure proves itself a more constant and reliable evidence than material. And this is likely ever to be the case, at any rate, to trace all the world's languages so far back toward their beginnings as to find in them evidences of identity is beyond the wildest hope. We must be content with demonstrating for these beginnings a unity of kind as alike a body of formless roots. But, on the other hand, since this unity is really demonstrated, since all structure is the result of growth, and no degree of differences of structure, any more than of difference of material, refuses explanation as the result of discordant growth from identical beginnings, it is equally inadmissible to claim that the diversities of language prove it to have had different beginnings. That is to say, the question of the unity of speech, and yet more that of the unity of the race, is beyond the reach of the student of language; the best view he can attain is the hypothetical one, that, if the race is one, the beginnings of speech were perhaps one—but probably not, even then. This negative conclusion is so clearly established as to leave no excuse for the still oft-repeated attempts to press language into service on either side of the controversy respecting human unity of race.

That all making and changing of language is by the unconscious of its speakers is too obvious to call for discussion. No other force capable of acting and of producing effects is growth, either demonstrable or conceivable as concerned in the individual work. The doctrine that language is an organism, growing out of its own inherent powers, exempt from the interference of those who use it, is simply an indefensible paradox. Every word that is uttered is so by an act of human will, at first in imitation of others, then more and more by a formed and controlling habit, it is accessible to no change except by influences working in the speaker's mind, and leading him to make it otherwise. Not that he is aware of this, or directs his action knowingly to that end. The whole process is unconscious. If any implication of reflective or intended action can be shown to inhere in any doctrine of linguistic science, it vitiates that doctrine. The attitude of the ordinary speaker towards his language is that of unreasoning acceptance, it seems to him that his names for things are their real names, and all others unintelligent nicknames; he thinks himself to possess his speech by the same tenure as his sight or hearing, it is "natural" to him (or, if he reasons about it, he attributes it to a divine origin, as races beginning to philosophize are wont to ascribe their various social institutions to their

god-), he knows nothing of its structure and relations; it never occurs to him to find fault with it, or to deem it insufficient and add to or change it, he is wholly unaware that it does change. He simply satisfies his social needs of communication by means of it, and if he has anything to express that is different from what has been expressed before, he takes the shortest way to a provision for the need, while any relaxation of the energy of utterance tends to a variation in the uttered combinations, and thus changes come by his act, though without his knowledge. His sole object is, on the basis of what language he has, to make known his thought in the most convenient way to his fellow, everything else follows with and from that human nature and circumstances being what they are, what follows actually is, as already shown, incessant growth and change. For it we have not to seek special disturbing causes in the history of the speakers, although such may come in to heighten and quicken the change; we know that even in a small community, on a narrow islet, cut off from all intercourse with other communities, the speech would grow different—as certainly, if not as rapidly, as anywhere in the world—and only by the action of its speakers—not that the speakers of a language act in unison and simultaneously to produce a given change. This must begin in an individual, or more or less accidentally in a limited number of individuals, and spread from such example through the community. Initiation by one or a few, acceptance and adoption by the rest,—such is the necessary method of all linguistic change, and to be read as plainly in the facts of change now going on among ourselves as in those of former language. The doctrine of the inaccessibility of language to other action than that of its speakers does not imply a power in the individual speaker to create or alter anything in the common speech, any more than it implies his desire to do so. What he suggests by his example must be approved by the imitation of his fellows, in order to become language. The common speech is the common property, and no one person has any more power over it than another. If there are, for example, a thousand speakers of a certain dialect, each one wields in general a thousandth part of the force required to change it,—with just so much more as may belong to his excess of influence over his fellows, due to recognized superiority of any kind on his part. His action is limited only by their assent, but this is in effect a very narrow limitation, insuring the adoption of nothing that is not in near accordance with the already existing, though it is also to be noted that he is as little apt to strike off into startling change as they to allow it, since the governing power of already formed habits of speech is as strong in him as in them. That change to which the existing habits naturally lead is easy to bring about, any other is practically impossible. It is this tendency on the part of the collective speakers of a language to approve or reject a proposed change according to its conformity with their already subsisting usages that we are accustomed to call by the fanciful name “the genius of a language.”

Dialectic
variation

On the relation of the part played in language-change by the individual to that by the community, in combination with the inevitableness of change, rests the explanation of the dialectic variation of language. If language were stable there would of course be no divarication, but since it is always varying, and by items of difference that proceed from individuals and become general by diffusion, there can be uniformity of change only so far as diffusion goes, or as the influences of communication extend. Within the limits of a single community, small or large, whatever change arises spreads gradually to all, and so becomes part of the general speech; but let that community become divided into two (or more) parts, and then

the changes arising in either part do not spread to the other, and there begins to appear a difference in linguistic usage between them. It is at first slight, even to insignificance, not greater than exists between the dialects of different localities or ranks or occupations in the same community, without detriment to the general unity of speech. This unity, namely, rests solely on mutual intelligibility, and is compatible with no small amount of individual and class difference, in vocabulary, in grammar, and in pronunciation, indeed, in the strictest sense, each individual has a dialect of his own, different from that of every other, even as he has a handwriting, a countenance, a character of his own. And every item of change, as it takes place, must have its season of existence as a local or class or trade peculiarity, before it gains universal currency, some of them linger long in that condition, or never emerge from it. All these differences in the speech of different sub-communities within the same community are essentially dialectic, they differ not in kind, but only in degree, from those which separate the best-marked dialects, they are kept down by general communication within the limit of general mutual intelligibility. Where that restraining influence ceases, the limit is gradually but surely overpassed, and real dialects are the result. From what we know of the life of language we can say positively that continued uniformity of speech without continued community is not practicable. If it were possible to divide artificially, by an impassable chasm or wall, a people one for ages, and continuing to occupy the same seats, the language of the divided parts would at once begin to be dialectically different, and after sufficient time had elapsed, each would have become unintelligible to the other. That is to say, whenever a community of uniform speech breaks up, its speech breaks up also, nor do we know of any other cause of dialectic diversity.

In applying this explanation of dialectic growth we have to allow for modifying circumstances of various nature, which alter not indeed the fact but the rate and kind of divarication. Some languages grow and change much more rapidly than others, with a corresponding effect upon divarication, since this is but a result of discordant growth. Usually, when there is division of a community, the parts get into different external circumstances, come in contact or mingle with different neighbouring communities, and the like, and thus quickens and increases their divergence of speech. But the modifying factor of by far the highest importance, here as elsewhere in the history of language, is civilization. Civilization in its higher forms so multiplies the forces of communication as to render it possible that the widely-divided parts of one people, living in circumstances and under institutions of very different character, should yet maintain a substantial oneness of speech, of this there is no more striking example than the two great divisions of the English-speaking people on opposite sides of the Atlantic. On the other hand, a savage people cannot spread even a little without dialectic disunity, there are abundant examples to be met with now of mutually unintelligible speech between the smallest subdivisions of a race of obviously kindred tongue—as the different clusters of huts on the same coral islet. It is with linguistic unity precisely as it is with political unity, and for the same reasons. Before the attainment of civilization the human race, whether proceeding from one centre of dispersion or from several, was spread over the earth in a state of utter disintegration; but every centre of civilization becomes also a centre of integration, its influences make for unity of speech as of all other social institutions. Since culture has become incontestably the dominant power in human history, the unifying forces in language have also been

stronger than the diversifying, and with culture at its full height, and spread equally to every land and race, one universal language, like one universal community, is not an absurdity or theoretic impossibility, but only a Utopian or millennial dream.

Dialectic variation is thus simply a consequence of the movements of population. As the original human race or races, so the divisions or communities of later formation, from point to point through the whole life of man on the earth, have spread and separated, have jostled and interfered, have conquered and exterminated or mingled and absorbed, and their speech has been affected accordingly. Hence something of these movements can be read in the present condition of languages, as in a faithful though obscure record—more, doubtless, than can be read in any other way, however little it may be when viewed absolutely. Dialectic resemblances point inevitably back to an earlier unity of speech, and hence of community, from what we know of the history of speech, they are not to be accounted for in any other way. The longer the separation that has produced the diversity, the greater its degree. With every generation, the amount of accordance decreases and that of discordance increases, the common origin of the dialects is at first palpable, then evident on examination, then to be made out by skilled research, then perhaps no longer demonstrable at all; for there is plainly no limit to the possible divergence. So long, now, as any evidence of original unity is discoverable we call the languages "related dialects," and combine them into a "family."

Families
of
speech.

The term "family" simply signifies a group of languages which the evidence thus far at command, as estimated by us, leads us to regard as descended by the ordinary processes of dialectic diversification from one original tongue. That it does not imply a denial of the possibility of wider relationship is obvious from what has been said above. That there is abundant room for error in the classification represented by it is also clear, since we may take purely accidental resemblances, or the results of borrowing, for evidence of common descent, or may overlook or wrongly estimate real evidences, which more study and improved method will bring to light. Grouping into families is nothing more than the best classification attainable at a given stage in the progress of linguistic science, it is in no small part provisional only, and is always held liable to modification, even sweeping, by the results of further research. Of some families we can follow the history by external evidences a great way back into the past, their structure is so highly developed as to be traced with confidence everywhere, and their territory is well within our reach. Such we regard with the highest degree of confidence, hardly allowing for more than the possibility that some other dialect, or group, or now-accepted family even, may sometime prove its right to be added on. But these are the rare exceptions; in the great majority of cases we have only the languages as they now exist, and in more or less scanty collections, of every degree of trustworthiness, and even their first grouping is tentative and incomplete, and involves an adjournment of deeper questions to the day of more light. To complete and perfect the work of classification by relationship, or the establishment of families and their subdivisions, is the first object of the comparative study of languages. No other classification has a value in the least comparable with it; that by grade of structure is a mere recreation, leading to nothing; that by absolute worth is of no account whatever, at any rate in the present state of our knowledge. On genetic relationship, in the first place, is founded all investigation of the historical development of languages; since it is in the main the comparison of related dialects, even in the case of families having a long recorded history, and

elsewhere only that, that gives us knowledge of their earlier condition, and enables us to trace the lines of change. In the second place, and yet more obviously, with this classification is connected all that language has to teach as to the affinities of human races, whatever aid linguistic science renders to ethnology rests upon the proved relationships of human tongues.

That a classification of languages, to which we have resorted now to proceed, is not equivalent to a classification of nations, races, and why this is so, is evident enough from the principles which have been brought out by our whole discussion of languages, and which, in their bearing upon this particular point, may well be recapitulated here. No language is a race-characteristic, determined by the special endowments of a race, all languages are of the nature of institutions, parallel products of powers common to all mankind—the powers, namely, involved in the application of the fittest available means to securing the common end of communication. Hence they are indefinitely transferable, like other institutions—like religions, arts, forms of social organization, and so on—under the constraining force of circumstances. As an individual can learn any language, foreign as well as ancestral, if it be put in his way, so also a community, which in respect to such a matter is only an aggregate of individuals. Accordingly, as individuals of very various race are often found in one community, speaking together one tongue, and utterly ignorant of any other, so there are found great communities of various descent, speaking the dialects of one common tongue, which at some period historical circumstances have imposed upon them. The conspicuous example, which comes into every one's mind when this subject is discussed, is that of the Romance countries of southern Europe, all using dialects of a language which, 2500 years ago, was itself the insignificant dialect of a small district in central Italy, but this is only the most important and striking of a whole class of similar facts. Such are the results of the contact and mixture of races and languages. If language-history were limited to growth and diversification, and race-history to spread and dispersion, it would be a comparatively easy task to trace both backward toward their origin; as the case is, the confusion is inextricable and hopeless. Mixture of race and mixture of speech are coincident and connected processes; the latter never takes place without something of the former, but the one is not at all a measure of the other, because circumstances may give to the speech of the one element of population a greatly disproportionate preponderance. Thus, there is left in French only an insignificant trace of the Celtic dialects of the predominant race-constituent of the French people, French is the speech of the Latin conquerors of Gaul, mixed perceptibly with that of its later Frankish conquerors, it was adopted in its integrity by the Norse conquerors of a part of the land, then brought into Britain by the same Norsemen in the course of their further conquests, this time only as an element of mixture, and thence carried with English speech to America, to be the language of a still further mixed community. Almost every possible phase of language-mixture is traceable in the history of the abundant words of Latin origin used by American negroes. What events of this character took place in prehistoric time we shall never be able to tell. If any one chooses to assert the possibility that even the completely isolated dialect of the little Basque community may have been derived by the Iberian race from an intrusive minority as small as that which made the Celts of Gaul speakers of Latin, we should have to admit it as a possibility—yet without detriment to the value of the dialect as indicating the isolated race-position of its speakers. In strictness, language is never a proof of race,

other in an individual or in a community; it is only a probable indication of race, in the absence of more authoritative opposing indications, it is one evidence, to be combined with others, in the approach towards a solution of the confessedly insoluble problems of human history. But we must notice, as a most important circumstance, that its degree of probability is greatest where its aid is most needed, in prehistoric periods and among uncivilized races, since it is mainly civilization that gives to language a propagative force disproportionate to the number of its speakers. On the whole, the contributions of language to ethnology are practically far greater in amount and more distinct than those derived from any other source.

Classification. The genetical classification of languages, then, is to be taken for just what it attempts to be, and no more primarily as a classification of languages only, but secondarily as casting light, in varying manner and degree, on movements of community, which in their turn depend more or less upon movements of races. It is what the fates of men have left to represent the tongues of men—a record imperfect even to fragmentariness. Many a family once as important as some of those here set down has perhaps been wiped out of existence, or is left only in an inconspicuous fragment, one and another has perhaps been extended far beyond the limits of the race that shaped it,—which, we can never tell to our satisfaction.

We begin with the families of highest importance and nearest to ourselves.

Aryan

1. *Aryan (Indo-European, Indo-Germanic). Really*—To this family belongs undoubtedly the first place, and for many reasons the historical position of the peoples speaking its dialects, who have long been the leaders in the world's history, the abundance and variety and merit of its literatures, ancient and modern, which, especially the modern, are wholly unapproached by those of any other division of mankind, the period covered by its records, hardly exceeded in duration by any other, and most of all, the great variety and richness of its development. These advantages make of it an illustration of the history of human speech with which no other family can bear a moment's comparison as to value, however important various other families may be in then bearing on one and another point or department of history, and however necessary the combination of the testimony of all to a solution of the problems involved in speech. These advantages have made Aryan language the training-ground of comparative philology, and its study will always remain the leading branch of that science. Many matters of importance in its history have been brought up and used as illustrations in the preceding discussion, but as its constitution and unextinguished development call for a fuller and more systematic exposition than they have found here, a special section is devoted to the subject (see p. 781 *§* below).

Semitic

2. *Semitic Really*—The family also is beyond all question the second in importance, on account of the part which its peoples (Hebrews, Phœnicians, Assyrians, Syrians, Arabs, Abyssinians, &c.) have played in history, and of the rank of its literatures. For a special treatment of it see *SEMITIC*. Some of the peculiarities of the language have been alluded to above; in the monotony and rigidity of its triliteral roots, and in the extended use which it makes of utterance change ("change of case" in the special sense of that term) for the purpose of grammatical distinction. It is more peculiar and unlike all the other known families of language than these are unlike one another. These are, and perhaps will always be, those to whom the peculiarities just mentioned will seem original, but if the views of language and its history taken above are in the main true, then that opinion is untenable. Semitic language must have grown into its present forms out of legumines accordant in kind, if not identical, in substance with those of other families; and the only question remaining to be solved is, through what processes and under what governing tendencies Semitic speech should have arrived at its present state. And with this solution is most obviously and incontestably bound up that of the other interesting and much discussed question, whether the Semitic family can be shown to be related with other families, especially with our own Aryan. To some the possession in common of grammatical gender, or of the classification of objects in general as masculine and feminine, is of itself enough to prove such relationship; but, though the fact is a striking one, and of no small importance as an indication, this degree of value can by no means be attributed to it in the present state of our knowledge—any more than to any other single item of structure among the infinite variety

of such, distributed among the multitude of human tongues. Many others compare the Semitic and Aryan "roots" with one another, and believe themselves to find there numerous indications of identity of material and signification, but these also must pass for insufficient, until it shall prove possible by their aid to work out an acceptable theory of how Semitic structure should have grown out of such lexical elements as underlie Aryan structure, or out of the abundant initial products of a structural growth that afterwards diverged into two so discordant forms. To show that, both the material and the method have been hitherto wanting, and any confident decision is at least premature, but present probabilities are strongly against the solubility of the question. While many general considerations favour the ultimate unity of these two great civilized and evolving white races of neighbouring homes, and no discordance of speech (as was shown above) can ever be made to prove their diversity of origin, it seems in a high degree unlikely that the evidence of speech will ever be made to prove them one. As regards the often claimed relationship of Semitic with Hamitic language, see the following section.

3. *Hamitic Family*—The prominent importance of this family Hamitic is due to a single one of its members, the Egyptian, in all other respects it is quite insignificant. It occupies the north-eastern corner of Africa, with the border-lands of that continent stretching westward along the whole shore of the Mediterranean, and southward to beyond the equator. It falls into three principal divisions: (1) the ancient Egyptian, with its descendant, the more modern Coptic (itself now for some centuries extinct, see *EGYPT, COPTIC*); (2) the Libyan or Berber languages of the Libyan Africa; (3) the Ethiope languages of eastern Africa. Its attraction thus plainly suggests the theory of its intrusion from Asia, across the isthmus of Suez, and its gradual spread from that point, and the theory is strongly favoured by the physical character of the Hamites, and the historical position especially of the Egyptians, so strikingly different from that of the African races in general. Linguistic evidences of the relationship of Hamitic with Semitic have also been sought, and by many believed to be found; but the maintenance of the two families in their separateness is an indication that those evidences have not yet been accepted as satisfactory, and such is indeed the case. The Egyptian is a language of extreme simplicity of structure, almost of no structure at all. Its radical words are partly monosyllabic, partly of more than one syllable, but not in the latter case any more than in the former showing traceable signs of extension by formative processes from simpler forms. It has no derivative system of any kind, and its roots are made from roots, the root is itself monosyllabic, there is nothing that can be properly called either declension or conjugation, and the same pronominal particles or suffixes have no a selective value, indicating use as a verb, and now a possessive, indicating use as a noun. There is no method known to linguistic science by which the relationship of such a tongue as this with the highly and peculiarly inflective Semitic can be shown, short of a thorough working out of the history of development of each family taken by itself, and a tracing in some measure of the steps by which each should have arrived at its present position from a common starting-point; and this has by no means been done. In short, the problem of the relation of Semitic with Hamitic, not less than with Aryan, depends upon that of Semitic growth, and the two must be solved together. There are striking correspondences between the phenomena of the two families, such as if supported by evidence from other parts of their material, would be taken as signs of relationship; but, in the absence of such support, they are not to be relied upon, not till it can be shown to be possible that two languages could grow to be so different in all other respects as are Egyptian and Hebrew, and yet retain by inheritance corresponding pronouns; And the possession of grammatical gender by Aryan, Semitic, and Hamitic speech, and by them almost alone, among all human languages, though an extremely noteworthy fact, is (as was pointed out above) in the present condition of linguistic science quite too weak a basis for a belief in the original identity of the three families.

Egyptian is limited to the delta and valley of the Nile, and is the only Hamitic language which has ancient records, of the others the existing forms alone are known.

The Libyan or Berber division of the family occupies the inhabitable part of northern Africa, so far as it has not been replaced by intrusive tongues of other connexion—in later times the Arabic, which since the Mohammedan conquest has been the cultivated tongue of the Mediterranean coast, while the earlier Vandal, Latin, and Punic have disappeared, except in the traces they may have left in Berber dialectic speech. The principal dialects are the Kabyle, the Shillia, and the Tuarek or Tamashek, corresponding nearly to the present Numidian, Mauritanian, and Gæthian respectively. Some authorities add the Hausa, from farther south, while by others this is considered a Semitic, and by yet others a negro tongue.

The third or Ethiope division includes as its chief members the Beja or Bisharin, the Saho, the Dankali, the Somali, and the more

inland Galla, the first two lying along the Red Sea north of Semitic Abyssinia, the others south of it, to the equator. By some authorities (Lepsius, Bleek) there is added to the Hamitic family as a fourth division a group from extreme southern Africa, the Hottentot and Bushman languages. The ground of this classification is the possession by the Hottentot of the distinctive of grammatical gender, and even its designation by signs closely corresponding to those used in the Ethiopic division. Others deny the sufficiency of this evidence, and rank the Hottentot as a separate group of African dialects, adding to it provisionally the Bushman, until better knowledge of the latter shall show whether it is or is not a group by itself. If the Hottentot be Hamitic, we shall have to suppose that at a very remote period of general racial fusion, and forced gradually southward, while all the time suffering mixture both of speech and of blood with the negro races, until the physical constitution of its speakers has become completely metamorphosed, and of its original speech no signs are left save those referred to above, and while such exceptional phonetic peculiarities have been worked out as the use of the clicks or clucking sounds (see HOPPESTON), and this must be regarded as at least extremely difficult.

4. *Monosyllabic South-eastern Asiatic Family*.—This body of languages may well enough be the next taken up, and here again (as was the case with the preceding family) on account of the prominent importance of one of its dialects and of the people speaking it—the Chinese people and language. The territory of the family includes the whole south-eastern corner of Asia. China form, on the north-east, Farsi, India in the south, and the high plateau Tibet, with the neighboring Himalayan region, to the westward. The ultimate unity of all these languages rests chiefly upon the evidence of their form, as being all alike essentially monosyllabic and isolating, or destitute of formal structure, the material correspondences among them, of accented words, are not sufficient to prove them related. The Chinese itself can be followed up, in contemporary records, to a period not far from 2000 B. C., and in language, the people, and language institutions, are then scarcely in the main what they have ever since continued to be (see CHINA), the other leading tongues come into view much later, as they receive culture and religion from China on the one hand (the Annamites), or from India on the other (the Tibetans, Burmese, Siamese), and the territory includes great numbers of wild tribes unknown until our own times, whose race-relations and language-relations are as yet very obscure. Current opinion tends to regard the Annamites, Peguans, and Burmese as forming a more nearly related group or division of the family, and as having been the earlier population of Father India, in part dispossessed and driven forward by the later intrusion from the north of Siamese and Burmese, of whom the former are more nearly related to the Chinese, and the latter to the Tibetans, but these groupings, lost as yet upon too slender evidence to be accepted with confidence.

The character of the languages of this family, especially as instanced by its most important member, the Chinese, has been pretty fully set forth in the general discussions above. They are languages of roots. that is to say, there is not demonstrable in any of their words a formative part, limiting the word, along with others similarly characterized, to a certain office or set of offices in the formation of the sentence. That the words are ultimate roots, come down from the first parents, and have no derivations, we have no means over to believe, and they may possibly have passed through processes of growth which equipped them with some scanty supply of forms, but no evidence to that effect has yet been produced. The indications relied on to show an earlier polysyllabism in the family (though already in Chinese reduced to monosyllabism before the earliest historical appearance of the language, some 4000 years ago) are the comparatively recent loss of certain final mutes in Chinese words, and the presence on a considerable scale in Tibetan spelling of added initial and final consonants, now silent in the literary dialect, but claimed to be still uttered in some parts of the country. If the theory connecting these phenomena be established, the Tibetan will approve itself to be by far the most primitive of the dialects of the family, furnishing the key to the history of the rest.

For further details respecting the various tongues of the monosyllabic family, the nature and the different divisions of its territory (BURMAH, CHINA, SIAM, TIBET, &c.) may be consulted. The languages all alike show an addition to the resources of distinction possessed by languages in general, in the use of tones—that is to say, words of which the alphabetic elements are the same differ in meaning according as they are uttered in a higher or a lower tone, with the rising or the falling inflexion, and so on. By this means, for example, the monosyllabic elements of the literary Chinese, numbering but 800 as we should write them, are raised to the number of about 1500 words.

5. *Ural-Altaic (Seythian, Turanian) Family*.—China and Tibet are bordered on the north and west by the eastern branches of another immense family, which stretches through central and

northern Asia into Europe, overlapping the European border in Turkey, and reaching across it in Russia and Scandinavia to the very shore of the Atlantic. Usage has not so definitely determined as in the case of most other families by what name it shall be called, Turanian is perhaps the commonest appellation, but also the most questionable. Five principal branches are generally reckoned as composing the family. The two easternmost are the Tungrian, with the Manchu for its principal division, and the Mongol (see MONGOLIA). Of these two the language is exceedingly simple in structure, being raised but little above the formlessness of the Chinese. The three others are the Turkish or Tatar, the dialects of which reach from the mouth of the Lena (Yakut) to Turkey in Europe, the Samoyed, from the Alta down to the arctic shore of Asia, and along this to the White Sea—an important congeniality of barbarous tribes, and the Finno-Hungarian, including the tongues of the two civilized peoples from which it takes its name, and also those of a great part of the population of northern and central Russia, to beyond the Ural Mountains, and finally the Lappish, of northern Scandinavia. The nearest relation of the Samoyed is with the Finno-Hungarian. The Turkish is a type of a well-developed language of purely agglutinative structure, that is, lacking that higher degree of integration which seems to internal change. Whether this degree is wholly wanting in Finnish and Hungarian is made a question, at any rate, the languages named have no reason to envy the tongues technically called "inflective." Of a value not inferior to that of inflective characteristics is one that belongs to all the Ural-Altaic tongues, in varying measure and use, and helps to bind them together into a single family—the law of the correspondence of vowels of the endings to agree with that of the root or its final syllable.

While the physical race-characteristics known as Mongolian are wanting in the speakers of the western dialects of this family, they are co-conspicuously present in the people of Japan and Corea; and hence the tendency of scholars to endeavor to connect the languages of the two latter countries, since they also are of agglutinative structure (see JAPAN and COREA), with the family now under treatment, as also with one another. Neither connexion, however, can at present be regarded as proved.

Other languages of north-eastern Asia, too little known to group, and too unimportant to treat as separate families, may be mentioned here by way of appendix to their neighbors of the most diversified and widespread Asiatic family. They are the Aino, of Yezo and the Kuril Islands, with part of the southern part of Kamtschatka, and the Yukagiri and Tchukchi, of the extreme north-east.

The opinion was recently held by many scholars that the agglutinative dialects—Acedian, Samian, &c.—of the presumed founders of Mesopotamian culture and teachers of the Assyrian Semites (see BABYLONIA) belonged to the Ural-Altaic family, and specifically to its Finno-Hungarian branch, but it is believed to have been generally abandoned. The mere possession of an agglutinative structure cannot be taken as proving anything in the way of relationship.

6. *Dravidian or South-Indian Family*.—This is an important Dravidic body of nearly and clearly related tongues, spoken by about 25,000,000 people, doubtless representing the main population of all India at the time when the intrusive Aryan tribes broke in from the north-west, and still filling nearly the whole of the Deccan, together with part of Ceylon. In an earlier article (see INDIA) the names of the dialects have been given, with indication of their locality and relative importance, and with some account of their leading features. They are languages of a high grade of structure, and of great power and euphony, and the principal ones have enjoyed a long cultivation, founded on that of the Sanskrit. As they obviously have no Aryan affinities, the attempt has been made to connect them also with the Ural-Altaic or Turanian family, but altogether without success, although there is nothing in their style of structure that should make such connexion impossible.

Not all the tribes that make up the non-Aryan population of India speak Dravidian dialects. The Santals and certain other wild tribes appear to be of another lineage, and are now generally known as Kolians.

7. *Malay-Polynesian Family*.—The islands, greater and smaller, lying off the south-eastern coast of Asia and those scattered over Polynesia, all the way from Madagascar to Easter Island, are peopled with their own peculiar families of languages, standing in no known relationship with those of the mainland. The principal one among them is the great Malay-Polynesian family. It falls into two principal divisions, Malayan and Polynesian. The Malayan includes, besides the Malay proper (see MALAYA), which occupies the Malaccan peninsula (yet doubtless not its original home of the division, but by immigration from the islands), the languages also of Sumatra, Java, Borneo, &c., of the Philippine Islands, of Formosa, and of Madagascar, together with the coasts of Celebes and other islands occupied in the interior by Papuans. The Polynesian division includes most of the tongues of the remaining scattered groups of

South-eastern Asiatic

Ural-Altaic

PART II—COMPARATIVE PHILOLOGY OF THE ARYAN LANGUAGES.

The study of Aryan comparative philology has from its outset necessarily been in close connexion with the study of Sanskrit, a language unparalleled amongst its cognates in antiquity and distinctness of structure, and consequently the natural basis of comparison in this field. It is therefore not to be wondered at that we find no clear views of the mutual relationship of the individual members of the Aryan family or their position with regard to other languages until Sanskrit began to attract the attention of European philologists, or that the introduction of Sanskrit as an object of study was closely followed by the discovery of the original community of a vast range of languages and dialects hitherto not brought into connexion at all, or only made the objects of baseless speculations. We meet with the first clear conception of this idea of an Indo-European community of languages in the distinguished English scholar Sir William Jones, who, as early as 1786, expressed himself as follows: "The Sanskrit language, whatever may be its antiquity, is of wonderful structure; more perfect than the Greek, more copious than the Latin, and more exquisitely refined than either, yet bearing to both of them a stronger affinity, both in the roots of verbs and in the forms of grammar, than could have been produced by accident; so strong that no philologist could examine all the three without believing them to have sprung from some common source which, perhaps, no longer exists. There is a similar reason, though not quite so forcible, for supposing that both the Gothic and the Celtic, though blended with a different idiom, had the same origin with the Sanskrit."¹ But neither Sir William Jones nor any of his older contemporaries who had arrived at similar conclusions ever raised this important discovery from a brilliant *aperçu* into a valid scientific theory through a detailed and systematic comparison of the languages in question. To have achieved this is the undoubted merit of the German, Franz Bopp (*q v*), the founder of scientific philology of the Aryan languages, and subsequently through this example also the founder of comparative philology in general. Next to him Jacob Grimm (*q v*), must be mentioned here as the father of historical grammar. The first part of his famous *Deutsche Grammatik* appeared in 1819, three years after Bopp had published his first epoch-making book, *Ueber das Conjugationssystem der Sanskritsprache*. Bopp's results were here at once utilized, yet Grimm's whole system was entirely independent of that of Bopp, and had no doubt been worked out before Grimm knew of his illustrious predecessor. In fact, their scientific aims and methods were totally different. Bopp's interest was not concentrated in comparison as such, but chiefly inclined towards the explanation of the origin of grammatical forms, and comparison to him was only a means of approaching that end.

In this more or less speculative turn of his interest Bopp showed himself the true son of a philosophical period when general linguistics received its characteristic stamp from the labours and endeavours of men like the two Schlegels and Wilhelm von Humboldt. Jacob Grimm's aims were of a less lofty character than those of Bopp, whose work, to his own mind, was crowned by his theory of the origin of inflexion through agglutination. In confining his task to a more limited range than the vast field of Aryan languages embraced in Bopp's researches, and thus fixing his attention on a group of idioms exhibiting a striking regularity in their mutual relationship, both where

they coincide and where they differ, he made it his foremost object to investigate and illustrate the continuous progress, subject to definite laws, by which these languages had been developed from their common source. He thus raised the hitherto neglected study of the development of sounds to an equal level with the study of grammatical forms, which had so far almost exclusively absorbed all the interest of linguistic research. Grimm's discovery of the so-called "Lautverschiebung," or Law of the Permutation of Consonants in the Teutonic languages (which, however, had been partly found and proclaimed before Grimm by the Danish scholar Rask), became especially important as a stimulus for further investigation in this line. Grimm's influence on comparative philology (which is secondary only to that of Bopp, although he was never a comparative philologist in the sense that Bopp was, and did not always derive the benefit from Bopp's works which they might have afforded him) is clearly traceable in the work of Bopp's successors, amongst whom Friedrich August Pott is universally judged to hold the foremost rank. In his great work, *Etymologische Forschungen auf dem Gebiete der indogermanschen Sprachen, mit besonderem Bezug auf die Lautumwandlung im Sanskrit, Griechischen, Lateinischen, Litauischen, und Gothischen* (Leipzig, 1833-36), we find Indo-Germanic etymology for the first time based on a scientific investigation of general Indo-Germanic phonology. Amongst Pott's contemporaries Theodor Benfey² deserves mention on account of his *Griech.* Benfey.

¹ Theodor Benfey was born on 28th January 1809 at Nötten, Hanover, the son of a Jewish tradesman who had gained some reputation as an acute and learned Talmudic scholar. At the early age of sixteen he entered the university of Göttingen (whence he afterwards exchanged for Munich) to devote himself to the study of classical philology. It was not until after 1830, when he had settled in Frankfurt-on-the-Main as a private teacher of languages, that he turned towards the study of Sanskrit. In 1834 he went back to Göttingen and began lecturing as a privat-docent. For some time his lectures extended over various branches of classical philology as well as of Oriental and comparative philology, but he soon began to concentrate himself on the latter department. After he had joined the Christian church he received, in 1848, an extraordinary professorship, and in 1852 he was appointed ordinary professor of Sanskrit and comparative philology. He died on 26th June 1881. Benfey also began his long and brilliant literary career in the field of classics. Besides his dissertation *Observationes ad Anacreontis fragmenta genuina* (Göttingen, 1829), his translation of the comedies of Terence (Stuttgart, 1837) deserves special notice. This was followed by his *Wörterlexikon* in 1839, and his quarto volume on "India" in Ersch and Gruber's *Encyclopädie*, 1840. Through these he at once gained a position of authority both in comparative and Indian philology. Of his other writings the more important are: *Ueber die Monotonie einiger alten Völker, insbesondere der Perser, Cyprioten, Juden, Syrer* (written in conjunction with A. Stern), Berlin, 1836; *Ueber das Verhältniss der ägypt. Sprache zum semit. Sprachstamm*, Leipzig, 1844; *Die pers. Keilschriftentafeln, mit Uebersetzung und Glossar*, Leipzig, 1847; *Die Hymnen des Samaveda*, Leipzig, 1848; *Vollständige Grammatik der Sanskritsprache*, Leipzig, 1853; *Chrestomathie aus Sanskritclassikern*, Leipzig, 1853; *Panditabandha*, 2 vols. Leipzig, 1859; *Geschichte der Sprachwissenschaft und orient. Philologie in Deutschland*, Munich, 1869. Of his numerous contributions to the various scientific periodicals of the time, those published in the *Abhandlungen der Göttinger Gesellschaft der Wissenschaften* are especially noteworthy:— "Ueber die indog. Endungen des Gen. Sing.," vol. xix; "Einleitung in die Grammatik der ved. Sprache," vol. xix; "Die quantitative Verschiedenheiten in den Samhita- und Panchastak Texten der *Ug. Samhita*," vol. xxi; "Das indog. Thema des Zahlworts *Yuga* ist 'du,'" vol. xxii; "Hermes, Minos, Tartaros," vol. xxii; "*Altper. mazdāh = Zerd. mazdāh = Skr. medhā*," vol. xxiii; "Emige Derivate des indog. Verbums *ambh = nabh*," and "Ueber einige Wörter mit dem Bindevocal *i* im Rigveda," vol. xxiv; "Behandlung des auslautenden *a* in *nā* 'was' und *nā* 'mocht' im Rigveda, nebst Bemerkungen über die urspr. Anspicue und Accentuierung der Wörter im *Veda*," vol. xxi. Some of his smaller articles in the *Göttinger Gelehrte Anzeigen* were reprinted under the titles of *Vedica und Verwandtes*, Strassburg, 1877, and *Vedica und Linguistica*, ibid., 1880. As the preceding list shows, Benfey's interest had become more and more concentrated on Vedic studies towards the end of his days, and indeed he had planned, as the crowning work of his life, an extensive grammar of Vedic Sans-

² For this quotation and the following historical sketch in general see Th. Benfey, *Geschichte der Sprachwissenschaft*, p. 438, Munich, 1869, and especially B. Delbrück, *Introduction to the Study of Language*, p. 1, Leipzig, 1882 (a second German edition appeared in 1884).

Historical sketch.

Bopp and J. Grimm

ishes *Wörterbuch* (Berlin, 1859), a work equally remarkable for responsiveness of contents and power of combination, yet showing no advance on Bopp's standpoint in its conception of phonetic change.

Schleicher. A third period in the history of Indo-Germanic philology is marked by the name of August Schleicher, whose *Compendium der vergleichenden Grammatik der indogermanischen Sprachen* first appeared in 1861. In the period subsequent to the appearance of Pott's *Etymologische Forschungen*, a number of distinguished scholars, too large to be recorded here individually,¹ had devoted their labours to the different branches of Aryan philology, especially assisted and promoted in their work by the rapidly progressing Vedic (and Avestic) studies that had been inaugurated by Rosen, Roth, Benfey, Westergaard, Müller, Kuhn, Aufrecht, and others. Moreover, new foundations had been laid for the study of the Slavonic languages by Miklosich and Schleicher, of Lithuanian by Kauschat and Schleicher, of Celtic by Zenzli. Of the classical languages Greek had found a most distinguished representative in Curtius, while Corssen, Mommsen, Aufrecht, Kirchhoff, &c., had collected most valuable materials towards the elucidation of Latin and the cognate Italic idioms. In his *Compendium* Schleicher undertook and solved the difficult task of sitting down the countless details amassed since the days of Bopp and Grimm, and thus making the individual languages stand out clearly on their common background, while Bopp's attention had been especially occupied with what was common to all Indo-Germanic tongues. There are two prominent features which characterize this part of Schleicher's work,—his assumption and partial reconstruction of a prehistoric parent-*vyeech*, from which the separate Indo-Germanic languages were supposed to have sprung, and the establishment of a long series of phonetic laws, regulating the changes by which that development of the individual idioms had taken place. On Schleicher's views of and contributions towards general comparative philology (which he erroneously supposed to consider as a branch of natural science) we need not enter here.

For some time after Schleicher's premature death (in 1868) Indo-Germanic philology continued in paths indicated by him and Curtius, with the exception, perhaps, of the school founded by Benfey, who had always stood on independent ground. The difference between the two schools, however, was less strikingly marked in their writings, because it chiefly concerns general views of language and the Indo-Germanic languages in particular, although the characteristic task of the period alluded to was that of working out the more minute details of comparison, but behind all this the general interest still clung to Bopp's old glottogenic problems. Lately, however, a new movement has begun, and a younger school of linguists has sprung up who are united in their opposition to many theories of the older generation, yet often differ materially

but Death, however, prevented him from completing more than the above mentioned preliminary studies by means of which he had intended to enter the field for his greater work. (For fuller biographical details see Bezzenger's, in his *Beiträge*, vii. 289 sq.)

¹ The extensive progress made in this period is best illustrated by the foundation of two periodicals especially devoted to Aryan comparative philology, Kuhn's *Zeitschrift für vergleichende Sprachforschung*, Berlin, from 1861 (now 27 vols.), and Kuhn's *Beiträge zur vergleichenden Sprachforschung*, Berlin, from 1868 (8 vols.). Benfey's school is more especially represented by the contributors to Benfey's *Orund und Uebersicht*, Göttingen (3 vols.), from 1862, and subsequently through Bezzenger's *Beiträge zur Kunde der indogermanischen Sprachen*, Göttingen (3 vols.), from 1877. France possesses two periodicals of the same kind, the *Revue de Linguistique*, Paris, from 1868, and the *Mémoires de la Société de Linguistique de Paris*, also from 1868, while England is represented by the *Proceedings and Transactions of the Philological Society*, and America by the *Transactions of the American Philological Association* (from 1888).

both with regard to method and the solution of individual problems. In its present state this younger school (often branded with the name of Neo-Grammarians, "Junggrammatiker," by its opponents real and imaginary) is marked by certain distinct tendencies. In the first place, they are inclined more or less to abandon glottogenic problems as insoluble, if not for ever, yet for the present and with the scanty means that Aryan philology alone can furnish for this purpose. In this they are in opposition to the whole of the older school. In the second place, they object to the use of all misleading metaphorical comparisons of processes in the history of language with processes of organic development,—comparisons used at all times, but especially cherished by Schleicher. In the third place—and this has been of the greatest practical importance—they hold that our general views of language and our methods of comparison should be formed after a careful study of the living languages, because these alone are fully controllable in every minute detail, and can therefore alone give us a clear insight into the working of the different motive forces which shape and modify language, and that the history of earlier periods of language, consequently, can only be duly illustrated by tracing out the shape which each of these forces has had in every individual case of change. Of these forces two are found to be especially prominent—phonetic variation and formation by analogy. They generally work in turns and often in opposition to one another, the former frequently tending to differentiation of earlier unities, the latter to abolition of earlier differences, especially to restoration of conformity disturbed by phonetic change. There are, however, other important differences in the action of the two forces. Phonetic change affects exclusively the pronunciation of a language by substituting one sound or sound-group for another. From this simple fact it is self-evident that phonetic changes as such admit of no exceptions. Pronunciation—that is, the use of certain sounds in certain combinations—is perfectly unconscious in natural unadvised speech, and every speaker or generation of speakers has only one way of utterance for individual sounds or their combinations. If, therefore, a given sound was once changed into another under given circumstances, the new sound must necessarily and unconsciously replace its predecessor in every word that falls under the same rules, because the older sound ceases to be practised and therefore disappears from the language. Thus, for instance, the sound of the short so-called Italian *a* in English has become exchanged for the peculiarly English sound in *man*, *hat*, &c., which is so exclusively used and practised now by English speakers that they feel great difficulty in pronouncing the Italian sound, which at an earlier period was almost as frequent in English as in any other language that has preserved the Italian sound up to the present day. Again, the sound of the so-called long English *a* in *make*, *paper*, &c., although once a monophthong, is now pronounced as a diphthong, combining the sounds of the English short *e* and *i*, and no trace of the old monophthong is left, except where it was followed by *r*, as in *har*, *mare* (also *car*, *their*, *where*, &c.), where the *a* has a broader sound somewhat approaching that of the short *a* in *hat*. This last instance may at the same time serve to illustrate the restrictions made above as to sounds changing their pronunciation in certain groups or combinations, or under given circumstances only. We may learn from it that phonetic change need not always affect the same original sound in the same way in all its combinations, but that neighbouring sounds often influence the special direction in which the sound is modified. The different sounds of the English *a* in *make* and *har* are both equivalents of the same Old English sound *ā* (= the Italian short *a*) in *macian*, *hara*. The latter sound has

been split in two, but this process again has taken place with perfect regularity, the one sound appearing before *r*, the other before all other consonants. It is easy to see that the common practice of comprising the history of the Old English *ð* in the one rule,—that it was changed into the sound of the *a* in *made* except when followed by an *r*,—can only be defended on the practical ground that this rule is convenient to remember, because the words exhibiting the former change are more numerous than the instances of the latter, apart from this there is nothing to justify the assumption that one of these changes is the rule and the other the exception. The fact is, that we have two independent cases of change, which ought to be stated in two distinct and independent rules according to the different positions in which the original *ð* stood before the splitting began. It is also easy to observe that the variety of modifying influences may be much more manifold than in the present instance of *made* and *hare*, and that the number of special phonetic rules in such cases must be increased in proportion to the progress made in the investigation of the said modifying powers. In this respect much still remains to be done, but what has been achieved is more than sufficient to prove the correctness of the statement from which we started above, that phonetic rules in themselves are without exceptions, however often phonetic processes may have been crossed and more or less effaced by non-phonetic influences in actual (especially literary) language, such as mixture of dialects, formation by analogy, and the like.

Anal-
ogical
changes.

Analogue change, on the other hand, does not affect the pronunciation of a language as a whole in the way phonetic change does, but is confined to the formation and inflexion of single words or groups of words, and therefore very apt to bear an entirely arbitrary and irregular character. A few instances will be sufficient to illustrate this. In Old English a certain number of substantives formed their plurals by mutation of the root-vowels, as *fēt*—*fē* or *bē*—*bē*. In Modern English this system of inflexion has been preserved in some cases, as in *foot*—*feet*, and altered in others as *book*—*books*. Now, while *foot*, *feet*, and *book* are the regular modern phonetic equivalents of the old *fēt*, *fē*, *bē*, the plural *books* can in no way be phonetically traced back to the old *bē*, the phonetic equivalent of which in Modern English would be **beech*. The only possible explanation of a form like *books* is that the older *bē* was at some date given up and replaced by an entirely new formation, shaped after the analogy of the numerous words with a plural in *-s* without modification of the root-vowel. That this should have been done in the case of *book*, but not in that of *foot*, is an accident, which must be accepted as a fact not allowing of any special explanation. Let us now take another instance from the English verb. In Old English the different persons of the pretense indicative in the so-called strong (irregular) verbs were generally distinguished by different root-vowels, *ridan*, “to ride,” and *bindan*, “to bind,” for instance, form their preterites thus *ic rād*, *thū rād*, *hē rād*, *wē*, *gē*, *hīs ridan*, and *ic band*, *thū bande*, *hē band*, *wē*, *gē*, *hīs bundan*. In Modern English this difference in the root-vowels has been abandoned, and *rode*, *bound* now stand for all persons, *rode* being the modern phonetic equivalent of the 1st and 3d sing. *rād*, while *bound* represents the *y*-forms of *bindan*. Inasmuch as a similar process of levelling has been carried through in all preterites of Modern English, regularity prevails even here. But when we look to its results in the individual verbs we soon find that the choice amongst the different forms which might have served as starting-points has been entirely arbitrary. It is indeed impossible to say why the old singular form should have been chosen as a model in one case, as in *rode*, and the old plural form in

another, as in *bound*. From these and numerous similar instances we must draw the conclusion that it is beyond our power to ascertain whence analogical changes may start, and to what extent they may be carried through when once begun. All we can do is to carefully classify the single cases that come under our observation, and in this way to investigate where such changes are especially apt to take place and what is then general direction. As to the latter points, it has been observed before that levelling of existing differences is one of the chief features in analogical change (as in the case of *rode* and *bound*). As to the former, it must be borne in mind that, before any analogical change can take place, some mental connexion must exist between the words or forms serving as models and those which are remodelled after the types suggested to the mind of the speakers through the former. Of such natural mental combinations two classes deserve especial notice. The mutual relationship in which the different, say inflexional, forms of the same word stand to each other, and the more abstract analogies between the inflexional systems of word-groups bearing a similar character, as, for instance, the different declensions of nouns and pronouns, or the different conjugations of verbs. The instance of *rode*, *bound* may serve to illustrate the former category, that of *books* the latter. In the first case a levelling has taken place between the different forms of the root-vowels once exhibited in the different preterite forms of *ridan* or *bindan*, which clearly constitute a natural group or mental unity in consequence of their meaning. The form of *rode* as a plural has simply been taken from the old singular, that of *bound* as a singular from the old plural. In the case of *book*—*books* for *bōc*—*bē*, this explanation would fall short. Although we might say that the vowel of the singular here was carried into the plural, yet this would not explain the plural *-s*. So it becomes evident that the old declension of *bōc*—*bē* was remodelled after the declension of words like *arm*—*arms*, which had always formed their plurals in *-s*. Isolated words or forms, on the other hand, which are no part of natural groups or systems, inflexional or formative, must be regarded as commonly safe from alterations through analogy, and are therefore of especial value with regard to establishing rules of purely phonetic development.

It is true that the distinction between phonetic and analogical change has always been acknowledged in comparative philology. At the same time it cannot be denied that analogical changes were for a long time treated with a certain disdain and contempt, as deviations from the only course of development then allowed to be truly “organic” and natural, namely, that of gradual phonetic change (hence the epithet “false” so constantly attached to analogy in former times). Amongst those who have recently contributed most towards a more correct evaluation of analogy as a motive-power in language, Professor Whitney must be mentioned in the first place. In Germany Professor Scherer (*Zur Geschichte der deutschen Sprache*, 1868) was the first to apply analogy as a principle of explanation on a larger scale, but in a wilful and unsystematic way. Hence he failed to produce an immediate and lasting impression, and the merit of having introduced into the practice of modern comparative philology a strictly systematic consideration of both phonetic and analogic change as co-ordinate factors in the development of language rests with Professor Leskien of Leipzig, and a number of younger scholars who had more or less The New experienced his personal influence. Amongst these Brug-Schöelmann, Osthoff, and Paul rank foremost as the most vigorous and successful defenders of the new method, the correctness of which has since been practically acknowledged by most of the leading philologists of all shades,

who in point of fact follow it in their investigations, in spite of the lively theoretical protest which some of them continue to maintain against it, and in spite of the general feeling of hostility and inclination towards mutual distrust often but too clearly visible in recent linguistic publications, from whatever side they may come.¹

From this historical sketch we may now proceed to a short examination of some of the chief results of Aryan comparative philology.

The
parent-
language

The most prominent achievement of the researches of Bopp and his followers was to prove that the majority of the European languages and dialects, together with a certain number of important languages spoken in Asia, form one great family,—that is, that they have sprung from one common source or parent-language. The name now mostly used in England for this community is *Aryan languages*. American and French scholars generally prefer to say *Indo-European languages*, while the name of *Indo-Germanic languages* is still almost universally used in Germany. It is hard to decide for or against any of these names from a scientific point of view. The word *Indo-Germanic* was not inappropriately coined by combining the names of the most easterly and westerly members of the family, the Indian and the Germanic or Teutonic group.² *Indo-European* seems to be a less lucky invention, as this combination of geographical names would erroneously point to all the languages of India and Europe as the constituents of our family, while a large number both of Indian and European idioms belong to entirely unrelated groups of languages. *Aryan* would no doubt be the best name in itself, for it seems that the primitive forefathers of the Aryan nations used the word *Aras* as a national name themselves. We find at least the Sanskrit *Ārya* thus used in India, and similarly the Old Persian *Ārya* (in the cuneiform inscriptions of Darius), Zend *Ārya* in Persia (whence the later *Āryān*, *Āriān*), and perhaps *Ēryā*, gen. *Ēryān*, as the national name for Ireland.³ But before the word *Aryan* came to be applied in the sense defined above it had for some time been used, and it is still largely used, in a more restricted sense as the special collective name for the languages of the Indian and Persian or Iranian groups of the Indo-Germanic family. This ambiguity tends to the use of the word *Aryan* less recommendable than it would be had its meaning been properly fixed from the beginning. It seems that outside of England *Aryan* will hardly gain ground, some recent attempts to introduce the name into Germany have utterly failed, and in the same way the other nations who share in scientific research in this domain cling to the older names.

Aryan
groups.

This large Indo-Germanic or Aryan family, then, to revert to our principal task, consists of ten groups or sub-

families of languages, three of which are located in Asia, while the rest belong to Europe.⁴

1 The *Indian Family*, in which Sanskrit, especially in its oldest form, preserved in the Vedic texts, stands foremost in rank. Of the older stages of the language Prakrit and Pāli may be mentioned here,—the former, in its various branches being the mother of the modern Indian dialects of Aryan descent (including also the Gipsy language), the latter (see above, p. 183) the idiom of the sacred books of the southern Buddhists.⁵

2 The *Iranian or Persian Family*, represented in the earliest period by Old Persian, scanty remnants of which have come down to us in the Achaemenian cuneiform inscriptions, and Zend, or, as it is also called, Old Bactrian, the language of the *Zend-Avesta*, the sacred books of the Zoroastrians. The chief modern representatives of this group are Persian, Afghan, Kurdish, and Ossetic.⁶

3 The *Armenian Family*, consisting of the different living dialects of Armenian. Armenian has but recently been proved to be an independent member of the Aryan family. It partakes of many peculiarities of the Iranian group, but at the same time shares several important characteristics of the European languages, so that it cannot be classed as a subdivision of either of these groups.⁷

4 The *Greek Family*, comprising the various old dialects of Greek, and the modern Romance idioms, which have been developed out of the later *korymbi* that had gradually superseded the old dialectal varieties.⁸

5. A fifth family, which may once have had a far larger extension, is now only represented by one surviving member, the *Albanian language*. As we have no old sources for this idiom, and only know it in its modern state of utter decay, it is extremely difficult to obtain definite results concerning its origin and position relatively to the surrounding languages. Bopp seems to have proved, however, that Albanian actually is an Aryan idiom.⁹ It is also certain that it belongs to the European type of Aryan, yet it is not particularly closely allied with Greek, as has often been assumed, but shows some remarkable coincidences with the northern European languages.¹⁰

6 The *Italic Family*. Its most important representative is Latin, from which the modern Romance languages have sprung. Closely connected with Latin was the Faliscan dialect, which is preserved in a few inscriptions only. A second branch of Italic is formed by Umbrian and Oscan, both of which soon became extinct through the overpowering influence of Latin, like the other less widely diffused idioms once spoken in Italy.¹¹

⁴ The fullest, yet now somewhat antiquated, account of all the members of the Aryan family will be found in the article "Indo-Germanischer Sprachstamm," by A. F. Pott, in Ersch and Gruber's *Encyclopädie* (Leipzig, 1840). See also especially Th. Benfey, *Geschichte der Sprachwissenschaft*, pp. 601-683.

⁵ For further particulars see SANSKRIT.

⁶ See the articles *Pāṭishāhī* (*supra*, p. 184 sq.) and *Persia* (*supra*, p. 653 sq.), and for the linguistic characteristics of this group H. Hübschmann, in *Zeitschrift für vergleichende Sprachforschung*, xxiv p. 872 sq.

⁷ See H. Hübschmann, "Ueber die Stellung des Armenischen im Kreise der indo-germanischen Sprachen," in *Zeitschrift für vergleichende Sprachforschung*, xliii p. 5 sq., where further references to earlier treatments of this question are given.

⁸ See GRÆK, vol. xi p. 129 sq. An exhaustive summary of all contributions towards linguistic elucidation of Greek is given in Gustav Meyer's excellent *Gräcische Grammatik*, Leipzig, 1889, which must now be considered the standard book on Greek grammar, together with the well-known works of G. Curtius, quoted at vol. xi p. 186.

⁹ Bopp, "Ueber das Albanische in seinen verwandtschaftlichen Beziehungen," Berlin, 1855, in *Abhandl. Berl. Akad.*

¹⁰ See especially G. Meyer, "Die Stellung des Albanischen im Kreise der indo-germanischen Sprachen," in *Bezenberger's Beiträge*, viii p. 188 sq., and *Albanische Studien*, Vienna, 1889, for further references, cp. Benfey, *Geschichte der Sprachwissenschaft*, p. 648 sq.

¹¹ A sketch of the history of Latin is given under *LATIN LANGUAGE*, a list of the chief books concerning the other dialects will be found in the appendix to Sayce's *Intro to the Science of Lang.*, vol. ii.

¹ The fullest systematic treatment of these questions of method will be found in Paul's *Prinzipien der Sprachgeschichte*, Halle, 1880. See also Osthoff, *Das physiologische und psychologische Moment in der sprachlichen Formenbildung*, Berlin, 1879, and Mistl, "Laute, Gesetze und Analogie," in *Zeitschrift für Vergleichende Sprachforschung*, xi p. 305 sq. Of those who on principle stand in theoretical opposition, the several schools of Benfey (now especially represented by Fick), Schleier, and Johannes Schmidt may be mentioned.

² The word *Indo-Germanic*, it is true, was invented before the Celtic languages were known to belong to the same family. But even after that discovery it was unnecessary to substitute the name *Indo-Celtic* as some authors have tried to do; for certainly the most westerly branch of Indo-Germanic in Europe (disregarding the Aryan colonies in Armenia) is Icelandic, an undoubtedly Germanic language. Other names, such as *aphelike* or *Sanskritic*, have hardly found any use in scientific literature.

³ For particulars see Professor Max Müller's *Lect. on the Science of Lang.*, lect. vi (first series), and ARYAN, vol. ii p. 672 sq., for this etymology of *Ēryā* see especially H. Zimmer, "Arisch," in *Bezenberger's Beitr. zu Kunde der indogerm. Sprachen*, iii p. 187 sq.

7 The *Celtic Family*, once covering a large part of western Europe, but now reduced to comparatively scanty remnants in the north-west of France and in the British islands. Among its extinct members the language of the Galatians in Asia Minor may be mentioned, of which little more is known than that it was Celtic. The earliest documents of Celtic speech we possess are some inscriptions in the idiom of the Gallic inhabitants of France and northern Italy. The surviving branches of Celtic show a clear division into two groups, the Northern or Gaelic group, formed by Irish, Gaelic or Scotch, and Manx, and a Southern or Britannic group, consisting of Welsh or Cymric, Cornish (extinct since 1778), and Armorican or Bas Breton in Brittany. The fundamental authority for the comparative study of Celtic grammar is Zeuss, *Grammatica Celtica*, 1853 (2d ed. by H. Ebel, 1871). After Zeuss, Stokes and Rhys in England, Ascoli in Italy, Ebel, Windisch, and Zimmer in Germany, and D'Arbois de Jubainville and H. Gaidoz in France have been the chief contributors to this field of research. The last-named is also the editor of a periodical especially devoted to Celtic studies, the *Revue Celtique* (Paris, from 1870).¹

8. The *Germanic or Teutonic Family*. This well-developed family is divided into two main groups, which are now commonly denoted Eastern and Western Germanic. The members of the former are Gothic (see GOTHIC LANGUAGE, vol. x, p. 852 sq.) and Scandinavian, with an eastern and a western subdivision, the former comprising Swedish and Danish, the latter Norse and Icelandic. Western Germanic, on the other hand, consists of English, Frisian (these two seem to form a separate branch), Saxon or Low German, Frankish (including Dutch), and Upper German (see article GERMAN LANGUAGE). The dialects of the numerous other Teutonic tribes not mentioned here have died out without leaving sufficient materials for linguistic classification.

9. The *Baltic Family*, comprising three distinct idioms—Prussian, Lithuanian, and Lettish. Prussian became extinct in the 16th century. The few specimens of this highly interesting language which have been preserved are collected by Nesselmann, *Die Sprache der alten Preussen* (Königsberg, 1845), and *Ein deutschpreussisches Vocabularium* (ibid., 1868). The same author has also published a dictionary, *Thesaurus linguae Prussicae* (Berlin, 1873). Amongst other contributions to Prussian grammar, Bopp's essay, *Ueber die Sprache der Altpreussen* (Berlin, 1853), is especially noteworthy. Of the two other branches, Lithuanian is the more important for comparative philology. The chief grammars are those by Schleicher (*Handbuch der litauischen Sprache*, 2 vols., Prague, 1856-57) and Kurschat (*Litauische Grammatik*, Halle, 1876), the best dictionary is by Kurschat (*Wörterbuch der lit. Sprache*, 2 vols., Halle, 1878-83). Some of the oldest texts are now being reprinted by Bezenberger.² For Lettish, Bielenstein's grammar (*Die lettische Sprache*, 2 vols., Berlin, 1863-64) and Ullmann's dictionary (*Lettisches Wörterbuch*, Riga, 1872) are the first books to be consulted.

10. The *Slavonic Family*. There are two main branches of Slavonic. The so-called Southern or South-Eastern branch embraces Russian, Rutenian (in Galicia), Bulgarian, Servian, Croatian, and Slovenian. The second branch is generally designated by the name of Western Slavonic. It is chiefly represented by Czechish or Bohemian and Polish. With the former the Sorbian dialects spoken

in Lusatia are very closely connected. Polish, again, is subdivided into Eastern Polish or Polish Proper and Western Polish, a few remnants of which now survive in the Kasubian dialects of Prussia. About the extinct members of this last group, which are generally comprehended under the name of Polabian dialects, Schleicher's *Laute- und Formenlehre der polabischen Sprache* (St. Petersburg, 1871) and an article by Leskien in *Im neuen Reich*, x p. 325, may be consulted. The oldest Slavonic texts, some of which go as far back as the 10th century, are a number of books destined for the use of the church. From this circumstance the peculiar dialect in which they are written is often called Church Slavonic. Schleicher and others identify this dialect with Old Bulgarian, while Miklosich thinks it should be classed as Old Slovenian. For comparative purposes as well as for Slavonic philology this idiom is the most important. The chief grammars are Schleicher, *Formenlehre der kirchenslavischen Sprache* (Bonn, 1852); Miklosich, *Laute- und Formenlehre der alt-slovenischen Sprache* (Vienna, 1850), and Leskien, *Handbuch der altpolabischen Sprache* (Vienna, 1871). The fundamental works on comparative Slavonic philology are Miklosich, *Vergleichende Grammatik der slavischen Sprachen* (4 vols., Vienna, 1852-68, 2d ed. of vol. 1, *Lautelehre*, 1870), and *Lencon Paleoslovenico-Græco-Latinum* (Vienna, 1862-65). A large number of special contributions are collected in Jagić, *Archiv für slavische Philologie* (Berlin, from 1876).

The mutual relationship of these ten families may be shortly characterized by saying that they are dialects of the primitive Aryan parent-speech, which at an early period of its existence must have formed a linguistic unity, but subsequently became dissolved into these subdivisions. This fundamental view now seems to be universally admitted to be correct. But it is extremely difficult to go beyond it in attempts to trace out the history of the process of dissolution. One problem offering itself at the very outset of such an attempt (although more of an ethnological than philological character) must at once be dismissed as insoluble,—the question of the original home of our Aryan forefathers and the directions of the wanderings that brought the single members of the great original tribe to the seats occupied in historical times by the several Aryan nations. There exist indeed no means for deciding whether they came from the north-eastern part of the Iranian plateau near the Hindu-Kush Mountains, as was once generally assumed, or whether Europe may boast of being the mother of the Aryan nationality, as some authors are now inclined to believe.³ The chief philological difficulty lies in the fact that some of these ten families stand in closer relationship with certain others than with the rest, so that they seem to form separate independent groups, and yet these groups cannot be severed from the rest without overlooking important linguistic facts which seem to speak for the existence of a closer connexion between single members of one group and single members or the whole of another. Before attention was drawn to this latter point it was easy enough to account for the origin of the grouping alluded to. If everything that is common to all Aryan languages must have originated in the common parent-speech—and the correctness of this assumption can hardly be doubted—then everything that is common to all the families of one particular group, but strange to the others, must be assigned to a period when these families formed a unity by themselves and were disconnected with the other stock. The fact, for instance, that all the European languages possess the three vowels *a, e, o*, where the Indian and Iranian group show the uniform *o*, which was then believed to be the primitive

¹ For further particulars see article CELTIC LITERATURE, and the very exhaustive critical and bibliographical study by Windisch, "Keltische Sprachen," in Bach and Greber's *Encyclopædie*.

² *Litauische und Lettische Drucke des 15ten Jahrhunderts*, Göttingen, 1878 sq.; cp. also *Beiträge zur Geschichte der lit. Sprache*, Göttingen, 1877, by the same author.

³ On this much vexed question see especially O. Schröder, *Sprachvergleichung und Urgeschichte*, Jena, 1883, *passim*.

sound, seemed to indicate that the primitive Aryan stock had once been split into two halves, one of which remained in Asia and retained the primitive *a*-sound, while the other half emigrated to Europe and there developed the new vowel-system, before any new divisions took place. The Aryan parent speech would thus appear to have been split into a European and an Asiatic "base-language." Similar facts in the history of the single European languages then led to the further assumption of a southern European base as the parent of Greek, Italic, and Celtic, and a northern European base for Germanic, Baltic, and Slavonic, and, with further subdivision, an Italo-Celtic and a Luto-Slavic base for Italic and Celtic on the one hand and for Baltic and Slavonic on the other. The pre-historic development of Aryan, according to this genealogical theory (which makes division of language dependent on division of nations), may be illustrated by the following genealogical table¹

It may still be admitted that at least the mutual position of the ten families is not the same in all cases. It cannot be doubted that Indian and Iranian resemble each other more than either of them does any other family. The same may also be said of Baltic and Slavonic, and even of Italic and Celtic, however different the latter two may appear to be at first sight.² But it is impossible to carry this system of genealogical grouping through. It will be observed that not all the ten families are represented in the genealogical tree given above; Albanian and Armenian have not found a place in it, nor could they be introduced without disturbing the entire table. If we look at Armenian, for instance, we find that its structure and phonology on the whole follow the Asiatic type, and yet Armenian shares the European vowel-system alluded to before; compare, for instance, Armenian *berem*, "I bear," with Greek *féro*, Latin *fero*, Old Irish *berimm* (and *dobur* for "*do-ber*"), Gothic *beira* (pronounced *bēra*), Lith. *ber̃i*, Slavonic *berŭ*, against Sanskrit *bhāráti*, Zend *bər̥tati*. Armenian, then, is half European, half Asiatic, and if such an intermediate idiom exists it is impossible to make a strict distinction between Asiatic and European. Let us take another instance. All the Asiatic languages have changed the original palatal *k* into sibilants, and the same change we find again in Slavonic and Baltic, both of which otherwise clearly belong to the European type; compare, for instance, Sanskrit and Zend *dāra*, "ten," Armenian *tam*, Slavonic *desŭt*, Lith. *dēsant*, with Greek *deka*, Latin *decem*, Old

Lith *deuk* (for "**dekun*"), Gothic *taihun*. In a similar way Luto-Slavic and Germanic are connected by the formation of a plural dative in *un*, as in Gothic *veitun*, Lith. *vilksun*, Slavonic *vŭlkonŭ*, against the Sanskrit *bhŭyus*, Latin *hŭi*, Irish *hŭi*; and so all round. The consequence is that every attempt at grouping the Aryan families of speech on the genealogical basis must fail, because it would have to cut asunder some of the natural ties that hold the single families together. It is true that some of the coincidences falling under this head may be due to mere chance, especially those in phonology; for we often see the same phonetic processes going on in languages which stand in no connexion whatever at the time. Yet in the case before us the number of the actual coincidences is too large to allow of such an explanation, and the fact of their existence is made all the more striking from the circumstance that it is each pair of *neighbouring* families which shows these connecting links. If they prove anything (and it cannot be doubted that they do), we must necessarily come to the conclusion that every such link is a witness for at least a temporary connexion between the two languages or families it holds together. To assume such temporary connexions in the time after a true division of nations had taken place (that is, to assume, for instance, that Slavonic had come into contact with the Asiatic languages after the Europeans had migrated from Asia to Europe, or the forefathers of the present Asiatic nations from Europe to Asia, as the case may be) seems impossible. It is likewise highly improbable that connexions intimate enough to leave distinct marks in language existed at a time when the original tribe had spread over the wide regions now covered by the Aryans, even supposing this spreading to have been so gradual as not to cause any break in the continuity of the Aryan population. And, even if we concede this, how are we to account for the fact that we have no longer the supposed continuity of speech, but well-defined single languages, whose separation must, after all, be due to breaks in the continuity of intercourse between the respective speakers? These and similar reasons point to the assumption that the origin of the phenomena alluded to must be sought in a remote period, when the Aryan tribe had an extension small enough to permit continuity of intercourse, and yet large enough to allow of dialectic variations in its different districts. In other words, when the actual break-up of the Aryan tribe into different nations came to pass the Aryan parent-speech was no longer a homogeneous idiom, but the development of dialects had begun. On their following wanderings, then, those tribes or clans would naturally cling together which had until then lived in the closest connexion both of intercourse and dialect (for community of intercourse and of speech always go together), or, as we might also say, the old unity would naturally be broken up into as many parts as there had been dialectic centres. Transition districts, which might have been spoken in the outlying parts of the old dialectic districts, would also naturally be then reduced to a common level in consequence of the general mixture of speakers that could not but have taken place on wanderings so extensive as those of the Aryan tribes must have been.

Such an assumption would indeed solve most of the difficulties mentioned above, especially the peculiar way in which the single families of Aryan are linked together. Each of these would then correspond to one of the main dialects of the parental language, and their mutual affinities would therefore be of the same kind as those of neighbouring dialects, say, of any living speech. And in these nothing is more common, may even more characteristic, than the gradual transition from one to the other, so that each dialect of an intermediate position partakes of some

¹ This pedigree is the one ultimately given by Schleicher. Others have assumed more or less different degrees of relationship. Greek and Italic, for instance, were for a long time believed to be particularly near relatives. A totally contrary view would come near the truth. Greek and Latin are about as different, both in phonology and grammatical structure, as any two members of the Aryan family; indeed there is nothing to recommend their combination but the intimate connexion in which the two nations and their literatures have stood within historical times, and the custom derived therefrom of studying the two classical languages together from our school-days.

² Amongst the characteristics of these two groups the general resemblance in the declension, and in the verb the formation of a future in *b* or *f* (Latin *amabo*, Old Irish *carfa*, *ruo chara*) and of a passive in *r* (Latin *forter*, Old Irish *carthar*, &c.), are the most important.

of the peculiarities of its neighbours to the right and left. In Old English the Kentish dialect, for instance, in some respects goes with West Saxon against Mercian, in others with Mercian against West Saxon, sometimes West Saxon and Mercian combine against Kentish, and sometimes each of them stands by itself, as the following table will show

West Saxon.	Kentish	Mercian
<i>hēlpōd</i>	<i>hēlpōd</i>	<i>hēlpōd</i> (he) helps
<i>leoht</i>	<i>leoht</i>	<i>leoht</i> light
<i>dēd</i>	<i>dēd</i>	<i>dēd</i> deed
<i>hwerde</i>	<i>hwerde</i>	<i>hwerde</i> (shep-)heid
<i>dēd</i>	<i>dēd</i>	<i>dēd</i> deal
<i>gylden</i>	<i>gylden</i>	<i>gylden</i> golden
<i>feld</i>	<i>feld</i>	<i>hēlfōd</i> (he) falls
<i>weorþ</i>	<i>weorþ</i>	<i>weorþ</i> (he) throws

If the inhabitants of the old kingdoms of Wessex, Kent, and Mercia had separately left their English abodes and wandered back to different parts of the Continent after their dialects had developed in the way illustrated above, would not their dialects have gradually developed into independent languages exhibiting the same characteristic features of mutual relationship as those found in the Indo-Germanic idioms?¹

It remains to give a short review of the main characteristics of Indo-Germanic, both phonetic and structural.

A. Phonology.—The consonant-system of the Aryan parent-language was chiefly characterized by the prevalence of stopped (explosive) sounds and the scarcity of spirants. The only representatives of the latter class were *s*, and in a few cases *z*, while there is no trace of sounds so common in modern languages as the English *f*, *th*, *sh*, or the German *ch*. Besides stops and spirants the system comprised nasals, liquids, and semi-vowels.

Stopped
sounds

The stops were either voiceless (and), like the English *p*, *t*, *k*, or voiced (sonant), like the English *b*, *d*, *g*, and either pure (unaspirated) or aspirated. By combining these two distinctions we arrive at four chief varieties of stops, which are generally thus symbolized: *p*, *p^h*, *b*, *b^h* for the labial, *t*, *t^h*, *d*, *d^h* for the dental class, &c. Here the *p*, *t*, *k* denote unaspirated voiceless stops, *p^h*, *t^h*, *k^h* their aspirates; *b*, *d*, *g* voiceless stops, and *b^h*, *d^h*, *g^h* their aspirates. In pronouncing these sounds English readers should be careful not to give the Aryan *p*, *t*, *k* the value of the English *p*, *t*, *k*, because these are always slightly aspirated. The true unaspirated sound is still found in the Romance and the Slavonic languages, in modern Greek, &c. The aspirates *p^h*, *t^h*, *k^h* should be sounded with a strong escape of breath after the explosion of the stop, inserting a distinct *h* between the initial *p*, *t*, *k* and the following sound (as is often done in Irish pronunciation; initial *p*, *t*, *k* in Danish may also be taken as examples). In the so-called media *b*, *d*, *g* the voice should always be distinctly audible, as in French, or in English medial *b*, *d*, *g* (initial *b*, *d*, *g* in English are often voiceless). The pronunciation of the voiced aspirates *b^h*, *d^h*, *g^h* is a very vexed question, as these sounds have disappeared from all the living Aryan languages except the modern Indian dialects, and these seem to show differences in the pronunciation of the aspirates which have not yet been fully cleared up. The old Indian grammarians made their aspirates out to be voiced stops followed by a corresponding, that is voiced, aspiration, and this description seems to correspond with the observations of Mr Alex. Ellis, who found that in the Benares pronunciation of Sanskrit *bho*, *dho*, *gho* are distinguished from *ba*, *da*, *ga* merely by a somewhat stronger pronunciation of the vowel. It seems, however, that another pronunciation exists in the west, and that *bho*, for instance, in Bombay is actually pronounced as a distinctly voiced *b* followed by a common *h*, the voice is broken off simultaneously with the opening of the lips, so that no vocalic sound is inserted between the *b* and the *h*. If this pronunciation was not original in Aryan, it seems to have come in at an early period; for it would be extremely difficult to explain the transition of original *bh*, *d^h*, *gh* into the Greek voiceless

aspirates *φ*, *θ*, *χ* (as in Greek *θέρα*, originally pronounced *p^h-hērā*, compared with Sanskrit *bhāṇinī*), unless we start from a voiceless aspiration.

With regard to their positions, the labials *p*, *p^h*, *b*, *b^h* do not seem to have differed from the common European labials of the present day. The so-called dentals *t*, *t^h*, *d*, *d^h* were really dental, that is, formed by touching the lower tip or back of the upper teeth with the tip of the tongue (the pronunciation of the English *t*, *d* the tongue is raised towards the upper gums). This purely dental pronunciation is still preserved in most of the Asiatic and some European languages. The supradental class represented in the Indian languages by the so-called cerebrals or linguals *ṭ*, *ṭ^h*, *ḍ*, *ḍ^h* seems not to have existed in primitive Aryan, but was most probably imported into Indian from the Dravidian idioms of southern India, where these sounds are very common. Of back consonants Aryan possessed two distinct parallel sets, now generally symbolized by *k¹*, *k²*, *g¹*, *g²*, *gh¹* and *k²*, *gh²*, *g²*, *gh²* respectively.² They may be characterized as front and back gutturals, or possibly as palatals and gutturals proper (compare the Semitic distinction of *ḳ* and *p*). The distinction of the two series is best preserved in the Asiatic languages and Latin-Slavic, where the front gutturals or palatals passed into spirants, while the back gutturals (at least originally) retained their character of explosives. In the other languages the difference is less clearly marked, as will be seen from the following table of correspondences.³

Aryan	Sans	Zend	Arim	Slav	Lith	Greek	Lat	Irish	Ger
<i>k¹</i>	<i>g</i>	<i>s</i>	<i>ṣ</i>	<i>s</i>	<i>sz</i>	<i>κ</i>	<i>c</i>	<i>c</i> , <i>ch</i>	<i>h</i> (<i>g</i>)
<i>g¹</i>	<i>j</i>	<i>z</i>	<i>z</i>	<i>z</i>	<i>z</i>	<i>γ</i>	<i>j</i>	<i>y</i>	<i>y</i>
<i>gh¹</i>	<i>h</i>	<i>h</i>	<i>h</i>	<i>h</i>	<i>h</i>	<i>χ</i>	<i>x</i>	<i>h</i>	<i>g</i>
<i>k²</i>	<i>k</i>	<i>c</i> (CZ)	<i>k</i>	<i>k</i>	<i>k</i>	<i>κ</i> (τ)	<i>c</i>	<i>c</i> , <i>ch</i>	<i>hw</i> , <i>h</i> (τ, g)
<i>g²</i>	<i>g</i>	<i>z</i>	<i>z</i>	<i>z</i>	<i>z</i>	<i>γ</i> (β)	<i>j</i>	<i>y</i>	<i>g</i> (<i>g</i>)
<i>gh²</i>	<i>gh</i> , <i>h</i>	<i>h</i>	<i>h</i>	<i>h</i>	<i>h</i>	<i>χ</i> (θ)	<i>x</i>	<i>h</i>	<i>g</i> (<i>g</i>)

Of nasals there were four, corresponding to the four classes of stops, Nasals *m*, *n*, and two guttural ones, which may be written *ṇ* and *ṇ^h*, the latter only occur before the corresponding explosives. Of liquids are liquids, *r* and *l* in the individual languages, but frequently interchanging.

It has been assumed, therefore, that Aryan had only one sound instead of the two, which was afterwards developed into either *r* or *l*. There seems to be sufficient reason, however, to believe that the later distinction of *r* and *l* was founded on some parallel distinction in Aryan; most probably we have to assume the coexistence of two varieties of *r*-sounds; the one which, at a later period, passed into *r*, may have been a distinct trilled *r* (*ṛ*), the other, the antecedent of *l*, may have been an untrilled variety. We find a similar distinction in the semi-vowels *y* and *u*, each of which must have Semitic had two distinct varieties. The first variety of *y* is in Greek vowels, represented by *ι*, the second by *υ*; as in *δύω*, compared with Sanskrit *yás* and *yugán*, &c., from these correspondences it would seem that the first *y* was a real semi-vowel, like the English *y*—that is, a non-syllabic—and the second a more spirant sound, like the North-German *y*. As to the *u*, the existence of a double sound other seems to follow from the different way in which initial *u* is treated even in Sanskritreduplication, compare perfects like *uvoca*, 3d plural *uvas*, with *uārika*, pl *uāridhā*.⁴ Here the transition of *u* into *o* points to a semi-vocalic pronunciation, as in English *u*. The other sound, which remains unaltered, may have been more like the Spanish English *u*. The sound of the sibilant *s* cannot be fixed exactly, it may have been dental either like the French *s*, or more supradental as in English. The voiced *z* is of extremely rare occurrence, it was confined to combinations of a sibilant with a voiced mute, such as *zā*, *zāh*, *zṛ*; compare, for instance, Aryan *mudho*,

¹ This fact was first discovered by Ascoli, *Corr. di glottologia*, 1870, p. 51 sq., and Fick, *Die alten Sprachverhältnisse der Indo-germanischen Europas*, p. 3 sq.; cf. also Joh. Schmidt, in *Jenais. Lit.-Zeitung*, 1874, p. 201 sq., and *Zeitschr. f. vergl. Sprachf.*, xxv p. 1 sq., H. Hubschmann, in *Zeitschr. f. vergl. Sprachf.*, xxxi pp. 20 sq., 385 sq., xxv p. 373 sq., H. Möller, *Die palatalen der indog. Grundsprache im Germanischen*, Leipzig, 1875, H. Coeur, in *Revue de Linguist.*, vii p. 177 sq., F. Kluge, *Beiträge zur Geschichte der german. Conjugation*, Strassburg, 1878, p. 42 sq.

² The voiceless aspirates are left out here because they are hardly frequent enough to enable us to make out exact rules of correspondence. It may be noticed here that in Sanskrit and Greek the old aspirates have been replaced by the corresponding unaspirated sounds (that is, *u*, *k*, *g*, and *ṛ*, *ṭ*, *ḍ*, *ḍ^h* respectively) whenever they were followed by another aspirate. See especially Grassmann, in *Zeitschr. f. vergl. Sprachf.*, xxi p. 81 sq.

³ Compare also the parallel of Sanskrit *ṣ*, perfect of *śṣ*, and Greek *ῥ*, perfect of *ῥ*, with initial *ῥ*. The discovery of the two *r*-sounds was first made by G. Schulze, *Über das Verhältniss des ῥ im indog. entsprechenden Lauten der verwandten Sprachen*, Göttingen, 1867.

⁴ A detailed history of the different views expressed with regard to the mutual relationships of the Indo-Germanic languages has been given by O. Schröder, *Sprachvergleichung und Culturgeschichte*, p. 66 sq., cf. especially Joh. Schmidt, *Die Verwandtschaftsverhältnisse der indog. Sprachen*, Vienna, 1872; A. Fick, *Die ehemalige Sprachverhältnisse der Indogermanen Europas*, Göttingen, 1878 (reviewed by Schmidt, in *Jenais. Literaturzeitung*, 1874, p. 201 sq.); A. Leskien, *Die Declination im Sanskrit, Griechisch und Germanisch*, Leipzig, 1876 (introduced by Paul, *Principien der Sprachgeschichte*, ch. xii; K. Brugmann, 'Zur Frage nach den Verwandtschaftsverhältnissen der indog. Sprachen,' in *Zeitschr. Internationales Zeitschrift für allgemeine Sprachwissenschaft*, i. (1884), p. 226 sq.

⁵ On Early English Pronunciation, iv p. 1135 sq.

It is obvious that through these rules the existence of *i*, *u*, *ɛ*, *ɔ*, *ɐ* cannot be explained, and yet they do exist. Osthoff has suggested the explanation that they represent intermediate stages of shortening between the full diphthongs and the short *a*, *u*, *ɛ*, *ɔ*, which were sometimes kept under the influence of a sort of half-stress. They may just as well be subsequent lengthenings of the shorts due to some reason as yet unknown, but this whole chapter is still very obscure, and it may be doubted if the point will ever be sufficiently elucidated.

The principle of explanation by presence or absence of stress in "roots" is also applicable to derivative or inflexional syllables. It is evident that forms like the Greek $\rho\acute{\alpha}\delta\epsilon\iota\varsigma$ (for $\ast\rho\acute{o}\delta\epsilon\iota\varsigma$) = $\rho\acute{\alpha}\delta\epsilon\iota\varsigma$, or $\lambda\acute{\alpha}\nu\epsilon\iota\varsigma$ (for $\ast\lambda\acute{a}\nu\epsilon\iota\varsigma$) = $\lambda\acute{\alpha}\nu\epsilon\iota\varsigma$, or $\tau\acute{\alpha}\rho\tau\epsilon\alpha$, $\tau\acute{\alpha}\rho\tau\alpha\mu\epsilon\alpha$, $\tau\acute{\alpha}\rho\tau\alpha\iota\omega$ follow the same rule as $\lambda\acute{\epsilon}\iota\tau\epsilon\alpha$, $\lambda\acute{\alpha}\tau\epsilon\alpha$, $\phi\acute{\epsilon}\rho\upsilon\tau\epsilon\alpha$, $\phi\acute{\epsilon}\rho\upsilon\tau\alpha\mu\epsilon\alpha$, $\phi\acute{\epsilon}\rho\upsilon\tau\alpha\iota\omega$, $\theta\acute{\epsilon}\lambda\alpha\phi\alpha\upsilon\tau\epsilon\alpha$, &c. But analogy and change of stress from one syllable to another (which even in root syllables have often somewhat obscured the original state of things) have done much to render the working of the old laws indistinct, so that no more than this short hint can be given here.

Function of pitch. There are yet other interchanges of vowels in Aryan, quite as important as those which find their explanation in presence or absence of stress, which do not seem to fall under the principle applied here. Amongst these the change of *e* and *o* into *i* and *u*, both in roots and derivative syllables, is the most frequent. Thus we have in Greek *ἡμέρα ἡμέρα*, *ἦμερ*, *ἠέμερ*—*ἀφ' ἧς ἡμέρας*; *ὀδός*, *ὄδος*, *ὅδος*; *ἐπεί*, *εὔπει*, *εὖπει*; *ἔργον*, *εὔργον* (*εὐργον*)—*ἐργάτης*, *εὐργάτης*, *εὐέργατος*, *πατήρ*—*πάτερ*, *πάτρης*, *πατρός*, *πατριών*. It is absolutely incredible that difference of stress could have changed either *e* into *i*, or *o* into *u*; for the greater or less effort in pronouncing a vowel can have nothing to do with the quality of the vowel uttered, and is equal to the force of the voice without variation of place and lips. If, then, there any distinguishing principle in the utterance of human speech governs these changes—and that assumption is inevitable—it must have been difference of pitch. This explanation was suggested independently by Fick and Möller's some years ago, but has not found its due share of attention, although it recommends itself both upon physiological and philological grounds. There is a natural physiological connexion between the palatal *ko* and high pitch and between the guttural *k* and low pitch; for in uttaring a high tone we generally raise the larynx above its normal level, and consequently push the tongue forward with it towards a more palatal position; for a low tone the larynx is lowered, and the tongue follows this movement by sliding backwards, that is, towards the pharynx. The same holds good for the pharyngeal *kh* observed in singing the vowel *a* on different notes. On the other hand, we know that in Sanskrit the stress syllables were uttered in a high tone (*udatta*), and regularly followed by a low-pitch syllable (*anuda*). This combination of high tone + low tone again corresponds with the sequel of *e* + *o* observable in a great many types of Aryan words for forms, such as *ἥμερ*, *ῆμερ*, *ῆμερος*, compare also *Bonit* against *bonitas* against the English *bon*. So far this theory seems very probable, yet several difficulties still remain. In the first place, the additional hypothesis must be made, that not all "accentuated," that is stressed, syllables had the high tone, if *o* is the characteristic vowel of low-pitch-syllables, words like *ἥμερ*, *ῆμερ* must have had low pitch on their first syllable while the second syllable was pronounced in high. Strange as such an accentuation might sound to English or German ears, it involves no practical difficulty, for there are at least some living Aryan idioms which possess similar distinctions. In Servian, for instance, the nominative *voda* is pronounced with a high rising tone on the first and a falling tone on the second, the stress being nearly equally divided between the two syllables, the accented *vo* in many, has a high tone on the first syllable and a low tone pronounced on the low falling tone.² In the second place, this theory requires a supplementary inquiry into the relations of pitch and stress in Aryan, for it seems evident that stress and high pitch did not always go together. That the reduplicated perfects like the Sanskrit *dādadra*, Greek *δέδερε*, for instance, originally had the stress on the root-syllable, and hence the high-pitch vowel *e*, while the unstressed reduplicative syllable shows the low-pitch vowel *a*, while the original pronunciation of Aryan *dedore*, therefore, must have been something like , while afterwards the stress was attracted by the high-tone syllable in Greek and the high tone by the old stress-syllable in Sanskrit. In this direction the investigations of Fick and Möller cannot be considered more than an opening up of the field for further research. I leave it to others to say what has been done hitherto with regard to an explanation of other vowel-changes of a similar character.

B *Grammatical Structure*—A few short remarks must suffice here, as a full characteristic of Aiyem morphology cannot be given without entering into a mass of more or less minute details.

Since the days of Bopp comparative philologists have on the Deirva-
whole accepted the theory of the old Sanskrit grammarians, that tion
all Indo-Germanic words and forms must be traced back to simple,
no longer divisible, monosyllabic elements, which have been called

roots." We cannot undertake here to discuss the question how far this theory, which has never been uncontested and is beginning to be doubted more and more, is historically correct. However, so much may be conceded that, after removing all the elements which are formed in the formation of single words or forms, the remaining formations of groups of such only in contrast with the whole mass of formation of the language are the general and grammatical monosyllables, which for practical purposes we must take as a philological starting-point, without asking whether these preparations of the philological laboratory even had an actual existence of their own or whether they are mere abstractions. The general means by which words and forms are derived from these "roots," or from the monosyllables and words, are, as partly external, partly internal. On the one hand, independent formations, which we looked at from this point of view, are based on a system of suffixes; that is, individualizing formative elements added at the end of less complete and less individualized formations. Inflects instead of suffixes occur only by exception, the chief instance being the insertion of a nasal, especially in certain verbal formations (as in *ya-n-a* go against *ya-gan*, Greek *α-ν-β-α* against *βαλεω*, Sanskrit *अ-व-ह-ति* against *वहति*). On the other hand, the internal element we meet is suppletion. Flexions in the proper sense do not seem to occur, even the verbal argument, which is the only case of an apparently real prefix, most likely was once an independent word, so that augmentation must be reckoned among the numerous cases of composition. As means of internal change we may mention the shifting of stress and pitch over the different syllables, and the change of vowels and consonants. Finally, we have seen, originally followed these variations of accent, yet much more here become independent formative monosyllables.

As to inflexion, Indo-Germanic is known to hold the foremost inflexion rank among all inflective languages. The distinction of nouns, of pronouns, and verbs is fully developed. In the nouns the introduction in the substantives of grammatical gender is especially noteworthy. Substantives of one gender may have the same way, though some of the individual languages have deviated from this rule, the pronouns, at least, in many cases had their own inflexions, otherwise they agree with the nouns in the distinction of number and cases. There were three numbers—singular, plural, and plural dual. Of course, the number of cases varied with certainty. The highest number we find distinguished in any language is seven—nominative, accusative, genitive, dative, instrumental, and locative (beside the vocative or interjectional case). But, judging from the fact that the same cases often have different meanings in different languages, it is probable that in some cases that ones are still greater variety of case-distinctions had existed. The single declensions are distinguished according to the various stem-suffixes immediately preceding the case-endings. The two chief subdivisions accordingly are the declensions of vocalic and of consonantal stems. In the vocalic stems the *a* and *i* stems are included, and *u* stems follow the type of the consonantal declension; this, however, appears but natural if we consider that the final *a* and *i* of these stems most probably are reductions of older diphthongs ending in a semi-vocalic or consonantal element. For declensional purposes we may only use the general external formal principles as used, namely, that of combining ready-made stems with suffixal endings, at the same time expressing case and number.

The verb, too, has in like manner its inflexional endings to ex-Inflection press the distinctions of number and person, but it also makes use of verb of all the other formative principles, both internal and external. The meaning of some of these is not always clear, but the signs of tense are nowhere more distinctly traceable than in the verb. Besides, we find the use of special suffixes for the distinction of tenses and moods, sometimes the inflexion of a nasal in the formation of tense-stems, then again on a larger scale the use of reduplication, and the use of the *an* as a common sign of the perfect and pluperfect tenses of the past. None of the individual languages seems to have preserved the original stock of Aryan verbal forms to its full extent. The oldest Sanskrit seems to come nearest to Aryan. Greek has also

been very conservative in one way; it has lost hardly anything that was original, but has, like Latin, created a host of apparently new forms, some of which still continue to baffle all attempts at an explanation. Germanic may serve as a type of the opposite character; it has lost all but the oldest preserved forms, and has added a host of new ones, but especially it has been extremely unproductive of durational forms. The differences thus exhibited by the different languages make it a difficult task to determine which formations belong to the primitive Aryan stock and which were added at later periods. General consent, however, seems to take the following points for settled. Of the three voices distinguished in Greek,

¹ *Morphologische Untersuchungen*, vol. IV, which treats of the Aryan t and ḡ.
² Fick, in *Gottinger gelehrte Anzeigen*, 1880, 1 p. 417 sq., and Moller, in Paul and Braune, *Beiträge*, vii. p. 483 sq.

³ See L. Masing, "Die Hauptformen des serbisch-chorwatischen Accents," in *Mém Acad Imp des Sciences*, vol xxii, St Petersburg, 1876

only two are of primitive growth, the active and the middle voice, the passive voice being a late specialization of the middle. There were three moods, an indicative, a subjunctive, and an optative, the difference of the latter two from the indicative lay partly in the inflexional endings, partly in the addition of a special mood-suffix before these terminations. There was also an imperative. The distinction of numbers was the same as in declension,—singular, dual, plural, each of which had three persons. The tenses may be divided into three groups. The first group comprises the present and perfect, the former of which is supposed to have been used originally as a general predicative form, being neither past, present, nor future, while the perfect was used to indicate the completion of the action signified by the root. The present is rarely formed direct from the root, but more generally from a special tense-stem derived from the root by the addition of some special tense suffix or infix, or reduplication. Of the different formations of the perfect met with in the individual languages only that through reduplication of the root-syllable is believed to be of Aryan origin. The second group is that of the past tenses, the imperfect and two aorists. In all these the past-tense is marked by the augment. The imperfect is regularly formed from the present stem, and the

aorist either from the root simple or reduplicated (root-aorist, corresponding to the so-called second aorist in Greek), or by inserting an *s* between the root and the inflexional endings (sibilant, or sigmatic aorist, the first aorist of Greek). The existence of a perfect derived from the perfect in a way similar to the derivation of the imperfect from the present is doubtful and not generally admitted. The last division is formed by the future, which, like the first aorist, inserts a sibilant after the root-syllable. None of the other formations of the future occurring here and there is believed to have existed in the parent-speech. Of participles there were three sets, belonging to the present, the perfect, and the aorist respectively. An infinitive had not yet been developed, its place in Aryan was supplied by the use of verbal nouns.

C. Comparative *Syntax*,¹ to conclude with, is the youngest Com-branch of Aryan philology. Its chief object so far has been to positively settle the original meanings and the primitive rules of use of the syntax. In different cases, moods, and tenses. Some attempts have also been recently made to fix the rules of primitive word-order. About all these questions we must refer the reader to the original investigations of the different authors who have more especially cultivated this branch of research. (E SI)

PHILOMELA. See NIGHTINGALE, vol xvii p 499

PHILOPOEMEN, "the last of the Greeks" as he was called by an admiring Roman, was a leading champion of the Achaean League, which preserved in Peloponnesus a last shred of Greek freedom. Sprung from an illustrious Arcadian family, he was born at Megalopolis in Arcadia in 272 B.C. His father Cranus dying in his infancy, Philopomen was brought up by his father's friend Cleander, an exile from Mantinea. In his youth he associated with Eodemus and Megalophanes, who had studied the Academic philosophy under Arcesilaus, and had proved themselves friends of freedom by helping to rid Megalopolis and Sicyon of tyrants. Philopomen soon distinguished himself in war and the chase. Hard-featured but of an iron frame, simple and hardy in his way of life, blunt and straightforward in speech and manner,² he was a born soldier, delighting in war and careless of whatever did not bear on it. Thus he would not practise wrestling because the athlete's finely-strung habit of body is ill-fitted to bear the strain of a soldier's life. He read books of a martial and stirring tone, like the poems of Homer, together with works on military history and tactics. Epaminondas was his pattern, but he could not school his hot temper into the unruffled patience of the Theban. Indeed we miss in this rugged soldier that union of refinement at home with daring in the field which had stamped the soldier-citizens of the best age of Greece. His leisure was devoted to the chase or to the cultivation of his farm, where he worked like one of his hands. In 222, when Cleomenes king of Sparta made himself master of Megalopolis by a night attack, Philopomen secured by his valour the retreat of the main body of the citizens to Messene, and encouraged them to refuse the misdeed invitation of Cleomenes to return to their homes on condition of renouncing their connexion with the Achaean League. Thus baffled, Cleomenes laid the city in ruins and retired. At the battle of Sellasia (early summer 221), where Cleomenes was defeated by the combined Achaean and Macedonian forces under Antigonus, king of Macedonia, Philopomen greatly distinguished himself by charging, without orders, at the head of the Megalopolitan cavalry and thus saving from defeat the wing on which he fought. His conduct won the admiration of Antigonus, who offered him a command in the Macedonian army, but he declined it and went to the wars in Crete. Returning after some time with fresh laurels, he was at once chosen to command the Achaean cavalry, which, from an ill-mounted, raw, and cowardly

body he soon turned into a highly-trained and thoroughly efficient force; at the head of it he overthrew the Ætolian and Elean horse, and slew their commander with his own hand (209). He was elected general of the Achaean League for the first time in 208. In this, the highest dignity of the confederacy, he infused greater vigour and independence into the councils of the League than had been shown by Aratus, who had leaned on Macedonia and trusted to diplomacy rather than the sword. Philopomen entirely changed the equipment and tactics of the troops of the League, substituting complete armour, long lances and large shields for the lighter arms hitherto in use, and adopting the Macedonian phalanx as the fighting order. But he did more: by example and precept he turned a nation of dandies into a nation of soldiers, who now spent on arms and accoutrements the wealth they had before lavished on dinners and dress. With the army thus transformed he defeated Machanidas, tyrant of Sparta, at the battle of Mantinea. The tyrant fell by Philopomen's hand, Tegea was taken, and Laconia ravaged. A bronze statue representing Philopomen slaying Machanidas was set up at Delphi by the Achæans. At the Nemean festival which followed the battle Philopomen, then general for the second time, was hailed by the people as the liberator of Greece. Jealous of the degree of independence to which Philopomen had raised the League, Philip king of Macedonia sent emissaries to murder him, but they were foiled. So great was the terror of his name that at the bare report that he was coming the Boeotians raised the siege of Megara and fled. When Nabis, successor of Machanidas in the tyranny of Sparta, seized Messene, Philopomen, though he held no office at the time and the general of the League refused to stir, collected his fellow-townsmen and drove out the tyrant. In his third generalship (201-200) he mustered the Achaean forces with great secrecy at Tegea and, invading Laconia, defeated the troops of Nabis. The Romans were now about to cross the sea for the war with Philip of Macedonia, and Philopomen was the means of preventing the Achæans from concluding an alliance with Philip against Rome. At the expiry of his year of office he sailed once more to Crete, where he successfully led the troops of the Gortynians, beating the Cretans with their own weapons of craft and surprise. Philopomen did not return to Peloponnesus till after the Romans under Flaminius had conquered Philip. He found the Romans and Achæans making war on Nabis and was again elected to the generalship (192). Nabis was besieging Gythrum, which with the other towns on the Lacomian coast had been wrested from him by the Romans, handed over by them to the Spartan exiles, and attached to the Achaean League. Being defeated in an attempt to relieve Gythrum

¹ A list of books concerning Aryan syntax will be found in the appendix to Sayce's *Introduction to the Science of Language*, vol. II.

² The simplicity of his manners is illustrated by a tale like that of Alfred and the cakes, *Fint*, *Phil*, 2.

by sea, Philopœmen landed and surprised a part of the tyrant's forces not far from that town, burned their camp, and slew many. After ravaging Laconia he marched on Sparta in the hope of compelling Nabis to raise the siege. But Nabis took Gythium and awaited the Achæans in a pass. Philopœmen was surprised, but by skilful generalship he not only extricated himself but routed the Spartans and cut off most of the fugitives. When Nabis was assassinated Philopœmen hastened to Sparta and induced it to join the Achæan League. In the same year (192) Antiochus, king of Asia, crossed into Greece to fight the Romans. By the advice, or at least with the concurrence, of Philopœmen the Achæans rejected the king's proposal that they should remain neutral, and declared war against him and his allies the Ætolians. In the following year Diophanes, general of the League, hearing that Sparta showed signs of revolt, marched against it accompanied by Flaminius. Philopœmen had remonstrated in vain against this step, and he now boldly threw himself into Sparta, composed the disturbances, and closed the gates against Diophanes and Flaminius. The grateful Spartans offered Philopœmen a splendid present, but he bade them keep such bribes for their enemies. In 189 Philopœmen, again general, proposed and carried in an assembly, which he summoned at Argos, a decree that the general assembly of the League should meet in all the cities of the League in rotation, instead of, as hitherto, at Ægium only. This measure was obviously meant to deprive Achæa of its position as head of the League, and to make the allied cities more equal. In the same year the Spartans made an unsuccessful attack on one of the maritime towns occupied by the exiles. As these towns were under Achæan protection the League required Sparta to surrender the authors of the attack. Far from complying, the Spartans put to death thirty partisans of Philopœmen and renounced their connexion with the League. The Achæans declared war, and in the following spring (188) Philopœmen, having been re-elected general, marched against Sparta, which was forced to pull down its walls, to expel the foreign mercenaries and the slaves whom the tyrants had freed, to exchange the laws and institutions of Lycurgus for those of the Achæans, and, lastly, to receive back the exiles. It would seem that on this occasion Philopœmen allowed his hatred of the old enemy of Megalopolis to overpower his judgment; his conduct was as unwise as it was cruel, for it afforded the Romans—what Philopœmen had hitherto been careful not to furnish them with—a pretext for meddling in the affairs of Greece. His treatment of Sparta was censured by the senate, and Roman officers in Greece remonstrated with the League on the subject. In 183, the last year of his life, Philopœmen was general for the eighth time (his seventh generalship perhaps fell in 187, but this is uncertain). He lay sick of a fever at Argos when word came that Messene, under Dinocrates, had revolted from the League. At first he despatched his friend and partisan Lycortas to put down the revolt, then growing impatient, in spite of the fever and his seventy years, he hurried in a single day to Megalopolis, and, taking with him the cavalry of his native town, entered Messenia and routed Dinocrates. But, the enemy being reinforced, he was compelled to fall back over broken ground. In his anxiety to cover the retreat of his troops he was left alone, and, his horse stumbling, he was thrown to the ground and taken prisoner. He was conducted with his arms pinioned through the streets of Messene and cast into a dungeon. At nightfall on the second day an executioner was sent to him with a cup of poison. Seeing the light and the executioner standing by, Philopœmen sat up with difficulty, for he was weak, and, taking the cup in his hand, he asked the man, What tidings of the

cavalry? Being told that they had mostly escaped, he bowed his head and said that it was well. Then he drained the cup and lay down to die. Swift vengeance overtook his murderers. The indignant Achæans, under Lycortas, ravaged Messenia, and when the capital surrendered all who had had part in the murder of Philopœmen were obliged to kill themselves. Dinocrates had already committed suicide. The body of Philopœmen was burned, and his bones conveyed to Megalopolis with every mark of respect and sorrow, the urn, almost hidden in garlands, being borne by his fellow-townsmen, the historian Polybius. Numerous statues were set up and honours decreed to him in the cities of the League. After the destruction of Corinth by Mummius some one proposed to destroy the statues of a man who had been no friend of the Romans, but the Roman general rejected the base proposal.

Philopœmen's lot was cast in evil days. Hardly were the Achæans freed by him from Macedonia when they had to submit to Rome. His policy towards the Romans was marked by a prudence and moderation hardly to be expected from one of his passionate nature. He saw that the final subjugation of Greece was inevitable, but he did his best to delay it, not by a war which would only have precipitated the catastrophe, but by giving the Romans no ground for interference, and by resisting their encroachments, so far as this could be done, by an appeal to reason and justice.

Our authorities for the life of Philopœmen are Polybius, Livy, Plutarch, and Pausanias. Polybius's work on Philopœmen was in three books, but it is lost. Plutarch's biography, like the account in Pausanias (viii. 49-51), is based on Polybius. (J. G. FR.)

PHILOSOPHY is a term whose meaning and scope have varied very considerably according to the usage of different authors and different ages, and it would hardly be possible, even having regard to the present time alone, to define and divide the subject in such a way as to command the adhesion of all the philosophic schools. The aim of the present article will be, however, leaving controversial details as far as possible in the background, to state generally the essential nature of philosophy as distinguished from the special sciences, and to indicate the main divisions into which, as matter of historical fact, its treatment has fallen.

Historical Use of the Term.—The most helpful introduction to such a task is afforded by a survey of the steps by which philosophy differentiated itself, in the history of Greek thought, from the idea of knowledge and culture in general. These steps may be traced in the gradual specification of the term. The tradition which assigns the first employment of the word to Pythagoras has hardly any claim to be regarded as authentic; and the somewhat self-conscious modesty to which Diogenes Laërtius attributes the choice of the designation is, in all probability, a piece of etymology crystallized into narrative. It is true that, as a matter of fact, the earliest uses of the word (the verb *φιλοσοφῆω* occurs in Herodotus and Thucydides) imply the idea of the *pursuit* of knowledge, but the distinction between the *σophós*, or wise man, and the *φιλόσοφος*, or lover of wisdom, appears first in the Platonic writings, and lends itself naturally to the so-called Socratic irony. The same thought is to be found in Xenophon, and is doubtless to be attributed to the historical Socrates. But the word soon lost this special implication. What is of real interest to us is to trace the progress from the idea of the philosopher as occupied with any and every department of knowledge to that which assigns him a special kind of knowledge as his province. A specific sense of the word first meets us in Plato, who defines the philosopher as one who apprehends the essence or reality of things in opposition to the man who dwells in appearances and the shows of sense. The philosophers, he says, "are those who are able to grasp the eternal and immutable"; they are "those who set their

affections on that which in each case really exists" (*Rep.*, 480). In Plato, however, this distinction is applied chiefly in an ethical and religious direction, and, while it defines philosophy, so far correctly, as the endeavour to express what things are in their ultimate constitution, it is not yet accompanied by a sufficient differentiation of the subsidiary inquiries by which this ultimate question may be approached. Logic, ethics, and physics, psychology, theory of knowledge, and metaphysics are all fused together by Plato in a semi-religious synthesis. It is not till we come to Aristotle—the encyclopaedist of the ancient world—that we find a demarcation of the different philosophic disciplines corresponding, in the main, to that still current. The earliest philosophers, or "physiologists," had occupied themselves chiefly with what we may call cosmology; the one question which covers everything for them is that of the underlying substance of the world around them, and they essay to answer this question, so to speak, by simple inspection. In Socrates and Plato, on the other hand, the start is made from a consideration of man's moral and intellectual activity, but knowledge and action are confused with one another, as in the Socratic doctrine that virtue is knowledge. To this correspond the Platonic confusion of logic and ethics and the attempt to substitute a theory of concepts for a metaphysics of reality. Aristotle's methodic intellect led him to separate the different aspects of reality here confounded. He became the founder of logic, psychology, ethics, and aesthetics as separate sciences, while he prefixed to all such (comparatively) special inquiries the investigation of the ultimate nature of existence as such, or of those first principles which are common to, and presupposed in, every narrower field of knowledge. For this investigation Aristotle's most usual name is "first philosophy", but there has since been appropriated to it, apparently by accident, the title "metaphysics". "Philosophy," as a term of general application, was not, indeed, restricted by Aristotle or his successors to the disciplines just enumerated. Aristotle himself includes under the title, besides mathematics, all his physical inquiries. It was only in the Alexandrian period, as Zeller points out, that the special sciences attained to independent cultivation. Nevertheless, as the mass of knowledge accumulated, it naturally came about that the name "philosophy" ceased to be applied to inquiries concerned with the particulars as such. The details of physics, for example, were abandoned to the scientific specialist, and philosophy restricted itself in this department to the question of the relation of the physical universe to the ultimate ground or author of things. This inquiry, which was long called "rational cosmology," may be said to form part of the general science of metaphysics, or at all events a pendant to it. By the gradual sifting out of the special sciences philosophy thus came to embrace primarily the inquiries grouped as "metaphysics" or "first philosophy". These would embrace, according to the scheme long current, ontology proper, or the science of being as such, with its branch sciences of (rational) psychology, cosmology, and (rational or natural) theology. Subsidiary to metaphysics, as the central inquiry, stand the sciences of logic and ethics, to which may be added aesthetics, constituting three normative sciences,—sciences, that is, which do not, primarily, describe facts, but rather prescribe ends. It is evident, however, that if logic deals with conceptions which may be considered constitutive of knowledge as such, and if ethics deals with the harmonious realization of the highest known form of existence, both sciences must have a great deal of weight in the settling of the general question of metaphysics.

Modern modifications of the above scheme will be presently considered; but it is sufficiently accurate as a starting-point, and its acceptance by so many generations of

thinkers is a guarantee for its provisional intelligibility. Accordingly, we may say that "philosophy" has been understood, during the greater part of its history, to be a general term covering the various disciplines just enumerated. It has frequently tended, however, and still tends, to be used as specially convertible with the narrower term "metaphysics." This is not unnatural, seeing that it is only so far as they bear on the one central question of the nature of existence that philosophy spreads its mantle over psychology, logic, or ethics. The organic conditions of perception and the associative laws to which the mind, as a part of nature, is subjected, are nothing to the philosopher, and therefore the handing over of (empirical) psychology to special investigators, which is at present taking place, can be productive of none but good results. Similarly, logic, so far as it is an art of thought or a doctrine of fallacies, and ethics, so far as it is occupied with a natural history of impulses and moral sentiments, do neither of them belong, except by courtesy, to the philosophic province. But, although this is so, it is perhaps hardly desirable to deprive ourselves of the use of two terms instead of one. It will not be easy to infuse into so abstract and bloodless a term as "metaphysics" the fuller life (and especially the inclusion of ethical considerations) suggested by the more concrete term "philosophy."

We shall first of all, then, attempt to differentiate philosophy from the special sciences, and afterwards proceed to take up one by one what have been called the philosophical sciences, with the view of showing how far the usual subject-matter of each is really philosophical in its bearing, and how far it belongs rather to the domain of science strictly so called. We shall also see in the course of this inquiry in what these various philosophical disciplines differ from one another, and how far they merge into another, or have, as a matter of fact, been confused at different periods in the history of philosophy. The order in which, for clearness of exposition, it will be most convenient to consider these disciplines will be psychology, epistemology or theory of knowledge, and metaphysics, then logic, aesthetics, and ethics. Finally, the connexion of the last-mentioned with politics (or, to speak more modernly, with jurisprudence and sociology) and with the philosophy of history will call for a few words on the relation of these sciences to general philosophy.

Philosophy and Science.—In distinguishing philosophy from the sciences, it may not be amiss at the outset to guard against the possible misunderstanding that philosophy is concerned with a subject-matter different from, and in some obscure way transcending, the subject-matter of the sciences. Now that psychology, or the observational and experimental study of mind, may be said to have been definitively included among the positive sciences, there is not even the apparent ground which once existed for such an idea. Philosophy, even under its most discredited name of metaphysics, has no other subject-matter than the nature of the real world, as that world lies around us in everyday life, and lies open to observers on every side. But if this is so, it may be asked what function can remain for philosophy when every portion of the field is already lotted out and enclosed by specialists? Philosophy claims to be the science of the whole; but, if we get the knowledge of the parts from the different sciences, what is there left for philosophy to tell us? To this it is sufficient to answer generally that the synthesis of the parts is something more than that detailed knowledge of the parts in separation which is gained by the man of science. It is with the ultimate synthesis that philosophy concerns itself; it has to show that the subject-matter which we are all dealing with in detail really is a whole, consisting of articulated members. Evidently, therefore, the relation existing be-

tween philosophy and the sciences will be, to some extent, one of reciprocal influence. The sciences may be said to furnish philosophy with its matter, but philosophical criticism reacts upon the matter thus furnished, and transforms it. Such transformation is inevitable, for the parts only exist and can only be fully, *i.e.*, truly, known in their relation to the whole. A pure specialist, if such a being were possible, would be merely an instrument whose results had to be co-ordinated and used by others. Now, though a pure specialist may be an abstraction of the mind, the tendency of specialists in any department naturally is to lose sight of the whole in attention to the particular categories or modes of nature's working which happen to be exemplified, and fruitfully applied, in their own sphere of investigation; and in proportion as this is the case it becomes necessary for their theories to be co-ordinated with the results of other inquirers, and set, as it were, in the light of the whole. This task of co-ordination, in the broadest sense, is undertaken by philosophy; for the philosopher is essentially what Plato, in a happy moment, styled him, *συντακτικός*, the man who insists on seeing things together. The aim of philosophy (whether attainable or not) is to exhibit the universe as a rational system in the harmony of all its parts; and accordingly the philosopher refuses to consider the parts out of their relation to the whole whose parts they are. Philosophy corrects in this way the abstractions which are inevitably made by the scientific specialist, and may claim, therefore, to be the only concrete science, that is to say, the only science which takes account of all the elements in the problem, and the only science whose results can claim to be true in more than a provisional sense.

For it is evident from what has been said that the way in which we commonly speak of "facts" is calculated to convey a false impression. The world is not a collection of individual facts existing side by side and capable of being known separately. A fact is nothing except in its relations to other facts; and as those relations are multiplied in the progress of knowledge the nature of the so-called fact is indefinitely modified. Moreover, every statement of fact involves certain general notions and theories, so that the "facts" of the separate sciences cannot be stated except in terms of the conceptions or hypotheses which are assumed by the particular science. Thus mathematics assumes space as an existent infinite, without investigating in what sense the existence or the infinity of this "Unding," as Kant called it, can be asserted. In the same way, physics may be said to assume the notion of material atoms and forces. These and similar assumptions are ultimate presuppositions or working hypotheses for the sciences themselves. But it is the office of philosophy, or theory of knowledge, to submit such conceptions to a critical analysis, with a view to discover how far they can be *thought out*, or how far, when this is done, they refute themselves, and call for a different form of statement, if they are to be taken as a statement of the ultimate nature of the real.¹ The first statement may frequently turn out to have been merely provisionally or relatively true; it is then superseded by, or rather inevitably merges itself in, a less abstract account. In this the same "facts" appear differently, because no longer separated from other aspects that belong to the full reality of the known world. There is no such thing, we have said, as an individual fact; and the nature of any fact is not fully known unless we know it in all its relations to the

system of the universe, or, in Spinoza's phrase, "sub specie aeternitatis." In strictness, there is but one *res completa* or concrete fact, and it is the business of philosophy, as science of the whole, to expound the chief relations that constitute its complex nature.

The last abstraction which it becomes the duty of philosophy to remove is the abstraction from the knowing subject which is made by all the sciences, including, as we shall see, the science of psychology. The sciences, one and all, deal with a world of objects, but the ultimate fact as we know it is the existence of an object for a subject. Subject-object, knowledge, or, more widely, self-consciousness with its implicates—this unity in duality is the ultimate aspect which reality presents. It has generally been considered, therefore, as constituting in a special sense the problem of philosophy. Philosophy may be said to be the explication of what is involved in this relation, or, in modern phraseology, a theory of its possibility. Any would-be theory of the universe which makes its central fact impossible stands self-condemned. On the other hand, a sufficient analysis here may be expected to yield us a statement of the reality of things in its *last terms*, and thus to shed a light backwards upon the true nature of our subordinate conceptions.

Psychology, Epistemology, and Metaphysics.—This leads to the consideration of our first group of subsidiary sciences.—*PSYCHOLOGY* (*g v*), epistemology (theory of knowledge, Erkenntnistheorie), and metaphysics (ontology; see *METAPHYSIC*). A special relation has always existed between psychology and systematic philosophy, but the closeness of the connexion has been characteristic of modern and more particularly of English thought. The connexion is not difficult to explain, seeing that in psychology, or the science of mind, we study the fact of intelligence (and moral action), and have, so far, in our hands the fact to which all other facts are relative. From this point of view we may even agree with Sir W. Hamilton when he quotes Jacob's dictum—"Nature conceals God, man reveals God." In other words, as has just been said, the ultimate explanation of things cannot be given by any theory which excludes from its survey the intelligence in which nature, as it were, gathers herself up. But knowledge, or the mind as knowing, willing, &c., may be looked at in two different ways. It may be regarded simply as a fact, in which case the evolutions of mind may be traced and reduced to laws in the same way as the phenomena treated by the other sciences. This study gives us the science of empirical psychology, or, as it is now termed, psychology *sens phrase*. In order to give an adequate account of its subject-matter, psychology may require higher or more complex categories than are employed in the other sciences, just as biology, for example, cannot work with mechanical categories alone, but introduces the conception of development or growth. But the affinities of such a study are manifestly with the sciences as such rather than with philosophy; and it has been already pointed out that the division of labour in this respect is proceeding rapidly. Since it has been taken up by specialists, psychology is being established on a broader basis of induction, and with the advantage, in some departments, of the employment of experimental methods of measurement. But it is not of mind in this aspect that such assertions can be made as those quoted above. Mind, as studied by the psychologist—mind as a mere fact or phenomenon—grounds no inference to anything beyond itself. The distinction between mind viewed as a succession of "states of consciousness" and the further aspect of mind which philosophy considers is very clearly put in a recent article by Professor Croom Robertson, who also makes a happy suggestion of two terms to designate the double point of view.

¹ The revisional office which philosophy here assumes constitutes her the critic of the sciences. It is in this connexion that the meaning of the definition of philosophy as "the science of principles" can best be seen. This is perhaps the most usual definition, and, though vague, one of the least misleading.

"We may view knowledge as mere subjective function, but it is its full meaning only as it is taken to represent what we may call objective fact, or as such as is named (in different circumstances) real, valid, true. As mere subjective function, which it is to the psychologist, it is best spoken of by an unambiguous name, and for this there seems none better than *Intellektion*. We may then say that psychology is occupied with the natural function of *Intellektion*, seeking to discover its laws, and distinguishing its various modes (perception, representative imagination, conception, &c.) according to the various circumstances in which the laws are found at work. Philosophy, on the other hand, is theory of *Knowledge* (as that which is known)."—"Psychology and Philosophy," *Mind*, 1888, pp. 15, 16.

The confusion of these two points of view has led, and still leads, to serious philosophical misconception. It is hardly an exaggeration to say that, in the English school since Hume, psychology superseded properly philosophical inquiry. The infusion of epistemological matter into the numerous analyses of the human mind rendered the substitution plausible and left men satisfied. And we find even a thinker with a wider horizon like Sir W. Hamilton encouraging the confusion by speaking of "psychology or metaphysics,"¹ while his lectures on metaphysics are mainly taken up with what belongs in the strictest sense to psychology proper, with an occasional excursion (as in the theory of perception) into epistemology. That this confusion is on the way to be obviated for the future is largely due to the Kantian impulse which has been strongly felt of late in English thought, and which has acted in this matter on many who could not, by any laxity of terminology, be numbered as Kantians or Neo-Kantians. The distinction between psychology and theory of knowledge was first clearly made by Kant, who repeatedly insisted that the *Critique of Pure Reason* was not to be taken as a psychological inquiry. He defined his problem as the *quid juris* or the question of the validity of knowledge, not its *quid facti* or the laws of the empirical genesis and evolution of intellection (to use Professor Robertson's phraseology). Since Kant philosophy has chiefly taken the form of theory of knowledge or of a criticism of experience. Not, indeed, a preliminary criticism of our faculties or conceptions such as Kant himself proposed to institute, in order to determine the limits of their application; such a criticism *ab extrinseco* of the nature of our experience is essentially a thing impossible. The only criticism which can be applied in such a case is the immanent criticism which the conceptions or categories exercise upon one another. The organized criticism of these conceptions is really nothing more than the full explication of what they mean and of what experience in its full nature or notion is. This constitutes the theory of knowledge, and lays down, in Kantian language, the conditions of the possibility of experience. These conditions are the conditions of knowledge as such, of self-consciousness in general, or, as it may be put, of objective consciousness. The inquiry is, therefore, logical or transcendental in its nature, and does not entangle us in any decision as to the conditions of the genesis of such consciousness to the individual. When we inquire into subjective conditions, we are thinking of facts causing other facts. But the logical or transcendental conditions are not causes or even factors of knowledge; they are the statement of its idea. Hence the dispute at the present time between evolutionist and transcendentalist rests, in general, on an *ignoratio elenchi*; for the history of the genesis of an idea (the historical or genetic method) does not contain an answer to—though it may throw light on—the philosophic question of its truth or validity. Speaking of this transcendental consciousness, Kant goes so far as to say that it is not

of the slightest consequence "whether the idea of it be clear or obscure (in empirical consciousness), no, not even whether it really exists or not. But the possibility of the logical form of all knowledge rests on its relation to this apprehension as a faculty or potentiality" (*Weile*, ed. Hartenstein, in 578 note). Or, if we return to the distinction between epistemology and psychology, by way of illustrating the nature of the former, we may take the summing up of Mr Ward in a valuable article on "Psychological Principles" recently contributed to *Mind* (April 1883, pp. 166, 167). "Comparing psychology and epistemology, then, we may say that the former is essentially genetic in its method, and might, if we had the power to revise our existing terminology, be called biology, the latter, on the other hand, is essentially devoid of everything historical, and treats, *sub specie aternitatis*, as Spinoza might have said, of human knowledge, conceived as the possession of mind in general."

Kant's problem is not, in its wording, very different from that which Locke set before him when he resolved to "inquire into the original, certainty, and extent of human knowledge together with the grounds and degrees of belief, opinion, and assent." Locke's *Essay* is undoubtedly, in its intention, a contribution to the theory of knowledge, as any one may verify for himself by turning to the headings of the chapters in the fourth book. But, because time had not yet made the matter clear, Locke suffered himself to digress in his second book into the purely psychological question of the origin of our ideas, or, as Kant called it, the physiology of the human mind. Appearing thus, first, as the problem of perception (in Locke and his English successors), widening its scope and becoming, in Kant's hands, the question of the possibility of experience in general, epistemology may be said to have passed with Hegel into a completely articulated "logic," that claimed to be at the same time a metaphysic, or an ultimate expression of the nature of the real. This introduces us to the second part of the question we are seeking to determine, namely, the relation of epistemology to metaphysics.

It is evident that philosophy as theory of knowledge must have for its complement philosophy as metaphysics or ontology. The question of the truth of our knowledge, and the question of the ultimate nature of what we know, are in reality two sides of the same inquiry, and therefore our epistemological results have to be ontologically expressed. But it is not every thinker that can see his way with Hegel to assert in set terms the identity of thought and being. Hence the theory of knowledge becomes with some a theory of human ignorance. This is the case with Herbert Spencer's doctrine of the unknowable, which he advances as the result of epistemological considerations in the philosophical prolegomena to his system. Very similar positions were maintained by Kant and Comte; and, under the name of "agnosticism," the theory has popularized itself of late in the outer courts of philosophy, and on the shifting borderland of philosophy and literature. The truth is that the habit of thinking exclusively from the standpoint of the theory of knowledge tends to beget an undue subjectivity of temper. And the fact that it has become usual for men to think from this standpoint is very plainly seen in the almost universal description of philosophy as an analysis of "experience," instead of its more old-fashioned designation as an inquiry into "the nature of things." Now it is matter of universal agreement that the problem of being must be attacked indirectly through the problem of knowledge; and therefore this substitution certainly marks an advance, in so far as it implies that the fact of experience, or of self-conscious existence, is the chief fact to be dealt with. But if so, then self-consciousness must really be treated as existing,

¹ It is true that he afterwards modifies this misleading identification by introducing the distinction between empirical psychology or the phenomenology of mind and intellectual psychology or ontology, *i.e.* metaphysics proper. But he continues to use the terms "philosophy," "metaphysics," and "mental science" as synonymous.

and as organically related to the rest of existence. If self-consciousness be treated in this objective fashion, then we pass naturally from epistemology to metaphysics or ontology. (For, although the term "ontology" has been as good as disused, it still remains true that the aim of philosophy must be to furnish us with an ontology or a coherent and adequate theory of the nature of the existent.) But if, on the other hand, knowledge and existence be *ab initio* opposed to one another—if consciousness be set on one side as over against existence, and merely holding up a mirror to it—then it follows with equal naturalness that the truly objective must be something which lurks unrevealed behind the subject's representation of it. Hence come the different varieties of a so-called phenomenalism. The upholders of such a theory would, in general, deride the term "metaphysics" or "ontology"; but it is evident, none the less, that their position itself implies a certain theory of the universe and of our own place in it, and philosophy with them will consist, therefore, in the establishment of this theory.

Without prejudice, then, to the claims of epistemology to constitute the central philosophic discipline, we may simply note its liability to be misused. The exclusive preoccupation of men's minds with the question of knowledge during the last quarter of a century or more drew from Lotze the caustic criticism that "the continual sharpening of the knife becomes tiresome, if, after all, we have nothing to cut with it." Shillingfleet's complaint against Locke was that he was "one of the gentlemen of this new way of reasoning that have almost discarded substance out of the reasonable part of the world." The same may be said with greater truth of the devotees of the theory of knowledge, they seem to have no need of so old-fashioned a commodity as reality. Yet, after all, Fichte's dictum holds good that knowledge as knowledge—*i. e.*, so long as it is looked at as knowledge—is, *ipso facto*, not reality. The result of the foregoing, however, is to show that, as soon as epistemology draws its conclusion, it becomes metaphysics; the theory of knowledge passes into a theory of being. The ontological conclusion, moreover, is not to be regarded as something added by an external process; it is an immediate implication. The metaphysic is the epistemology from another point of view—regarded as completing itself, and explaining in the course of its exposition that relative or practical separation of the individual known from the knowable world which it is a sheer assumption to take as absolute. This, not the so-called assumption of the implicit unity of being and thought, is the really unwarrantable postulate; for it is an assumption which we are obliged to retract bit by bit, while the other offers the whole doctrine of knowledge as its voucher.

Logic, Aesthetics, and Ethics—If the theory of knowledge thus takes upon itself the functions discharged of old by metaphysics, it becomes somewhat difficult to assign a distinct sphere to logic. It has already been seen how the theory of knowledge, when it passed out of Kant's hands, and tried to make itself (a) complete and (b) presuppositionless, became for Hegel a logic that was in reality a metaphysic. This is the comprehensive sense given to logical science in the article *Logik* (*qv*) in this work; and it is there contended that no other definition can be made consistent with itself. It is, of course, admitted that this is not the traditional use of the term (see vol. xiv. p. 802). Ueberweg's definition of logic as "the science of the regulative laws of thought" or "the normative science of thought" comes near enough to the old sense to enable us to compare profitably the usual subject-matter of the science with the definition and end of philosophy. The introduction of the term "regulative" or "normative" is intended to differentiate the science from psychology as the

science of mental events. In this reference logic does not tell us how our intellects connect themselves as mental phenomena, but how we ought to connect our thoughts if they are to realize truth (either as consistency with what we thought before or as agreement with observed facts). Logic, therefore, agrees with epistemology (and differs from psychology) in treating thought not as mental fact but as knowledge, as idea, as having meaning in relation to an objective world. To this extent it must inevitably form a part of the theory of knowledge. But, if we desire to keep by older landmarks and maintain a distinction between the two disciplines, a ground for doing so may be found in the fact that all the main definitions of logic point to the investigation of the laws of thought in a subjective reference,—with a view, that is, by an analysis of the operation, to ensure its more correct performance. According to the old phrase, logic is the art of thinking. Moreover, the fact that ordinary logic investigates its laws primarily in this reference, and not disinterestedly as immanent laws of knowledge or of the connexion of conceptions, brings in its train a limitation of the sphere of the science as compared with the theory of knowledge. We find the logician uniformly assuming that the process of thought has advanced a certain length before his examination of it begins, he takes his material full-formed from perception, without, as a rule, inquiring into the nature of the conceptions which are involved in our perceptive experience. Occupying a position, therefore, within the wider sphere of the general theory of knowledge, ordinary logic consists in an analysis of the nature of general statement, and of the conditions under which we pass validly from one general statement to another. But the logic of the schools is eked out by contributions from a variety of sources (*e.g.*, from grammar on one side and from psychology on another), and cannot claim the unity of an independent science.

ÆSTHETICS (*qv*) may be treated as a department of psychology or physiology, and in England this is the mode of treatment that has been most general. To what peculiar excitation of our bodily or mental organism, it is asked, are the emotions due which make us declare an object beautiful or sublime? And, the question being put in this form, the attempt has been made in some cases to explain away any peculiarity in the emotions by analysing them into simpler elements, such as primitive organic pleasures and prolonged associations of usefulness or fitness. But, just as psychology in general can in no sense do duty for a theory of knowledge, so it holds true of this particular application of psychology that a mere reference of these emotions to the mechanism and interactive play of our faculties cannot be regarded as an account of the nature of the beautiful. The substitution of the one inquiry for the other may doubtless be traced in part to the latent assumption—standing very much in need of proof—that our faculties are constructed on some arbitrary plan, without reference to the general nature of things. Perhaps by talking of "emotions" we tend to give an unduly subjective colour to the investigation; it would be better to speak of the *perception* of the beautiful. Pleasure in itself is unqualified, and affords no differentia. In the case of a beautiful object the resultant pleasure borrows its specific quality from the presence of determinations essentially intellectual in their nature, though not reducible to the categories of science. We have a *prima facie* right, therefore, to treat beauty as an objective determination of things. The question of aesthetics would then be formulated—What is it in things that makes them beautiful, and what is the relation of this aspect of the universe to its ultimate nature, as that is expounded in metaphysics? The answer constitutes the substance of aesthetics, con-

sidered as a branch of philosophy. But it is not given simply in abstract terms, aesthetics includes also an exposition of the concrete phases of art, as these have appeared in the history of the world, relating themselves to different stages of the spirit's insight into itself and into things.

Of *ETHICS* (*ἠθικά*) it may also be said that many of the topics commonly embraced under that title are not strictly ethical at all, but are subjects for a scientific psychology employing the historical method with the conceptions of heredity and development, and calling to its aid, as such a psychology will do, the investigations of ethnology, and all its subsidiary sciences. To such a psychology must be relegated all questions as to the origin and development of moral ideas. Similarly, the question debated at such length by English moralists as to the nature of the moral faculty (moral sense, conscience, &c.) belongs entirely to psychology. This is more generally admitted in regard to the controversy concerning the freedom of the will, though that still forms part of most ethical treatises. If we exclude such questions in the interest of systematic correctness, and seek to determine for ethics a definite subject-matter, the science may be said to fall into two departments. The first of these deals with the notion of duty, as such, and endeavours to define the ultimate end of action, the second lays out the scheme of concrete duties which are deducible from, or which, at least, are covered by, this abstractly-stated principle. The second of these departments is really the proper subject-matter of ethics considered as a separate science, but it is often conspicuous by its absence from ethical treatises. However moralists may differ on first principles, there seems to be remarkably little practical divergence when they come to lay down the particular laws of morality. Hence, as it must necessarily be a thankless task to tabulate the commonplaces of conduct, the comparative neglect of this part of their subject is perhaps sufficiently explained. It may be added that, where a systematic account of duties is actually given, the connexion of the particular duties with the universal formula is in general more formal than real. It is only under the head of "casuistry" that ethics has been much cultivated as a separate science. The first department of ethics, on the other hand, is the branch of the subject in virtue of which ethics forms part of philosophy. As described above, it merges in general metaphysics or ontology, and ought rather to be called, in Kant's phrase, the metaphysic of ethics. A theory of obligation is ultimately found to be inseparable from a metaphysic of personality. The connexion of ethics with metaphysics will be patent as a matter of fact, if it be remembered how Plato's philosophy is summed up in the idea of the good, and how Aristotle also employs the essentially ethical notion of end as the ultimate category by which the universe may be explained or reduced to unity. But the necessity of the connexion is also apparent, unless we are to suppose that, as regards the course of universal nature, man is altogether an *imperium in imperio*, or rather (to adopt the forcible phrase of Marcus Aurelius) an abscess or excrescence on the nature of things. If, on the contrary, we must hold that man is essentially related to "a common nature," as the same writer puts it, then it is a legitimate corollary that in man as intelligence we ought to find the key of the whole fabric. At all events, this method of approach must be truer than any which, by restricting itself to the external aspect of phenomena as presented in space, leaves no scope for inwardness and life and all that, in Lotze's language, gives existence "value." Historically we may be said in an intelligible sense to explain the higher by showing its genesis from the lower. But in philosophy it is exactly the reverse; the lower is always to be explained by the higher. In the ethical

reference it has been customary to argue, as Sir W. Hamilton does, from man's moral being to "an Intelligent Creator and Moral Governor of the Universe." It is evident that the argument *ex analogia hominis* may sometimes be carried too far; but if a "chief end of man" be discoverable—*ἀνθρώπων ἀγαθόν*, as Aristotle wisely insisted that the ethical end must be determined—then it may be assumed that this end cannot be irrelevant to that ultimate "meaning" of the universe which, according to Lotze, is the quest of philosophy. If "the idea of humanity," as Kant called it, has ethical perfection at its core, then a universe which is organic must be ultimately representable as a moral order or a spiritual kingdom such as Leibnitz named, in words borrowed from Augustine, a city of God.

Politics, Sociology, Philosophy of History.—In Aristotle we can observe how ethics is being differentiated from politics, but this differentiation does not, and ought not to, amount to a complete separation. The difficulty, already hinted at, which individualistic systems of ethics experience in connecting particular duties with the abstract principle of duty is a proof of the failure of their method. For the content of morality we are necessarily referred, in great part, to the experience crystallized in laws and institutions and to the unwritten law of custom, honour, and good breeding, which has become organic in the society of which we are members. The development of society is therefore brought within the scope of philosophy. So far as this development is traced in a purely historical spirit, it will be simply a sequence of efficient causes, in which, starting with a b c, we eventually arrive at A B C. But, if this sequence is to be philosophized, it must be shown that we have no means of knowing what a b c is except in its relation to A B C, its resultant. We interpret the process, therefore, as the realization of an immanent end. The state, as the organism in whose play morality is realized, becomes an interest of reason; and the different forms of state-organization are judged according to the degree in which they realize the reconciliation of individual freedom and the play of cultured interests with stable objectivity of law and an abiding consciousness of the greater whole in which we move. So far as the course of universal history can be truly represented as an approximation to this reconciliation by a widening and deepening of both the elements, we may claim to possess a philosophy of history. (A. SE.)

PHILOSTRATUS, the eminent Greek sophist, was probably born in Lemnos between 170 and 180 A.D. From his incidental statements respecting himself we learn that he studied at Athens, and was afterwards attached to the court of the empress Julia Domna, consort of Severus. Since he does not speak of her as living, while mentioning her as his patroness in his *Life of Apollonius of Tyana*, this work was probably written after her death. From some passages in it and his *Lives of the Sophists*, he would seem to have been in Gaul with Caracalla, and he may probably have accompanied that emperor on his progress through his dominions. The only other fixed date we possess for his life is afforded by his dedication of the *Lives of the Sophists* to Antonius Gordianus as proconsul. Gordianus was consul in 230, and his proconsulship must have been between that year and 234. It seems to be implied that Philostratus resided in Rome, and, according to Suidas, he lived until the reign of Philip (244-249). His works now extant are a biography of Apollonius of Tyana, *Lives of the Sophists*, *Heracles*, *Imagines*, and *Epistles*.

The *Life of Apollonius of Tyana* has been partly discussed under APOLLONIUS. It may be compared to the *Cyropædia* of Xenophon as a romance founded on fact, treating of a distinguished historical person, not in an historical spirit, but as an ideal model for imitation. While, however, the

incidents of Xenophon's romance were mostly his own invention, Philostratus was indebted for his to the narrative attributed to Damis, Apollonius's travelling companion, and many of the sayings ascribed to Apollonius, such as his bon-mots against Domitian and his protest against gladiatorial combats, are probably authentic. The rest of the work testifies to the increasing fondness of the age for the marvellous, which Lucian had vainly endeavoured to stem in the preceding generation, and to the tendency to set up semi-mythical sages like Pythagoras as prophets, at the expense of sober reasoners like Zeno and Epicurus. Philostratus, however, is careful to disclaim all connexion of his hero with mere vulgar thaumaturgy. The sorcerer, he expressly says, is a miserable person. Apollonius is the sage who foreknows the future not by incantations but by wisdom and conformity to the will of the gods,—a new Pythagoras, the prototype, we can now see, of Apuleius, Plotinus, and the other later Platonists, who, without wholly discarding philosophical method, coquetted with ecstasy and revelation. Philosophy, in truth, had become bankrupt, physical science did not yet exist, and the best minds of the time were necessarily thrown back on the supernatural. Philostratus gives this tendency of the age a concrete expression, and there is no reason to conceive that his work was composed in any spirit of antagonism to Christianity, whose Founder, equally with Apollonius himself, was venerated by his patron Alexander Severus. Though a mass of fiction, it is still very valuable as delineating the ideal of the philosophic character as recognized in the 3d century. It is full of errors in geography and chronology, but possesses great literary merit, being varied, entertaining, animated, and lively and accurate in its pictures of character. *Sophistia certe artis egregium dedit in hoc libro specimen*, says Kayser. The distinction between a philosopher and a sophist is clearly laid down by Philostratus himself in his next important work, the *Lives of the Sophists*. The philosopher investigates truth independently, the sophist embellishes the truth, which he takes for granted. The distinction is much the same as that between the theologian and the preacher, or the jurist and the advocate. Philostratus, though by no means attempting detailed biography after the fashion of Diogenes Laertius, has given us interesting sketches of a number of distinguished ornaments of the sophistical profession, mostly his immediate predecessors or contemporaries. He thus affords a lively picture of the intellectual standard of an age full of curiosity and intelligence, but unable to make progress in knowledge for want of a scientific method or a scientific spirit, living on old literary models which it was unable to emulate or vary, and hence compelled to prefer show to substance, and manner to matter. The *Heroicon* is a good specimen of the popular literature of the day. It may have arisen out of Caracalla's visit to Ilium, and the games celebrated by him in honour of Achilles. The subject is the injustice of Homer to Palamedes, which is expounded to a Phœnician merchant by a Thracian vine-dresser on the authority of the latter's tutelary demon, the hero Proteus. It was probably a common theme of declamation in the schools, to which Philostratus has contributed an elegant and graceful setting. The *Imagines*, after the life of Apollonius the most entertaining of Philostratus's writings, is perhaps the most valuable of any from the light it throws on ancient art. The writer is introduced as living in a villa near Naples, which contains a collection of choice paintings. To please the son of his host and his young companions he undertakes to describe and explain the pictures, which are sixty-four in all, including mythological, historical, allegorical, and landscape subjects. The descriptions are exceedingly good, and reveal the skilful word-painter no less than the accomplished

connoisseur of art. As pointed out by M. Bougot, they either actually are or are intended to be taken for improvisations, which explains some irregularities in the style. It has been much disputed whether they are genuine descriptions of actually existing works of art. The affirmative has been maintained by Goethe and Welcker, the negative by Heyne. In our days the controversy has been revived by two eminent German archaeologists, Friederichs and Brunn, the former impugning, the latter maintaining the actual existence of the pictures. Their arguments are reviewed in a recent and valuable work by E. Bertrand, who sides with Brunn, as also does Hellag. Perhaps the point is not of such extreme moment, for, if Philostratus had not actual pictures in his mind, he must nevertheless have described such as his hearers or readers were in the habit of seeing. The traces of improvisation, however, pointed out by M. Bougot afford a strong argument that he was lecturing upon a visible collection, and in any case his work is a most valuable guide to the manner in which heroic figures were delineated in ancient paintings, to the general grouping and arrangement of such works, and to the qualities which they were expected to possess. Philostratus's *Épîtres* are entirely artificial, and mostly amatory. The style is good, and the originals of some pretty conceits appropriated by modern poets may be found in them.¹

The first complete edition of the works of Philostratus was published by F. Morel, Paris, 1608. It is not much esteemed. That by Olearius (Leipzig, 1709) is much better, but the chief restorer of the text is C. F. Kayser, who, after having edited most of the writings of Philostratus, separately published a collective edition at Zurich in 1844, reissued in 1858, and again at Leipzig in 1870-71. There is a very good edition, with a Latin translation by W. H. Munn (Paris, 1849), this also contains Euanthius's *Lives of the Sophists* and the declamations of Himerus. The first two books of the *Life of Apollonius* were translated into English by the celebrated and unfortunate Charles Diodot in 1680, but the unorthodox nature of the commentary, attributed in part to Lord Hailes of Glesbury, occasioned the work to be prohibited, and it was not continued. A complete translation by Dr. Berwick, an English clergyman, was published in 1809. A French translation by Chassang (*Le Nouveau dans l'Antiquité*, Paris, 1862) contains some valuable notes. The most important works on the *Imagines* are Friederichs, *Die Philostratischen Bilder*, 1860; Brunn, *Die Philostratischen Gemälde*, 1861; A. Bougot, *Une galerie antique*, 1881; and E. Bertrand, *Un critique d'art dans l'antiquité*. *Philostrate et son école*, 1882. (R. G.)

PHILOXENUS, one of the last of the dithyrambic poets of Greece, was born in 435 B.C. in the island of Cythera. When the island was conquered by the Athenians in 424 Philoxenus was sold as a slave to Agesylas, who gave him the name of Myrmex ("ant"). On the death of Agesylas he was bought by the dithyrambic poet Melanippides, who educated him, no doubt in his own profession. Philoxenus afterwards resided in Sicily, at the court of Dionysius, tyrant of Syracuse, whose bad verses he declined to praise, and was in consequence sent to work in the quarries. Being fetched back again and asked by the tyrant how he liked his verses now, the poet made no reply but "Take me away to the quarries." He is said to have quitted Sicily in disgust at the luxury and vulgarity of the people, abandoning an estate which he owned in the island. From Sicily he seems to have gone to Tarentum, and thence perhaps to Corinth. He visited Colophon in Asia Minor and died at Ephesus in 380. According to Suidas, Philoxenus composed twenty-four dithyrambs and a lyric poem on the genealogy of the Æacidae. In his hands the dithyramb seems to have been a burlesque drama in verse, which was acted and sung to the accompaniment of elaborate instrumental music and enlivened

¹ A younger Philostratus, also called the Lemnian, is several times mentioned by the elder as a contemporary sophist. He speaks of him as a friend, but does not say that he was a kinsman. Another and much inferior collection of *Imagines* is extant under the name of this writer, who claims relationship with the elder Philostratus. It is probably a spurious work.

with the dance,—in short, it was a sort of comic opera. The music, which Philoxenus, himself composed, appears to have been of a debased, Offenbachian character. His masterpiece was the *Cyclops* or *Giddeu*, a pastoral burlesque on the love of the Cyclops for the fair Galatea. Its general style may probably be gathered from the sixth idyl of Theocritus. The work must have been well known before 388, for it was parodied by Aristophanes in his play the *Plutus*, performed in that year. Another work of Philoxenus, sometimes attributed to a notorious parasite and glutton of the same name, is the *Antenor* (Dinner), of which considerable fragments have been preserved by Athenæus. This poem, of which the text is very obscure and corrupt, is little more than an elaborate hill of fare put into verse, and, as such, possesses more interest for cooks than scholars. In the time of Aristotle it was the one book read by the Athenian quidnuncs. The great popularity enjoyed by Philoxenus is attested not only by the allusions to him in the comic poets of his day but also by a complimentary resolution passed by the Athenian senate in 393 on the motion of the dithyrambic poet Cinesias. The intention of the decree was doubtless mainly political—to propitiate Dionysus—but the poet was included in it. Nor was his popularity transient; the poet Antiphanes of the Middle Comedy spoke of Philoxenus as a god among men, Alexander the Great had his poems sent to him in Asia along with the tragedies of Æschylus, Sophocles, and Euripides, the Alexandrian grammarians received him into the canon; and down to the time of Polybius his works were regularly learned and annually acted by the Arcadian youth. The scanty fragments of his works are to be found in Bergk's *Poetæ Lyrici Græci*, vol. iii.

PHLEGON, of Tralles in Asia Minor, a Greek writer of the 2d century, was a freedman of the emperor Hadrian. His chief work was the *Olympiads* (chronicles, or collection of Olympic victories and chronicles), a universal history in sixteen books, from the 1st down to the 229th Olympiad (776 B.C. to 137 A.D.). If we may judge from the sample preserved by Photus, the work contained lists of the victors in the Olympic games together with a bare and disjointed summary of the chief historical events, it is probable, however, that Photus quoted from an epitome in eight books which we know to have existed, and which, together with another epitome in two books, is ascribed by Suidas to Phlegon himself. Portions of another work of Phlegon, *On Marvels*, along with parts of another *On Long-lived Persons*, and the opening part of his *Olympiads*, are extant in a Heidelberg MS. of the 10th century.

The book *On Marvels* contains some ridiculous stories about ghosts, prophecies, and monstrous births. The work *On Long-lived Persons* includes a list, extracted by Phlegon from the Roman censuses, of persons who had lived a hundred years and upwards. He mentions two men aged 136 years each, one of whom he professes to have seen. Other works ascribed to Phlegon by Suidas are a description of Sicily, a work on the Roman festivals in three books, and a topography of Rome. Eusebius Spartianus tells us that a life of Hadrian was published in Phlegon's name, but that it was written by the emperor himself. A work on *Women Wise and Brave in War* has sometimes been wrongly attributed to Phlegon. From his remains Phlegon is seen to have been credulous and superstitious to absurdity, but his literary style deserves the remark of Photus that, without being pure Attic, it is not very bad. The complaint of Photus, that Phlegon wearied his readers by the numerous oracles which he dragged in, is fully borne out by the remains of his works. These remains are collected by Westermann in his *Scriptores rerum mirabilium Græci* (1839) and by Müller in his *Fragmenta Historiarum Græcorum*, vol. iii.

PHLOX, a considerable genus of *Polemoniaceæ*, chiefly consisting of North-American perennial plants, with entire, usually opposite, leaves and showy flowers generally in terminal clusters. Each flower has a tubular calyx with five lobes, and a salver-shaped corolla with a long slender

tube and a flat limb. The five stamens are given off from the tube of the corolla at different heights and do not protrude beyond it. The ovary is three-lobed with one to two ovules in each cell, it opens into a three-valved capsule. Many of the species are cultivated for the beauty of their flowers, and the forms obtained by cross-breeding and selection are innumerable. The garden varieties fall under three groups,—the annuals, including the lovely *P. Drummondii* from Texas and its many forms; the perennials, including a dwarf section of alpine plants (forms of *P. subulata*), suitable, by reason of their prostrate habit and neat mode of growth, for the rockery; and the taller-growing decussate phloxes which contribute so much to the beauty of gardens in late summer, and which have probably originated from *P. paniculata*. The range of colour in all the groups is from white to rose and lilac.

PHOCÆA, in ancient geography, was one of the cities of Ionia, on the western coast of Asia Minor. It was the most northern of the Ionian cities, and was situated on the coast of the peninsula that separates the Gulf of Cyme, which was occupied by Æolian settlers, from the Hæmæan Gulf, on which stood Smyrna and Clazomenæ.¹ Its advantageous position between two good harbours, called Naustathmus and Lampter, is pointed out by Livy (xxxvii. 31), and was probably the cause which led the inhabitants to devote themselves from an early period to maritime pursuits. We are expressly told by Herodotus that the Phocæans were the first of all the Greeks who undertook distant voyages and made known to their countrymen the coasts of the Adriatic, as well as those of Tyrhænia and Spain. In the latter country they established friendly relations with Arganthonius, king of Tartessus, who even invited them to emigrate in a body to settle in his dominions, and, on their declining this offer, presented them with a large sum of money. This they employed in constructing a strong wall of fortification around their city, a defence which stood them in good stead when the Ionian cities were attacked by Cyrus in 546. On that occasion they refused to submit when besieged by Harpagus, the general of Cyrus; but, mistrusting their power of ultimate resistance, they determined to abandon their city, and embarking their wives and children and most valuable effects, to seek a new home in the western regions, where they had already founded several flourishing colonies, among others those of Alalia in Corsica and the important city of Massilia in the south of Gaul. A large part of the emigrants, however, relented, and, after having proceeded only as far as Chios, returned to Phocæa, where they submitted to the Persian yoke. The rest, however, having bound themselves by a solemn oath never to return, proceeded to Corsica, where they settled for a time, but, being afterwards expelled from the island, they founded the colony of Veſta or Elea in southern Italy.

Phocæa continued to exist under the Persian government, but greatly reduced in population and commerce, so that, although it was joined in the revolt of the Ionians against Persia in 500, it was only able to send three ships to the combined fleet that fought at Lade. Nor did it ever again assume a prominent part among the Ionian cities, and it is rarely mentioned in Greek history. But at a later period it was sufficiently powerful to oppose a vigorous resistance to the Roman prætor Æmilius during the war against Antiochus in 191. On that occasion the town was taken and plundered, but it continued to survive, and we learn from its coins that it was a place of some importance throughout the Roman empire. The ruins still visible on the site bear the name of Palea Foggia, but they are of little interest. A small town in the immediate neighbourhood, known as Nova Foggia, appears to date only from Byzantine times.

¹ It was said to have been founded by a band of emigrants from Phocæa, under the guidance of two Athenian leaders, named Philogeus and Damon, but it joined the Ionian confederacy by accepting the government of Athenian rulers of the house of Cœurus.

PHOCAS, emperor of the East from 602 to 610, was a Cappadocian of humble origin, and was still but a centurion when chosen by the army of the Danube to lead it against Constantinople. A revolt within the city soon afterwards resulted in the abdication of the reigning emperor MAURICIUS (q.v.) and in the speedy elevation of Phocas to the vacant throne (23d November 602). The secret of his popularity is hard to discover, but perhaps it is to be sought in the sheer recklessness of his audacity, courage is nowhere imputed to him, and he is known to have been ignorant, brutal, and deformed. "Without assuming the office of a prince he renounced the profession of a soldier; and the reign of Phocas afflicted Europe with ignominious peace, and Asia with desolating war." By the representations of Theodosius, Maurice's supposed son, and of Narses, the Byzantine commander-in-chief on the Persian frontier, Chosroes (Khosrau) II. was induced to take up arms against the emperor in 604 (see PERSIA, above, p. 614). The failures of the generals of Phocas could not but tend to weaken his always insecure tenure of the imperial crown, and the appearance of the Persian armies as far west as Chalcedon in 609-610 made his deposition by HERACLIUS (q.v.) an easy task. He was beheaded by his successful rival on 4th October 610.

PHOCION, an Athenian statesman, whose private virtues won him the surnames of "the Good," but whose mistaken policy fatally contributed to the downfall of Athens, was born about 402 B.C. His father, Phocus, was a pestle-maker, but would seem to have been a man of means, for Phocion in his youth was a pupil of Plato. If Plutarch is right in saying that he afterwards studied under Xenocrates, this implies that he kept up his philosophical studies in later life, for Xenocrates was his junior and did not succeed to the headship of the Academy until 339. As men of kindred character, they may well have been friends, we find them on one occasion serving on the same embassy. It was perhaps from the Academic philosophy that Phocion learned that contempt for luxury and that truly Socratic simplicity and hardness which characterized him throughout life. From Plato too he may have caught that scorn for the Athenians of his day which he often betrayed—a scorn harmless, perhaps, in the study, but fatal in the council and the camp. His words, though few, were pitiful and forcible, his wit keen and caustic. Many of his trenchant sayings have been preserved by Plutarch. He was the only orator whom Demosthenes feared, when Phocion rose to speak Demosthenes used to whisper to his friends, "Here comes the chopper of my speeches." Gruff in manner, he was kind at heart, ever ready to raise the fallen and succour those in peril, even when they were his enemies. Being once reproached for pleading the cause of a bad man, he replied that the good had no need of help. When other generals were sent by Athens to the allies, the people closed their gates against them and prepared for a siege, but if it was Phocion they went out to meet him and conducted him in joyful procession into their midst. In his youth he saw service under the distinguished general Chabrias, whose temper, by turns sluggish and impetuous, he alternately stimulated and repressed. He thus won the regard of his good-natured commander, and was introduced by him to public notice and employed on important services. When Chabrias defeated the Spartans in the sea-fight off Naxos (September 376) Phocion commanded with distinction the left wing of the Athenian fleet. After the death of Chabrias (357) Phocion cared for the relatives of his patron, patiently endeavouring to train to virtue his wild and wayward son. A consistent advocate of peace, he was yet a good officer, and held the annual office of general no less than forty-five times, though he never sought election.

He was amongst the last of the Athenian leaders who combined the character of statesman and soldier. In 351 Phocion and Evagoras, lord of the Cyprian Salamis, were sent by Idrieus, prince of Caria, with a military and naval force to put down a revolt which had broken out against the Persians in Cyprus. The task was successfully accomplished. Next year¹ Phocion commanded a force which the Athenians sent to Euboea in support of the tyrant Plutarch of Eretria. For a time the Athenians were in a dangerous position, but Phocion extricated himself and defeated the enemy on the heights above Tamynae. After the battle he humanely dismissed all his Greek prisoners, fearing the vengeance which the Athenians too often wreaked on their fallen foes. In 341 he returned to the island and put down Clitarchus, whom Philip, king of Macedonia, had set up as tyrant of Eretria. Demosthenes had long warned the Athenians against Philip, but there is nothing to show that in this he was backed by Phocion. On the contrary, from the opposition which he so often offered to Demosthenes, as well as from his subsequent policy, we may infer that Phocion discredited rather than corroborated the warnings of his contemporary. But, when Philip laid siege to Byzantium, the Athenians, at last thoroughly aroused to their danger, sent Chares with an expedition to relieve it. He failed to do so, and Phocion took his place (340). The Byzantines had refused to admit Chares into their city, but they welcomed Phocion. Athenians and Byzantines fought side by side, and Philip was compelled to raise the siege and retire from the Hellespont. Phocion afterwards retaliated on the king's territory by raids, in one of which he was wounded. When the Megarians appealed to Athens for help, Phocion promptly marched to their aid, fortified the port Nisaea, and connected it with the capital by two long walls, thus securing Megara and its port against attacks by land.² In spite of the successful issue of his expedition to Byzantium Phocion advised the Athenians to make peace with Philip. But the war party led by Demosthenes prevailed, and the battle of Cheronaea (August 338), in which Philip overthrew the united armies of Athens and Thebes, converted Greece into a province of Macedonia. This brought Phocion and the peace party into power, but Phocion consulted the dignity of Athens so far as to advise the people not to take part in the congress of the Greek states summoned by Philip to meet at Corinth until they knew what terms Philip meant to propose. The Athenians soon had reason to regret that they did not follow this advice. When the

¹ Diodorus (xvi. 46) speaks of Phocion as still in Cyprus in 350. But this can hardly be true if Phocion led the expedition to Euboea in Anthesterion (end of February and beginning of March) 350. See next note.

² The dates and even the order of the events from the Cyprian down to the Megarian expedition are variously given by modern writers. The order in the text is that of Plutarch and Diodorus. The dates assigned to the Cyprian, second Euboean, and Megarian expeditions are those of Diodorus. The first expedition to Euboea (as to the date of which see Clinton's *Festi Hellenica*, vol. i.) and that to Megara are not mentioned by Diodorus. Plutarch mentions the Megarian after the Byzantine expedition. But the siege of Byzantium was not raised till the earlier half of 339, and Phocion afterwards spent some time in Macedonian waters. Thus he could hardly have been at Megara before midsummer 339. But Eusebius was seized by Philip in the winter of 339/338, and its seizure was the occasion of a league between Athens and Thebes. Hence, as the motive assigned for the Megarian expedition was distrust of Thebes, that expedition cannot have taken place after the seizure of Elateas. But the six months between midsummer and winter 339 would hardly suffice for the construction of the Long Walls. Perhaps, then, Plutarch has misplaced the expedition to Megara, and it ought to be dated earlier. Thirlwall assigns it to 343.

³ The Athenians had rendered the same service to the Megarians more than a century before, but these first Long Walls had been destroyed by the Megarians themselves in the Peloponnesian War (424).

news of Philip's assassination reached Athens (336) Phocion vainly dissuaded the people from publicly expressing what he termed a dastardly joy.

After the revolt of Thebes and its destruction by Philip's son and successor Alexander the Great, Athens, having been implicated in the movement, was called on by Alexander to surrender the orators of the anti-Macedonian party, including Demosthenes (336). Phocion advised the men to give themselves up, but nevertheless by his intercession he induced the conqueror to relent.¹ Alexander conceived a high opinion of Phocion, and even afterwards treated him with marked respect. He would have loaded him with presents, but Phocion steadily declined them, the only favour he asked being the release of some prisoners. When Harpalus, a Macedonian officer who had betrayed the confidence reposed in him by Alexander, fled for refuge to Athens, Phocion, though he contemptuously refused the bribes which Harpalus offered him, nevertheless resisted the proposal to surrender the fugitive (324); and, after the death of Harpalus, Phocion and his son-in-law cared for his infant daughter. The wild joy which the death of Alexander (323) roused at Athens was not shared by Phocion, and he had nothing better than scorn for that heroic effort to shake off the Macedonian yoke known as the Lamian War (323-322). When the news of Leosthenes's victory over Antipater, the regent of Macedonia, was greeted at Athens with enthusiasm (323), Phocion sneeringly asked, "When shall we have done conquering?" Still, when a body of Macedonian and mercenary troops under Micion landed in Attica and ravaged the country, Phocion led out a force and defeated them with loss. After the battle of Crannon (322) Phocion's personal influence induced the victorious Antipater to spare Attica the misery of invasion, but he could not prevent the occupation of Munychia (one of the ports of Athens) by a Macedonian garrison. However, Menyllus, the commander of the garrison, was a friend of Phocion and respected the feelings of the Athenians. Further, the Athenians were required by Antipater to surrender the chief members of the anti-Macedonian party, amongst them Demosthenes and Hypereides, and to restrict their franchise by a property qualification. In consequence Hypereides was executed, Demosthenes died by his own hand, and over 13,000 citizens lost the franchise, many of them going into exile. These disfranchised citizens had afterwards an important influence on Phocion's fate. For some years Athens dwelt in peace, if not in honour, under the shadow of Macedonia. Phocion had the direction of affairs and filled the magistracies with respectable men. By his intercession with Antipater he procured for many of the exiles a repeal or mitigation of their sentence, but he declined to petition Antipater to withdraw the garrison from Munychia. The presents offered him by Antipater and Menyllus he refused. In 318 Antipater died, leaving as his successor in the regency of Macedonia the veteran general Polyperchon, instead of his own son Cassander. The new regent, finding himself isolated and wishing to strengthen himself against his enemies, tried to attach the Greeks to his cause by proclaiming in the name of the young king Philip Arrhides that the oligarchies established by Antipater in the Greek cities should be abolished and the democracies restored, and that all exiles, with a few exceptions, should be allowed to return. A special letter to Athens in the king's name announced the restoration of the democracy. But Cassander was not to be set aside lightly; he was naturally supported by all who

had benefited by his father's measures, *etc.*, by the oligarchical and Macedonian party in the Greek states. Before the news of the death of Antipater got abroad Cassander sent Nicanor, an adherent of his own, to relieve Menyllus of the command in Munychia. Menyllus unsuspectingly resigned the command to him, and Nicanor held the place for Cassander. When, a few days later, the death of Antipater became known, there were angry murmurs at Athens that Phocion had been a party to the deception. Phocion heeded them not, but, following his usual policy, propitiated Nicanor in favour of Athens. But the people were excited by the promises of Polyperchon; Phocion could no longer hold them in. In a public assembly at which Nicanor was present an attempt was made to seize the obnoxious Macedonian, but he escaped. Warnings now poured in on Phocion to beware of him, but he confided in Nicanor's good intentions and would take no precaution. So Nicanor was enabled to seize and intrench himself in Piræus, the chief port of Athens. The irritation against Phocion was intense. An attempt to treat with Nicanor failed, he simply referred the envoys, of whom Phocion was one, to Cassander. The arrival in Attica of Alexander, son of Polyperchon, revived the hopes of the Athenians. He came at the head of an army and brought in his train a crowd of the exiles, and it was thought that, along with the constitution, he would restore Munychia and Piræus to Athens. Far from doing so, it soon appeared that his intention was to seize and hold these ports for Polyperchon, and rumour said that to this step he was instigated by Phocion. The people were furious. In a public assembly they deposed the existing magistrates, filled their places with the most pronounced democrats, and sentenced all who had held office under the oligarchy to exile or death. Among these was Phocion. With some of his companions in misfortune he fled to Alexander, who received the fugitives courteously and sent them to Polyperchon and the king, who were with an army in Phocis. Thither, too, came an embassy from Athens to accuse Phocion and his fellows before the king and to demand the promised independence. Polyperchon resolved to propitiate the Athenians with blood, so, after an audience disgraceful to all who took part in it except to Phocion, the refugees were packed in carts and sent to Athens to be tried by what Polyperchon called the now free people. A savage mob filled the theatre where the trial was to take place, the returned exiles mustered in force, and with them were women, aliens, and slaves. The prisoners were charged with having betrayed their country in the Lamian War and overturned the democracy. Every attempt Phocion made to defend himself was drowned in a storm of hooting. At last, renouncing the attempt, he was heard to say that for himself he pleaded guilty, but the rest were innocent. "Why," he asked, "will you kill them?" He was answered with a great shout, "Because they are your friends." Then Phocion was silent. All were condemned to die, the multitude rising to their feet like one man to give the verdict. A howling rabble followed them with curses to the prison. Phocion was the last to die (317), for he allowed his best friend Nicoteles, as a last token of regard, to die before him. His old disdainful wit did not desert him. When his turn came there was not poison enough left, and he had to pay for more, remarking that at Athens a man could not even die for nothing. His body was cast out of Attic territory, but his faithful wife² secretly brought back his bones and interred them by the hearth. Afterwards the

¹ So Plutarch, *Phocion*, c. 17. But Diodorus (xvii. 15) and Plutarch himself elsewhere (*Demosth.*, c. 28) ascribe to Demades the credit of having mollified Alexander. Phocion's name is not mentioned in this connexion by Arrian (*Anab.*, i. 10) nor by Justin (xi. 4).

² The story that this service was rendered by a Megarian woman rests on a false reading in Plutarch, *Phoc.* c. 87, *Μεγαρίκη* before γὰρ being the interpolation of an ignorant copyist who mistook the preceding *ῥή* for *Μεγαρίκη*.

repentant Athenians buried them with public honours and raised a hyacinth statue to his memory.

The chief authorities for the life of Phocion are Diodorus (xvi. 42, 46, 74, xvi. 15, xviii. 18, 64-67) and the biographies of Plutarch and Nepos.

xi plate
I

PHOCION was in ancient times the name of a district of central Greece, between Boeotia on the east and the land of the Ozolian Locrians on the west. It adjoined the Gulf of Corinth on the south, while it was separated on the north from the Malian gulf by the ridge of Mount Cnemis and the narrow strip of territory occupied by the Epeuenudian and Opuntian Locrians. In early times, indeed, a slip of Phocian territory extended between these two Locrian tribes to the sea, and the port of Daphnus, opposite to the Cenean promontory in Euboea, afforded the Phocians an opening in this direction, but in the time of Stabro Daphnus had ceased to exist, and its territory was incorporated with Locris (Strabo, ix. 3, § 1).

Phocis was for the most part a rugged and mountainous country. In the centre of it rose the great mountain mass of Parnassus, one of the most lofty in Greece, attaining to the height of 8068 feet, and an underfall of this, Mount Cirphus (4130 feet), sweeps round to the Gulf of Corinth on the south, separating the Gulf of Crissa from that of Anticyra, both of which were included in the Phocian territory. The range of Mount Cnemis on its northern frontier was of less elevation (about 3000 feet), but rugged and difficult of access, while the upper valley or plain of the Cephissus, which intervened between this and the northern slopes of Mount Parnassus, constituted the only considerable tract of fertile and level country comprised within the limits of Phocis. The little basin adjoining the Crissean gulf, though fertile, was of very limited extent, and the broad valley leading into the interior from thence to Amphissa (now Salona) belonged to the Ozolian Locrians. Besides the Cephissus, the only river in Phocis was the Pleistus, a mere torrent, which rose in Mount Parnassus, and, after flowing past Delphi, descended through a deep ravine to the Crissean gulf.

Phocis possessed great importance in a military point of view, not only from its central position with regard to the other states of northern Greece and its possession of the great sanctuary of Delphi, but from its command of the pass which led from the Malian gulf across Mount Cnemis to Elatea in the valley of the Cephissus, and afforded the only access for an invader who had already passed Thermopylae into Boeotia and Attica. Hence the alarm of the Athenians in 339 when it was suddenly announced that Philip had occupied Elatea. Again, the only practicable communication from Boeotia with Delphi and the western Locrians lay through a narrow pass known as the Schiste Hodes, between Mount Cirphus and the underfalls of Mount Helicon. From this point another deep valley branches off to the Gulf of Anticyra, and the Tricoda or junction of the three ways was the spot celebrated in Greek story as the place where Oedipus met and slew his father.

The most important city in Phocis after Delphi was Elatea, the position of which has already been described; next to this came Abœ, also in the valley of the Cephissus, near the Boeotian frontier, celebrated for its oracle of Apollo. In the same neighbourhood stood Danis and Ambrysus; while farther south, towards the Corinthian gulf, lay Anticyra, on the gulf of the same name. Crissa, which had been in early times one of the chief cities of Phocis, and had given name to the Crissean gulf, was destroyed by order of the Amphictyonic council in 591, and never rebuilt. The other towns of Phocis were places of no importance, and their names scarcely appear in history.

The whole extent of Phocis did not exceed half that of Boeotia, but it was broken up into a number of small townships—twenty-

two in all—forming a confederacy, the deputies of which used to meet in a “*synedion*” or council-chamber near Danis. But from an early period the predominance of Delphi, owing to the influence of its celebrated oracle, threw all the others into the shade. At first (as has been already stated in the article DELPHI) the Phocians were masters of the oracle, and of the town that had grown up on its site, but after the first Sacred War in 595 a.c., and the destruction of Crissa, Delphi became an independent city, and from this period a strong feeling of hostility subsisted between the Delphians and the Phocians. The latter, however, thus deprived of their chief city, sank into a position of insignificance, and played but an unimportant part in the affairs of Greece. During the Persian War of 480 their territory was ravaged by the invaders, and several of their small cities destroyed. In the Peloponnesian War they were zealous allies of the Athenians, and for a short time recovered possession of Delphi, which was, however, soon after wrested from them; and it maintained its independence from the peace of Nicias in 421 till the outbreak of the Sacred War in 357. On this occasion the Phocians, who had been sentenced by the Amphictyons to the payment of a heavy fine, rose in arms against the decree, which they attributed to the hostile influence of the Thebans, and, under the command of Philomelus, made themselves masters of Delphi, and seized on the sacred treasures of the temple. With the assistance of these resources they were able to maintain the contest, under the command of Onomachus, Phylinus, and Phalaesus, for a period of ten years, not only against the Thebans and their allies, but even after the accession of Philip, king of Macedonia, to the side of their adversaries. Thus the Phocians, a people on which the Phocians bore a prominent part in Greek history. After their final defeat by Philip a decree was passed by the Amphictyons, in 346, that all the Phocian towns except Abœ should be destroyed, and the inhabitants dispersed in villages. Notwithstanding the ruin thus brought upon their country, many of their towns seem to have been subsequently rebuilt, and the Phocians were able to take part with the Athenians in the final struggle for Greek independence at Chæronea, and in the Samian War. Their last appearance in history was in defence of Delphi against the attack of the Gauls in 279, but they still continued to subsist as a separate though obscure people in the days of Stabro.

Of the origin of the Phocians as a people we have no information. The earliest traditions connect them with the pre-Hellenic Lelages, as was the case also with the Locrians; and this connection was probably intended to convey the fact that the two nations were tribes of the same race. They first appear under the name of Phocians in the Homeric catalogue as having joined the Greek armament against Troy under the command of the two sons of Iphitus (*Iliad*, ii. 517), and were restored amongst the Æolic division of the northern Greeks.

For the ancient geography of Phocis, see Strabo (ix. 3) and Pausanias (x.). The country and the existing remains of antiquity are described by Dodwell (vol. i. chaps. 6 and 7) and Leake (*Northern Greece*, vol. i.).

PHOEBUS (φῶς/ος, the bright or pure), a common epithet of APOLLO (q.v.). Artemis in like manner is called Phœbe, and in the Latin poets and their modern followers “Phœbus” and “Phœbe” are often used simply for the sun and the moon respectively.

PHOENICIA (Gr. Φοινίκη) forms part of the seaboard of SYRIA (q.v.), extending along the Mediterranean (sometimes called the Phœnician Sea) from the mouth of the Eleutherus in the north to Mount Carmel in the south, a distance of rather more than two degrees of latitude. In early times Phœnicians were settled beyond this district, but for the Persian period Dor may be taken approximately as the limit towards the south. In the north a strip of country on the other side of the Eleutherus (Nahr al-Kebir) was frequently reckoned to Phœnicia. Formed partly by alluvium carried down by perennial streams from the mountains to the east, and fringed by great sand-dunes thrown up by the sea, Phœnicia is covered by a very fertile vegetable soil. It is only at Eleutherus in the north, and near Acra (Akka) in the south, that this strip of coastland widens out into plains of any extent; a smaller plain is found at Beirut (Beyrouth). For the most part the mountains approach within not many miles of the coast, or even close to it, leaving only a narrow belt of lowland, which from remote antiquity has been traversed by a caravan-route. To the south of Tyre the cliffs sometimes advance so close to the sea that a passage for the road had to be hewn out of the rocks, as at Scala Tyriorum (Bas an-

Nakura), and farther north at Promontorium Allum (Ras-al-Abyad). It is not known how far inland the Phœnician territory extended, the limit was probably different at different times. Both the maritime district, partly under artificial irrigation, and the terraces, laid out with great care on the mountain-sides, were in antiquity in a high state of cultivation, and the country—more especially that portion which lies north of the Kāsimiye (Litāni) along the flanks of Lebanon—still presents some of the richest and most beautiful landscapes in the world, in this respect far exceeding the Italian Riviera. The lines of the limestone mountains, running for the most part parallel to the sea, are pierced by deep river-valleys, those that debouch to the south of the Kāsimiye have already been mentioned in the article PALESTINE; the most important of those to the north are the Nahr Zahrani, Al-Auwah, Damur (Tamyias), Nahr Beirūt, Nahr al-Kelb (Lyceus), Nahr Ibrahim (Adonis), Nahr Abu Ali (Kaddisha). The mountains are not rich in mineral products, but it may be mentioned that the geologist Fraas has recently discovered indubitable traces of amber-digging on the Phœnician coast. The purple-shell (*Urosalpinx* and *branda*) is still found in large quantities. The harbours on the Phœnician coast which played so important a part in antiquity are nearly all silted up, and, with the exception of that of Beirūt, there is no safe port for the large vessels of modern times. A few bays, open towards the north, break the practically straight coast-line; and there are a certain number of small islands off the shore. It was, in the main, such points as these that the Phœnicians chose for their towns, since, while affording facilities for shipping, they also enabled the Phœnicians to protect themselves from attacks from the mainland, which was subject to them within but narrow limits.

Race—The ethnographic relations of the Phœnicians have been the subject of much debate. As in Gen. x, Sidon, the firstborn of Canaan, is classed with the Hamites, many investigators are still of opinion that, in spite of their purely Semitic language, the Phœnicians were a distinct race from the Hebrews. They attach great weight to the peculiarities that mark the course of Phœnician civilization, and, above all, to their political organization and colonizing habits, which find no analogues among the Semites. In favour of the opposite and more probable view, that the Phœnicians, like the Canaanites, are an early offshoot from the Semitic stock, it may be urged (1) that the account in Gen. x. is not framed on strict ethnographic lines, and (2) that the absence from Phœnicia of all trace of an original non-Semitic form of speech cannot be reconciled with the theory of an exchange of language. The close connexion which existed from an early period between the Phœnicians and the Egyptians accounts for many coincidences in the matter of religion. Phœnician civilization, being on the whole of but little originality, may have been that of a Semitic people, who, from their situation on the narrow strip of country at the east end of the Mediterranean, were naturally addicted to trade and colonization.

Language—Inscriptions, coins, topographical names preserved by classical writers, proper names of persons, and the Punic passages in the *Penulus* of Plautus combine to show that the Phœnician language, like Hebrew, belonged to the north Semitic group. Even the Phœnician which survived as a rustic dialect in north Africa till the 5th century of our era was very closely akin to Hebrew. Though it retained certain old forms obsolete in Hebrew, Phœnician, as we know, represents on the whole a later stage of grammatical structure than the language of the Old Testament. Its vocabulary, in like manner, apart from a few archaisms, coincides most nearly with later Hebrew. At a very early period Semitic words were

adopted into Greek from Phœnician; and it is also quite certain that the Phœnicians had at least a great share in the development and diffusion of the alphabetic character which forms the foundation of all European alphabets. We possess, however, only a few Phœnician inscriptions and coins of very early date. The longest and most important of the inscriptions—that on King Eshmun'azar's tomb—is in letters which, while very ancient in certain of their features, present a series of important modifications of the original type of the Semitic alphabet, as it can be fixed by comparison of the oldest documents. Still more divergent from the ancient characters are the forms of the letters on the Phœnician, *i.e.*, Punic, monuments of north Africa. (A 80)

Religion—Considering the great part which the Phœnicians played in the movements of ancient civilization, it is singular how fragmentary are our sources of knowledge for all the most essential elements of their history. What we are told of their religion is only in appearance an exception to this rule. Eusebius in the *Preparatio Evangelica* cites at length from the Greek of Philo of Byblus a cosmogony and theogony professedly translated from a Berytan Sanchuniathon, who wrote 1221 B.C. But that this work is a forgery appears from the apocryphal authorities cited, and the affinity displayed with the system of Euhemerus. The forger was Philo himself, for the writer borrows largely from Hesiod and was therefore a Greek; he gives Byblus the greatest prominence in a history professedly Berytan, and was therefore a Byblian; and finally Philo was a fanatical Euhemerist, and the admitted object of the work was to make converts to that system. The materials used by Philo were, however, in all probability mainly genuine, but so cut and clipped to fit his system that they must be used with great caution and constantly controlled by the few scattered data that can be gathered from authentic sources.

The two tracts of Hamnibal's oath to Philip of Macedon (Polyb., vii. 9, 2)—Sun, Moon, and Earth, and Rivers, Meadows, and Waters—contain the objects on which all Phœnician worship is based. Rivers were generally sacred to gods, trees to goddesses; mountains, too, were revered as nearer than other places to heaven, and betylæ or meteoric stones were held sacred as divine messengers.

Philo's second generation of men (*Gēnos* and *Genea*) first worshipped the plants of the earth, till a drought ensued and they stretched out their hands towards the sun as the Lord of Heaven or Beelsamēn (Baal-Shamaim),—an indication that the worship of heavenly bodies was regarded as a later development of religion. Baudissin, on the other hand, has lately maintained that all Phœnician deities were astral and only manifested themselves in the terrestrial sphere, that the things holy to them on earth were symbols, not dwelling-places, of the gods. And there seems to be little doubt that this was the theory of later Phœnician theology, as appears in the legend of the fiery star of the queen of heaven that fell into the holy stream at Aphaca (Sozom., ii. 5, 5), in the coincidence of the names of sacred rivers with those of the celestial gods, and in the name Ζεὺς Θαλάσσιος (Hesych.) for a Sidonian sea-god. But surely this theory was devised to remove a contradiction which theologians felt to be involved in the popular religion. In the latter logical consistency is not necessarily to be presumed, and astral and terrestrial worship might well exist side by side. In historical times the astral element had the ascendancy; the central point in religion, and the starting-point in all Phœnician mythology, was the worship of the Sun, who has either the Moon or (as the sun-god is also the heaven-god) the Earth for wife. In Byblus, for which alone we possess some details of the local cult, El was the founder and

lord of the town, and therefore of course had the pre-eminence in religion, and so the Byblian Philo makes *El* to be the highest god and the other *Elim* or *elohim* subordinate to him. In the other towns also the *numen patrum* was a form of the sun-god, or else his wife, and enjoyed somewhat exclusive honour—a step in the direction of monotheism similar to the Moabite worship of Chemosh (cp the *Mesha* stone). *El* is represented as the first to introduce circumcision and the first who sacrificed an only son or a virgin daughter to the supreme god. He wanders over all the earth, westward towards the setting sun, and leaves Byblus to his spouse Daaltis—this is meant to explain why she had the chief place in the cult of Byblus; her male companion *Elūn*, *Shadid* (or *μέγιστος θεός*), is conceived as her youthful lover, and *El* is transformed into a hostile god, who slays *Shadid* with the sword. According to another legend the youthful god is killed by a boar while hunting, and the mourning for him with the finding of him again make up a chief part of Byblian worship, which at an early date was enriched with elements borrowed from Egypt and the myth of Osiris. In other places we find as spouse of the highest god the moon-goddess *Astarte* with the cow's horns, who in Tyre was worshipped under the symbol of a star as queen of heaven. With her worship as with that of *Baalit* were associated wild orgies, and traces of the like are not lacking even at Carthage (Aug., *Civ. Dei*, ii. 4), where theology had given a more earnest and gloomy character to the goddess *Astarte* was viewed as the mother of the Tyrian sun-god *Melkarth* (Eudoxus, in Athen., ix. p. 392 D), or, as his full title runs, "our lord *Melkarth* the *Baal* of Tyre" (*OIS*, No. 122). On account of his regular daily course the Sun is viewed as the god who works and reveals himself in the world, as son of the god who is above the world, and as protector of civil order. But, again, as the Sun engenders the fruitfulness of the earth, he becomes the object of a sensual nature-worship, one feature of which is that men and women interchange garments. A chief feast to his honour in Tyre was the "awakening of *Heracles*" in the month *Pentius* (February/March; Menander of Eph., in Jos., *Ant.*, viii. 5, 3), a festival of the returning power of the sun in spring, probably alluded to in the sarcasm of *Eljah* (1 Kings xviii. 27). Peculiar to Berytus is the worship of *Poseidon* and other sea-gods, who are connected genealogically with *Zeus Belus*, a son of *El*, born beyond the *Euphrates*, and perhaps therefore connected with the Babylonian fish-gods. Berytus was also a chief seat of the worship of the *Cabiri*, the seven nameless sons of *Sydek*, with their brother *Eshmun*, who is the eighth and greatest of the *Cabiri*. Philo supplies for them a genealogy which is an attempt to present the growth of man from rude to higher civilization, and presents analogies, long since observed, to the genealogy of the sons of *Cain* in *Genesis*. Not only their half-divine ancestors but the *Cabiri* themselves belong to a comparatively recent stage of religious development. They are the patron deities of manual arts and civil industry, and as such are the great gods of the Phœnician land, specially worshipped in the federal centre *Tripolis*. On coins of this town they are called *Syrian* (i.e., perhaps *Assyrian*) gods,¹ which seems to imply that the Phœnicians themselves regarded as not primitive the many Egyptian elements which were quite early introduced into the religion of the *Cabiri*, and especially of *Eshmun*. On the other hand, a figure allied to *Eshmun*, *Taaut*, the inventor of the alphabet, is certainly borrowed from the Egyptian *Tehuti*. So, too, *Onka* (*Steph.*, s.v. "Ὀγκαίαν") is probably the *Anu* of *Sais*, and it is possible that the whole

cycle of gods who revealed and interpreted the sacred books is Egyptian, some of the latter have the form of a serpent.

The Phœnicians did not set up anthropomorphic statues of the gods, but symbolic pillars of stone, or, in the case of the queen of heaven, of wood (*asherah*). If an actual image was used, likeness to man was avoided by fantastic details: the god had two heads or wings, or some animal emblem, or was dwarfish or hemiaphrodite, and so on. The sacrifices were of oxen and other male domestic animals—as expiatory offerings also stags²—and for minor offerings birds. Human sacrifices were exceptionally offered by the state to avert great disasters, the victim was chosen from among the citizens and must be innocent, whereas children were chosen, and by preference firstborn or only sons. The same idea that the godhead demanded the holiest and most costly gift explains the prostitution of virgins at certain feasts in the sacred groves of the queen of heaven, and the temporary consecration of maidens or matrons as *kedeshoth* (*ιερόδουλο*). For this custom, as for that of human sacrifice, substitutes were by and by introduced in many places, thus at Byblus it was held sufficient that the women cut off their hair at the feast of *Adonis* (*De Dea Syr.*, c. 6).

Origin of the Phœnicians.—The oldest towns were held to have been founded by the gods themselves, who presumably also placed the Phœnicians in them. Imitating the Egyptians, the race claimed an antiquity of 30,000 years (Africanus, in Syncellus, p. 31), yet they retained some memory of having migrated from older seats on an Eastern sea. Herodotus (vii. 89) understood this of the Persian Gulf; the companions of Alexander sought to prove by learned etymologies that they had actually found here the old seats of the Phœnicians. But all this rested on a mere blunder, and the true form of the tradition is preserved by *Trogus* (Just., xviii. 3, 3), who places the oldest seats of the Phœnicians on the *Syrium stagnum* or *Dead Sea*—with which the Greeks before the time of the *Diadochi* had no acquaintance—and says that, driven thence by an earthquake, they reached the coast, and founded *Sidon*. This earthquake Bunsen has ingeniously identified with that which destroyed *Sodom* and *Gomorra*, and with which *Genesis* itself connects the migrations of *Lot*. Perhaps it played much such a part in the mythic history of the peoples of Canaan as the breach of the dam of *Mamb* does in the history of the Arabs.

In historical times the Phœnicians called themselves *Canaantes* and their land *Canaan* (*Kēna'an*, *Kēna'*; *Xvā* in *Hecataeus*, fr. 254), the latter applying equally to the coast which they themselves held and the inland highlands which the *Israelites* occupied. The Greeks call people and land *Φοίνικες*, *Φοινίκη*; the former is the older word, which in itself disposes of the idea that *Phœnicia* means the land of the date-palm, which the Greeks called *φοίνιξ*, i.e., *Phœnician*.³ In truth, *Φοίνικες*, with an antique termination used in forming other names of nations (*Αἰθίοκες*, *Οπρῆκες*), is derived from *φῶνός*, "blood-red," probably in allusion to the dark complexion of the race.

When the southern part of the coast of Canaan was occupied by the *Philistines* the region of *Ekron* became the boundary of *Phœnicia* to the south (*Josh.* xiii. 3); the northern boundary in the time of the Persians was the town of *Posidium* and the mouth of the *Oiontes* (*Herod.*, ii. 91, *Pseudo-Scylax*, § 104). Under the *Seleucids* these limits contracted, the southern boundary being the *Chorseus* (*Ptol.*, Codd B E, Pal. 1), which falls into the sea north of the tower of *Straton*, and the northern the river

¹ For stags offered to *Taaut* see *Clermont-Ganneau*, *Journ. As.*, ser. 7, vol. xi. p. 232 sq., 444 sq.

² In reality the date-palm is not aboriginal in these regions, *Hehn*, *Kulturpflanzen*, 8c., 8d. ed., p. 233.

Eleutherns, so that Ortho-sia was the last town of Phœnicia and the whole region of Aradus was excluded.¹ Under the Roman empire the southern boundary was unchanged, but the northern advanced to a little south of Balanea.² A still narrower definition of Canaan is that in Gen x 19 and Josh xiii. 2-6, where Sidon or its territory is the northern limit, but the reference is only to the land destined to be occupied by Israel, for a younger hand has added to Sidon (the firstborn of Canaan) and Heth a list of other nations, sons of Canaan, extending northwards as far as Hamath.³

It is a singular fact that alike in the Old Testament and in Homer, in the time of Tyre's greatest might, we constantly read of Sidonians and not of Tyrians. The explanation that Sidonians is a synonym of Phœnicians in general is defended on 1 Kings v 1 [15] compared with vs 6 [20], but is not adequate, the same chapter distinguishes between the Sidonians and the Gblites or men of Byblus (E.V., "stone squarers," ver 18 [32]) And in Gen x we have besides Sidon the peoples of Arce, Sinna, Aradus, and Simrya enumerated in order from south to north—mostly unimportant towns afterwards absorbed in the land of Aradus—and yet Tyre is lacking, though one fancies that we could better miss even Aradus, which was a colony from Sidon (Strabo, xvi p 753), only Aradus was founded by fugitives, and so must, from the first, have been independent. Hence we may conjecture that the list in Genesis is political in principle, and this gives us a solution of the whole difficulty, viz, that, during the flourishing period of Phœnicia, Sidon and Tyre formed a single state whose kings reigned first in Sidon and then in Tyre, but whose inhabitants continued to take their name from the old metropolis. The first unambiguous example of two distinct kings in Tyre and Sidon is in the end of the 8th century B.C., on an inscription of Sennacherib (Schrader, *K d T*, 3d ed., p 286 sq.), and there is every reason to think that the revolt of Sidon from Tyre about 726 spoken of by Menander (Jos., *Ant.*, ix 14, 2) was a revolt not from Tyrian hegemony but from the Tyrian kingdom. The several Phœnician cities had lists of their kings back to a very early date. Abednab⁴ reigned at Berytus in the time which Philo had ciphered out as that of the judge Jeubbaal, &c., about the beginning of the 13th century B.C., and in Sidon there is word of kings at the time to which the Greeks referred the rape of Europa (15th century, see Lœtus, in Taitan, *Adv. Græcos*, 58). The leading Phœnician towns are mentioned in connexion with the Syrian wars of the Pharaohs of the XVIIIth, XIXth, and XXth Dynasties (16th-13th century), thus under Thothmes III we read of Berytus, Aco, Joppe, and repeatedly of Aradus, which is commonly spoken of along with Haleb (Aleppo) and other eastern districts. The mention of Tyre is less certain, as there were two cities which the Egyptians called T'ar, but there is no mistake as to the city on the sea called "Taru the haven" in the journey of an Egyptian of the 14th century (*Rec. of the Past*, i 107 sq.)—"water is carried to it in barks, it is richer in fish than in sands", the noble aqueducts therefore, of which the ruins are still seen, were not yet constructed.

The oldest parts of Tyre were taken to be the town on the mainland, afterwards known as Palætyrus, and the so-called temple of Hercules built on a rocky point, which Hiram by and by united with the insular part of the town. According to native historians this temple was more properly one of Olympian Zeus, that is, of Baal-Shamaim, the Lord of Heaven.⁵ Herodotus, after inquiries made

⁴ Noldkette's conjecture for Ἀβδναβός, in Porphyry, ap Euseb., *Præp. Ev.* x, 9.

⁵ This appears by comparing Herod., ii 44, with the mention of the same golden stele by Menander (Jos., *Cont. Ap.*, i 18).

on the spot, fixes the founding of the city in 2756 B.C.; but Tyre did not attain great importance till the later island city was built. According to Tiogus (Justin, xviii 3, 5) the Phœnicians (not the people of Sidon, as the passage is often misread) were the first to be subdued by the king of Assur, who took ship and founded Tyre a year before the taking of Troy. This goes well with the spread of the Phœnician power in the time of the later judges and with the fact that Assalon was still a Canaanite town under Ramesses II (c 1385 B.C.), while in the eighth year of Ramesses III (c 1246) the Palæstina made a raid into Egypt.⁶ Philistus (in Euseb., *Gen.*, No 803) gives us without knowing it the era used by Tyre and in early times, also in Cathage, when he says, that Zorus (i.e., Zor, Zor, Tyre) and Cathage were taken by Cathage in 1213 B.C., or rather, according to a very good MS (Regn.), in 1209, which agrees with the date 1208 for the fall of Troy on the Persian marble, and also may be reconciled with the notice (taken from Philistus) in Apian, *Panua*, i, that the founding of Zorus and Cathage was fifty years before the fall of Troy, if we suppose that Philistus took for the latter event the latest date we know of, viz, that assigned by Democritus.⁷ Now the latest date we know of, viz, that assigned by Democritus, is 1181 for the founding of Tyre, and places the founding of Cathage (*Cont. Ap.* i 18) in the 155th year from Hiram's accession. The best authority for the last-mentioned event is Timæus, who puts it in 814 B.C. This gives us for the founding of Tyre a date twelve years later than that of Philistus, but it is probable that Josephus in summing up the individual reigns between Hiram and the building of Cathage as given by Menander departed from this intention, his author in assuming that twelve years of Assatius and the twelve of the contemporaneous usurper were not to be reckoned separately.⁸ This hypothesis enables us to give a restored chronology which cannot be far from the truth (see *infra*).

Manufactures and Inventions.—The towns of the Phœnician coast were active from a very early date in various manufactures. Glass work, for which the sands of the Delus gave excellent material, had its chief seat in Sidon, embroidery and purple-dyeing were favoured by the prevalence of the purple-giving murex all along the coast. The ancients ascribed to the Phœnicians the invention of all three industries, but glass-making seems to have been borrowed from Egypt, where this manufacture is of immemorial antiquity, and several circumstances indicate that the other two arts probably came from Babylon—in particular, the names of the two main tints of purple—dark red (argaman) and dark blue (tkkheleth)—seem not to be Phœnician. The Phœnicians, however, brought these arts to perfection and spread the knowledge of them. In other particulars also the ancients looked on the Phœnicians as the inventive people *par excellence* to them as the great trading nation was ascribed the invention of arithmetic, measure, and weight, which are really Babylonian in origin, and also of writing, although it is not even quite certain that it was the Phœnicians who adapted the Egyptian hieroglyphic alphabet to Semitic use.⁹ Yet here again the Phœnicians have undisputedly the scarcely inferior merit of having communicated the art to all the nations of the Mediterranean basin.

Navigation, Trade, Colonies.—The beginnings of navigation lie beyond all human memory, but it is not hard to understand how the ancients made this also an invention of the Phœnicians, whose skill as seamen was never matched by any ancient people before or after them. Even in later times Greek observers noted with admiration the exact order kept on board Phœnician ships, the skill with which every corner of space was utilized, the careful disposition of the cargo, the vigilance of the steersmen and their mates (Xen., *Œc.*, viii. 11 sq.). They steered by the pole-star, which the Greeks therefore called the Phœnician star (Hyginus, *Po. Ast.*, ii. 2); and all their

⁶ See Brugsch, *Geschichte Aegyptens*, pp 518, 598.

⁷ If Democritus was born in 470 (Thrasylus), his date for the fall of Troy is 1160.

⁸ He is contemporaneous on the reading Μεθ' οὗ Ἀσσυρίων given by Theophrastus, *Ad Autol.*, ii 19. If Josephus took it so, then according to the best readings he would get exactly 155 years.

⁹ That the Semitic alphabet did not come from cuneiform writing may be taken as certain; but also it is not probable that it came from the hieratic character of the Egyptians.

vessels, from the common round γαλός, to the great Tarshish ships, the East-Indian—so to speak—of the ancient world, had a speed which the Greeks never rivalled. Of the extent of the Phoenicians' trade in the last days of Tyre's glory Ezekiel (xxvii 12-25) has left a lively picture, which shows how large was the share they had in overseas as well as in naval commerce. It was they, in fact, who from the earliest time distributed to the rest of the world the wares of Egypt and Babylon (Herod., i 1). To the lands of the Euphrates and Tigris there were two routes: the more northerly passed obligingly through Mesopotamia and had on it the trading places of Haran (Cairhæ), Canneh (Cenæ), and Eden, the other, more southerly, had Sheba (Sabea) for its goal, and led down the Euphrates, passing Asshur (Sura) and Chilmad (Charmande). There were other routes in the Persian and Macedonian period, but they do not belong to the present history.

Actual inland settlements of the Phoenicians seem to have been few, we know of one near the head of the northern trade road, Laish, which was lost to the Danites in the time of the judges (Judges xviii), and one on the southern route, Eddana on the Euphrates (Steph. B, sv), which corresponds in name with Eden, but is not the same place, but perhaps rather the Giddan of Isidore of Charax (§ 1). In the Arabian caravan trade in perfume, spices, and incense for worship the Phoenicians had a lively interest (Herod., iii. 107). These wares were mainly produced not in Arabia but in eastern Africa and India, but Sheba in Yemen was the emporium of the whole trade, and the active commerce of this rich and powerful state in the times before the Persian is seen better than by any direct testimony from the exact knowledge of the Sabeans lands shown in Gen. x, from the many references to Arabia and Sheba in the Assyrian monuments, and from such facts as Euting's discovery at Tadmā in the heart of Arabia of an Aramaic inscription of the 6th century B.C., composed by a man with an Egyptian name¹.

In Egypt Phoenician trade and civilization soon took firm root, they alone were able to maintain their Egyptian trade and profits in the anarchic times of the XXIIIrd to the XXVth Dynasties (825-650 B.C.), times like those of the Mameluke beys, in which all other foreign merchants were frightened away and the Greek legend of the inhospitable Busiris originated.² The Tyrians had their own quarter in old Memphis (Herod., ii. 112), but there never were real colonies of the Phoenicians in Egypt.

That in matters economic Syria and Palestine depended on Phoenicia might have been inferred even if we had not the express testimony of Ezekiel that these lands were included in the sphere of Tyrian trade, so too was Togarmah, an Armenian district.

Cilicia was important to the Phoenicians as the natural point of shipment for wares from the Euphrates regions; and the opposite island of Cyprus attracted them by its store of timber for shipbuilding, and of copper. Both these countries were originally peopled by the non-Semitic Kittim, who have left their name in the Cilician district Cetis and the Cyprian city Citium, but they came under profound Semitic influences, mainly those of the Phoenicians, who on the mainland had settlements at Myrandaus (Xen., *Anab.*, i. 4, 6) and Tarsus,³ while in Cyprus Citium—which to the last remained the chief seat of the Phoenician tongue and culture—was held to have its foundation from Belus (Steph., sv. "Ἀδελφός"), and Carpassa from Pygmalion (Id., sv). Pseudo-Scylax (§ 103),

writing in 346 B.C., knows Carpassa, Ceryneia, and Lapethus as Phœnician, but the view that Phœnician sway in Cyprus was very ancient and that the Phœnicians were gradually driven back by the Greeks appears not to be sound. On the contrary, the balance of power seems to have varied greatly, the Assyrian tribute-lists of 873 and 667 (Schrader, *KAT*, p. 354 sv) contain but two names of Phœnician cities in Cyprus, Silli (Soh) and Kartladast (probably New Paphos), not one of the later Phœnician kingdoms is mentioned, so that presumably none of them then existed, and not one of the ten Cyprian kings mentioned appears to be Phœnician by name. Menander tells us (Jos., *Ant.*, ix. 14, 2) that the kings of Tyre ruled over Cyprus at the close of the 8th century, but a very clear proof that there was no ancient and uninterrupted political connexion with Phœnicia lies in the fact that the Cyprian Greeks took the trouble to frame a Greek cuneiform character modelled on the Assyrian.

The Homeric poems represent the Phœnicians as present in Greek waters for purposes of traffic, including the purchase and capture of slaves, but not as settlers. Tradition (see especially Thucyd., i. 8) is unanimous in representing the Carians and Phœnicians as having occupied the islands of the Ægean before the migrations of the Greeks to Asia Minor, but so far as the Phœnicians are concerned this holds only of the southern islands—afterwards occupied by Dorians—where they had mining-stations, and also establishments for the capture of the murex and purple-dyeing.⁴ The most northerly of the Cyclades on which we can prove a Phœnician settlement is Oiliarus (Steph., sv), which was occupied by Sidonians, probably with a view to the use of the marble quarries of Paros, which lies opposite. Similarly the Byblinians occupied Melos (Steph., sv), which produced a white pigment (Melian earth), alum, and sulphur. Two great islands were held as main seats of the purple trade, Cythera (Herod., i. 105) and Thera, with the neighbouring Anaphe (Herod., iv. 147; Steph., sv. "Μεγίσλαπος"),—as also the town Itanus at the eastern extremity of Crete (Steph., sv). Specially famous was the purple of the Laconian waters,—the isles of Elishah of Ezekiel xxvii. 7. Farther east the Phœnicians were settled in Rhodes.⁵ The Greek local tradition about the Phœnicians seems, in Thera and Rhodes, to embody real historical reminiscences, and it is confirmed for Thera and Melos by the discoveries of Phœnician pottery and ornaments in the upper strata of the tuff, and for other places by peculiar cults which survived among the later Dorian settlers. Thus the Aphrodite Urania of Cythera was identical with the Oriental goddess of love at Paphos, and Herodotus (i. 105) makes her temple to be founded from Ascalon; the coins of Itanus (Monnet, ii. 284 sv) show a fish-tailed deity, in Rhodes human sacrifices to Cronus were long kept up (Porph., *De Abs.*, ii. 54). The legends of Rhodes and Crete have a character quite distinct from that of other Greek myths, and so give lasting testimony to the deep influence in both islands of even the most hideous aspects of Phœnician religion, it is enough to refer in this connexion to the stories of the eight children of Helios in Rhodes, of Europa, the Minotaur, and the brazen Talos in Crete. The pre-Hellenic inhabitants of the islands, the Carians and their near kinsmen the Eteocretans or Minoites (probably identical with the Philistines, q.v.), had no native civilization, and were therefore wholly under the influence of the higher culture of the Phœnicians. But on the Greeks too the Phœnicians had no small influ-

¹ Noldeke, in *Stüb. Berl. Ak.*, 1884, p. 818 sv.

² Σάβης, the herald of Busiris, is simply סב, "dog."

³ Tarsus was founded by Aradians, Dio Chr., xxxii. 40. Ἀῤῥ, a city of the Phœnicians in Heateus, i. 259, is probably not Ἐγγε but Gaza.

⁴ As an enormous supply of murex was needed for this industry, the conjecture of Dmücker is probably sound, that the purple stations were the oldest of all Phœnician settlements.

⁵ Rodanum, i. Chron. 1. 7, by which Rodanum in Gen. x. 4 must be corrected, see Ergas (?) and Polyzeus, in Athen., viii. p. 860 D.

once, as appears even from the many Phœnician loan-words for stuffs, utensils, writing materials, and similar things connected with trade.¹ From the Phœnicians the Greeks derived their weights and measures; *purî*, the Hebrew *maneh*, became a familiar Greek word. From Phœnicia too they had the alphabet which unanimous tradition connects with the name of Cadmus, founder of Thebes. Hence Cadmus has been taken to mean "caster" (from *κρη*), and Thebes viewed as a Phœnician colony, but the Greeks did not speak Phœnician, and the Phœnicians would not call themselves Easterns. Further, an inland colony of Phœnicians is highly improbable; and all other traces seem to connect Cadmus with the north. But the Cadmeans, who traced their descent to Cadmus, colonized Thera, and it was they who, mingling with the Phœnicians left on the island, learned the alphabet. It was in Thera, where the oldest Greek inscriptions have been found, that the invention of letters was ascribed to the mythic ancestor, and that he was made out to be a Phœnician. We now know better than we did a few years ago how much the oldest Greeks depended before the migrations on the movements of Eastern civilization, and can well believe that the Phœnicians played a very important part in this connexion. Thus in the tombs of Mycenæ we find Phœnician idols, objects of amber, and an ostrich egg side by side with rich jewels of gold, Oriental decoration, and images of Eastern plants and animals; thus too the rock-tombs of Hyettus closely resemble those of Phœnicia; and above all we find on the Isthmus of Corinth, that most ancient seat of commerce, the worship of the Tyrian Melkart under the name of Melicertes. Yet with all these proofs of a lively trade there is no trace of Phœnician settlements on the Greek mainland and the central islands of the Ægean, but in the north Thesus was occupied for the sake of its gold mines (Herod., vi. 47), and so probably was Galesus on the opposite Thracian coast (Harpor., s.v.), where also it was Phœnicians (Strabo, xiv. p. 680, from Callisthenes) who opened the gold mines of Pangæus. Beyond these points their settlements in this direction do not seem to have extended; the Tyrians, indeed, according to Ezekiel, traded in slaves and bronze-ware with the Greeks of Pontus (Javan), the Tibareni (Tubal), and Moschi (Meshech), but all supposed traces of actual settlements on these coasts prove illusory, and Proconessus on the Gulf of Astacus, which Stephanus attributes to the Phœnicians, lies so isolated that it was perhaps only a station of their fleet in Persian times.

The great centre of Phœnician colonization was the western half of the Mediterranean and the Atlantic coasts to the right and left of the straits. In especial the trade with Tarshish, that is, the region of the Tartessus (Gualquivir), was what made the commercial greatness of the Phœnicians; for here they had not only profitable fisheries (tunny and murena) but above all rich mines of silver and other metals, to which the navigable rivers Guadiana and Guadalquivir gave easy access. The untutored natives had little idea of the value of the metals; for long there was no competition, and so the profits were enormous, it was said that even the anchors were of silver in ships returning from Spain (Diod., v. 35). Next the Phœnicians ventured farther on the ocean and drew tin from the mines of north-west Spain or the richer deposits of Cornwall; the tin islands (Cassiterides) were reached from Brittany, and are always distinguished from the British mainland, so that the old view which makes them the Scilly Islands is probably right. The tin was supposed to be produced where it was exchanged,—a very common case.² Amber too was brought in very early times from the farthest north; amber ornaments are often mentioned by Homer,

and have been found in the oldest tombs of Cumæ and in those by the Lion gate at Mycenæ. The Phœnicians can hardly have fetched the amber themselves from the Baltic or even from the North Sea (where it scarcely can have ever been common); it came to them by two trade routes, one from the Baltic to the Adriatic, the other up the Rhine and down the Rhone. But indeed a deposit of amber has been found in the Lebanon not far from Sidon,³ and perhaps the Phœnicians worked this and only concealed, after their manner, the origin of the precious ware. Certainly the ancients knew of Syrian amber, and knew also that amber could be dug from the ground.⁴ The rich trade with Spain led to the colonization of the west (Diod., *ut supra*). Strabo (l. 48) dates the settlements beyond the Pillars of Hercules soon after the Trojan War, in the time, that is, of Tyrie's first expansion. Luxus in Mauretania was older than Gades (Pliny, xix. 63) and Gades a few years older than Utica (Vell., i. 2), which again was founded 1101 B.C. (Pseudo-Arist., *Mor. eusei*, 134, Boethius, in *Pha.*, xvi. 216). Most of the African colonies were no doubt younger, we have dates for Aozā (587-585, Menander) and Carthage (814, Timæus). Here, as generally in like cases, the farthest points were settled first and the need for intermediate stations to secure connexion was felt later. The colonization was carried out on a great scale. Ophelas (Strabo, xvii. 826) may exaggerate when he speaks of 300 cities on the Mauretanian coast beyond the Pillars of Hercules; but the colonists and the Carthaginians after them stamped west Africa with a thoroughly Phœnician character, and their language was dominant, at least in the cities, far beyond the limits of their nationality, just as was the case with Latin and Arabic in later times. It is most likely that so great a mass of colonists was not wholly drawn from the narrow bounds of Phœnicia, but that the inland Canaanites, pushed back by Hebrews and Philistines, furnished many recruits; the supposed testimonies to this fact, however, are late, and certainly apocryphal.

Surveying the great settlements of the Phœnicians from east to west, we find them first in Sicily, occupying in a way typical of the commencement of all their settlements, projecting headlands and neighbouring islets, from which they traded with the Siculi (Thucyd., vi. 2). Then chief seat seemingly was Messana (Hecataeus, *Polit.*, 29), on the south coast, *Μησανή* on coins, Heraclea Minora of the Greeks. Before the Greeks they retired to the north coast, where they held Motya, Panormus, and Soloeis, supported by their alliance with and influence over the Elymi, and by the neighbourhood of Carthage, which here and elsewhere succeeded to the heritage of Tyre, and gave protection to the Phœnician colonies. The islands between Sicily and Africa—Malta, with its excellent harbour and commanding position on the naval highway, Gulus, and Cosmus—were also occupied (Diod., v. 12), and a beginning was made with the colonization of Sardinia (ib., v. 82), where Caralis is said to be a Tyrian foundation (Clandian, *B. Gald.*, 620); but real sovereignty over this island and Corsica was first exercised by the Carthaginians.⁵ It is uncertain if Phœnician trade with and influence on the Etruscans is older than the political alliance of the latter with Carthage, there were, at least, no Phœnician colonies in Italy. On the east coast of Spain Bærum (Aulon, *Ælian.*, xxix. 63) and Old Carthage (Ibid., i. 6, 64) as settlements apparently older than the Spanish empire of Carthage, but their origin is therefore necessarily Phœnician, especially as Old Carthage lies inland, they may date from the conflicts of Carthage and the Massahotes. In Tartessus, on the other hand, or Tarterann, as it was called later, all the important coast towns were Phœnician (Strabo, iii. 151, 156 sq., 169 sq.)—Abdera, Sex (which was regarded as one of the oldest of the Tyrian settlements in Spain), Malaca, Carteia, and, most famous of all, Gades, with its most holy shrine of Hercules, it lay on an islet which had not even drinking water, but the position was a commanding one. Still further off lay Onoba, where the Tyrians are said to have settled before they were in Gades. In Africa the most easterly settlement was Great Leptis, which is the only colony ascribed to Sidonians, driven from their home by

⁵ The Greeks of the 6th century had a very fantastic idea of the value of these islands (Herod., i. 170, v. 106, 124).

civil troubles (Sallust, *Jug.*, 78), and is therefore presumably one of the oldest. Less certain are the accounts that the sister cities Gêa and Sabatha were founded, the former by Phœnicians, from Sicily, the latter from Tyre (Sil Ital., iii 256 sq.). The district Emposia on the Lesser Syria was named from its many Phœnician trading towns. Here, on the river Cneps, coin produced three hundredfold, and a great trade-road led inland to the land of the Garamantes. That the commercial town of Tacape (Kâbu) and the island of Memm (Juba), with its purple-dyeing trade, were Phœnician is proved by inscriptions, and Capsa, in inland Numidia, was deemed a foundation of the Tyrian Hercules (Oros, v 15). Among the Phœnician towns in Africa proper Achelluta was Melitan (Steph., s.v. Ἀχελούτα), Lesser Leptis and Hadrumetum Tyrian (Pliny, v 78, Solin., 27, as was also Acaia, according to *C.I.L.*, viii 68), while inland from Leptis, near Azua in inland Mammotania. On the north coast Carthage and Utica are Tyrian colonies, and probably also Hippo Zarytus, though Sidon, on a coin, claims it and other Tyrian colonies as her daughters (Movers, *Phœnizier*, i 2, p. 134). The unidentified town of Cantele and the island Eudemia are called Liby-Phœnician (Steph., s.v.), and this name in later times denoted the Phœnicians in Africa apart from the contrast to Carthage. The Semitic populations were thence soon over all this region, but we cannot generally distinguish Phœnician colonies, Cathaginian foundations, and native settlements that had become Punic. Chaleo, on the coast east of Oian, in the country of the Macesyli, was Phœnician, but then great domain was the Atlantic coast of Mauritania. Tingis and Zelis, if originally Berber, became thoroughly Phœnician cities (Mela, i 6, 9, Strabo, iii 140), the chief colony here was Lixus (Ps.-Scylax, § 113), a city accounted greater than Carthage. Southward, on the so-called Κόλπος Ἐμπόρεως, and onwards to the mouth of the Dra river Tyrian colonies lay thick, and here a great trade-route went inland to the country of the Blacks. These colonies were ruined by the invasion of the Pharusii and Nigritæ (Strabo, xvii 828), who spread destruction just as did the Almoravids when they issued from the same region in the 11th century, the Cathaginians saved the remnant of their kinsmen by sending Hanno to found the new colony of Thyminetum and plant 30,000 Liby-Phœnicians in the old ports of Karikon Techos, Gytte, Aca, Melitta, and Acanthus. The most westerly point reached by the Phœnicians was the Fortunata Island (the largest of the Canaries, probably), which later fancy painted in glowing colours after intercourse with so distant a region had ceased (Diod., v 20).

The trading connexions of the Phœnicians reached far beyond their most remote colonies, and it must have been their knowledge of Africa which encouraged Pharaoh Necho to send a Phœnician expedition to circumnavigate Africa. This greatest feat of ancient seamanship was actually accomplished in 611-605 B.C., at a time when the mother-country had already lost its independence, and the colonial empire had but a shadow of its former splendour. The power of Tyre rested directly on her colonies, which, unlike the Greek colonies, remained subject to the mother-city; we read of rebellions in Utica and Cirtium which were put down by arms. The colonies paid tithes of all their revenues and sometimes also of booty taken in war to the Tyrian Hercules, and sent envoys to Tyre for his chief feast. But Tyre was too remote long to exercise as effective a control over her dependencies as was possible to the more favourably placed Carthage, the relation gradually became looser, and the more substantial obligations of the colonies ceased to be discharged; yet Carthage certainly paid tithes to the Tyrian Hercules as late as the middle of the 6th century B.C.

Fragments of History—Josephus (*Ant.*, viii. 5, 3, and *Ap.*, i. 17, 18) has fortunately preserved extracts of two Hellenistic historians, Diodorus and Menander of Ephesus, which supply at least the skeleton of the history of the golden age of Tyre. From them we learn that Hiram (or rather Hiram I., son of Abibal, reigned from 980 to 946 B.C. He enlarged the insular town to the east by filling up the so-called ἐνούρεον, united the temple of Baal-Shamaim with the main island by a mole, placed in it a golden pillar, and splendidly renewed the temples of Hercules¹ and Astarte. The inhabitants of Utica—so the text must be corrected

(Ἰρωκαὶος)—having ceased to pay tribute, Hiram reduced them in a victorious expedition, after which he founded the feast of the awaking of Hercules in the month Pertus. The Tyrian annals also mentioned the connexion of Hiram with Solomon king of Jerusalem. The relations of Phœnicians and Israelites had been generally friendly before this, it appears from Judges v. 17, Gen. xlix. 13, 20, that Asher, Zebulun, and Dan acknowledged some dependence on Sidon, and had in return a share in its commerce, and the only passage in the older period of the judges which represents Israelites as subject to Sidonians, and again casting off the yoke, is Judges x. 12, which perhaps refers to the time of power of the Canaanites of Hazor (Gieseler, i. 412). The two nations drew closer together under the kings Hiram built David's palace (2 Sam. v. 11), and also gave Solomon cedar and fir-trees, as well as workmen for his palace and temple, receiving in exchange large annual payments of oil and wine, and finally the cession of a Galilean district (Cabul), in return for the gold he had supplied to decorate the interior of the temple. The temple was quite in Phœnician style, as appears particularly in the two pillars Jachin and Boaz. We may also judge that it was Hiram's temples that led Solomon to propose to himself a similar work.² One commercial result of the alliance with Solomon was the united expedition from Ezongaber on the Gulf of Akaba to Ophir (Malabar)³. The oldest known Phœnician inscription (*C.I.S.*, No. 5) is of a servant of "Hiram king of the Sidonians," a title which, as we have seen, is quite suitable for the king of Tyre. Hiram's grandson Abdastarte I. (929-920) was murdered by his foster-brothers, and the eldest took the regal title (920-908), but in the last twelve years of his reign he shared his throne with a son of the old house, [Abd]astarte II. (908-896). His brother Astharym or Abdastharym (896-887) was murdered by a third brother Phelles, who, in turn, after a reign of but eight months, was slain by Ithobal I., priest of Astarte, whose reign (887-855) marks a return to more settled rule. Ithobal was beloved of the gods, and his intercession put an end to a year of drought which Josephus recognized as that which is familiar to us in the history of Eljah and Ahab. In 1 Kings xvi. 31 Ithobal appears as Ethbaal, king of the Sidonians. At this time the Tyrians still continued to expand mightily. Botrys in Phœnicia and Acaia in Africa are foundations of Ithobal; the more famous Carthage owed its foundation to the civil discords that followed on the death of King Metten I. (849-820). According to the legend current in later Carthage (Justin, xvii. 4, 3-6, 9), Metten's son Phygmalion (820-773), who began to reign at the age of nine, slew, when he grew up, his uncle Siharbas, the priest of Hercules and second man in the kingdom, in order to seize his treasures. The wife of Siharbas was Elissa, Phygmalion's sister, and she fled and founded Carthage. Truth and fable in this legend are not easy to disentangle, but as Elissa is named also in the Tyrian annals she is probably historical.

From the time of Ithobal downwards the further progress of Phœnicia was threatened by a foreign power. The older campaigns of the empires of the Euphrates and Tigris against the Mediterranean coast had left no abiding results—neither that of the Chaldeans in 1535 or 1538 (Eus., *Can.*, No. 481), nor that of Tiglath-Pileser I., c. 1120 B.C.⁴

¹ The date 11 or 12 Hiram which Josephus gives for the building of the temple (*Ant.*, viii. 3, 1, *Ap.* i. 18) must in the Tyrian annals have referred to the cutting of wood in Lebanon for the native temples, which Josephus then misinterpreted by 1 Kings v. 6[20] sq.

² So Caldwell, *Comp. Gram. of Dravidian Languages*, p. 66, Bunnell, *Indian Antiquary*, 1872, p. 230. The decisive argument is that the Hebrew word for "peacocks" can only be the Tamil *thēn* [see, however, OPIH].

³ He had the control of the ships of the Aradians; Ménant, *Ann. des rois d'Assyrie*, p. 50.

⁴ This is the Agenorium at the northern extremity of the island (Att., i. 24). Except in this point the topography of Senan (*Miss de Phén.*, v 546 sq., and Pl. lxx) is here followed.

More serious was the new advance of the Assyrians under Ashurnāṣirpal (c. 870), when this prince took tribute from the lords of Tyre, Sidon, Byblus, Mahallat, Maz, Kaiz, the Westland, and the island Aradus. A king of Aradus was one of the allies of Rammāmādu of Damascus whom Shalmaneser III smote at Karkar in 854, thereafter the Assyrian took tribute of Tyre in 842 and 839, and in the latter year also from Byblus. Again in 803 Rammāmādu boasted of exacting tribute from Tyre and Sidon, but thereafter there was a respite until Tiglath Pileser II., the real founder of the Assyrian empire, to whom Tyre paid tribute in 741, and again along with Byblus in 738. In Tiglath Pileser's Philistine campaign of 734 Byblus and Aradus paid tribute, but a heavy contribution had to be exacted from Metten of Tyre by an Assyrian captain. For the history of Eluleus, who reigned in Tyre under the name of Pylas¹ (c. 728-692), we have a fragment of Menander. He subdued a revolt of the Cittæi in Cyprus, but thereafter was attacked by Shalmaneser IV.,² to whom Sidon, Aco, Palætyrus, and many other cities submitted, revolting from Tyre. A new kingdom was thus formed under a king [E]lul, whose name makes it likely that he was a relative of the Tyrian prince, and who presently appears on the monuments as lord of Great Sidon (the same name as in Josh. xix. 28), Lesser Sidon (= Palætyrus), and other cities. But insular Tyre did not yield, and Shalmaneser had to make a second expedition against it, for which the jealous particularism of the other Phœnician cities supplied the ships. With much inferior forces the Tyrians gained a naval victory and the king drew off. But the blockade was continued, and seems to have ended after five years in a capitulation. This siege probably began about the same time with that of Samaria, and may be dated 724-720. About 716 Ionian sea-rovers attacked Tyre and were repulsed by Sargon (Schrader, *K.I.T.*, p. 169), an affair in which we may find the historical basis of such legends as that in the *Cyclo Cyprus*, that Sidon was taken by Priam's son Alexander. [E]lul did not prove a faithful subject, Sennacherb attacked him, and he had to flee to Cyprus, Ithobal being set in his place (701). Among the Phœnician kings who appeared to do homage to Sennacherb a prince of Tyre does not appear. One sees from all this how barbarous and ill-consolidated the Assyrian power in the west was; after the retreat of Sennacherb it was even for a time seriously threatened by the Ethiopian dynasty which then held Egypt, and this may explain the revolt of Abdimilkut, king of Sidon, which was visited by Esarhaddon with the destruction of the city, the captivity of part of the inhabitants, and the execution of the rebel king (680 B.C., Méant, p. 241 sq.). Further unsuccessful revolts of Tyre (Baal I being king, 662 or later) and of Aradus are recorded in the reign of Ashurbanipal, but at last the war of this monarch with his brother seems to have enabled Phœnicia to throw off the yoke without a contest (c. 650).

The Assyrians had proved their inability to create anything, but their talent for destruction was brilliantly exhibited in Phœnicia, and the downfall of Tyre was occasioned, if not caused, by their intervention in the west. For what Justin (xviii. 3, 6 sq.) relates of the Tyrians, that they were so reduced in number by protracted war with the Persians that, though they were at last victorious, their slaves were able to overpower and slay them to a man, all save Straton, whom a faithful servant saved, and whom the slaves chose, on account of his wisdom, to be king and founder of a new dynasty (Abdastarte III.), is only to be understood by reading Assyrians for Per-

sians.³ The catastrophe must have occurred soon after the events already noticed; and in the same period falls the decay of the colonial power of Tyre, which we cannot follow in detail, though we can recognize some of its symptoms. After reaching the Mediterranean the Assyrians established themselves in Cyprus (709), in the Greek islands farther west the Phœnicians had before this time been gradually displaced by the Dorian migration, which, however, must not be taken to be a single movement eastward in the 11th century, but a long course of colonizing expeditions, starting from Argos and continued for generations, about which we can only say that the whole was over by the middle of the 8th century. Thasus, the most northern settlement in the Aegean, was already deserted by the Phœnicians when the father of the poet Archilochus led a Parian colony thither in 708. But the loss of the more western colonies seems to have been contemporary with the fall of Tyrian independence. About 701 Isaiah looks for a revolt of Tartessus (xxiii. 10), and the first Greek visitor, the Samian Coleus (639), found no trace of Phœnician competition remaining there (Herod., i. 152). These circumstances seem to justify us in understanding what the contemporary poet Anacreon (fr. 8) says of the hundred and fifty years' reign of Arganthionus over Tartessus as really applying to the duration of the kingdom; and as he died in 545 the kingdom will date from 695. In Sicily the Phœnicians began to be pushed back from the time of the founding of Gela (690); and Himera (648) and Selinus (628) mark the limits of Greek advance towards the region on the north-west coast, which the Phœnicians continued to hold. In 654 the Carthaginians occupied the island Ebusus, on the sea-way to Spain (Diod., v. 16), a step obviously directed to save what could still be saved. Soon after this, when Psammetichus opened Egypt to foreigners (650), the Greeks, whose mental superiority made them vastly more dangerous rivals than the Assyrians, supplanted the Phœnicians in their lucrative Egyptian trade, it is noteworthy that Egypt is passed over in silence in Ezekiel's full list of the trading connexions of Tyre.

In the last crisis of the dying power of Assyria the Egyptians for a short time laid their hand on Phœnicia, but after the battle of Carchemish (605) the Chaldeans took their place. Apries made an attempt to displace the Chaldeans, took Sidon by storm, gained over the other cities, and defeated the king of Tyre, who commanded the Phœnician and Cyprian fleet (Herod., ii. 161; Diod., i. 68). The party hostile to Chaldea now took the rule all through Phœnicia. The new king of Tyre, Ithobal II., was on the same side (589), and after the fall of Jerusalem Nebuchadnezzar laid siege to the great merchant-city, which was still rich and strong enough to hold out for thirteen years (587-574).⁴ Ezekiel says that Nebuchadnezzar and his host had no reward for their heavy service against Tyre, and the presumption is that the city capitulated on favourable terms, for Ithobal's reign ends with the close of the siege, and the royal family is subsequently found in Babylon, obviously as cards that might on occasion be played against the actual princes of Tyre.⁵ The king appointed by Nebuchadnezzar was Baal II (574-564), on whose death a republic was formed under a single suffet. This form of government lasted a year, and then after three months' interregnum under the high priest Abbar there were for six years

¹ So Codd Samb. Buz. The name may be Pyl-zer.

² The best MSS.—Paris, 1421, and Oxon—offer (according to a private communication of Professor Niese) traces pointing to the reading *ἡρί τοῦτον Σελάμης*.

³ There was no Straton, king of Tyre, between 587 and 480, a war between Tyrians and Persians between 480 and 390 is nowhere heard of, and is highly improbable, and Straton, from what we learn of his descendants, cannot have reigned later than this.

⁴ See the Tyrian sources in Jos., *Ap.*, i. 21, compared with Ezek. xxvi. 1 sq., xxix. 17 sq.

⁵ See Wiener's "Pflanzprogramm": *De Nebuc. exp. Tyr. ad Bab.* xxvi. xxviii. (Leipzig, 1848).

two suffets—presumably one for the island and one for Old Tyre—after which an elected king, Balatorus, ruled for a year (557-556). The next two kings (556-533) were brought from Babylon. Under the second of these, Hiram III, Phœnicia passed in 538 from the Chaldeans to the Persians, at the same time Amasis of Egypt occupied Cyprus (Herod., ii. 182). There seems to have been no struggle, the great siege and the subsequent civil disorders had exhausted Tyre completely, and the city now becomes second to Sidon. Accordingly about this time Carthage asserted her independence, the political activity of Hanno the Great, the real founder of the Carthaginian state, falls in the years 538-521.¹ Of Hanno it is said that he made his townsmen Africans instead of Tyrians (Dio Chrys., *Or.*, xxv. 7). The old dependence was changed for a mere relation of piety.

Constitution.—As Carthage was of old a republic, and its constitution underwent many changes, it is not safe to infer from the two Carthaginian suffets that Tyre also stood in the oldest time under two such magistrates. All Canaanite analogy speaks for kingship in the several cities as the oldest form of Phœnician government. The royal houses claimed descent from the gods, and the king could not be chosen outside their members (Curt., iv. 1, 17). The land belonged to the king, who was surrounded by much splendour (Ezek. xxviii. 13), but the highly-developed independent activity of the citizens limited his actual power more than in ordinary Oriental realms; it was possible for war or peace to be decided at Tyre in the king's absence, and in Sidon against his will (Arian., ii. 15, 16; Curt., iv. 1, 16). In Tyre the high priest of Hercules was the second man in the state (Just., xvii. 4, 5), and so the office was by preference given to a kinsman of the king. The sovereign had a council of elders, who in Sidon were in number a hundred, of these the most distinguished were the ten First whom we find at Marathus and Carthage (Diod., ii. 628; Just., xvii. 6, 1).—Originally, it may be supposed, heads of the most noble houses. The third estate was the people, the freemen, however, were much outnumbered by the slaves, as we have seen in Tyre. Under the Persians there was a federal bond between the cities, which we may suppose to be due to that great organizer Darius I. The federation comprised Sidon, Tyre, and Aradus—Sidon being chief—and contributed 300 talents to the Persian fleet (Herod., vii. 96-99), the contingents of the lesser towns were under the command of the great cities, which probably had the rule in other matters also. This holds for Marathus, Sigon, Maramme, which belonged to Aradus (Arr., ii. 13), even for Byblus also, which had its own kings in the Persian period, and seems from the number of its coins and inscriptions to have been very flourishing. We know the names of sixteen kings of Sidon, ten of Byblus, eight of Aradus, but none of Berytus in historical times; presumably it formed with Byblus a single kingdom, and in later times the capital was moved to the latter. Tripolis was a bond of three cities, Sidonian, Tyrian, and Aradian, a stadium distant from one another (Diod., xvi. 41). Here sat the federal council under the kings of the three leading states, who were accompanied to Tripolis by their senators (probably 300 in all). Among the chief concerns of this council were the relations to the Persian Government, which was represented at the meetings.

Under Persian Rule.—Phœnicia, Palestine, and Syria formed the fifth satrapy, paying a tribute of £99,396. The Phœnicians were favoured subjects for the sake of

¹ This date is got from Justin, who in xix. 1, i says of his Mago the same thing that others say of Hanno; for the defeat spoken of in xviii. 7, 1 is the battle against the Phœnicians in 538, and the war with a Spartan prince in Sicily (xix. 1, 7) is the war with Darius (510). Taking into account the eleven years of Hædrabai's dictatorship we get Hanno's date as above.

their indispensable fleet, and having also common interests against Greece they were amongst the most loyal subjects of the empire. Sidon, as we have seen, was now the chief city; its king at the time of the expedition of Xerxes was Tetramnestus. Among his descendants was the youthful Eshmun'azar, whose inscription on the great sacrophagus in Egyptian style now in the Louvre, taken with other notices, enables us to make out the following fragment of a genealogical table with much probability.²

Reckoning back from Straton II., and remembering that Eshmun'azar II died as a minor under the regency of his mother, we may place the death of the latter c. 400 B.C.; the gift of Dor and Japho, which he received from the great king, may have been a reward for fidelity in the rebellion of the younger Cyrus. Certainly it was not Eshmun'azar who led the eighty ships that joined Conon in 396 (Diod., xiv. 79), an event which may have been the beginning of the friendly relations between Sidon and Athens, indicated in a decree of "proxenia" for Straton I. (*C.I.G.*, No. 87). Tyre was then quite weak; between 391 and 386 it was stormed by Evagoras of Salamis (Isocr., *Paneg.*, 161, and *Evag.*, 23, 62, Diod., xv. 2), who had already made the Greek element dominant over the Phœnician in Cyprus. Straton was friendly with Evagoras's son Nicoteles, they rivalled one another in debauchery, and both found an unhappy end through their implication in the great revolt of the satraps (Athen., xii. 631). When Tachos entered Phœnicia Straton joined him, and on his failure (361) was about to fall into the hands of the foe when his wife slew him first and then herself (Jerome, i. 1, 311 Vall.). A new revolt of Sidon against Persia took place under Tennes II. on account of insults offered to the Sidonians at the federal diet at Tripolis. Again they joined the Egyptian Nectanebus II., carried the rest of Phœnicia with them, and with the aid of Greek mercenaries from Egypt drove the satraps of Syria and Cilicia out of Phœnicia. Tennes, however, whose interests were not identical with those of the citizens at large, betrayed his people and opened the city to Artaxerxes III. The Sidonians, to the number of 40,000, are said to have banded themselves and their families within their houses (345 B.C., Diod., xvi. 41-45). Tennes himself was executed after he had served the ends of the great king. The *Periplus* ascribed to Scylax (§ 104) describes the respective possessions of Tyre and Sidon in the year before this catastrophe, Sidon had the coast from Leontopolis to Ornithopolis, an Aradus near the later Sycammon, and Dor; Tyre had Sarepta and Exoppe (9) in the district of the later Calamon, farther south a town seemingly called Cirthea, and, strangely enough, the important Ascalon. Tyre now again for a short time took the first place. When, however, Alexander entered Phœnicia after Issus and the kings were absent with the fleet, Aradus, Byblus, and Sidon joined him, the last-named showing special zeal against Persia. The Tyrians also offered submission, but refused to allow Alexander to enter the city and sacrifice in the temple of Hercules. Alexander was determined to make an example of the first sign of opposition that did not proceed from Persian officials, and

² See for details Gutschmid, in *Jahrbuch f. Phil. u. Pädag.*, 1857, p. 613 sq.

at once began the siege. It lasted seven months, and, though the king, with enormous toil, drove a mole from the mainland to the island, he made little progress till the Persians were mad enough to dismiss the fleet and give him command of the sea through his Cyprian and Phœnician allies. The town was at length forced in July 332, 8000 Tyrians were slain, 30,000 inhabitants sold as slaves, and only a few notables, the king Azemiltes, and the Carthaginian festival envoys, who had all taken shelter in the fane of Hercules, were spared (*Art*, ii. 13, 15 sq.). Tyre thus lost its political existence, and the foundation of Alexandria presently changed the lines of trade and gave a blow perhaps still more fatal to the Phœnician cities. The Phœnicians thenceforth ceased to be a great nation, though under the Greeks Tyre and Sidon were still wealthy towns, the seats of rich merchant.

Sources and Helps.—The only at all continuous records of ancient tradition are the account of Phœnician mythology by Philo of Byblus, the extracts by the Syrian monk by Josephus from Menander of Ephesus, and what Justin in the 18th book of his abridgment of Pompeius Trogus has taken from Timæus. Everything else has to be pieced together in mosaic fashion. The chief help is Movers's unfinished work, *Die Phœnizier*, i. ii. 1-3 (Bonn, 1841-56), which must be completed with his article "Phœnizien," in Esch and Guben (1848). Both works are learned and indispensable, but to be used with caution wherever the author's judgment on his material is involved, especially in the treatment of the mythology, which is mostly syncretistic, whereas it is essential to a right understanding of this subject to distinguish the peculiarities of the several Semitic nations. Selden, *De diis Syris* (London, 1617), is still a valuable mine. The best recent contributions are those of Bandtzen, *Studien zur semitischen Religionsgeschichte* (Lipsitz, 1876, 1878). To the colonial history Bunsen's monumental *Chanaan* (Cern, 1846) is not superior even by Movers, who, as has been wittily observed, has created with the help of etymology Phœnician *chambres de réunion*, and, though Olshausen (*N Rhein Mus.* 1853, p. 821 sq.) does not go quite so far, both he and Mullenhoff (*Deutsche Alterthumskunde*, i. 1870) follow the steps of Movers much too closely. A good corrective is given by Meltzer (*Fisch u. Kalklager*, i. 1878), though he, again, is sometimes too sceptical. Movers is best on the history proper, and the admirable sketch in Grote's *History of Greece* should also be consulted. See also Drucker, *Gesch. des Alterthums*, and Maspero, *Hist. anc. de l'Orient* (A. v. G.).

Art.—Of Phœnician buildings few remains now exist on Phœnician soil; the coast has always been, and still is, densely peopled, and the builders of successive generations, like those of the present day, have regarded ancient edifices as their most convenient quarries. Phœnician architecture had its beginning in the widening and adaptation of caves in the rocks, the independent buildings of later times, constructed of great blocks of unhewn stone, are direct imitations of such cave-dwellings. As Syrian limestone (which is the material employed) does not admit of the chiselling of finer details, the Phœnician monuments are somewhat rough and irregular. Not a vestige remains of the principal sanctuary of this ancient people, the temple of Melkart in Tyre; but Renan discovered a few traces of the temple of Adonis near Byblus, and a peculiar mausoleum, Bury al-Bazzak, still remains near Amrit (Marathus). It may also be conjectured that the conduits of Ras al-Ain, south of Tyre, are of ancient date. Various notices that have come down to us render it probable that the Phœnician temples, in the erection of which great magnificence was undoubtedly displayed, were in many respects similar to the temple at Jerusalem; and confirmatory evidence is afforded by the remarkable remains of a sanctuary near Amrit, in which there is a cella in the midst of a large court hewn out of the rock, and other buildings more of an Egyptian style. In the domain of art originality was as little a characteristic of the Phœnicians as of the Hebrews, they followed foreign and especially Egyptian models. This influence is mainly evident in sculptured remains, in which Egyptian motifs such as the Ureus frieze and the winged sun-disk not unfrequently

occur. It was in the time of the Persian monarchy that Phœnician art reached its highest development; and to this period belong the oldest remains, numismatic as well as other, that have come down to us. The whole artistic movement may be divided into two great periods: in the first (from the earliest times to the 4th century B.C.) Egyptian influence is predominant, but the national Phœnician element is strongly marked, while in the second Greek influence has obtained the mastery, and the Phœnician element, though always making itself felt, is much less obtrusive. In the one period works of art, as statues of the gods and even sculptured sarcophagi, were sometimes imported direct from Egypt (such statues of the gods have been found even in the western colonies), in the other Greek works were procured mainly from Rhodes. The Phœnicians also adopted from the Egyptians the custom of depositing their dead in sarcophagi. The oldest examples of those anthropoid stone coffins are made after the pattern of Egyptian mummy-cases, they were painted in divers colours, and at first were cut in low relief, afterwards, however, towards and during the Greek period, the contours of the body began to be shown in stronger relief on the cover. Modern excavations show that, besides stone coffins (in marble or basalt), which indeed cannot be considered the oldest kind of receptacle, the Phœnicians employed coffins of wood, clay, and lead, to which were often attached metal plates or, at times it may be, decorations in carved wood. Embalming also seems to have been frequently practised as well as covering the body with stucco. Great care was bestowed by the Phœnicians on their burial-places, and their cemeteries are the most important monuments left to us. The tombs are subterranean chambers of the most varied form: the walls and roof are not always straight, sometimes there are two tiers of tombs one above the other, often several rows one behind the other. While in early times a mere perpendicular shaft led to the mouth of these excavations, at a later date regular stairs were constructed. The dead were deposited either on the floor of the chamber (often in a sarcophagus) or, according to the later custom, in niches. The mouths of the tombs were vaulted up and covered with slabs, and occasionally cippi were set up. The great sepulchral monuments (popularly called *naghâ-îl*, "spindles") which have been found above the tombs near Amrit are very peculiar: some are adorned with lions at the base and at the top with pyramidal finials. Besides busts (which belong generally to the Greek period), the smaller objects usually discovered are numerous earthen pitchers and lamps, glass wares, such as tear-bottles, tesserae, and gems. Unframed tombs are seldom met with.

Literature.—For topography and art, see Renan, *Mission de Phénicie* (Paris, 1848); for language, Schröder, *Die phœnizische Sprache* (Halle, 1869), and Stade in *Morgenländische Forschungen* (1875, p. 167); and for inscriptions, *Corp. Inscr. Sem.* (Paris, 1881, and following years) (A. 80).

PHŒNIX. Herodotus (ii. 73), speaking of the animals in Egypt, mentions a sacred bird called "phœnix," which he had only seen in a picture, but which the Heliopolitans said visited them once in five hundred years on the death of its father. The story was that the phoenix came from Arabia, bearing its father embalmed in a ball of myrrh, and buried him in the temple of the sun. Herodotus did not believe this story, but he tells us that the picture represented a bird with golden and red plumage, and closely resembling an eagle in size and shape. The story of the phoenix is repeated with variations by later writers, and was a favourite one with the Romans. There is only one phoenix at a time, says Pliny (*N.H.*, x. 2), who, at the close of his long life, builds himself a nest with twigs of cassia and frankincense, on which he dies; from his corpse is generated a worm which grows into the young

phœnix The young bird lays his father on the altar in the city of the sun, or burns him there, as Tacitus has it (*Ann.* vi 28) The story of the birth and death of the phœnix has several other forms According to Horapollon (ii 57) he casts himself on the ground and receives a wound, from the ichor of which the new phœnix springs; but the most familiar form of the legend is that in the *Physiologus*, where the phœnix is described as an Indian bird which subsists on air for 500 years, after which, lading his wings with spices, he flies to Heliopolis, enters the temple there, and is burned to ashes on the altar Next day the young phœnix is already feathered, on the third day his pinions are full-grown, he salutes the priest and flies away The period at which the phœnix re-appears is very variously stated, some authors giving as much as 1461 or even 7006 years, but 500 years is the period usually named, and Tacitus tells us that the bird was said to have appeared first under Sesostrius, then under Amasis, again under Ptolemy III., and once more in 34 A.D., after an interval so short that the genuineness of the last phœnix was suspected The phœnix that was shown at Rome in the year of the secular games, A.D. 800, was universally admitted to be an imposture¹

The form and variations of these stories characterize them as popular tales rather than official theology, but they evidently must have had points of attachment in the mystic religion of Egypt, and indeed both Horapollon and Tacitus speak of the phœnix as a symbol of the sun Now we know from the *Book of the Dead* and other Egyptian texts that a bird called the "bennu" was one of the sacred symbols of the worship of Heliopolis, and Wiedemann (*Ztsch. f. Aeg. Sprache*, xvi p 89 sq.) has made it tolerably clear that the bennu was a symbol of the rising sun, whence it is represented as a "self-generating" and called "the soul of Ra (the sun)," "the heart of the renewed Sun" All the mystic symbolism of the morning sun, especially in connexion with the doctrine of the future life, could thus be transferred to the bennu, and the language of the hymns in which the Egyptians praised the luminary of dawn as he drew near from Aialia, delighting the gods with his fragrance and rising from the sinking flames of the morning glow, was enough to suggest most of the traits materialized in the classical pictures of the Phœnix That the bennu is the prototype of the phœnix is further confirmed by the fact that the former word in Egyptian means also "palm-tree," just as the latter does in Greek How far the Egyptian priests translated the symbolism of the bennu into a legend it would be vain to conjecture, that the common people did so is only what we should expect, and it is to be observed that the monuments have not yet shown any trace of the element in the classical legend which makes the phœnix a prodigy instead of a symbol—its actual appearance at long intervals The very various periods named make it probable that the periodical return of the phœnix belongs only to vulgar legend, materializing what the priests knew to be symbolic The hieroglyphic figure of the bennu is that of a heron

( *bennu*, or  *bāh*), and the gorgeous colours and plumed head spoken of by Pliny and others would be least inappropriate to the purple heron (*Ardea purpurea*),

with which, or with the allied *Ardea cinerea*, it has been identified by Lepsius and Peters (*Älteste Teste des Totenbuchs*, 1867, p 51). But it must be remembered that the bennu in the Egyptian texts is really a male symbol, having the very vaguest connexion with any real bird, and the golden and purple hues described by Herodotus may be the colours of sunrise rather than the actual hues of the purple heron How Herodotus came to think that the bird was like an eagle is quite unexplained, perhaps this is merely a slip of memory

Many commentators still understand the word בֶּנְיָן, *bēnīn*, in Job xxiv 18 (A.V. "sand") of the phœnix This interpretation is perhaps as old as the (original) Septuagint, and is current with the later Jews, whose appetite for fable, however, is often greater than their exegetical sagacity Compare Esssmenger's *Entwickeltes Judenthum*, vol. 1 *passim* Among the Arabs the story of the phœnix was confused with that of the salamander, and the samand or samandal (Dammī, ii 38 sq.) is represented sometimes as a qualified, sometimes as a bird It was highly believed in, for the incombustible cloths woven of flexible asbestos were popularly thought to be made of its hair or plumage, and were themselves called by the same name (comp. Yāqūt, i 629, and Dozy, s.v.) The *ankā* (Pers. *sansarī*), a stupendous bird like the roc (*rūkh*) of Marco Polo and the *Arakūn* *Nyktē*, also borrows some features of the phœnix According to Kāwīmī (i 420) it lives 1700 years, and when a young bird is hatched the parent of opposite sex burns itself alive In the book of Kalilah and Dimnah the *smūn* or *ankā* is the king of birds, the Indian garūda on whom Vishnu rides

PHŒNIXVILLE, a borough in the United States, in Schuylkill township, Chester county, Pennsylvania, is situated 27½ miles north-west of Philadelphia by the Philadelphia and Reading Railroad, on the right bank of the Schuylkill river, which is there joined by French Creek, crossed by eight fine bridges Phœnixville is best known as the seat of the blast-furnaces and mills of the Phœnix Iron Company, which had its origin in a rolling and slitting mill erected in 1790 by Benjamin Longstreth, and long ranked as the largest in the States The works cover 150 acres and employ sometimes 2500 men Phœnixville also contains a pottery, a sash and planing mill, a shirt-factory, and needle works, and iron, copper, and lead are all mined in the neighbourhood The vicinity of the borough is noted for its large number of magnificent iron bridges The population was 2670 in 1850, 4886 in 1860, 5292 in 1870, and 6683 in 1880

PHONETICS (τὰ φωνητικά, the matters pertaining to the voice, *phōnē*) is the science and art of the production of sounds, including cries, by means of the organs of speech in man and their analogues in other animals

This very extensive subject may be divided into the following three parts. (1) *Anatomical*, the accurate description of all the organs employed, emissive (lungs, with the muscles acting on them, trachea, larynx, pharynx, mouth and its parts, nose and its passages, with its closing valve the uvula) and receptive (the ear, external and internal, and parts of the brain with which the auditory nerve communicates). As all voice-sounds are produced by imitation, defects in the receptive organs entail defects in the action of the emissive The congenitally deaf are consequently mute. (2) *Physiological*, the co-ordinated action of the parts just referred to in hearing and uttering sounds, and especially expiration and inspiration, with laryngeal, oral, and nasal actions, and the relation of these actions to the will (on these see VOICE). (3) *Acoustical*, with especial reference to the action of double membranous reeds, as in the glottis, the effects of resonance chambers, both fixed and variable in shape and size, open and closed, single and combined, and of the passage of air, more or less in a state of sonorous vibration, through tubes of variable lengths and widths, with walls of variable hardness, and with or without the interposition of semi-viscous fluids, as well as of flapping, smacking, or vibrating parts, and of other obstructions; also investigations into the nature, pro-

¹ Some other ancient accounts may be here referred to That ascribed to Hesiodus is, in the judgment of Cobet (*Mnemosyne*, 1883), stolen from Herodotus by a late forger The poem of the Jew Ezechiel quoted by Eusebius (*Præp. Ev.* ix 29 80) appears to refer to the phœnix Here the sweet song is first mentioned, — a song which, according to the poem on the phœnix ascribed to Lucianus, accompanies the rising sun The bird is often spoken of in Latin poetry, and is the subject of an idyl by Claudian See also Solinus, cap. xxxiii., with Salmassius's *Excerptationes*, Tertullian, *De resur. carnis*, c. 33, Clemens Rom., *Ep.* i. ch. xxv.

duction, and appreciation of qualities of tone, and their gradual but rapid gliding one into another, as well as into the nature of sympathetic vibration, not only of the different cavities filled with air in the organs of speech but of the solid bony parts, and also the softer cartilages, sinews, and muscles, connecting and supporting them. This part of the subject, which is far from having been fully investigated at present, has two main subdivisions—(a) *musical*, regarding the nature and properties of musical sound, and especially song, with their varieties due to force, pitch, and quality, as partly investigated in Helmholtz's *Sensations of Tone*, (b) *rhetorical*, regarding the mechanism of speaking as distinct from singing, the blending and differentiation of qualities of tone, partly musical and partly unmusical, with constantly variable and ill-defined pitch and force, influenced by feeling, this subdivision embraces speech in particular, its special sounds for conveying thought and feeling, with their constantly-shifting characters, and also cries of joy and pain, as well as, properly speaking, the cries of the lower animals by which they communicate with those of the same kind, hence it comprehends also language, elocution, and philology in their fundamental constitution.

In a more restricted sense, applied solely to human beings, and to articulate significant sounds (that is, exclusive of cries of pain and pleasure, or the inarticulate and often unconscious noises of snoring, snuffing, gargling, panting, laughing, crying, sobbing, sneezing, and the like), the term "phonetics" is used to designate a work on the enumeration, evaluation, relations, classification, analysis, and synthesis of *SPEECH-SOUNDS* (*q v*)—that is, of the sounds actually used in speech for conveying and recording thought by different nations and tribes, together with a means of fixing them by visible signs. The alphabet has followed speech-sounds with very halting steps. It is only in quite recent times that sufficient knowledge of the nature of speech has been obtained to enable us in some measure to understand and unravel the mysteries of the old enigmatic forms, and thus to construct a surer basis for philology than the guesses on which it once rested.

In a still more restricted and popular sense the term "phonetics" has been recently used for attempts to construct a new practical alphabet for English or other individual languages, or for several such languages simultaneously, with a view either of superseding the alphabets at present in use, or of improving their employment, or, at any rate, of facilitating the generally very difficult tasks of teaching and learning to read and write. Attempts of this kind are by no means recent: witness Loys Meigret, *Traité touchant le commun usage de l'écriture françoise* (1545); Sir Thomas Smith, *De recta et emendata lingua Anglica scriptio* (1568); J. Hart, *An orthographie, containing the due order and reason, howe to write or painte thimage of mannes voice, most like to the life or nature* (1569); [William] Bullokar's *Booke at large for the Amendment of Orthographie for English speech* (1580); Alexander Gill (master of St Paul's school, London, when Milton was there), *Logonomia Anglica. quæ gentis sermo fuculibus adducitur* (1619 and 1621); Charles Butler, *The English Grammar, or the Institution of Letters, Syllables, and Words in the English tongue* (1633). All these works are more or less printed in the orthography proposed, and each orthography is different. They are described and illustrated in A. J. Ellis's *Early English Pronunciation*, parts i and iii. It is, however, not necessary in this place to go beyond attempts made by persons still living. In 1847, after three years of experiments, Isaac Pitman and Alexander John Ellis brought out their phonotypy, consisting of twenty-three old types and seventeen new ones, with which, among much other matter, the *Bible*

and the *Phonetic News* newspaper were printed in 1849, and extensive experiments were made, showing that reading in this alphabet could be rapidly taught, and that when children had learned to read phonotypy well they could easily learn to read in ordinary spelling. The new letters were subsequently much and frequently altered in meaning by Pitman, who in 1884 still produced a *Phonetic Journal* weekly in his present phonotypy. Very numerous forms of phonotypy, following either the old or the new edition, have also appeared in America. Many other systems have been tried by accenting, italicizing, supernumbering, or diacritically marking the letters to make the ordinary letters of English spelling convey their sounds. Almost every new "pronouncing dictionary" has its own method. This last plan has been, on the whole, successfully applied for teaching to read by many writers. In order to avoid new types, or even accented letters, and yet have a practical phonetic alphabet for English and its dialects, Ellis prefixed to part iii of his *Early English Pronunciation* (1871) an account of "Glossic, a new system of spelling intended to be used concurrently with the existing English orthography, in order to remedy some of its defects without detracting from its value." This has been extensively used by the English Dialect Society and in Ellis's works on *Pronunciation for Singers* (1877) and *Speech in Song* (1878), in which it is fully explained and used in complete practical accounts of the phonology of English, German, French, Italian, and Spanish. Henry Sweet, in his *Handbook of Phonetics* (Oxford, 1878), proposed his "Broad Roman," admitting, however, a few inverted letters. Subsequently, the English Spelling Reform Association was started, and great numbers of new attempts at phonetic alphabets for English only were made, which will be found described and illustrated at full length in W. R. Evans's *Spelling Experimenter and Phonetic Investigator* (2 vols., September 1880 to April 1883). There is also an American spelling reform association. But neither association has as yet agreed upon a new alphabet. In 1881 the Philological Society of London approved of certain "partial corrections of English spelling" submitted by Sweet, and these are more or less used in the *Proceedings* of that society, as edited by Sweet, and are generally approved by the American association, but they are not by any means an entirely phonetic scheme. In the books referred to, and particularly Evans's, the whole of this special branch of the subject of phonetics, so far as English is concerned, may be sufficiently examined. (A. J. S*.)

PHORMIUM, or **NEW ZEALAND FLAX** (also called "New Zealand hemp"), is a fibre obtained from the leaves of *Phormium tenax* (ord. *Liliaceæ*). The plant is a native of New Zealand, the Chatham Islands, and Norfolk Island; it is now cultivated as an ornamental garden-plant in Europe, and for economic purposes it has been introduced into the Azores. The leaves grow from 3 to 6 and even 9 feet in height and from 2 to 3 inches in breadth, springing from the extremity of a rhizome. After the tuft of leaves has continued growing for about three years a flowering stalk springs up to the height of about 16 feet, and when it comes to maturity the whole plant dies down. Meantime, however, lateral branches or fans have been given off from the main rhizome, and thus the life of the plant is continued by stem as well as seed. Phormium has been treated as a cultivated plant in New Zealand, though only to a limited extent, and with no promising results, for the supplies of the raw material dependence has been principally placed on the abundance of the wild stocks and on sets planted as hedges and boundaries by the Maoris. Among these people the fibre has always been an article of considerable importance, yielding cloaks, mats, cordage,

fishing-lines, &c., its valuable properties having attracted the attention of traders even before colonists settled in the islands. The leaves, for fibre-yielding purposes, come to maturity in about six months, and the habit of the Maoris is to cut them down twice a year, rejecting the outer and leaving the central immature leaves. Phormium is prepared with great care by native methods, only the mature fibres from the under-side of the leaves being taken. These are collected in water, scraped over the edge of a shell to free them from adhering cellular tissue and epidermis, and more than once washed in a running stream, followed by renewed scraping till the desired purity of fibre is attained. This native process is exceedingly wasteful, not more than one-fourth of the leaf-fibre being thereby utilized. But up till 1860 it was only native-prepared phormium that was known in the market, and it was on the material so carefully, but wastefully, selected that the reputation of the fibre was built up. The troubles with the Maoris at that period led the colonists to engage in the industry, and the sudden demand for all available fibres caused soon afterwards by the Civil War in America greatly stimulated their endeavours. Machinery was invented for disintegrating the leaves and freeing the fibre, and at the same time experiments were made with the view of obtaining it by water-retting and by means of alkaline solutions and other chemical agencies. But the fibre produced by these rapid and economical means was very inferior in quality to the product of Maori handiwork, mainly because weak and undeveloped strands are, by machine preparation, unavoidably intermixed with the perfect fibres, which alone the Maoris select, and so the uniform quality and strength of the material are destroyed. No means have yet been devised for producing by mechanical or chemical means fibre in the perfect condition it shows when selected and prepared by Maoris. Phormium is a cream-coloured fibre with a fine silky gloss, capable of being spun and woven into many of the heavier textures for which flax is used, either alone or in combination with flax. It is, however, principally a cordage fibre, and in tensile strength it is second only to Manila hemp; but it does not bear well the alternations of wet and dry to which ship-ropes are subject. It is largely used as an adulterant of Manila hemp in rope-making, and recently it has come into use as a suitable material for the bands of self-binding reaping-machines. Between 1864 and 1876 there were exported from New Zealand 26,434 tons of phormium, valued at £592,218; in 1881 the exports were 1807 tons, of the value of £26,285.

PHOSPHORESCENCE, a name given to a variety of phenomena due to different causes, but all consisting in the emission of a pale more or less ill-defined light, not obviously due to combustion. The word was first used by physicists to describe the property possessed by many substances of themselves becoming luminous after exposure to light. Such bodies were termed "phosphori," and the earliest known appears to have been barium sulphide, which was discovered by Vincenzo Cascioli, a cobbler of Bologna, at the beginning of the 17th century. See **PHOSPHORUS**. Subsequently, when certain animals were observed to be similarly endowed, the word "phosphorescent" was applied to them also. It is clear, however, that the light derived from previous exposure to light, which thus becomes, as it were, stored up, is hardly comparable with that which is produced by living protoplasm and evidently under the control of the nervous system. It has been suggested that this latter should have a special name appropriated to it, and here it will certainly be convenient to divide the subject into two heads in accordance with this distinction.

A **PHOSPHORESCENCE IN MINERALS**.—In addition to the phosphorescence after insolation already alluded to

(see **LIGHT**, vol. xiv p. 603) many minerals exhibit this property under other circumstances: (*a*) on heating to a temperature much below what is known as "red heat" (fluor spar, lepidolite, gumme)—this being often attended with a change in molecular structure or in specific heat, (*b*) on friction, as in the case of fused calcium chloride (Homburg's phosphorus), (*c*) on cleavage, a property manifested by mica, the two split portions becoming electrified—the one positive, the other negative, (*d*) on crystallization, as boracic acid after fusion, or water on rapid freezing¹.

A few meteorological phenomena may here be mentioned. Rain has been seen to sparkle on striking the ground, and waterspouts and meteoric dust have presented a luminous appearance. The *sympa fituus*, or will-o'-the-wisp, seen in marshy districts, has given rise to much difference of opinion. Kirby and Spence suggest that it may be due to luminous insects, but this explanation will certainly not apply in all cases, and it is perhaps on the whole more reasonable to believe that the phenomenon is caused by the slow combustion of marsh gas (methyl hydride).

B PHOSPHORESCENCE IN ORGANISMS.—The vegetable kingdom has furnished few instances of the property under consideration, the earliest on record took place in the year 1762, when a daughter of Linnæus saw luminous emanations from a species of *Tropæolum*, since which time a like appearance has been noticed in *Helianthus annuus*, *Lilium bulbiferum*, *Calendula officinalis*, *Taygetes patula*, and *T. erecta*, all of which are red or orange-coloured flowers. A few cryptogams have been seen to shine in the dark, e.g., *Schistospora osmundacea* among the liverworts, *Rhizomorpha subterranea*, *Fungus igneus* in Ambony, and other fungi in Brazil and Italy; and the mycelium (thread-like fibres) of other species growing in decayed wood is also occasionally luminous. There are also a number of small marine phosphorescent organisms² (*Pyrosoma*, *Peridinium*), concerning which it is impossible to say with certainty whether they should be referred to the animal or the vegetable kingdom. But the most brilliant as well as the most varied and interesting cases of phosphorescence belong to the animal world, and there is not one of the larger groups which does not furnish some instances of it.

Nature of the Light.—The light emitted by different animals varies very much in colour: green has been noticed in the glow-worm, fire-flies, some beetle-stars, centipedes, and annelids, blue is seen in the Italian fire-fly (*Luciola italica*); and this and light green are the predominant colours exhibited by marine animals, although the beautiful Girdle of Venus and some species of *Salpa* and *Cleodora* appear red, and *Pavonaria* and other gorgonoids lilac. The curious lantern-fly (*Pyrola pyrolychnus*) has a purple light. One very remarkable instance is mentioned of an *Appendicularia* in which the same individual appeared first red, then blue, and finally green.³ In comparatively few cases has the light been examined by the spectroscope. Panceri⁴ states that in every instance observed by him it was monochromatic, the spectrum consisting of a continuous band without any separate bright lines; in *Pholis* this band extended from the line E of the solar spectrum to a little beyond F, in *Umbellula*, examined on the voyage of the "Challenger," it was sharply included between the lines b and D.⁵

Luminous Organs.—In the lowest forms of life and in

many jelly-fish there seem to be no organs specially set apart for the production of light, this being emitted from the whole surface of the body, but even in the latter group a degree of specialization is found, for in some it is only the marginal sense-organs, in others the radial canals and ovaries, that are luminous. In other groups of animals the localization of the photogenic property in certain organs or tissues is universal, and these present the utmost variety in structure and situation. In the sea-pens (*Pennatulæ*) every polyp has eight luminous bands on the outer surface of the stomach, when the colony is touched the light commences at the point irritated and then spreads to other portions. *Pyrosoma*, a colonial free-swimming ascidian, has two small patches of cells at the base of each inhalant tube, the cells have no nucleus, but contain a material which appears from its chemical relations to be fatty; as in *Pennatulæ*, the light spreads from the irritated point. In the transparent pelagic mollusc (*Phyllorhœ*) there are rounded cells connected with the nerve-twigs from which, as also from the ordinary cells of the nerve-ganglia, the light emanates. Several annelids (*Chaetopterus*, *Tomopteris*) have luminous organs at the bases of lateral processes of the body. The rock-boring mollusc (*Pholæ*), whose phosphorescent properties were known as long ago as the time of Pliny, has three distinct luminous organs—(1) a curved band along the anterior border of the mantle, (2) two small triangular patches at the entrance of the anterior siphon, and (3) two long parallel cords situated within this latter; these are all covered with ciliated epithelium, like that of other parts of the mantle, but having granular contents.¹

The glow-worm (*Lampyrus splendidula*) has been investigated by Max Schultz,² he finds that the male has a pair of organs in each of the two segments preceding the last in the abdomen, each organ consists of a pale transparent superficial layer, which gives off the light, and a deep opaque layer, whose function is less obvious, but which may serve as a reflector? Quite recently Emery³ has examined the Italian fire-fly, in which both male and female are luminous. As in the glow-worm, the organ consists of two layers. The dorsal contains large quantities of uric acid salts, while in the ventral layer there are clear cells arranged in cylindrical lobules, which surround vertically-disposed tracheal limbs—a structure comparable to the stellate tracheal cells of Schultz. The luminous organs are regarded as homologous to the "fat body" so common in insects. The ultimate branches of the tracheæ ramify in these and terminate in peculiar star-like cells, nerve-fibres are also present. The Mexican fire-flies (*Pyrophorus*) are in most respects similar to the glow-worm, but have a pair of organs in the thorax and one in the abdomen, whilst the lantern-flies (*Fulguræ*) carry their light at the extremity of a long curved proboscis. Many crustaceans are luminous, but in most cases it has not been observed from what part of the body the light emanates, in some instances, however (*Thysanopoda* [*Nyctiphanes*] *norvegica*, *Euphausia pelliculæ*, &c.), there are small globular phosphorescent organs, which have often been described as eyes, beneath the thorax and between the abdominal swimmerets. Sars⁴ states that "these globules . . . constitute a highly complicated luminous apparatus, the lenticular body of the organs, generally described as a true eye-lens, acting as a condenser, which . . . enables the animal to produce at will a very bright flash of light in a given direction." Mr John Murray in the same place records the occurrence

of a very brilliant display of this phosphorescence during the "Triton" expedition in the Farøe Channel.

Many deep-sea fish possess round shining bodies imbedded in the skin, either in the vicinity of the eye or along the sides of the body, some of these resemble modified eyes, whilst the structure of others recalls a glandular organ without the usual duct,⁵ and it is supposed that some or all of these are luminous organs, the lens in the former group acting as a bull's eye (see Ichthyology, vol. xii. p. 684).

Dead and putrescent animals are not unfrequently phosphorescent; this fact has most commonly been observed in fish, though instances are not wanting in which the property has been manifested by molluscs and other animals, and even by the human body. Furthermore, a few startling but apparently well-authenticated instances are on record in which human beings have been luminous while yet alive owing to certain states of disease.⁶

Causes of Phosphorescence.—On this head it is at present impossible to write with certainty, it seems likely, however, from the variety of the effects produced by different chemical and physical agents, that the causes are manifold. In many instances light is only emitted after stimulation, either mechanically, chemically (by fresh water, milk, ammonia), or by electricity, though there are cases, in which this last has no effect whatever. The fact that the nervous system is so often closely connected with the luminous organs indicates that the exhibition of the light is either dependent on the volition of the animal or is the reflex result of the stimulation of sensory nerves (Pancini). In the glow-worm the distribution of tracheæ (air-tubes) throughout the photogenic apparatus, and the fact that carbonic acid extinguishes the light while oxygen intensifies it, suggest that it is due to some form of slow combustion, while the fatty contents of the luminous cells of this and many other animals point to the probability that it is a containing free phosphorus the active agent in the reaction. Since a large number of luminous organs retain their power after the death of the animal, and even after desiccation and subsequent moistening, there seems no necessity to adopt the theory that we have to deal with an instance of the direct transformation of vital into radiant energy.

The well-known phosphorescence of the sea is due to the animals which inhabit it, except in a few cases in which it has been ascribed to putrescent matter. This was known as long ago as 1748, when Vauquelin⁷ discovered in the waters of the Adriatic a luminous animalcule which was named by him *Nereis noctiluca*, and was probably the creature now known as *Noctiluca milanesis*. This minute animal swims in countless myriads on the surface of the sea not very far from land, and is the commonest cause of its diffuse luminosity, although other low forms of life such as *Paramecium* (*Ceratium*) contribute in no small degree, and in mid-ocean another organism, *Pteropoda*, which has often been mistaken for *Noctiluca*, appears to replace it, and is very abundant. The brilliant sparkling phosphorescence more rarely seen is caused by the presence of copepods and other small surface crustaceans.

Uses of Phosphorescence.—The service rendered by this property to its possessors is in many cases by no means obvious, indeed it would seem certain that to certain extent the light and other surface organisms survive in part protected by venomous enemies phosphorescence must be a "perilous gift." It is possessed by so many anthozoa and jelly-fish, which have also stinging organs, that fish have perhaps learned to shun instinctively all phosphorescent animals, fishermen state that fishes avoid nets in which phosphorescent *Medusæ* have become entangled, if such be the case, it would be possible for animals otherwise defenceless to obtain protection by acquiring this property. A similar hypothesis has been advanced with respect to the Italian fire-fly,⁸ although, as regards the glow-worm, it has been generally believed that the light serves to attract the opposite sex, and the same has been stated with respect to the earth-worm. The fact that so many deep-sea animals are phosphorescent, coupled with the discovery that many fish from those regions have large and normally-developed eyes whilst others have organs which appear to be adapted for the production of light, has led to the belief that this source of light becomes of great importance in the depths of the ocean where no sunlight penetrates—an hypothesis which is known as the "albyssal theory of light." (W. E. H.)

PHOSPHORUS AND PHOSPHATES "Phosphorus" (*phosphōros*, light-bringer) had currency in chemistry as a generic term for all substances which shine in the dark without burning, until the name came to be monopolized by a peculiar kind of "phosphorus" which was discovered, some time previous to 1678, by the German alchemist Brand of Hamburg. Brand, hoping to obtain thereby an essence for the "ennobling" of silver into gold, subjected urine-solids to dry distillation. In lieu of the hoped-for essence he obtained as part of the distillate a wax-like, easily fusible solid which, besides being phosphorescent, readily caught fire, to burn with a dazzling light into a white solid acid. The new phosphorus naturally excited universal interest, but it was, and remained, only a rather costly chemical curiosity until Scheele, in 1771, starting from the discovery of Gahn that bone-ash is the lime-salt of a peculiar non-volatile acid, proved that this acid is identical with the one formed in the combustion of phosphorus, and that the latter, being only "phlogisticated" bone-ash acid, can be obtained from it by distillation with charcoal at a high temperature. This method of Scheele's is used to the present day for the manufacture of phosphorus, and even the theoretical notion on which it rests is recognized as correct as far as it goes, anhydrous bone-ash acid being a compound of phosphorus with oxygen the formation of which involves the liberation of part of the *energy* ("phlogiston") of each in the kinetic form of heat. That phosphorus is an elementary substance was originally a surmise, which, however, has been confirmed by all subsequent experiences. In comparatively recent times it was found that Brand's phosphorus is susceptible of passing (by mere loss of energy) into two allotropic modifications, known as "red" and "metallic" phosphorus respectively, so that the name "phosphorus" has again come to assume a generic meaning, being used for these three substances and the element as such conjointly.

Manufacture.—For the manufacture of ordinary phosphorus any kind of phosphate of lime might be used, and in fact mineral phosphates are used occasionally, though as a rule the bones of domestic animals are employed as a raw material. Such bones (apart from a large percentage of water and a small admixture of fats and other subsidiary organic components) consist essentially of two things, namely, (1) *osseine*—a nitrogenous organic compound, insoluble in water, but convertible by long treatment with hot water into a solution of "glue"—and (2) an infusible and incombustible part,—the two being united together (perhaps chemically) into a cellular tissue. The following analysis of the humerus of an ox gives an idea of the constitution of the second part and its ratio to the whole.

Phosphate of lime, $P_2O_5 \cdot 3CaO$	61.4
Phosphate of magnesia, $P_2O_5 \cdot 3MgO$	1.7
Carbonate of lime	8.6
Osseine	28.3
	100.0

The percentages, however, in bones generally are subject to great variation. When bones are heated to redness in the absence of air the organic part is destroyed, and there remains ultimately a cellular tissue of bone-phosphate impregnated, so to speak, with finely-divided charcoal. This black residue, known as "bone-black," is used largely for the decoloration of sugar-syrup, and, after having been exhausted in this direction, forms a cheap material for the manufacture of bone-ash and consequently of phosphorus, but, as a rule, the phosphorus-manufacturer makes his bone-ash direct from bones, by burning them in a furnace (constructed and wrought pretty much like a limekiln) between alternate layers of coal.

The burned bones (which retain their original shape)

are ground up into granules of about the size of lentils, and these are then placed in a wooden tank coated inside with lead, to be decomposed by means of about their own weight of chamber-acid, i.e., sulphuric acid containing about 60 per cent of real H_2SO_4 . To accelerate the action the bone-meal is mixed with boiling water previous to the addition of acid, and steam may be passed into the magma when its temperature threatens to fall too low. The acid readily decomposes the carbonate of the bone-ash, and then acts, more slowly, on the phosphate, the process being completed in about twenty-four hours, and the result, in regard to the latter, is that about two-thirds of the phosphate are decomposed into sulphate of lime (gypsum), which separates out as a precipitate, and phosphoric acid, which unites with the residual one-third of the phosphate and the water into a solution of superphosphate of lime—

To eliminate the gypsum the mass is diluted with water, allowed to settle, and the solution drawn off with lead syphons, then the residue is washed by decantation, and ultimately filtered off through a bed of straw contained in a cask with a perforated bottom. The spent heat of the distillation-furnace is utilized to concentrate the untied liquors to about 1.45 specific gravity, when a remnant of gypsum separates out, which must be removed. The clarified liquor is then mixed with about one-tenth of its weight of granulated charcoal, and the whole evaporated in an iron basin until the mass is sufficiently dry to be passed through a copper sieve and granulated. The granules are heated cautiously over a fire, to be dehydrated as far as possible without loss of phosphorus (as phosphuretted hydrogen), and the dry mass is then transferred to fire-clay retorts—either pear-shaped with bent-down necks, or cylinders, about 18 inches long and 4 inches in diameter, with straight necks—arranged within a powerful furnace. The condensers are made of earthenware, and must be so arranged that loss of phosphorus by combustion is avoided as far as possible, its condensation takes care of itself. One construction is to give the condenser the form of a bell-jar resting in a saucer containing water, lateral orifices in the bell serve to couple every two bells into one, to unite each with its retort-neck, and to send the vapour (of phosphuretted hydrogen, carbonic oxide, and other poisonous gases) into a chimney, where they take fire spontaneously, and the products are carried away by the draught. While the condensers are being adjusted the fire is kindled and raised very slowly, but ultimately forced up to the highest temperature which the retorts can stand, and maintained at this pitch until the appearance of the flames of the escaping vapours proves the absence from them of phosphorus, free or combined. This takes from thirty-six to forty-eight hours. The reduction-process, though in reality very complex, is in its principal features easily understood. The acid-phosphate behaves as if it were a mere mixture of $\frac{2}{3} \times P_2O_5 + \frac{1}{3} \times P_2O_5 \cdot 3CaO$ (bone-phosphate). The quasi-free acid ($\frac{2}{3}P_2O_5$) is reduced by the charcoal with formation of carbonic oxide and phosphorus-vapour, one-third of the phosphorus remaining in its original form of bone-phosphate.

The distillation of phosphorus is rather a dangerous operation, because the connecting pipes at the condensers are apt to get blocked up with frozen phosphorus, and consequently must be cleared from lime by copper or iron wires being pushed through them (at a certain risk to the operator). Another difficulty is that, although a retort may be quite whole in the ordinary sense, it may, and as a rule does, admit of the perspiration of phosphorus-vapour. To render retorts as nearly as possible impermeable to the

vapour they are being provided with two or three coats of some kind of cement, such as a mixture of slaked lime and borax, or a magma of clay, horse-dung, and water. In the collecting and further manipulation of the phosphorus the dangerous inflammability of the substance demands that all operations be conducted under water.

As soon as the retorts have cooled down sufficiently the condensers are detached and then tubed hinged up to prevent access of air to the inside. The necks of the retorts are knocked off and thrown into water to save the phosphorus, which has condensed within them and to unite it with that of the condensers. From the analysis of the ox-bone quoted we calculate that its ash contains 17.6 per cent. of phosphorus, of which two-thirds ($= 11.7$ per cent.) should be recoverable as free phosphorus; according to Fleck, the yield of phosphorus is 8 per cent., while Payen puts it down at 8 to 10 per cent. But this crude phosphorus is largely contaminated with blown-over bone-ash and charcoal and with "acid" phosphorus. Its purification used to be effected everywhere by melting it under water of about 60°C , and pressing it through chamois leather by means of a force-pump. In certain French works porous fireclay serves as a filtering medium, while superheated steam supplies at the same time the necessary heat and pressure. By the addition of coarsely-powdered charcoal to the phosphorus the clogging-up of the pores of the fireclay septum is precluded. A more effectual method of purification is to re-distil the crude (or perhaps the previously filtered) phosphorus from out of cast-iron retorts, the necks of which dip half an inch deep into water contained in a bucket. A chemical method of purification is that of Butcher, who fuses the crude phosphorus (100 parts) under water, with addition of 3.5 parts of oil of vitrol and 3.5 parts of bichromate of potash. The phosphorus passes, with a feeble gas-evolution, into an almost colourless liquid, with a loss of only 4 per cent. of its weight, as against the 10 to 15 per cent. unavoidably involved in the distillation process. To bring the purified phosphorus into the traditional form of sticks it is fused under water and sucked up into slightly conical glass tubes about two-fifths of an inch wide and a foot long; the tubes are closed below with the finger and immersed in cold water to cause the contents to freeze. The solid stick is then pushed out by means of a rod, and cut into pieces with a pair of scissors. For emission into commerce the sticks are put into cylindrical wide-necked glass bottles, or into tin canisters, full of water, which latter had better be mixed with a sufficiency of alcohol or glycerin to prevent freezing (and bursting) in winter time.

Seubert, about 1844, invented an ingenious apparatus for the continuous casting of phosphorus-sticks, consisting of a funnel-shaped vessel of copper, terminating below in a long horizontal copper tube, the outer end of which lies within a tank full of cold water. The phosphorus is placed in the funnel, covered with water, and the whole up to the cold-water tank raised (by means of a water-bath and steam-pipes) to a suitable temperature, matters being arranged so that the phosphorus freezes just on arriving at the exit end of the tube. The workman then catches the protruding button of phosphorus and pulls out an endless stick, which is cut up into pieces of the desired length. This ingenious apparatus, however, has not been found to work satisfactorily, and has been given up again in favour of some form of the old method. The loss of one-third of the phosphorus contained in the bone-ash, which is unavoidably involved in the ordinary method of phosphorus-making, can be avoided, according to Wohler, by adding finely-powdered quartz to the mixture which goes into the retorts. The superphosphate is then completely decomposed with formation of a residue of silicate, instead of

phosphate, of lime. An improvement by Fleck aims at the utilization of the organic part of the bones. He proposes to recover the fat from the bones by boiling them with water and then the gelatin by digesting them in hydrochloric acid of 1.05 specific gravity. The gelatin remains in a coherent form; the phosphate passes into solution as mono-calcic salt, which is recovered by evaporation in crystals and then reduced by distillation with charcoal. None of these (and other) proposals have been much heeded; the manufacture of phosphorus at present, in fact, is almost a monopoly, the bulk of what occurs in commerce being produced by two firms, viz., Albright and Wilson of Oldbury, near Birmingham, and Coignet and Son in Lyons. According to E. Kopp, the production in 1874 amounted to 1200 tons.

Recently purified phosphorus is a slightly yellowish or colourless solid of about the consistence of beeswax. At low temperatures it is brittle, specific gravity = 1.83 at 10°C . It fuses at 44°C . into a strongly light-refracting liquid of 1.743 (Kopp) specific gravity. Neither in the solid nor in the liquid state does it conduct electricity. When heated further (in an inert atmosphere such as hydrogen or carbonic-acid gas) it boils at 280°C , and assumes the form of a colourless vapour which at 1040°C is 4.5 times as heavy as air or 65.1 times as heavy as hydrogen, whence it follows that its molecular weight is $2 \times 65.1 = 130.2$ = very nearly four times the atomic weight of phosphorus (31.0). Phosphorus is insoluble in water, more or less sparingly soluble in alcohol, ether, fatty oils, and oil of turpentine, and very abundantly soluble in bisulphide of carbon. When exposed to the air, and especially to moist air, it suffers gradual oxidation into phosphorous and phosphoric acids with evolution of a feeble light. Phosphorus does not phosphoresce in the absence of oxygen. Singularly, it does not phosphoresce in pure oxygen either, unless the tension of the gas be reduced to some point considerably below one atmosphere (Graham). Phosphorus is a most dangerous poison, doses of as little as 0.1 gramme ($= 1.5$ grains) are known to have been fatal to adults. The heads of a few lucifer matches may suffice to kill a child. Phosphorus is used chiefly for the manufacture of lucifer matches (see MATCHES, vol. xv. pp. 625, 626) and also in the manufacture of iodide of methyl and other organic preparations used as auxiliary agents in the tar-colour industry. Phosphorus-paste, made by working up a small proportion of phosphorus melted under water in a hot mortar with flour, is used as poison for vermin.

Red Phosphorus.—A red infusible solid which is always produced when ordinary phosphorus is made to burn in an insufficient supply of air, and also by the long-continued action of sunlight on phosphorus-sticks kept under water, used to be taken for a lower oxide of the element, until A. v. Schrotter of Vienna showed, in 1846, that it is nothing but an allotropic modification of the elementary substance. A given mass of ordinary phosphorus can be converted almost completely into the red modification by keeping it at 240° to 250°C . in the absence of air for a sufficient time. The addition of a trace of iodine to phosphorus at 200°C brings about the conversion suddenly with large evolution of heat (Brodie). Red phosphorus is now an article of chemical manufacture. The phosphorus is simply heated, and kept at the requisite temperature, within a large iron pot which communicates with the atmosphere by only a narrow tube. At a very slight pressure of the material the air within the apparatus is quickly deoxygenated and converted into (merit) nitrogen. The requisite steady temperature is maintained by means of a bath of molten solder. By the mere effect of the heat the phosphorus becomes more and more viscid and darker and darker in colour, and is at last completely converted into a dark-red opaque infusible solid. This, however, always includes a small proportion of the ordinary modification, which is most readily extracted by powdering the crude product and exhausting it with bisulphide of carbon, which does not affect the red kind. A less expensive method is to boil the powdered raw product with successive quantities of caustic-soda ley, when the ordinary phosphorus only is dissolved as hypophosphite with evolution of phosphuretted hydrogen. The residue is washed and

dried and then sent out in bottles or canisters like any ordinary chemical preparation. It is not at all affected by even moist air, nor by aërated water, hence it is neither phosphorescent nor poisonous. When heated in air to about 260° C it begins to pass into the ordinary modification, and consequently burns less readily enough, into the same phosphoric acid, P_2O_5 , as ordinary phosphorus does. But its combustion-heat amounts to only 5070 Centigrade-units per unit-weight of fuel as against the 5953 units produced in the combustion of ordinary phosphorus. The balance of 883 units is the equivalent of the surplus of energy contained in the yellow as compared with the red modification. This accounts for the relative chemical inertness of the yellow form. The specific gravity of red phosphorus is 2.089 to 2.106 at 17° C, its electric conductivity power is about 0.000,001 of that of silver wire (Matthiessen). It is used in making safety-matches.

Metallic Phosphorus—This, discovered by Hittorf, is obtained by heating ordinary phosphorus with lead in sealed-up tubes to redness for forty hours. After removal of the lead by nitric acid metallic phosphorus remains, partly in the shape of dark iridescent plates, partly in the form of muscogreen rhombohedra. It requires a temperature of 355° to be converted into ordinary phosphorus-vapour. The specific gravity is 2.24 at 15° C.

Detection of Phosphorus—The detection of (old) phosphorus in medico-legal cases offers no difficulty as long as the phosphorus has not disappeared by oxidation. In the case of a mass of food or the contents of a stomach the first step is to spread out the mass on a plate and view it in the daylight. A very small amount of phosphorus becomes visible by its phosphorescence. Failing this, the mass is distilled with water from out of a glass flask connected with a glass Liebig's condenser in a dark room. The minutest trace of phosphorus suffices to impart phosphorescence to the vapour at some stage of the distillation. Should this second test fail we must search for phosphorous acid, which may be there as a product of the oxidation of the phosphorus originally present as such. To test for phosphoric acid would be of no use, as salts of this acid are present in all animal and vegetable juices and tissues. Phosphorous acid, if present, can be detected by treating the mass, in a properly constructed gas evolution apparatus, with pure hydrochloric acid and zinc. The hydrogen gas evolved must be purified by passing it over pieces of solid caustic potash, and then over a solution of caustic soda in water. If the reagents are pure and phosphorous acid is absent the gas burns with a colourless flame, which remains so even when depressed by means of a porcelain plate; in the presence of phosphorous acid the gas contains phosphinettied hydrogen, which causes the flame of the gas to exhibit a green color, at least when depressed by means of a porcelain plate. The test is very delicate, but in interpreting a positive result it must be remembered that it applies likewise to phosphorous acid, and that certain salts of this acid are recognized medicinal agents.

Of all phosphorus compounds other phosphates are the commonest, and they can be detected by the tests given below under "Phosphates." All other phosphorus compounds, when fused with carbonate of alkali and nitre, or heated in sealed-up tubes with strong nitric acid to a sufficient temperature, are changed so that the phosphorus assumes the form of ortho-phosphoric acid, which is easily detected. Either of the two operations named (by the mere action of the alkali or of the acid *qua* acid) converts what may be present of meta-phosphoric or pyro-phosphoric into ortho-phosphoric acid.

Phosphor-bronze—This name has been given to a class of useful metallic substances produced by the chemical union of either pure copper or of copper alloys with phosphorus. Most commercial copper is contaminated with a small proportion of its own sub-oxide, which, in the case of an otherwise pure metal, detracts from its tenacity and plasticity, and all ordinary bronze is subject to a similar contamination, because, whatever kind of copper may have been used in making it, the tin is sure to suffer partial oxidation, and some of this oxide, as Montefiori-Levi and Kunzel found, remains diffused throughout the casting. A phosphor-copper alloy, being homogeneous and solidly, Experience shows that both in the case of copper and bronze the oxygen present as metallic oxide can be removed by introduction into the fused metal of a judiciously limited proportion of phosphorus, which takes out the oxygen (and itself) into the slag as phosphate, and thus produces a purely metallic and consequently superior metal. A small excess of phosphorus in either case effects further improvement. A phosphor-copper containing 0.1 to 0.5 per cent of the non-metallic element has all the plasticity of the pure metal coupled with higher degrees of hardness and solidity. An alloy of from 0.5 to 2.0 per cent gives good castings, because, unlike the pure metal, it does not form blisters on solidifying. In the case of phosphorized bronze the presence of somewhat more than 0.5 per cent. of phosphorus (in the finished alloy) produces a warmer tone of colour (more gold-like than that of the plain alloy), a greater resistance to the action of acids, a higher degree of elasticity, and a higher breaking-strain. The latter may be more than double that of the corresponding plain bronze. By

increasing or diminishing the proportion of phosphorus the mechanical properties of a phosphor-bronze can be modified at will, within wide limits. By its fine colour and its perfect fluidity when molten it lends itself particularly well for the casting of artistic or ornamental articles. The introduction of phosphorus into the metal is best effected by fusing it with the proper proportion of a *rich* phosphor-copper. A phosphor-copper containing about 0.5 per cent of phosphorus can be produced as follows. A kind of potential phosphorus ("phosphorus mass") is made by mixing superphosphate of lime with 20 per cent of charcoal, and dehydrating the mixture at a dull red heat. Six hundred parts of this mass are mixed with 876 of copper-tunings and 76 of charcoal, and kept at copper-fusion heat for sixteen hours within a graphite crucible. The phosphor-copper is obtained in the form of detached granules, which are picked out, re-fused, and cast out into cast-iron moulds. Phosphor-bronze has only come to be popularly known during the last decade or two, but as early as 1848 A. & H. Paikes of Birmingham took out a patent for phosphoriferous metallic alloys.

Phosphor etal Hydogen—Of these three are known, namely, (1) phosphine, a gas of the composition and specific gravity PH_3 , (2) a volatile liquid of the composition and vapour-density P_2H_4 , and (3) a yellow solid of the probable composition P_3H_3 . The liquid compound (No. 2) at once catches fire when it comes into contact with air, and a small admixture of its vapour to any inflammable gas, such as coal-gas, renders the latter self-inflammable. The most important and best known of the three hydrides is phosphine, PH_3 . This gas is formed when any (pure) phosphorus acid is heated—thus $PH_3O_2 = 3PH_3 + 2H_2O$; P_2H_4 , also, when phosphorus is being dissolved in hot solutions of caustic potash, soda, or baryta,

also by the action of water on the phosphides of highly basulous metals. The gas evolved by any of these processes is impure, that obtained by the second or third invariably includes vapour of P_2H_4 , and consequently is self-inflammable. Pure phosphine can be obtained only by decomposing solid oxide of phosphonium with concentrated caustic potash-ley in a suitable gas-evolution bottle previously filled with hydrogen to avoid explosions. It is a colourless gas, smelling intensely like rotten fish, and very poisonous. It is slightly soluble in water, and takes fire in air only beyond 100° C. It may be mixed with pure oxygen without change; but when the mixture is suddenly expanded it explodes violently. Notwithstanding its analogy to ammonia (NH_3), phosphine is only very feebly basic. It unites with gaseous hydriodic or hydrobromic acid into solid phosphonium salts PH_4I or PH_4Br , but these are both decomposed by water into the gas and the corresponding acids. Pure phosphine is a little known gas, chemists are more familiar with the (impure) gas which is evolved when "phosphine of calcium" is thrown into water, and which, containing vapour of P_2H_4 , at once catches fire when it bubbles out of the water into the air, with formation of steam and a smoke of meta-phosphoric acid, which latter, in a still atmosphere, assumes the form of an exquisite cotton-wool. During the last decade or so this reaction has come to be pretty extensively utilized in navigation for producing a light on the surface of the sea at night, in case of accidents, and for other purposes. A British patent for this useful application of phosphide of calcium was granted (No. 1328) to the agent of Siles and Pegot Ogier of Paris on the 8th of August 1859, but allowed to lapse in 1863, to be subsequently wrought by others. The manufacture of the phosphide is now (1881) effected chiefly by one firm (in Warrington, England), and through the courtesy of their chemist, Mr. W. G. Johnston, the writer is enabled to give the following details. The preparation of the phosphide is effected within a crucible standing on a support within a furnace, and divided by a perforated false bottom into two compartments. The lower is charged with pieces of phosphorus, the upper, up to the closely-fitting lid, with fragments of calcium. The firing is conducted so that the lime is hot before the phosphorus, through the radiation and conduction of the heat applied above, begins to volatilize. A charge yielding 20 lb of product is finished in from five to eight hours. The reaction is very complex, but it is easy to see through its general course; part of the phosphorus deoxidizes lime with formation of P_2O_3 , which unites with other lime into phosphate, and of calcium, which combines with other phosphorus to produce chiefly P_2H_4 . Of the latter, P_2H_4 seems to predominate, and consequently the product, when thrown into water, should yield chiefly the hydride P_2H_4 ; but this latter very readily breaks up into phosphine and solid hydride P_3H_3 . The crude phosphide forms a brown stone-like mass, which must at once be secured in air-tight receptacles. But most of it is immediately worked up into "lights" of various kinds, of which the "life-buoy" light is the most select. Each of these consists of a cylindrical turned-iron box, the upper half of which is taken up by an inverted hollow box, which serves as a float when the light is in the water. The lower half contains

or etruic acid; but the writer is far from recommending the substitution. Professor Gangue has made the very surprising discovery that meta-phosphoric and pyro-phosphoric, although so closely allied to ortho-phosphoric acid, are poisons, as phosphorus acids is.

Phosphoric acid readily combines with and neutralizes alkalis, even when these are given as carbonates. The concentrated acid, when heated in porcelain or glass, strongly attacks either material, hence its concentration ought always to be effected in platinum. In former times, when phosphorus was expensive, the acid, or rather an apology for the same, used to be prepared from bone-ash.

Alkaline Phosphates—Of these the di-sodic salt is of the greatest practical importance. It is prepared by somewhat more than neutralizing the hot aqueous solution of carbonate of soda. A cheaper (manufacturing) process is to prepare a solution of "super-phosphate" from bone-ash by the action of vitriol, and, after elimination of the gypsum, to supersaturate the liquid with carbonate of soda and filter off the phosphate of lime produced (see p 815 *supra*), where the process is explained indirectly). The salt, from sufficiently strong hot solutions, separates out in large transparent crystals of the composition $\text{P}_2\text{O}_5 \cdot \text{Na}_2\text{H} + 12\text{H}_2\text{O}$, which lose their crystal-water on exposure to dry air, even at ordinary temperatures, and very quickly at 100°C . The residue, $\text{P}_2\text{O}_5 \cdot \text{NaH} = (\text{P}_2\text{O}_5 \cdot 2\text{Na}_2\text{O} \cdot \text{H}_2\text{O})$, when heated to redness, loses its immanent water and becomes pyro-phosphate, which latter retains its specific character on being dissolved in water. A solution of the (original) salt in water has a mild taste (hence its preferential application as a pleasant purgative), it colours red litmus-paper intensely blue, and does not act upon alkaline carbonates. It, when evaporated with the calculated proportion of an ounce of soda (Na_2CO_3 per P_2O_5) to excess at last, ultimately, a red heat, it yields a residue of tri-sodic salt ($\text{P}_2\text{O}_5 \cdot \text{Na}_3$) as a white mass, infusible at the highest temperature producible within a platinum crucible over a glass blowpipe. The solution of this salt in water has all the properties of a mixed solution of $\text{P}_2\text{O}_5 \cdot \text{Na}_2\text{H} + \text{NaOH}$; yet it is capable of depositing crystals of the composition $\text{P}_2\text{O}_5 \cdot \text{Na}_3 + 12\text{H}_2\text{O}$. The mono-sodic salt ($\text{P}_2\text{O}_5 \cdot \text{NaH}$), producible by mixing together solutions containing the quantities H_2PO_4 and Na_2HPO_4 , is of no importance. Of the three *potash* salts, the mono-metallic salt ($\text{P}_2\text{O}_5 \cdot \text{K}$) is the most readily produced. It forms beautiful anhydrous crystalline crystals which at a red heat lose their H_2O and become meta-phosphate, $\text{P}_2\text{O}_5 \cdot \text{K}$.

Ammonia Salts—A strong solution of the acid, when supersaturated with ammonia, deposits on cooling crystals of the diammoniac salt $\text{P}_2\text{O}_5 \cdot (\text{NH}_3)_2\text{H}$, liable to be contaminated with the mono-ammoniac salt. The tri-ammoniac salt is very unstable, and hardly known.

The double salt $\text{P}_2\text{O}_5 \cdot (\text{NH}_3)_2\text{NaH} + 4\text{H}_2\text{O}$ was known to the alchemists as "*sal microcosmum urinum*," and is interesting historically as having served Bland as a raw material for the making of phosphorus. It is easily prepared, either by mixing the solution of the two quantities $\text{P}_2\text{O}_5 \cdot \text{Na}_2\text{HPO}_4$ and $\text{P}_2\text{O}_5 \cdot (\text{NH}_3)_2\text{HPO}_4$ together and allowing to crystallize, or by dissolving the former along with NH_4Cl parts of sal-ammoniac in water, and removing the chloride of sodium produced by crystallization in the *heat*. Microcosmic salt, when heated to redness, leaves a viscid glass of meta-phosphate of soda, which dissolves all basic metallic oxides pretty much as fused borax does, with formation of glasses which often exhibit colours characteristic of the dissolved oxides. Hence its application in blowpipe analysis.

Phosphates of Lime—The normal salt $\text{P}_2\text{O}_5 \cdot 3\text{CaO}$ or $\text{P}_2\text{O}_5 \cdot \text{Ca}_3$, where $\text{Ca} = \frac{1}{2}\text{CaO}$ —one equivalent of calcium, or perhaps a compound of it and carbonate of lime, forms the predominating component of bone-ash. A hydrate of the salt is produced by precipitating chloride of calcium solution with excess of ordinary phosphate of soda, mixed with enough of ammonia to produce (virtually) tri-alkaline salt, as a gelatinous precipitate similar in appearance and behaviour on filtration to precipitated alumina. A suspension of this precipitate in water, into fine acid with a quantity of water sufficient to dissolve it, into fine acid with a precipitate of di-calcic salt, $2\text{P}_2\text{O}_5 \cdot \text{Ca}_2\text{H} = \text{P}_2\text{O}_5 \cdot \text{H} + \text{P}_2\text{O}_5 \cdot \text{Ca}_2\text{H}$. A very impure form of this salt, known as "superphosphate," enters into the composition of many artificial manures. Such superphosphates is made industrially by treating broken-up bones, or powdered bone-ash, or powdered phosphoric, or coprolite, or occasionally apatite with chamber-acid, meaning vitriol of about 80 per cent., as it comes out of the chamber. The phosphate is mixed with the acid in a lead-lined trough by means of machinery, when a rather lively reaction sets in, involving the evolution of vapour of water mixed with hydrofluoric acid, and fluoride of silicon if mineral phosphate is used, possibly also with traces of fluoride or chloride of arsenic, and, in any case, with stinking volatile organic substances. The

vapour, therefore, must be removed by means of suitable draught arrangement. The mass passes, from the trough into a (ventilated) chamber, where the reaction gradually accomplishes itself with ultimate formation of a porous friable mass, dry to the touch. This is superphosphate as it goes out into commerce or is used as an ingredient in making more complex manures. Its value is determined chiefly by its percentage of "soluble phosphoric acid," meaning the percentage of P_2O_5 extractable as $\text{P}_2\text{O}_5 \cdot \text{H}$ or $\text{P}_2\text{O}_5 \cdot \text{Ca}_2\text{H}$, by a certain large proportion of cold water. This percentage is liable to decrease on long-continued storing, especially in the case of mineral superphosphates, through a gradual formation of (or regeneration of originally present) phosphate of iron and alumina, partly, perhaps, also through the spontaneous decomposition of some of the mono-calcic salt into insoluble di-calcic salt and free acid. The portion of the P_2O_5 which has thus become insoluble is designated a "reduced" phosphoric acid. In regard to other phosphates than those named reference may be made to the handbooks of chemistry.

Analysis—Phosphoric acid, when given in any form, *soluble in solution of ammonia*, can be detected and determined by "magnesium mixture" (a solution of chloride of magnesium and sal-ammoniac, $\text{MgCl}_2 \cdot 2\text{NH}_4\text{Cl}$, strongly alkalinized by addition of aqueous ammonia). The phosphoric acid is very gradually, but at last completely, precipitated in microscopic crystals of the salt $\text{P}_2\text{O}_5 \cdot \text{Mg}(\text{NH}_3)_2 + 6\text{H}_2\text{O}$, which, though slightly soluble in water, can be washed pure, without loss, with dilute ammonia. All other acids except arsenic acid (As_2O_3)—which behaves like phosphoric acid, and, if present, must be removed by sulphuretted hydrogen—remain dissolved. The precipitate, when kept at a red heat, assumes the composition $\text{P}_2\text{O}_5 \cdot 2\text{MgO}$, and from its weight the phosphoric acid present can be calculated. Phosphates soluble in acids, and reprecipitated from their solutions as such by ammonia—as phosphate of lime or alumina, or ferric oxide—used to give great difficulties to the analysts until Sonnenschein founded an excellent quantitative method for their analysis upon a reaction discovered by Swanberg and Struve, which is explained under *MOBYDENIUM* (vol. xvi, p 697). The phosphate is dissolved in nitric acid (hydrochloric is less to be recommended) and the solution mixed and kept for some hours at 40°C , with a large excess of a solution of molybdate of ammonia in excess of nitric acid. The phosphoric acid (along with any arsenic acid that may be present) comes down as yellow crystalline phospho-molybdate of ammonia, soluble in phosphoric acid and slightly in water, but insoluble in *dilute* nitric acid in the presence of a sufficiency of nitrate of ammonia. The precipitate is soluble in aqueous ammonia, and from the solution of P_2O_5 can be reprecipitated by magnesia mixture as above explained. Neither of the two methods applies directly to meta-phosphates or pyrophosphates. Regarding these, see the last paragraph of the section "phosphorus" above. (W. D.)

PHOTIUS, patriarch of Constantinople from 857 to 867 and again from 877 to 886 A.D., the most eminent literary and ecclesiastical character of his age, was probably born between 820 and 825. If we could credit the assertions of his adversaries, his father, an official of the imperial court, named Sergius, was of heathen extraction, and his mother, Irene, a faithless nun. It is more certain that he displayed from an early age the most extraordinary talent and appetite for knowledge, and that, having mastered whatever Greek literature could give him (Latin and Hebrew he never acquired), he began to teach with distinguished success grammar, rhetoric, divinity, and philosophy. The way to public life was probably opened for him by the brilliant marriage of his maternal uncle to the princess Irene, sister of the empress Theodora, who, upon the death of her husband Theophilus in 842, had assumed the regency of the empire. Photius became captain of the guard and subsequently first imperial secretary. Somewhere about 850 he was entrusted with a mission to the "Assyrians," by whom the Saracens must be meant, possibly to the court of the caliph of Baghdad. Just previous to his departure on this mission he compiled his *Bibliotheca*, or *Myrobiblion*, the noblest monument of his erudition, and, from the number of classical authors whose writings it has partially preserved, by much the most important of his works.

Some time after his return from this embassy an unexpected path was opened to Photius's ambition by the dissensions between the patriarch Ignatius and Bardas, the uncle of the youthful emperor Michael III., who had succeeded to the regency on the disgrace of Theodora. Ignatius,

a man of austere morals and apparently not exempt from spiritual pride, had excommunicated Bardas on the ground of an alleged incestuous connexion with his daughter-in-law. Bardas retorted by an accusation of a conspiracy. Ignatius was arrested and imprisoned (November 857), and upon his refusing to resign was illegally deposed, when Photius, receiving all the necessary sacerdotal orders within six days, was installed as patriarch in his place. This sudden elevation of a layman to the highest ecclesiastical office could not but provoke scandal, even though the laic, as was actually the case, might be the first theologian of his age. Ignatius, continuing to refuse the abdication which could alone have given it a semblance of legality, was treated with extreme severity, and a violent persecution broke out against his adherents. Photius urged clemency in his epistles to Bardas, probably with sincerity, but shrank from taking the only step which could have effectually repressed the persecution and healed the schism,—the resignation of the patriarchate. In judging his conduct, however, two circumstances have to be borne in mind,—the fact that the party of Ignatius dwindled away so rapidly as to flatter Photius with the hope of its extinction, and the espousal of his competitor's cause by Nicholas, bishop of Rome, in a manner highly offensive to the independent feeling of the Eastern Church. Photius felt himself the champion of Eastern Christianity against Latin pretensions, and, when in 863 Nicholas finally anathematized and deposed him, he replied by a counter-excommunication. He also sought to ally himself with Western bishops who had been displaced or suspended by the arrogant Nicholas, and with the latter's secular adversaries, while at the same time he was more honourably engaged in endeavours to reunite the Armenians to the Eastern Church, in combating the Paulicians, and in successful missions to the Russians and Bulgarians. While these transactions were proceeding the situation was suddenly changed by the murder of Photius's patron, Cesar Bardas, by order of the emperor Michael, who was himself assassinated by his colleague Basil in the following year (867). The fall of Photius immediately ensued, but the attendant circumstances are exceedingly obscure. According to Georgius Hamartolus, or rather his continuator, the cause was Photius's stern reproof of the crime by which Basil had obtained the throne. As the only definite testimony of any kind, this statement cannot be wholly disregarded, but it is certainly difficult to reconcile it with the general suppleness of Photius in his relations with the Byzantine court. Whatever the cause, Photius was removed from his office and banished about the end of September 867, a few days after the accession of Basil, and the deposed Ignatius, brought back from his exile, was reinstated on 23d November. The convocation of a general council followed, to give the restoration of Ignatius a character of indisputable legality. This synod, regarded by the Latins as the eighth œcumenical council, but rejected as such by the Greeks, met in October 869. The attendance of Eastern bishops was relatively very small; Photius's friends and creatures generally remained faithful to him; and the ostentatious patronage of Pope Hadrian must have been irritating to the Orientals. Photius, when brought before the assembly, maintained a dignified silence, which perplexed his accusers, but could not avert his condemnation. It seems, nevertheless, to have been generally felt that the proceedings of the council were entitled to little moral weight. The usurper, for such he unquestionably was, had successfully identified himself with the cause of his church and nation. In his captivity, which, notwithstanding his complaints, the extent of his correspondence proves to have been mild, he maintained the same unbending spirit, and rejected all overtures of compromise. About

876 he was suddenly recalled to Constantinople and entrusted with the education of Basil's children. A tale of his having regained favour by forging an illustrious genealogy for the upstart emperor may be dismissed without hesitation as an invention of his enemies. The cause was in all probability Basil's recognition of the fact that he had disgraced and banished the ablest man in his dominions, and the best qualified to fill the patriarchate upon the decease of the aged Ignatius. This event soon occurred, probably in October 877, and after a decent show of reluctance Photius again filled the patriarchal throne. According to his own account, which there seems no reason to discredit, he had become fully reconciled to his predecessor, and had shown him much kindness. Photius now proceeded to obtain the formal recognition of the Christian world. In November 879 a synod, considered by the Greeks as the eighth œcumenical council, and far more numerously attended than the one by which he had been deposed, was convened at Constantinople. The legates of Pope John VIII. attended, prepared to acknowledge Photius as legitimate patriarch, a concession for which John was so much censured by Latin opinion that Baronius rather fancifully explains the legend of Pope Joan by the contempt excited by his want of spirit. John, however, was firm on the other two points which had long been contested between the Eastern and Western Churches, the ecclesiastical jurisdiction over Bulgaria and the introduction of the "filioque" clause into the creed. He disowned his legates, who had shown a tendency to yield, again excommunicated Photius, and thus kindled smouldering ill-will into the open hostility which has never been appeased to this day. Strong in the support of the council, Photius simply ignored him. He has been accused of interpolating John's letters, a charge not improbable in itself, but which can neither be proved nor disproved at this date. At the height of glory and success he was suddenly precipitated from his dignity by another palace revolution. Archbishop Theodore Santabaren, his confidant and favourite, had accused Basil's son, Leo, of a conspiracy against his father. Leo owed his liberty and eyesight to Photius's entreaties; nevertheless, on his accession in 886, he involved his benefactor in the ruin of his accuser. Arrested, degraded from the patriarchate, banished to the monastery of Bordi in Armenia, Photius, as if by magic, disappears from history. No letters of this period of his life are extant, which leads to the inference that his imprisonment was severe. The precise date of his death is not known, but it is said to have occurred on 6th February 891.

For long after Photius's death his memory was held in no special honour by his countrymen. His literary merits were obscured by the growing barbarism of the times, and the anarchy and apparent decadence of the Roman Church made his protest against its pretensions seem superfluous. But, when, in the ensuing age, the Greek Church and state were alike in danger from Latin encroachments, Photius became a national hero, and is at present regarded as little short of a saint. To this character he has not the least pretension. Few men, it is probable, have been more atrociously calumniated, but, when every specific statement to his prejudice has been rejected, he still appears on a general review of his actions worldly, crafty, and unscrupulous. Yet, however short he may fall of the standard of an Athenæus or a Luther, he shows to no little advantage when regarded as an ecclesiastical statesman. His firmness was heroic, his sagacity profound and far-seeing, he supported good and evil fortune with equal dignity; and his fall was on both occasions due to revolutions beyond his control. If his original elevation to the patriarchate was unquestionably irregular, his re-enthronement was no less entirely legal; he began as a usurper and ended as a patriot. His zeal for the promotion of learning, education, and missions was most genuine, and fruitful in good. In erudition, literary power, and force and versatility of intellect he far surpassed every contemporary. The records of his actions are so imperfect or so prejudiced that in endeavouring to judge his personal character we have to rely principally upon the internal evidence of his own letters. With every allowance for their *ex parte* and rhetorical character and the writer's manifest desire to display

himself in the most favourable light, they nevertheless seem to afford sufficient testimony of a magnanimous spirit and a feeling heart.

The most important of the works of Photius is his renowned *Myrobolion*, a collection of extracts from and abridgments of 280 volumes of classical authors, the originals of which are now to a great extent lost. Dictated in haste immediately before his departure on his Eastern embassy, it is open to the charges of imperfect recollection and hasty criticism, but these are as nothing in comparison with its merits. It is especially rich in extracts from historical writers. To Photius we are indebted for almost all we possess of Ctesias, Memnon, Canon, the lost books of Diodorus Siculus, and the lost writings of Arrian. Theology and ecclesiastical history are also very fully represented. The best edition is Bekker's (Berlin, 1824-25), which, however, has neither notes nor a Latin version. The text of his works in importance is the *Amphilochia*, a collection of 333 questions and answers on difficult points in Scripture, addressed to Amphilochus, archbishop of Cyzicus. This valuable work has exposed Photius to charges of plagiarism, which, as he does not claim entire originality, are wholly undeserved. The only complete edition is that published by Sophocles Gennadius at Athens in 1858. Photius is further

author of a *Lexicon* (London, 1822), of a *Novoromanos* on harmony of the ecclesiastical canons with the imperial edicts relating to the discipline of the church, a work of great authority, but based on the labours of his predecessors, and of numerous theological writings. The more important of these are his treatise *Against the Paphlagonians*, in four books, and his controversy with the Latins on the procession of the Holy Spirit. His *Epistles* are valuable from their contents, but the style is often affected or unsuitable to the subject. The most complete edition is Valletta's (London, 1864). Many of Photius's works yet remain in manuscript. The only complete edition is Bishop Malou's in Migne's *Patrologia Græca*, and this is very imperfect and unsatisfactory.

After the allusions in his own writings the chief contemporary authority for the life of Photius is his bitter enemy Nicetas the Paphlagonian, the biographer of his rival Ignatius. In modern times his life has been written with great prejudice and animosity by Baronius, and by Wegelin in the *Mémorial de la Berlin Academy*, and more fairly by Hankins (*De Photio: unus de usque Scriptores*, pt. 1). But all previous writers are superseded by the classical work of Cardinal Haegenrother, *Photius, Patriarch von Constantinopel* (3 vols., Ratisbon, 1867-69). As a dignitary of the Roman Catholic Church Cardinal Haegenrother is naturally biased against Photius as an ecclesiastic, but his natural candour and sympathy with intellectual eminence have made him just to the man, while his investigation of all purely historical and literary questions is industrious and extensive in the highest degree. (R G.)

PHOTOGRAPHY

IT would be somewhat difficult to fix a date when what we now know as "photographic action" was first recorded. No doubt the tanning of the skin by the sun's rays was what was first noticed, and this is as truly the effect of solar radiation as is the darkening of the sensitive paper which is now in use in photographic printing operations. We may take it that Scheele, the Swedish chemist, was the first to enter upon a scientific investigation of the darkening action of sunlight on silver chloride. He found by experiment that when silver chloride was exposed to the action of light beneath water there was dissolved in the fluid a substance which, on the addition of caustic (silver nitrate), caused the precipitation of new silver chloride, and that on applying liquor ammonia to the blackened chloride an insoluble residue of metallic silver was left behind. He also noticed that of the rays of the spectrum the violet most readily blackened the silver chloride. In Scheele, then, we have the first who applied combined chemical and spectrum analysis to the science of photography. Senefelder repeated Scheele's experiments, and found that in fifteen seconds the violet rays blackened silver chloride as much as the red rays did in twenty minutes.¹ About twenty years later than Scheele's experiments Count Rumford contributed a paper to the *Philosophical Transactions of the Royal Society* (1798) entitled "An inquiry concerning the chemical properties that have been attributed to light," in which he tried to demonstrate that all effects produced on metallic solutions could be brought about by a temperature somewhat less than that of boiling water. Robert Harrup in 1802, however, conclusively showed in *Nicholson's Journal* that, at all events, salts of mercury were reduced by visible radiation and not by change of temperature. In 1801 we come to the next decided step in the study of photographic action, when Ritter proved the existence of rays lying beyond the violet limit of the spectrum, and found that they had the power of blackening silver chloride. Such a discovery naturally gave a direction to the investigations of others, and Seebeck (between 1802 and 1808) and Bérard turned their attention to this particular subject, eliciting information which at the time was of a valuable nature. We need only mention two or three other cases where the influence of light was noticed at the beginning of this century. Wollaston observed the conversion of yellow gum guaiacum into a green tint by the violet rays, and the restoration of the colour by the red rays,—both of which, he it observed,

are the effect of absorption of light, the original yellow colour of the gum absorbing the violet rays, whilst the green colour to which it is changed absorbs the red rays. Davy found that puce-coloured oxide of lead, when damp, became red in the red rays, whilst it blackened in the violet rays, and that the green oxide of mercury became red in the red rays,—again an example of the necessity of absorption to effect a molecular or chemical change in a substance. Desmoriens in 1801 observed the change effected in Prussian blue, and Bockman noted the action of the two ends of the spectrum on phosphorus, a research which, it may be mentioned, Draper extended further in America at a later date.

To England belongs the honour of first producing a Wedgwood photograph by the utilization of Scheele's observations on chloride of silver. In June 1802 Wedgwood published in the *Journal of the Royal Institution* the paper—"An account of a method of copying paintings upon glass and of making profiles by the agency of light upon nitrate of silver, with observations by H. Davy." He remarks that white paper or white leather moistened with a solution of nitrate of silver undergoes no change when kept in a dark place, but on being exposed to the daylight it speedily changes colour, and, after passing through various shades of grey and brown, becomes at length nearly black. The alteration of colour takes place more speedily in proportion as the light is more intense.

"In the direct beam of the sun two or three minutes are sufficient to produce the full effect, in the shade several hours are required, and light transmitted through different-coloured glasses acts with different degrees of intensity. Thus it is found that red rays, or the common sunbeams passed through red glass, have very little action upon it, yellow and green are more efficacious, but blue and violet light produce the most decided and powerful effects."

Wedgwood then goes on to describe the method of using this prepared paper by throwing shadows on it, and inferentially by what we now call "contact printing." He states that he has been unable to fix his prints, no washing being sufficient to eliminate the traces of the silver salt which occupied the unexposed or shaded portions. Davy in a note states that he has found that, though the images formed by an ordinary camera obscura were too faint to print out in the solar microscope, the images of small objects could easily be copied on such paper.

"In comparing the effects produced by light upon muriate of silver (silver chloride) with those upon the nitrate it seemed evident that the muriate was the most susceptible, and both were more readily acted upon when moist than when dry—a fact long ago known. Even in the twilight the colour of the moist muriate of silver, spread upon paper, slowly changed from white to faint

¹ It may here be remarked that had he used a pure spectrum he would have found that the red rays did not blacken the material in the slightest degree.

violet, though under similar circumstances no intermediate alteration was produced upon the nitrate. Nothing but a method of preventing the unshaded parts of the delineations from being coloured by exposure to the day is wanting to render this process as useful as it is elegant."

In this method of preparing the paper lies the germ of the silver-printing processes which are practised at the present time (1884), and it was only by the spread of chemical knowledge that the hiatus which was to render the "process as useful as it is elegant" was filled up—when hyposulphite of soda, discovered by Chausser in 1799, or three years before Wedgwood published his paper, was used for making the print permanent. Here we must call attention to an important observation by Dr Seebeck of Jena in 1810. In the *Verleichte* of Goethe he says:

"When a spectrum produced by a properly constructed prism is thrown upon moist chloride of silver paper, if the painting be continued for from fifteen to twenty minutes, whilst a constant position for the spectrum is maintained by any means, I observed the following. In the violet the chloride is a reddish brown (sometimes more violet, sometimes more blue), and this coloration extends well beyond the limit of the violet, in the blue the chloride takes a clear blue tint, which fades away, becoming lighter in the green. In the yellow I usually found the chloride unaltered, sometimes, however, it had a light yellow tint, in the red and beyond the red it took a rose or lilac tint. This image of the spectrum shows beyond the red and the violet a region more or less light and uncoloured. This is how the decomposition of the silver chloride is seen in this region. Beyond the brown band, . . . which was produced in the violet, the silver chloride was coloured a grey-violet for a distance of several inches. In proportion as the distance from the violet increased, the tint became lighter. Beyond the red, on the contrary, the chloride took a feeble red tint for a considerable distance. When moist chloride of silver, having received the action of light for a time, is exposed to the spectrum, the blue and violet behave as above. In the yellow and red regions, on the other hand, it is found that the silver chloride becomes paler; . . . the parts acted upon by the red rays and by those beyond take a light coloration."

This has been brought prominently forward by Dr J M Eder as being undoubtedly the first record we have of photographic action lending itself to production of natural colours, a fact which, in describing the history of photographic phenomena, has been more or less overlooked. We shall see later on that this observation of Seebeck was allowed to lie fallow for many years, until it was again taken up and published as a novelty. In photography perhaps, above all other technical applications of science, there has been a great flood of rediscovery, owing, no doubt, in the first instance to the fact that much published in one country has remained unknown in others, and also to the fact that it is difficult to boil down photographic literature and to ascertain what is really scientifically true and what is merely the result of unscientific use of the imagination. Photography has suffered greatly also from the fact that those who follow it are usually artists rather than scientific men, and fall into mistakes of theory which must of necessity lead to wrong conclusions.

The first to find a process of photography which gave pictures that were subsequently unaffected by light was Nicéphore de NIÉPCE (*q. v.*). His process, which he called provisionally "héliographie, dessins, et gravures," consists in coating the surface of a metallic plate with a solution of asphaltum in oil of lavender and exposing it to a camera image. In his description he recommends that the asphaltum be powdered and the oil of lavender dropped upon it in a wine-glass, and that it be then gently heated. A polished plate is covered with this varnish, and, when dried, is ready for employment in the camera. After requisite exposure, which is very long indeed, a very faint image, requiring development, is seen. Development is effected by diluting oil of lavender with ten parts by volume of white petroleum. After this mixture has been allowed to stand two or three days it becomes free from turbidity and is ready to be used. The plate is placed in a dish

and covered with the solvent. By degrees the parts unaffected by light dissolve away, and the picture, formed of modified asphaltum, is developed. The plate is then lifted from the dish, as much as possible of the solvent being allowed to drain away. It is next placed on an inclined support and carefully freed from all the remaining solvents by washing in water. Subsequently, instead of using oil of lavender as the asphaltum solvent, Niepce employed an animal oil, which gave a deeper colour and more tenacity to the surface-film than did his original agent.

Later still, Daguerre and Niepce used as a solvent the brittle residue obtained from evaporating the essential oil of lavender dissolved in ether or alcohol,—a transparent solution of a lemon-yellow colour being formed. This solution was used for covering glass or silver plates, which, when dried, could be used in the camera. The time of exposure varied somewhat in length. Daguerre remarked that "the time required to procure a photographic copy of a landscape is from seven to eight hours, but single monuments, when strongly lighted by the sun, or which are themselves very bright, can be taken in about three hours." Perhaps there is no sentence which could be quoted that illustrates more forcibly the advance made in photography from the days when this process was described. The ratio of three hours to $\frac{1}{37}$ th of a second is a fair estimate of the progress made since Niepce. The development was conducted by means of petroleum-vapour, which dissolved the parts not acted upon by light. As a rule silver plates seem to have been used, and occasionally glass; but it does not appear whether the latter material was chosen because an image would be projected through it or whether simply for the sake of effect. Viewed in the light of present knowledge, a more perfectly developable image in half-tone would be obtained by exposing the film through the back of the glass. The action of light on most organic matter is apparently one of oxidation. In the case of asphaltum or bitumen of Judea the oxidation causes a hardening of the material and an insolubility in the usual solvents. Hence that surface of the film is generally hardened first which first feels the influence of light. Where half-tones exist, as in a landscape picture, the film remote from the surface first receiving the image is not acted upon at all, and remains soluble in the solvent. It is thus readily seen that, in the case of half-tone pictures, or even in copying engravings, if the action were not continued sufficiently long when the surface of the film farthest from the glass was first acted upon, the layer next the glass would in some places remain soluble, and on development would be dissolved away, carrying the top layer of hardened resinous matter with it, and thus give rise to imperfect pictures. In carbon-printing development from the back of the exposed film is absolutely essential, since it depends on the same principles as does heliography, and in this the same mode of procedure is advisable. It would appear that Niepce began his researches as early as 1814, but it does not appear that he was very successful in his first endeavours: it was not till 1827 that he had any success worth recounting. At that date he communicated a paper to Dr Bauer of Kew, the secretary of the Royal Society of London, with a view to its presentation to that society. Its publication, however, was prevented because the process, of which examples were shown, was a secret one. There lies before the present writer an authentic MS. copy of Niepce's "Mémoire," dated "Kew, le 8 Décembre 1827," in which he says it will be found that "in his framed drawings made on tin the tone is too feeble, but that by the use of chemical agents the tone may be darkened." This shows that Niepce was familiar with the idea of using some darkening medium even with his photographs taken on tin plates.

Daguerre and Niepce *Daguerreotype*.—We have already noticed in the joint process of Daguerre and Niepce that polished silver plates were used, and we know from the latter that amongst the chemical agents tried iodine suggested itself. Iodine vapour or solution applied to a silvered plate would cause the formation of silver iodide on those parts not acted upon by light. The removal of the resinous picture would leave an image formed of metallic silver, whilst the black parts of the original would be represented by the darker silver iodide. This was probably the origin of the daguerreotype process. Such shrewd observers as Niepce and Daguerre, who had formed a partnership for prosecuting their researches, would not have thus formed iodide of silver without noticing that it changed in colour when exposed to the light. What parts respectively Daguerre and Niepce played in the development of the daguerreotype, which we shall shortly describe, will probably never be known with absolute accuracy, but in a letter from Dr Bauer to Dr Bennett, F.R.S., dated 7th May 1839, the former says:

"I received a very interesting letter from Mons Isidore Niepce, dated 12th March [about a month after the publication of the daguerreotype process], and that letter fully confirms what I suspected of Daguerre's manoeuvres with poor Nicéphore, but Mr Isidore observes that for the present that *letta* might be considered confidential."

Dr Bauer evidently knew more of "poor Nicéphore's" work than most people, and at that early period he clearly thought that an injustice had been done to Niepce at the hands of Daguerre. It should be remarked that Nicéphore de Niepce died in 1833, and a new agreement was entered into between his son Isidore de Niepce and Daguerre to continue the prosecution of their researches. It appears further that Niepce communicated his process to Daguerre on 5th December 1829. At his death some letters from Daguerre and others were left by him in which the use of iodine, sulphur, phosphorus, &c., is mentioned as having been used on the metal plates, and their sensitiveness to light, when thus treated, commented upon. We are thus led to believe that a great part of the success in producing the daguerreotype is due to the elder Niepce, and indeed it must have been thought so at the time, since, on the publication of the process, life-pensions of 6000 francs and 4000 francs were given to Daguerre and to Isidore Niepce respectively. In point of chronology the publication of the discovery of the daguerreotype process was made subsequently to the Talbot-type process. It will, however, be convenient to continue the history of the daguerreotype, premising that it was published on 6th February 1839, whilst Talbot's process was given to the world on 25th January of the same year.

Daguerreotype pictures were originally taken on silver-plated copper, and even at the present day the silvered surface thus prepared serves better than electro-deposited silver of any thickness. An outline of the operations is as follows. A brightly-polished silver plate is cleaned by means, first of finely-powdered pumice and olive oil then of dilute nitric acid, and a soft buff is employed to give it a brilliant polish, the slightest trace of foreign matter or stain being fatal to the production of a perfect picture. The plate, thus prepared, is ready for the iodizing operation. Small fragments of iodine are scattered over a saucer, covered with gauze. Over this the plate is placed, face downwards, resting on supports, and the vapour from the iodine is allowed to form upon it a surface of silver iodide, which is the sensitive compound. It is essential to note the colour of the surface-formed iodide at its several stages, the varying colours being due to interferences caused by the different thicknesses of the minutely thin film of iodide of silver. The stage of maximum sensitiveness is obtained when it is of a golden orange colour. In this

state the plate is withdrawn and removed to the dark slide of the camera, ready for exposure. A plan frequently adopted to give an even film of iodide was to saturate a card with iodine and hold the plate a short distance above the card. Long exposures were required, varying in Paris from three to thirty minutes. The length of the exposure was evidently a matter of judgment, more particularly as over-exposure introduced an evil which was called "solarization," but which was in reality due to the oxidation of the iodide, itself altered by prolonged exposure to light. As a matter of history it may be interesting to remark that the development of the image by means of mercury-vapour is said to be due to a chance discovery of Daguerre. It appears that for some time previous to the publication of the daguerreotype method he had been experimenting with iodized silver plates, producing images by what would now be called the "punning out" process. This operation involved so long an exposure that he sought some means of reducing it by the application of different reagents. Having on one occasion exposed such a plate to a camera-image, he accidentally placed it in the dark in a cupboard containing various chemicals, and found after the lapse of a night that he had a perfect image developed. By the process of exhaustion he arrived at the fact that it was the mercury-vapour, which even at ordinary temperatures volatilizes, that had caused this intensification of the almost invisible camera-image. It was this discovery that enabled the exposures to be very considerably shortened from those which it was found necessary to give in mere camera-printing. The development of the image was effected by placing the exposed plate over a slightly heated (about 75° C.) cup of mercury. The vapour of mercury condensed on those places where the light had acted in an almost exact ratio to the intensity of its action. This produced a picture in an amalgam of mercury, the vapour of which attached itself to the altered iodide of silver. Proof that such was the case was subsequently afforded by the fact that the mercurial image could be removed by heat. The developing box was so constructed that it was possible to examine the picture through a yellow glass window whilst the image was being brought out. The next operation was to fix the picture by dipping it in a solution of hyposulphite of soda. The image produced by this method is so delicate that it will not bear the slightest handling, and has to be protected from accidental touching.

The first great improvement in the daguerreotype process was the resensitizing of the iodized film by bromine vapour. Mr Goddard published his account of the use of bromine in conjunction with iodine in 1840, and M. Claudet employed a combination of iodine and chlorine vapour in 1841. In 1844 Daguerre published his improved method of preparing the plates, which is in reality based on the use of bromine with iodine. That this addition points to additional sensitiveness will be readily understood when we remark that so-called instantaneous pictures of yachts in full sail, and of large size, have been taken on plates so prepared,—a feat which is utterly impossible with the original process as described by Daguerre. The next improvement to be noticed in the process was toning or gilding the image by a solution of gold, a practice introduced by M. Fizeau. Gold chloride is mixed with hyposulphite of soda, and the levelled plate, bearing a sufficient quantity of the fluid, is warmed by a spirit-lamp until the required vigour is given to the image, as a consequence of which it is better seen in most lights. Nearly all the daguerreotypes extant have been treated in this manner, and no doubt their permanence is in a great measure due to this operation. Images of this class can be copied by taking electrotypes from them, as shown by Grove and others. These reproductions are admirable in every way, and furnish a post-

true proof, if any were needed, that the daguerrean image is a relief

Fox-
Talbot
process

Fox-Talbot Process.—In January 1839 Fox Talbot described the first of his processes, photogenic drawing, in a paper to the Royal Society. He states, that he began experimenting in 1834, and that in the solar microscope he obtained an outline of the object to be depicted in full sunshine in half a second. We must turn, however, to the *Philosophical Magazine* for the account of the full details of his method, which consisted essentially in soaking paper in common salt, brushing one side only of it with about a 12 per cent solution of silver nitrate in water, and drying at the fire. Fox Talbot stated that by repeating the alternate washes of the silver and salt—always ending, however, with the former—greater sensitiveness was attained. This is the same in every respect as the method practised by Wedgwood in 1802, but, when Calotype we come to the next process, which he called "calotype" or "beautiful picture," we have a distinct advance. This process Talbot protected by a patent in 1841. It may be briefly described as the application of iodide of silver to a paper support. Carefully-selected paper was brushed over with a solution of silver nitrate (100 grains to the ounce of distilled water), and dried by the fire. It was then dipped into a solution of potassium iodide (500 grains being dissolved in a pint of water), where it was allowed to stay two or three minutes until silver iodide was formed. In this state the iodide is scarcely sensitive to light, but is sensitized by brushing "gallo-nitrate of silver" over the surface to which the silver nitrate had been first applied. This "gallo-nitrate" is not a chemical compound, but merely a mixture, consisting of 100 grains of silver nitrate dissolved in 2 oz. of water, to which is added one-sixth of its volume of acetic acid, and immediately before applying to the paper an equal bulk of a saturated solution of gallic acid in water. The prepared surface is then ready for exposure in the camera, and, after a short insolation in the dark, develops itself, or the development may be hastened by a fresh application of the "gallo-nitrate of silver." The picture is then fixed by washing it in clean water and drying slightly in blotting paper, after which it is treated with a solution of potassium bromide, and again washed and dried. Here there is no mention made of hyposulphite of soda as a fixing agent, that having been first used by Sir J. Herschel in February 1840. In a strictly historical notice it ought to be mentioned that development by means of gallic acid and nitrate of silver was first known to Rev J. B. Reade. When impressing images in the solar microscope he employed gallic acid and silver in order to render more sensitive the chloride of silver paper that he was using, and he accidentally found that the image could be developed without the aid of light. The priority of the discovery was claimed by Fox Talbot, and his claim was sustained after a lawsuit, apparently on the ground that Reade's method had never been legally published. It would be beyond the scope of the present article to give the slight improvements which Talbot afterwards made in the process. In one of his patents he recognizes the value of the proper fixing of his photogenic drawings by the use of hyposulphite of soda, and also the production of positive prints from the calotype negatives. We pass over his application of albumen to porcelain and its subsequent treatment with iodine vapour, as also his application of albumen in which iodide of silver was held in suspension to a glass plate, since in this he was undoubtedly preceded by Niepce de St Victor in 1848.

Albumen Process on Glass.—It was a most decided step in advance when Niepce de St Victor, a nephew of Nicéphore de Niepce, employed a glass plate and coated it with iodized albumen. The originator of this method did not

meet with much success. In the hands of M. Blanquart Éviard it became more practicable, but it was carried out in its greatest perfection by M. Le Gray. The outline of the operations is as follows. The whites of five fresh eggs are mixed with about one hundred grains of potassium iodide, about twenty grains of potassium bromide, and ten grains of common salt. The mixture is beaten up into a froth with an egg-whisk or fork, and allowed to settle for twenty-four hours, when the clear liquid is decanted off. A circular pool of albumen is poured on a glass plate, and a straight ruler (its ends being wrapped with waxed paper to prevent its edge from touching the plate anywhere except at the margins) is drawn over the plate, sweeping off the excess of albumen, and so leaving an even film. The plate is first allowed to dry spontaneously, a final heating being given to it in an oven or before the fire. The heat hardens the albumen, and it becomes insoluble and ready for the nitrate of silver bath. One of the difficulties is to prevent crystallization of the salts held in solution, and this can only be effected by keeping them in defect rather than in excess. The plate is sensitized for five minutes in a bath of nitrate of silver, acidified with acetic acid, and exposed whilst still wet, or it may be slightly washed and again dried and exposed whilst in its desiccated state. The image is developed by gallic acid in the usual way. After the application of albumen many modifications were introduced in the shape of starch, serum of milk, gelatin, all of which were intended to hold iodide *in situ* on the plate; and the development in every case seems to have been by gallic acid. At one time the waxed-paper process subsequently introduced by Le Gray was a great favourite. Paper that had been made translucent by white wax was immersed in a solution of potassium iodide until impregnated with it, after which it was sensitized in the usual way, development being by gallic acid. This procedure is still followed in some meteorological observatories for obtaining transparent magnetograms, barograms, &c. Reflexion will show that in images obtained by this process the high lights are represented by metallic silver, whilst the shadows are translucent. Such a print is technically called a "negative." When chloride of silver paper is darkened by the passage of light through a negative, we get the highest lights represented by white paper and the shadows by darkened chloride. A print of this kind is called a "positive."

Collodion Process.—A great impetus was given to photography in 1850, rendering it easy of execution and putting it into the hands of the comparatively untrained. This was the introduction of collodion, a vehicle which up to the present day holds its own against the more rapid processes on account of the facility with which the plates are prepared, and also because it is a substance totally unaffected by silver nitrate, which is not the case when any organic substance is employed, and, it may be said, inorganic as well in many instances. Thus albumen forms a definite silver compound, as do gelatin, starch, and gum. The employment of collodion for use in photography was first suggested by Le Gray, who has been already mentioned in connexion with the albumen process. He does not appear to have gone beyond suggestion, and it remained for Archer of London, closely followed by Fry, to make a really practical use of the discovery. Collodion is a solution of cotton or cellulose in which some atoms of its hydrogen have been replaced by NO₂, by treatment with a more or less dilute mixture of sulphuric and nitric acids. The action of the sulphuric acid is to take up the molecules of water formed by elimination of the hydrogen from the cotton, which combines with oxygen from the nitric acid, the latter acid supplying the cotton with NO₂. According to the temperature of the acids and

Albumen
process
on glass.

their dilution a tri-nitro or di-nitro cellulose is said to be formed, one of which is the explosive gun-cotton, insoluble in ether and alcohol, whilst the other, though inflammable, is readily soluble in a mixture of these two solvents. When collodion is poured on a glass plate it leaves on drying a hard transparent film which under the microscope is slightly reticulated. Before drying, the film is gelatinous and perfectly adapted for holding *in situ* salts soluble in ether and alcohol. Where such salts are present they crystallize out when the film is dried, hence such a film is only suitable where the plates are ready to be immersed in the silver bath. As a rule, about five grains of the soluble cotton are dissolved in an ounce of a mixture of equal parts of ether and alcohol, both of which must be of low specific gravity, 735 and 805 respectively. If the alcohol or ether be much diluted with water the cotton (pyroxilin) precipitates, but, even if less diluted, it forms a film which is "crappy" and uneven. Such was the material with which Le Gray proposed to work, and which Archer actually brought into practical use. The opaque silver plate with its one impression was abandoned, and the paper support of Talbot, with its inequalities of grain and thickness, followed suit, though not immediately. When once a fine negative had been obtained with collodion on a glass plate—the image showing high lights by almost complete opacity and the shadows by transparency (as was the case, too, in the calotype process)—any number of impressions could be obtained by means of the silver-printing process introduced by Fox Talbot, and they were found to possess a delicacy and refinement of detail that certainly eclipsed the finest print obtained from a calotype negative. To any one who had practised the somewhat tedious calotype process, or the waxed-paper process of Le Gray with its still longer preparation and development, the advent of the collodion method must have been extremely welcome, since it effected a saving in time, money, and uncertainty. The rapidity of photographic action was much increased, and the production of pictures became possible to hundreds who previously had been excluded from this art-science by force of circumstances. We can merely give an outline of the procedure, referring the reader for further information to the manuals of photography. A glass plate is carefully cleaned by the application of a detergent such as a cream of trisulph powder or spirits of wine (to which a little ammonia is often added), then wiped with a soft rag, and finally polished with a silk handkerchief or chamois leather previously freed from grease. A collodion containing soluble iodides and bromides is made to flow over the plate, all excess being drained off when it is covered. A good standard formula for the collodion may be taken to be as follows,—55 grains of pyroxilin, 5 oz. of alcohol, 5 oz. of ether; and in this liquid are dissolved 2½ grains of ammonium iodide, 2 grains of cadmium iodide, and 2 grains of cadmium bromide. When the collodion is set, *i. e.*, when it is in a gelatinous condition, the plate is immersed in a bath of nitrate of silver—a vertical form being that mostly used in Britain, whilst a horizontal dish is used on the Continent—a good formula for which is 350 grains of silver nitrate with 10 oz. of water. The plate is steadily lowered into this solution without pause, and moved in it until all the repellent action between the aqueous solution of the silver and the solvents of the collodion is removed, when it is allowed to rest for a couple of minutes, after which period it is taken out and placed in the dark slide ready for exposure in the camera. After undergoing proper exposure the plate is withdrawn, and in a room lighted with yellow light the developing solution is applied, which originally was a solution of pyrogallie acid in water restrained in its action by the addition of acetic acid. One of the old formulae

employed by Delamotte was 9 grains of pyrogallie acid, 2 drachms of glacial acetic acid, and 3 oz. of water. The image gradually appears after the application of this solution, building itself up from the silver nitrate clinging to the film, which is reduced to the metallic state by degrees. Should the density be insufficient a few drops of nitrate of silver are added to the pyrogallie-acid solution and the developing action continued.

In 1844 Hunt introduced another reducing agent, which has continued to be the favourite down to the present time, *viz.*, ferrous sulphate. By its use the time of necessary exposure of the plate is reduced, and the image develops with great rapidity. A sample of this developing solution is 20 grains of ferrous sulphate, 20 minims of acetic acid, with 1 oz. of water. This often leaves the image thinner than is requisite for the formation of a good print, and it is intensified with pyrogallie acid and silver. There are other intensifiers used to increase the deposit on a plate by means of mercury or uranium, followed by other solutions to still further darken the double salts formed on the film, but into these it is not necessary to enter here. Such intensifying agents have to be applied to the image after the plate is fixed, which is done by a concentrated solution of hyposulphite of soda or by cyanide of potassium, the latter salt having been first introduced by Martin and Gaudin in 1855 (*La Lumière*, 23d April 1855). Twenty-five grains of cyanide of potassium to one ounce of water is the strength of the solution usually employed. The reaction of both these fixing agents is to form with the sensitive salts of silver double hyposulphites or cyanides, which are soluble in water, not, as is often considered to be the case, to merely dissolve the silver salt itself. It may be well to remark that the utility of bromides in the collodion process seems to have been recognized in its earliest days, Archer (1852) and Bingham (1850) both mentioning it. We notice this, since as late as the year 1866 a patent-right in its use was sought to be enforced in America, the patent being taken out by James Cutting in July 1854.

Positive Pictures by the Collodion Process.—In the infancy Positive of the collodion process it was shown by Mr Horne that collodion a negative image could be made to assume the appearance of a positive by whitening the metallic silver deposit. This he effected by using with the pyrogallie acid developer a small quantity of nitric acid. A better result was obtained by Mr Fry with ferrous sulphate and ferrous nitrate, whilst Dr Diamond gave effect to the matter in a practical way. Mr Archer used mercuric chloride to whiten the image. To Mr Hunt, however, must be awarded the credit of noticing the action of this salt on the image, in his paper in the *Philosophical Transactions* of 1843. The whitened picture may be made to stand out against black velvet, or black varnish may be poured over the film to give the necessary black background, or, as has been done more recently, the positive pictures may be produced on japanned iron plates (ferrotypes plates) or on japanned leather. This process is still practised by some photographers, and from the number of ferrotypes plates sold the number of portraits taken by it must be still very large.

Moist Collodion Process.—From what has been stated above it will be seen that for the successful working of the collodion process it was necessary that the plate should be exposed very shortly after its preparation; thus was a drawback, inasmuch as it necessitated taking a heavy equipment into the field. In May 1854 Messrs Spiller and Crookes published in the *Philosophical Magazine* a process whereby they were enabled to keep a film moist (so as to prevent crystallization of the silver nitrate) several days, enabling plates to be prepared at home, exposed in the field, and then developed in the dark room. The plate

Collodion process

was prepared in the usual way and a solution of zinc nitrate and silver nitrate in water was made to flow over it. The hygroscopic nature of the zinc salt kept sufficient moisture on the plate to attain the desired end. Various modifications in procedure have been made since, but it is scarcely necessary to record them here, for details the reader may consult the volumes of the *Photographic Journal*, 1854-55.

Collodion dry plates. *Dry Plates.*—It would appear that the first experiments with collodion dry plates were due to M. Gaudin. In *Le Lunardier* of 23d April and 27th May 1854 he describes his researches on the question; whilst in England Mr G. R. Murrehead, on the 4th August 1854, stated that light acts almost as energetically on a dry surface as on a wet after all the silver has been washed away from the former previous to desiccation. Dr Taupenot, however, seems to have been the first to use a dry-plate process that was really workable. His original plan was to coat a plate with collodion, sensitize it in the ordinary manner, wash it, cause a solution of albumen to flow over the surface, dry it, dip it in a bath of silver nitrate, acidified with acetic acid, and wash and dry it again. The plate was then in a condition to be exposed, and was to be developed with pyrogallol acid and silver. In this method we have a double manipulation, which is long in execution, though perfectly effective, as we know from experience.

Alkaline developer.

A great advance was made in all dry-plate processes by the introduction of what is known as the "alkaline developer," which is, however, inapplicable to all plates on which silver nitrate is present in the free state. It will be remembered that the developers previously described, either for collodion or paper processes, were dependent on the reduction of metallic silver by some such agent as ferrous sulphate, the reduction taking place gradually and the reduced particles aggregating on those portions of the film which had been acted upon by light. The action of light being to reduce the silver iodide, bromide, or chloride to the state of sub-salts (e.g. sub-iodide of silver), these reduced particles really acted as nuclei for the crystallized metal. It will be evident that in such a method of development the molecular attraction acts at distances relatively great compared with the diameters of the molecules themselves. If it was possible to reduce the altered particles very greatly increased its rapidity of action by reducing the time of exposure necessary to get a developable image. In 1882 Dr Eder demonstrated that gelatin chloride of silver plates could be developed with ferrous citrate, which could not be so readily accomplished with ferrous oxalate. The exposure for chloride plates when developed by the latter was extremely prolonged. In the same year Abney showed that if ferrous oxalate were dissolved in potassium citrate a much more powerful agent was formed, which allowed not only gelatino-chloride plates to be readily developed but also collodio-chloride plates. These, it may be said, were undevelopable except by the precipitation method until the advent of the agents last-mentioned, the chloride being as readily reduced as the sub-chloride rendered the development of an image impracticable.

Amongst the compounds of an alkaline developer we Re-mentioned a restrainer. This factor, generally a bromide or chloride of an alkali, serves probably to form a compound with the silver salt which has not been acted upon by light, and which is less easily reduced than is the silver salt alone,—the altered particles being left intact. The action of the restrainer is regarded by some as due to its combination with the alkali. But whichever theory is correct the fact remains that the restrainer does make the primitive salt less amenable to reduction. Such restrainers as the bromides of the alkalis act through chemical means; but there are others which act through physical means, an

An image was obtained from the double film by means of the developer, which penetrated through the upper unexposed film, and the development was prolonged until an image appeared through the same film, when the plate was fixed, washed, and dried. A piece of gelatinous paper was cemented on the upper film, and a similar piece on the lower after both had been stripped off the glass. When quite dry the two papers were forcibly separated, a film adhering to each. The upper film, *although never exposed to light*, showed an image in some cases more intense than the under film. The action of the alkaline developer was here manifest. The bromide of silver in close contiguity to the exposed particles was reduced to the metallic state. Hence, from this and similar experiments Abney was able to announce that silver bromide could not exist in the presence of freshly precipitated or reduced metallic silver, and that a sub-bromide was immediately formed. Thus $\text{Ag}_2\text{Br}_2 + \text{Ag}_2 = 2\text{AgBr}$. From this it will be seen that the deposited silver is well within the sphere of molecular attraction, and that consequently a less exposure (i.e., the reduction of fewer molecules of the sensitive salt) would give a developable image.

The alkalis used embraced the alkalis themselves and the mono-carbonates. The sole reducing agent up till recent times was pyrogallol acid. In the year 1880 Abney found that hydroquinone was even more effective than pyrogallol acid, its reducing power being stronger. Various other experimentalists tried other kindred substances, but without adding to the list of really useful agents. In 1884, however, Herr Egh and Arnold Spiller brought out hydroxylamin as a reducing agent, which promises to be of great use if it can be prepared cheaply enough.

Another set of developers for dry plates dependent on Other the reduction of the silver bromide and the metallic state dry-plate is founded on the fact that certain organic salts of iron can be utilized. In 1877 Mr Carey Lea of Philadelphia and Mr William Willis announced almost simultaneously that a solution of ferrous oxalate in neutral potassium oxalate was effective as a developer, and from that time it has been universally acknowledged as a useful agent in that capacity, and it is a rare favourite, more especially amongst Continental photographers. In 1881 Abney showed that the addition of a small quantity of sodium hyposulphite very greatly increased its rapidity of action by reducing the time of exposure necessary to get a developable image. In 1882 Dr Eder demonstrated that gelatin chloride of silver plates could be developed with ferrous citrate, which could not be so readily accomplished with ferrous oxalate. The exposure for chloride plates when developed by the latter was extremely prolonged. In the same year Abney showed that if ferrous oxalate were dissolved in potassium citrate a much more powerful agent was formed, which allowed not only gelatino-chloride plates to be readily developed but also collodio-chloride plates. These, it may be said, were undevelopable except by the precipitation method until the advent of the agents last-mentioned, the chloride being as readily reduced as the sub-chloride rendered the development of an image impracticable.

Amongst the compounds of an alkaline developer we Re-mentioned a restrainer. This factor, generally a bromide or chloride of an alkali, serves probably to form a compound with the silver salt which has not been acted upon by light, and which is less easily reduced than is the silver salt alone,—the altered particles being left intact. The action of the restrainer is regarded by some as due to its combination with the alkali. But whichever theory is correct the fact remains that the restrainer does make the primitive salt less amenable to reduction. Such restrainers as the bromides of the alkalis act through chemical means; but there are others which act through physical means, an

example of which we have in the preparation of a gelatin plate. In this case the gelatin wraps up the particles of the silver compound in a colloidal sheath, as it were, and the developing solution only gets at them in a very gradual manner, for the natural tendency of all such reducing agents is to attack the particles on which least work has to be expended. In the case of bromide of silver the developer has only to remove one atom of bromine, whereas it has to remove two in the case of sub-bromide of silver. The sub-bromide formed by light and that subsequently produced in the act of development are therefore reduced. A large proportion of gelatin compared with the silver salt in a film enables an alkaline developer to be used without any chemical restrainer; but when the gelatin bears a small proportion to the silver such a restrainer has to be used. With collodion films the particles of bromide are more or less unenveloped, and hence in this case some kind of chemical restrainer is absolutely necessary. We may say that the organic iron developers require less restraining in their action than do the alkaline developers.

Alkaline development was first used by Major Russell in a dry-plate process in which the collodion was merely bromized by means of bromides soluble in alcohol. The plate was prepared by immersion in a strong solution of silver nitrate and then washed and a preservative applied. The last-named agent executes two functions, one being to absorb the halogen liberated by the action of light and the other to preserve the film from atmospheric action. Tannin, which Major Russell employed, if we mistake not, is a good absorbent of the halogens, and acts as a varnish to the film. Other collodion dry-plate processes carried out by means of the silver-nitrate bath were very numerous at one time, many different organic bodies being also employed. In most cases ordinary iodized collodion was made use of, a small percentage of soluble bromide being as a rule added to it. When plates were developed by the alkaline method this extra bromide induced density, since it was the silver bromide alone which was amenable to it, the iodide being almost entirely unaffected by the weak developer which was at that time in general use.

One of the most successful bath dry-plate processes was introduced by Mr. R. Manners Gordon and was a really beautiful process. The plate was given an edging of albumen and then coated with ordinary iodized collodion to which one grain per ounce of cadmium bromide had been added. It was kept in the silver-nitrate bath for ten minutes, after which it was washed thoroughly. The following preservative was then applied:—

1	Gum arabic	20 grs
	Sugar candy	5 "
	Water	6 dr
2	Gallie acid	3 grs
	Water	2 dr.

These ingredients were mixed just before use and, after filtering, applied for one minute to the plate, which was allowed to drain and set up to dry naturally. Great latitude is admissible in the exposure, it should rarely be less than four times or more than twenty times that which would be required for a wet plate under ordinary circumstances. The image may be developed with ferrous sulphate restrained by a solution of gelatin and glacial acetic acid, to which a solution of silver nitrate is added just before application, or by the following alkaline developer:—

1	Pyrogallie acid	96 grs
	Alcohol	1 oz.
2	Potassium bromide	12 grs.
	Water	1 oz.
3	Ammonium carbonate	80 grs.
	Water	1 oz.

The development of the image requires 6 mmins of No. 1, $\frac{1}{2}$ drachm of No. 2, with 3 drachms of No. 3. If property

exposed the image appears rapidly and gradually gains in intensity, and when all action from the developer ceases the plate is washed and further intensified with pyrogallie acid and silver as is a wet plate. The image is finally fixed in sodium hyposulphate.

In photographic processes not only has the chemical condition of the film to be taken into account, but also the optical. When light falls on a semi-opaque or translucent film it is scattered by the particles in it and passes through the glass plate to the back. Here the rays are partly transmitted and partly reflected, a very small quantity of them being absorbed by the material of the glass. Theory points out that the strongest reflexion from the back of the glass should take place at the vertical angle. In 1875 Abney investigated the subject and proved that practice agreed with theory in every respect, and that the image of a point of light in development on a plate was surrounded by a ring of reduced silver caused by the reflexion of the scattered light from the back surface of the glass, and that this ring was shaded inwards and outwards in such a manner that the shading varied with the intensity of the light reflected at different angles. To avoid "halation," as this phenomenon is called, it was usual for photographers to cover the back of their dry plates with some material which should be in optical contact with it, and which at the same time should absorb all the photographically active rays, and only replace those which were incapable of reducing the silver salt. This was called "backing a plate."

Collodion Emulsion Processes.—In 1884 Bolton and Sayce published the germ of a process which revolutionized photographic manipulations, and by a subsequent substitution of gelatin for collodion gave an impetus to photography which has carried it to that state of perfection at which it has arrived at the present time (1884). In the ordinary collodion process it will be recollected that a sensitive film is procured by coating a glass plate with collodion containing the iodide and bromide of some soluble salt, and then, when set, immersing it in a solution of silver nitrate in order to form iodide and bromide of silver in the film. The question that presented itself to Bolton and Sayce was whether it might not be possible to get the sensitive salts of silver formed in the collodion whilst liquid, and a sensitive film given to a plate by merely letting this collodion, containing the salts in suspension, flow over the glass plate. Gaudin had attempted to do this with chloride of silver, and later G. W. Simpson had succeeded in perfecting a printing process with collodion containing chloride of silver, citric acid, and nitrate of silver; but the chloride until recently has been considered a slow working salt, and nearly incapable of development. Up to the time of Bolton and Sayce's experiments iodide of silver had been considered the staple of a sensitive film, and, though bromide had been used by Major Russell and others, it had not met with so much favour as to lead to the omission of the iodide. At the date mentioned the suspension of iodide of silver in collodion was not thought practicable, and the inventors of the process turned their attention to bromide of silver, which they found could be secured in such a fine state of division that it remained suspended for a considerable time in collodion, and even when precipitated could be resuspended by simple agitation. The outline of the method was to dissolve a soluble bromide in plain collodion, and add to it drop by drop an alcoholic solution of silver nitrate, the latter being in excess or defect according to the will of the operator. To prepare a sensitive surface the collodion containing the emulsified sensitive salt was poured over a glass plate, allowed to set, and washed till all the soluble salts resulting from the double decomposition of the soluble bromide and the silver nitrate, together with the unaltered soluble

Collodion emulsion process.

bromide or silver nitrate, were removed, when the film was exposed wet, or allowed to dry and then exposed. The rapidity of these plates was not in any way remarkable, but the process had the great advantage of doing away with the sensitizing nitrate of silver bath, and thus avoiding a tiresome operation. The plates were developed by the alkaline method, and gave images which, if not primarily dense enough, could be intensified by the application of pyrogallie acid and silver nitrate as in the wet collodion process. Such was the crude germ of a method which was destined to effect a complete change in the aspect of photographic negative taking,¹ but for some time it lay dormant. In fact there was at first much to discourage trial of it, since the plates often became veiled on development. Mr Carey Lea of Philadelphia, and Mr W. Cooper, jun., of Reading, may be said to have given the real impetus to the method. Mr Carey Lea, by introducing an acid into the emulsion, established a practicable collodion emulsion process, which was rapid and at the same time gave negative pictures free from veil. To secure the rapidity Carey Lea employed a fair excess of silver nitrate, and Colonel Wortley gained further rapidity by a still greater increase of it; the free use of acid was the only means by which this could be effected without hopelessly spoiling the emulsion. It may be well to mention that the effect of the addition of the mineral acids such as Carey Lea employed is to prevent the formation of (or to destroy when formed) any sub-bromide or oxide of silver, either of which acts as a nucleus on which development can take place. Captain Abney first showed the theoretical effect of acids on the sub-bromide, as also the effect of oxidizing agents on both the above compounds (see below). A more valuable modification was introduced in 1874 by Mr W. B. Bolton, one of the originators of the process, who allowed the ether and the alcohol of the collodion to evaporate, and then washed away all the soluble salts from the gelatinous mass formed of pyroxilin and sensitive salt. After washing for a considerable time, the pellicle was dried naturally or washed with alcohol, and then the pyroxilin redissolved in ether and alcohol, leaving an emulsion of silver bromide, silver chloride, or silver iodide, or mixtures of all suspended in collodion. In this state the plate could be coated and dried at once for exposure. Sometimes, in fact generally, preservatives were used, as in the case of dry plates with the bath, in order to prevent the atmosphere from rendering the surface of the film spotty or insensitive on development. This modification had the great advantage of allowing a large quantity of sensitive salt to be prepared of precisely the same value as to rapidity of action and quality of film. A great advance in the use of the collodion bromide process was made by Colonel Stuart Wortley, who in June 1873 made known the powerful nature of a *strongly* alkaline developer as opposed to the weak one which up to that time had usually been employed. The brief exposure necessary for a collodion emulsion plate, or indeed any dry plate, had not been recognized till the introduction of this developer. Thus at once placed in the hands of photographers an instrument which by judicious use enabled them to shorten the time of exposure of their plates and to render possible effects which had before been considered out of the question. As an example of the preparation of a collodion emulsion and the developer usually employed with it we give the following.—2½ oz. of alcohol, 5 oz. of ether, 75 grains of pyroxilin. In 1 oz. of alcohol are dissolved 200 grains of zinc bromide;² it is then acidulated with 4 or 5 drops

of nitric acid, and added to half the above collodion. In 2 drachms of water are dissolved 330 grains of silver nitrate, 1 oz. of alcohol being added. The silvered alcohol is next poured into the other half of the collodion and the brominized collodion dropped in, care being taken to shake between the operations. An emulsion of bromide of silver is formed in suspension, and it is in every case left for 10 to 20 hours to what is technically called "ripen," or, in other words, to become creamy when poured out upon a glass plate. When the emulsion has ripened it may be used at once or be poured out into a flat dish and the solvents allowed to evaporate till the pyroxilin becomes gelatinous. In this state it is washed in water till all the soluble salts are carried away. After this it may be either spread out on a cloth and dried or treated with two or three doses of alcohol, and then redissolved in equal parts of alcohol (specific gravity, 805) and ether (specific gravity, 720). In this condition it is a washed emulsion, and a glass plate can be coated with it and the film dried, or it may be washed and a preservative applied. An excellent preservative introduced by Colonel Stuart Wortley is as follows—

1	Salyun, a saturated solution in water.	
2	{ Tannin	60 grs.
	{ Distilled water	1 oz
3	{ Gallic acid	45 grs.
	{ Water	1 oz

To make the preservative, take 2 oz. of No. 1, 1 oz. of No. 2, ½ oz. of No. 3, 40 grains of sugar, and 7 oz. of water. The plates are immersed in this solution and dried. It is often necessary to give the plate a previous coating with very dilute albumen or gelatin in order to make the film of collodion adhere during development, which can be effected by the strong alkaline developer, or by the ferrous oxalate developer, previously noticed.

The type of a useful alkaline developer is as follows:—

1	{ Pyrogallie acid	96 grs.
	{ Alcohol	1 oz
2	{ Potassium bromide	12 grs.
	{ Water distilled	1 oz
3	{ Ammonium carbonate	80 grs.
	{ Water	1 oz

To develop the plate 6 minims of No. 1, ½ drachm of No. 2, and 3 drachms of No. 3 are mixed together and made to flow over the plate after washing the preservative off under the tap. Sometimes the development is conducted in a flat dish, sometimes the solution is poured on the plate.³ The unredduced salts are eliminated by either cyanide of potassium or sodium hyposulphite. Intensity may be given to the image, if requisite, either before or after the "fixing" operation. Where resort is had to ferrous oxalate development, the developer is made in one of two ways—(1) by saturating a saturated solution of neutral potassium oxalate with ferrous oxalate, and adding an equal volume of a solution (10 grains to 1 oz. of water) of potassium bromide to restrain the action, or (2) by mixing, according to Eder's plan, 3 volumes by measure of a saturated solution of the potassium oxalate with 1 volume by measure of a saturated solution of ferrous sulphate, and adding to the ferrous oxalate solution thus obtained an equal bulk of the above solution of potassium bromide. The development is conducted in precisely the same manner as indicated above, and the image is fixed by one of the same agents.

Gelatin Emulsion Process.—The facility with which Gelatin collodion emulsion plates could be prepared had turned all attention investigation into this channel, and collodion was not the only vehicle that was tried for holding the sensitive salts in suspension. As early as September 1871 Dr R. L.

¹ An account of Mr Styes's process is to be found in the *Photographic News* of October 1865, or the *Photographic Journal* of the same date.

² The advantages of this salt were pointed out by Mr. Warnerke in 1875.

³ For further details the reader is referred to *Instruction in Photography*, p. 99.

Maddox had tried emulsifying the silver salt in gelatin, and had produced negatives of rare excellence, as the present writer can testify from personal knowledge. In November 1873 Mr King described a similar process, getting rid of the soluble salts by washing. Efforts had also been made in this direction by Mr Burgess in July 1873. Mr R. Kennett in 1874 may be said to have been the first to put forward the gelatin emulsion process in a practical and workable form, as he then published a formula which gave good and quick results. It was not till 1878, however, that the great capabilities of silver bromide when held in suspension by gelatin were fairly known, in March of that year Mr C. Bennett showed that by keeping the gelatin solution liquid at a low temperature for as long as seven days extraordinary rapidity was conferred on the sensitive salt. The molecular condition of the silver bromide seemed to be altered, and to be amenable to a far more powerful developer than had hitherto been dreamt of. In 1874 the Belgian chemist Stas had shown that various modifications of silver bromide and chloride were possible, and it seemed that the green molecular condition (one of those noted by Stas) of the bromide was attained by prolonged warming. It may in truth be said that the starting-point of rapid plates was 1878, and that the full credit of this discovery should be allotted to Mr C. Bennett. Both Kennett and Bennett got rid of the soluble salts from the emulsion by washing; and in order to attain success it was requisite that the bromide should be in excess of that necessary to combine with the silver nitrate used to form the emulsion. In June 1879 Alvey showed that a good emulsion might be formed by precipitating a silver bromide by dropping a solution of a soluble bromide into a dilute solution of silver nitrate. The supernatant liquid was decanted, and after two or three washings with water the precipitate was mixed with the proper amount of gelatin. Dr van Monckhoven of Ghent, in experimenting with this process, hit upon the plan of obtaining the emulsion by splitting up silver carbonate with hydrobromic acid, leaving no soluble salts to be extracted. He further, in August 1879, announced that he had obtained great rapidity by adding to the bromide emulsion a certain quantity of ammonia. This addition rapidly altered the bromide of silver from its ordinary state to the green molecular condition referred to above. At this point we have the branching off of the gelatin emulsion process into two great divisions, viz., that in which rapidity was gained by long-continued heating, and the other in which it was gained by the use of ammonia—a subdivision which is maintained to the present day. Photographers' opinions as to the respective merits of the two methods are much divided, some maintaining that the quality of the heated emulsion is better than that produced by alkalinity, and *vice versa*. We may mention that in 1881 Dr Herschell introduced a plan for making an alcoholic gelatin emulsion with the idea of inducing rapid drying of the plates, and in the same year Dr H. Vogel of Berlin brought forward his ideas for combining gelatin and pyroxylon together by means of a solvent which acted on the gelatin and allowed the addition of alcohol in order to dissolve the pyroxylon. This method was called "colloido-gelatin emulsion," and apparently was only a short-lived process, which is not surprising, since its preparation involved the inhalation of the fumes of acetic acid.

The warming process introduced by Bennett was soon superseded. Colonel Stuart Wortley in 1879 announced that, by raising the temperature of the vessel in which the emulsion was stewed to 150° Fahr., instead of days being required to give the desired sensibility only a few hours were necessary. A further advance was made by boiling the emulsion, first practised, we believe, by Mr Mansfield

in 1879. Another improvement was effected by Mr W. B. Bolton by emulsifying the silver salt in a small quantity of gelatin and then raising the emulsion to boiling point, boiling it for from half an hour to an hour, when extreme rapidity was attained. It would be impossible to enumerate many minor improvements in this process that have from time to time been made, it is sufficient to have stated in historical sequence the different important stages through which it has passed. It may be useful to give an idea of the relative rapidities of the various processes we have described.

Daguerreotype, originally	half an hour's exposure.
Calotype	2 or 3 minutes "
Collodion	10 seconds "
Collodion emulsion	15 seconds "
Rapid gelatin emulsion	1/5th second "

By this it will be seen what advances have been made in the art of photography during the forty-five years of its existence.

The following is an outline of two representative processes. All Gelatin operations should be conducted in light which can act but very slightly on the sensitive salts employed, and this is more necessary now with this process than with others on account of the extreme ease with which the equilibrium of the molecules is upset in giving rise to the molecule which is developable. The light to work with, and which is safe, is gaslight or candlelight passing through a sheet of Chance's stained red glass backed by orange paper. Stained red glass allows but few chemically effective rays to pass through it, whilst the orange paper diffuses the light. If daylight be employed, it is as well to have a double thickness of orange paper. The following should be weighed out—

1 Potassium iodide	3 grs
2 Potassium bromide	185 "
3 Nelson's No 1 photographic gelatin	80 "
4 Silver nitrate	175 "
5 Autotype or other hard gelatin	100 "
6 Nelson's No 1 gelatin	100 "

Nos 3 and 5 are rapidly covered with water or washed for a few seconds under the tap to get rid of any adherent dust. No 5 is dissolved in 1 1/2 oz of water, and a little tincture of iodine added till it assumes a light cherry colour. No 1 is dissolved in 60 minims of water. No 4 is dissolved in 1/2 oz of water, and No 3 is allowed to swell up in 1 oz of water, and is then dissolved by heat. All the flasks containing these solutions are placed in water at 160° Fahr and carried into the "dark room," as the orange-lighted chamber is ordinarily called. Nos 3 and 4 are then mixed together in a jar or flask, and No 2 added drop by drop till half its bulk is gone, when No 1 is added to the remainder, and the double solution is dropped in as before. When all is added these ought to be formed an emulsion which is very ruddy when examined by gaslight, or orange by daylight. The flask containing the emulsion is next placed in boiling water, which is kept in a state of ebullition for about three-quarters of an hour. It is then ready, when the contents of the flask have cooled down to about 100° Fahr., for the addition of No. 5, which should in the interval be placed in 2 oz of water to swell and finally be dissolved. The gelatin emulsion thus formed is placed in a cool place to set, after which it is turned into a piece of coarse canvas or mosquito-netting made into a bag. By squeezing, threads of gelatin containing the sensitive salt can be made to fall into cold water, by this means the soluble salts are extracted. This is readily done in two or three hours by frequently changing the water, or by allowing running water to flow over the emulsion-threads. The gelatin is next drained by straining canvas over a jar and turning out the threads on to it, after which it is placed in a flask, and washed till it dissolves, half an ounce of alcohol being added. Finally, it is filtered through chamois leather or swansdown calico. In this state it is ready for the plates.

The other method of forming the emulsion is with ammonia. The same quantities as before are weighed out, but the solutions of Nos 2 and 3 are first mixed together and No 4 is dissolved in 1 oz of water, and strong ammonia of specific gravity 880 added to it till the oxide first precipitated is just redissolved. This ammoniacal solution is then dropped into Nos 2 and 3 as previously described, and finally No 1 is added. In this case no boiling is required, but to secure rapidity it is as well that the emulsion should be kept an hour at a temperature of about 120° Fahr., after which half the total quantity of No 5 is added. When set the emulsion is washed, drained, and redissolved as before; but in order to give tenacity to the gelatin the remainder of No 5 is added before the addition of the alcohol, and before filtering.

Coating the Plates.—Glass plates are best cleaned with nitric Coating acid, rinsed, and then treated with potash solution, rinsed again, the plate,

and dried with a clean cloth. They are then ready for receiving the emulsion, which, after being warmed to about 120° Fahr., is poured on them in sufficient quantity to cover well the surface. This being done, the plates are placed on a level shelf and allowed to stay there till the gelatin is thoroughly set, they are then put in a drying cupboard, through which, by a simple contrivance, a current of warm air is made to pass. It should be remarked that the warmth is only necessary to enable the air to take up the moisture from the plates. They ought to be dry in about twelve hours, and they are ready for immediate use.

Exposure.—With a good emulsion and on a bright day the exposure of a plate to a landscape, with a lens whose aperture is one-sixteenth that of the focal distance, should not be more than one-half to one fifth of a second. This time depends, of course, on the nature of the view, if there be foliage in the immediate foreground it will be longer. In the portrait-studio, under the same circumstances, an exposure with a portrait-lens may be from half a second to four or five seconds.

Development of the Plate.—To develop the image either a ferrous or a cadmate solution of alkaline pyrogallol acid may be used. The former is conveniently prepared as described on p. 826. No chemical restrainer such as bromide of potassium is necessary, since the gelatin itself acts as a natural restrainer. If the alkaline developer be used, the following may be taken as a good standard—

(Pyrogallol)	99 grs
1 Citric acid	10 "
Water	10 oz
2 Potassium iodide	10 grs
Water	10 oz
3 Ammonia, 880	1 dr
Water	10 "

One drachm of each of these is taken and the mixture made up to 2 oz. with water. The plate is placed in a dish and the above poured over it without stoppage, whereupon the image gradually appears and, if the exposure has been properly timed, gains sufficient density for printing purposes. It is fixed in a solution of hyposulphite of soda, as in the other processes already described, and then thoroughly washed for two or three hours to eliminate all the soluble salts, long washing is necessary on account of the nature of the gelatin.

Intensifying the Negative.—Sometimes it is necessary to intensify the negative, which can be done in a variety of ways with mercury salts. An excellent plan, introduced by the Platinotype Company, is to use a saturated solution of mercuric chloride in water, and a subsequent addition of 2 grains to the ounce of platonic chloride. This is put in a dish and the metallic solution added to seal a sufficient density is obtained. With most other methods with mercury the image is apt to become yellow and to fade, with this apparently it is not.

Varnishing the Negative.—The negative is usually protected by giving negative a first film of plain collodion and then a coat of shellac or other photographic varnish. This protects the gelatin from moisture and also from becoming stained with the silver nitrate owing to contact with the sensitive paper used in silver printing.

Printing Processes

The first printing process may be said to be that of Fox Talbot (see above, p. 824), which has continued to be generally employed to the present day (with the addition of albumen to give a surface to the print)—an addition first made, we believe, by Fox Talbot. Paper for printing is prepared by washing 160 parts of ammonium chloride with 24 parts of spirits of wine and 5000 parts of water, though the proportions vary with different manufacturers. These ingredients are dissolved, and the whites of fifteen fairly-sized eggs are added and the whole beaten up to a froth. In hot weather it is advisable to add a drop of carbolic acid to prevent decomposition. The albumen is allowed two or three days to settle, when it is filtered through a sponge placed in a funnel, or through two or three thicknesses of fine muslin, and transferred to a flat dish. The paper is cut of convenient size and allowed to float on the solution for about a minute, when it is taken off and dried in a warm room. For dewy prints, on which colouring is to take place, plain salted paper is useful. It can be made of the following proportions—80 parts of ammonium chloride, 100 parts of sodium citrate, 10 parts of gelatin, 5000 parts of distilled water. The gelatin is first dissolved in hot water, and the remaining components are added. It is well filtered, and the paper allowed to float on it for three minutes, then withdrawn and dried.

Sensitizing Bath.—To sensitize the paper it is made to float on a 10 per cent solution of silver nitrate for three minutes. It is then hung up and allowed to dry, after which it is ready for use. To print the image the paper is placed in a printing-frame over a negative and exposed to light. It is allowed to print till such time as the image appears rather darker than it should finally appear.

Toning and Fixing the Print.—The next operation is to tone and fix the print. In the earlier days this was accomplished by means of a bath of sel d'or—a mixture of hyposulphite of soda and auric chloride. This gilded the darkened parts of the print which light

had reduced to the semi-metallic state; and on removal of the chloride by means of hyposulphite an image composed of metallic silver, an organic salt of silver, and gold was left behind. There was a suspicion, however, that part of the coloration was due to a combination of sulphur with the silver, not that pure sulphide of silver is in any degree fugitive, but the sulphuretted organic salt of silver seems to be liable to change. This gave place to a method of alkaline toning, or rather, we should say, of neutral toning, by employing auric chloride with a salt, such as the carbonate or acetate of soda, chloride of lime, borax, &c. By this means there was no danger of sulphuration during the toning, to which the method by sel d'or was prone owing to the decomposition of the hyposulphite. The substances which can be employed in toning seem to be those in which an alkaline base is combined with a weak acid, the latter being readily displaced by a stronger acid, such as nitric acid, which must exist in the paper after printing. This branch of photography owes much to the Rev. T. V. Hadfield, he having carried on extensive researches in connection with it during 1854 and subsequent years. MM Davanne and Girard, a little later, also investigated the matter with fruitful results.

The following may be taken as two typical toning-baths—

(A) Auric chloride	1 part
Sodium carbonate	10 parts
Water	5000 "
(B) Borax	100 "
Water	4000 "
(C) Auric chloride	1 part
Water	4000 parts.

In the latter (a) and (b) are mixed in equal parts immediately before use. Each of these is better used only once. A third bath is—

Auric chloride	2 parts
Chloride of lime	2 "
Chalk	40 "
Water	8000 "

These are mixed together, the water being warmed. When cool the solution is ready for use. In toning prints there is a distinct difference in the *modus operandi* according to the toning-bath employed. Thus in the first two baths the print must be thoroughly washed in water to enable all free silver nitrate to be carried away from the image, that salt forming no part in the chemical reactions. On the other hand, where free chlorine is used, the presence of free silver nitrate or some active chlorine absorbing is a necessity. In 1873 Abney showed that with such a toning-bath free silver nitrate might be eliminated, and if the print were immersed in a solution of such salt such as lead nitrate the toning would proceed rapidly and without causing any fading of the image whilst toning, which was not the case when the free silver nitrate was totally removed and no other chlorine absorbent substituted. This was an important factor in the matter, and one which had been overlooked. In the third bath the free silver nitrate should only be partially removed by washing. The print, having been partially washed or thoroughly washed, as the case may be, is immersed in the toning-bath till the image attains a purple or bluish tone, after which it is ready for fixing. The solution used for this purpose is a 20 per cent solution of hyposulphite of soda, to which it is best to add a few drops of ammonia in order to render it alkaline. About ten minutes suffice to effect the conversion of the chloride into hyposulphite of silver, which is soluble in hyposulphite of soda and can be removed by washing. The organic salts of silver seem, however, to be very different, and while the toning is proceeding which the ammonia just recommended helps to remove. If it is not removed, there is a sulphur compound left behind, according to Spiller, which by time and exposure becomes yellow.

The use of potassium cyanide for fixing prints is to be avoided, as this reagent attacks the organic coloured oxide which, if removed, would render the print a ghost. The washing of silver prints should be very complete, since it is said that the least trace of hyposulphite left behind retards the fading of the image a mere matter of time. Whether this be due to the hygroscopic nature of the hyposulphite and its reaction on the organic salt of silver, or to the destruction of the hyposulphite and sulphurizing of the black organic salt, seems at present to be an undetermined question. The stability of a print has been supposed to be increased by immersing it, after washing, in a solution of alum. The alum, like any other acid body, decomposes the hyposulphite into sulphuric acid and sulphurous acid. If this be the case, it seems probable that the destruction of the hyposulphite by time is not the occasion of fading, but that its hygroscopic character is. This, however, as has already been said, is a moot point. It is usual to wash the prints some hours in running water. We have found that half a dozen changes of water, and between successive changes the application of a sponge to the back of each print separately, are equally or more efficacious. On drying, the print assumes a darker tone than what it has after leaving the fixing-bath.

Different tones can thus be given to a print by different toning-baths; and the gold itself may be deposited in a ruddy form or in a blue form. The former molecular condition gives the red and sepia tones, and the latter the blue and black tones. The degree

of minute subdivision of the gold may be conceived when it is stated that, on a couple of sheets of albuminized paper fully printed, the gold necessary to give a decided tone does not exceed half a grain.

Colloido-chloride Silver Printing Process—In the history of the emulsion processes we have already stated that Gaudin had attempted to use silver chloride suspended in collodion, but it was not till the year 1864 that any practical use was made of the suggestion so far as silver printing is concerned. In the autumn of that year Mr. George Wharton Simpson worked out a method which has been more or less successfully employed, and is still one of the best with which we are acquainted. The formula appended is the original one which Mr. Simpson published.—

1	Silver nitrate	60 parts
1	Distilled water	60 "
2	Strontium chloride	64 "
3	Alcohol	1000 "
3	Chloride of gold	64 "
3	Alcohol	1000 "

To every 1000 parts of plain collodion 30 parts of No. 1, previously mixed with 60 parts of alcohol, are added, 60 parts of No. 2 are next mixed with the collodion, and finally 30 parts of No. 3. This forms an emulsion of silver chloride and also contains citric acid and silver nitrate. The defect of this emulsion is that it contains a large proportion of soluble salts, which are apt to crystallize out on drying, more particularly if it be applied to glass plates. The addition of the citric acid and the excess of silver nitrate is the key to the whole process, for, unless some body were present which on exposure to light was capable of forming a highly-coloured organic oxide of silver, no vigour would be obtained in printing. If pure chloride be used, though an apparently strong image would be obtained, yet on fixing only a feeble trace of it would be left, and the print would be worthless. The colloido-chloride emulsion may be applied to glass, as before stated, or to paper, and the printing carried on in the usual manner. The toning takes place by means of the chloride-of-lime bath or by ammonium sulpho-cyanide and gold, which is practically a return to the *sel d'or* bath. The organic salt formed in this procedure does not seem so prone to be decomposed by keeping as does that formed by albumen, and the washing can be more completely carried out. This is a beautiful process, and deserving of more attention than has hitherto been given to it.

Gelatino-citric-chloride Emulsion—A modified emulsion printing process was introduced by Abney in 1881, which consisted in suspending silver chloride and silver citrate in gelatin, these being no excess of silver present. The formula of producing it is as follows.—

1	Sodium chloride	40 parts
1	Potassium citrate	40 "
1	Water	600 "
3	Silver nitrate	150 "
3	Water	600 "
3	Gelatin	320 "
3	Water	1700 "

Nos 2 and 3 are mixed together whilst warm, and No. 1 is then gently added, the gelatin solution being kept in brisk agitation. This produces the emulsion of citrate and chloride of silver. The gelatin containing the suspended salts is heated for five minutes at boiling point, when it is allowed to cool and subsequently slightly washed, as in the gelatino-bromide emulsion. It is then ready for application to paper or glass. The prints are of a beautiful colour, and seem to be fairly permanent. They may be readily toned by the boxer or by the chloride of lime toning-bath, and are fixed with the hyposulphite solution of the strength before given.

Printing with Salts of Uranium—The sensitiveness of the salts of uranium to light seems to have been discovered by Niepce, and the fact was subsequently applied to photography by Burnett in England. One of the original formulas consisted of 30 parts of uranic nitrate with 600 parts of water. Paper, which is better if slightly sized previously with gelatin, is floated on this solution. When dry it is exposed beneath a negative, and a very faint image is produced; but it can be developed into a strong one by 6 to 10 per cent solution of silver nitrate to which a trace of acetic acid has been added, or by a 2 per cent solution of auric chloride. In both these cases the silver and gold are deposited in the metallic state. Another developer is a 2 per cent solution of ferro-cyanide of potassium to which a trace of uric acid has been added, sufficient to give a red coloration. The development takes place most readily by letting the paper float on these solutions.

Wothly Type—A variation was introduced in the uranium process by Herr Wothly in 1864, when he employed uranic nitrate with other salts in the collodion, and then coated starched paper with the product. The paper was printed until it assumed a bluish-black image, which was subsequently intensified by means of gold. The most generally used Wothly-type formula, however, consisted of a triple salt of silver nitrate, uranic nitrate, and ammonic nitrate, which were dissolved in collodion. This compound was applied to paper sized with arrowroot, and, after drying, the printing proceeded in the usual manner, the image being subsequently fixed

with hyposulphite of soda. The prints produced by this method were very beautiful, but for some reason they found no great favour with the public.

Printing with Chromates—The first mention of the use of Printing potassium bichromate for printing purposes seems to have been made by Mungo Ponton in May 1859, when he stated that paper, chromed if saturated with this salt and dried, and then exposed to the sun's rays, says through a drawing, would produce a yellow picture on an orange ground, nothing more being required to fix it than washing it in water, when a white picture on an orange ground was obtained. In 1840 M. E. Bequerel announced that paper sized with iodide of starch and soaked in bichromate of potash was, on drying, more sensitive than unsized paper. Joseph Dixon of Massachusetts, in the following year, produced copies of bank notes by using gum arabic with bichromate of potash spread upon a lithographic stone, and, after exposure of the sensitive surface through a bank-note, by washing away the unsized gum and inking the stone as in ordinary lithography. The same process, with slight modifications, has been used quite recently by Sunnet and Toovey of Brussels, and is capable of producing most excellent results. Dixon's method, however, was not published till 1854, when it appeared in the *Scientific American*, and consequently, as regards priority of publication, it ranks after Fox Talbot's photo-engraving process (see below), which was published in 1852. On 18th December 1855 M. Alphonse Potevin took out a patent in England, in which he vaguely described a method of taking a direct carbon-print by rendering gelatin insoluble through the action of light on bichromate of potash. This idea was taken up by Mr. Poncey of Doncaster, who perhaps was the first to put the process into actual carbon-prints, notwithstanding that Testud did so some years before. Mr. Poncey published his process on 1st January 1859, but, as described by him, it was by no means in a perfect state, half-tones being wanting. The cause of this was first pointed out by Abbé Labouze in 1868, whilst describing a kindred process in a note to the French Photographic Society. He says, "There are two essential qualities . . . (2) that no dust or particles of matter should have its superposed side (and not its prepared side, as in ordinary printing) placed in contact with the negative in the pressure-frame, as it is only by printing in this way that we can expect to be able afterwards to remove by washing the unacted-upon portions of the mixture. In a positive of this sort printed from the front or prepared side the attainment of half-tones by washing away more or less depth of the mixture, according to the depth to which it has been hardened, is prevented by the insoluble parts being on the surface and in consequence protecting the soluble part from the action of the water used in washing, so that either nothing is removed, or by steeping very long till the unaltered soluble part is sufficiently softened the whole depth comes bodily away, leaving the paper white." This method of exposing through the back of the paper was crude and unsatisfactory, and in 1860 Farjot patented a process in which, after exposure to light of the negative film which contained pigment, the surface was coated with collodion, and the print placed in warm water, where it separated from the paper support and could be transferred to glass. Potevin opposed this patent, and his opposition was successful, for he had used this means of detaching the films in his powder-carbon process, in which ferric chloride and tartaric acid were used. Farjot at one time gave an impetus to carbon-printing, and in 1861 M. Swan (to whom the printing process was so much) took up the matter, and in 1864 secured a patent. One of the great features in Swan's innovations was the production of what is now known as "carbon-tissue," made by Carbon-coating paper with a mixture of gelatin, sugar, and colouring-tissue, matter, and rendered sensitive to light by means of bichromate of potash or ammonia. After exposure to light Swan placed the printed carbon-tissue on an indurated surface, to which it was made to adhere by pressure. The print was then removed, the paper backing stripped off, and the soluble gelatin containing colouring matter washed away. The picture could then be re-transferred to its final support of paper. In 1869 J. R. Johnson of London took out a patent in which he claimed that carbon-tissue which had been soaked in water for a short period, by its tendency to swell further, would adhere to any waterproof surface such as glass, metal, waxed paper, &c., without any adhesive matter being applied. This was a most important and fruitful improvement. Johnson also added soap to the gelatin to prevent its excessive brittleness on drying, and made his final support of gelatinized paper, rendered insoluble by chrome alum. In 1874 J. R. Sawyer patented a flexible support for developing on; this was a sized paper coated with gelatin and treated with an ammoniacal solution of

shellac in heat, on which was at least tabbed. The advantage of this flexible support is that the dark parts of the picture have no tendency to contract from the lighter parts, which they were apt to do when a metal plate was used, as was the case in Johnson's original process. With this patent, and minor improvements made since, carbon-painting has arrived at the state of perfection in which we find it to-day.

According to Luewag, the carbon-tissue when prepared on a large scale consists of from 120 to 150 grains of gelatin (a soft knoll), 15 grains of soap, 21 grains of sugar, and from 4 to 8 grains of dry coloring matter. The last-named may be of various kinds, from lamp-black pigment to soluble colours such as alizarin. The gelatin, sugar, and soap are dissolved in water and allowed to stand for an hour, and then melted, the liquid afterwards recovering the colours, which have been ground with a mallet on a slab. The mixture is filtered through fine muslin. In making the tissue in large quantities the two ends of a piece of roll-paper are pasted together and the paper hung on two rollers, one of wood about 5 inches in diameter is held near the top of the room and the other over a trough containing the gelatin solution, the paper being brought into contact with the surface of the gelatin by being made to revolve on the rollers. The thickness of the coating is proportional to the rate at which the paper is drawn over the gelatin—the slower the movement, the thicker the coating. The paper is taken off the rollers, cut through, and hung up to dry on wooden lathes. If it is required to make the tissue sensitive at once, 120 grains of potassium dichromate should be mixed with the ingredients in the above formula. The carbon-tissue when dry should be allowed to stand for a sensitizing bath consisting of one part of potassium dichromate in forty parts of water. This is effected by turning up about 1 inch from the end of the sheet of tissue (cut to the proper size), making a roll of it, and letting it unroll along the surface of the sensitizing solution, where it is allowed to remain till the gelatin film feels soft. It is then taken off and hung up to dry in a dark room through which a current of warm air is passing. Tissue dried quickly, and which is not so sensitive, may be made to work then if moistened though not so sensitive, as the tissue is coloured, it is not possible to ascertain by inspection of it whether the printing operation is sufficiently carried out, and in order to ascertain this it is usual to place a piece of ordinary silvered paper in an "actinometer," or "photometer," alongside the carbon-tissue to ascertain the amount of light that has acted on it. There are several devices for ascertaining this amount, but the simplest is taken from the design of a varying number of thicknesses of gold-beater's skin. The value of 1, 2, 3, &c., thicknesses of the skin as a screen to the light is ascertained by experiment. Supposing it is judged that a sheet of tissue under some one negative ought to be exposed to light corresponding to a given number of thicknesses, chloride of silver paper is placed alongside the negative beneath the actinometer and allowed to remain there until it has become as visible tint beneath a number of thicknesses equivalent to the strength of the negative. After the tissue is removed from the printing-frame—supposing a double transfer is to be made—it is placed in a dish of cold water, face downwards, along with a piece of Sawyer's flexible support (already described). When the edges of the tissue begin to curl up, its surface and that of the flexible support are brought together and placed flat. The water is pressed out with an India-rubber squeezer called a "squeegee," and the two surfaces adhere. About a couple of minutes later they are placed in warm water of about 90° to 100° Fahr., and the paper of the tissue, loosened by the gelatin solution next it becoming soluble, can be stripped off, leaving the image (reversed as regards right and left) on the flexible support. An application of warm water removes the rest of the soluble gelatin and pigment. When dry, the image is transferred to its permanent support. This usually consists of white paper coated with gelatin and made insoluble with chrome alum, though it may be mixed with barium sulphate or other similar pigments. This transfer-paper is made to receive the image by being soaked in hot water till it becomes slimy to the touch, and the surface of the dampened print is brought in contact with the surface of the infra-red paper in the same manner as was done with the flexible support and the carbon-tissue. When dry the infra-red paper bearing the gelatin image can be stripped off the flexible support, which may be used again as a temporary support for other pictures.

Such is a brief outline of carbon-printing as practised at the present day, subject, of course, to various modifications which need not be entered into here. We ought, however, to mention that if a reversed negative be used the image may be transferred at once to its final support instead of to the temporary flexible support, which is a point of practical value, since single-transfer are better than double-transfer prints.

Printing with Salts of Iron.—Sir John Herschel and Mr Hunt in their various sundry papers and publications entered into various methods of printing with salts of iron. At the present time there are two or three which are practised, being used in draughtsmen's offices for copying tracings. When a ferric salt is exposed to light it becomes reduced to the ferrous state, and when this latter compound

is treated with potassium ferri-cyanide a blue compound is formed. If, therefore, a solution of a ferric salt be brushed over a paper, and the latter be dried, and then exposed behind a tracing, the parts of the ferric salt on the paper exposed beneath the white ground are converted into a ferrous salt, and if potassium ferri-cyanide be brushed over the paper, or the paper floated upon it, the tracing shows white lines on a blue ground. Another method is to mix ferri-cyanide of potassium with a ferric salt, and expose it behind a tracing or drawing. Where the light acts, the mixture is converted into a blue compound. The resulting print is the same as the foregoing. Another method of producing blue lines on a white ground is to expose paper coated with gum and a ferric salt to light, and then treat it with potassium ferri-cyanide. This body forms an insoluble blue compound with the ferric salt, whilst the ferrous salt is inactive, or only gives a soluble body. A further development of printing with salts of iron is the beautiful platotype process. Sized paper is coated with a solution of ferric oxalate and a platinum salt, and exposed behind a negative. It is then floated on a hot solution of neutral potassium oxalate, when the image is formed of platinum black. This process was introduced by M. W. Willis in 1854. The principle of it is that a ferric salt when in solution is capable of reducing a platinum salt to metallic platinum. In this case the ferrous salt is dissolved by the potassium oxalate, and at the moment of solution the platinum salt is reduced and forms the image.

Photo-mechanical Printing Processes.—Allison has already been Photo-mechanical to the invention of Paterny, who claimed to have discovered a method of making a plate in contact with bichromate of potash, salt print, and then exposing it to light and dampening, would recover a greasy ink on those parts which had been affected by light. But Paul Oreloli seems to have made the discovery previous to 1854, for in his patent of that year he states that his designs were inked with printing ink before being transferred to stone or zinc. Tessie de Motay (in 1855) and Maschall of Metz, however, seem to have been the first to produce half-tones from gelatin films by means of greasy ink. Their general method of procedure consisted in coating metallic plates with gelatin impregnated with bichromate or trichromate of potash or ammonia and mercuric chloride, then treating with oleate of silver, exposing to light through a negative, washing, inking with a lithographic roller, and printing from the plates as for an ordinary lithograph. The half-tones by this process were very good, and illustrations executed by it are to be found in several existing books. The method of producing the plates, however, was most laborious, and no one was able to supply it by Albert of Munich. He had been experimenting for many years, endeavouring to make the gelatin films more durable than those of Tessie de Motay. He added gum-resins, alum, tannin, and other such matters, which had the property of hardening gelatin, but the difficulty of adding sufficient to the mass in its liquid state before the whole became coagulated rendered these unmanageable. It was at last occurred to him that if the hardening action of light were utilized by exposing the surface next the plate to light after or before exposing the front surface of the film and the image, the necessary hardness might be given to the gelatin without adding any chemical hardeners to it. In Tessie de Motay's process the hardening was almost absent, and the plates were consequently not durable. It is evident that to effect this one of two things had to be done: either the metallic plate used by Tessie de Motay must be abandoned, or else the film must be stripped off the plate and exposed in that manner. Albert adopted the latter plan, and his success was assured, since instead of less than a hundred impressions being pulled from one plate he was able to take over a thousand. This occurred about 1867, but the formula was not published for two or three years afterwards, when it was divulged by Ohm and Grossman, one of whom had been employed by Albert of Munich, and had endeavored to introduce a process which resembled Albert's earlier efforts. The "Lichtdruck" process, given about this time to these surface-printing processes, and Albert may be considered, if not the inventor, at all events the perfecter of the method. Another modification of "Lichtdruck" was patented in England by Ernest Edwards under the name of "heliotype." Helio-type consisted in coating a glass plate, the surface of which was type, very finely ground, with bichromated gelatin to which a certain amount of chrome alum had been added. The film itself was much thicker than that of the Albert type, since it had to be detached from the surface of the glass by stripping, which was rendered possible by the previous application of a waxing solution to the plate. After the film was stripped off it was exposed under a negative for the time necessary to give a good image with printing ink, after which the inner side was exposed to light for almost the same length of time. The gelatin sheet was then transferred to a pewter plate, to which it was cemented by thick India-rubber cement and soaked in water till all the soluble bichromate was extracted. After this it was placed in a type printing-press and inked with a lithographic or gelatin roller, and an impression pulled on paper in the same manner as in printing with type, save that a greater pressure was brought to bear on the surface. This pressure was necessary

for two reasons,—the relief of the image would be too great if only a moderate pressure were used, and the entire surface was so large that a heavy pressure was requisite to make the paper bite on the ink. Between each pull the gelatin film was damp, the surface moisture taken off with a dry cloth, and the inking proceeded with. The first back to this process was undoubtedly the great relief that is given from the film being so thick, but it is a more manageable process in some respects than that of Albert, since the support is unbreakable. We should mention that Edwards also patented the use of two or more inks of different degrees of stiffness. The stiffest, which was generally black, adhered to the most deeply printed parts of the image, the next stiffest to the next most deeply printed parts, and so on. By this means most doubtless the great relief that is acquired a different tone from that of the deeper printed parts, which was an advantage as regards artistic effect. The same method of inking could be applied to Albert's process with the same results. Since the time of the helotype patent many improvements have been made in the minor details of the operations, and various firms now produce prints in greasy ink very little if at all inferior to silver prints.

Woodbury type

Woodbury Type.—This process was invented by Mr W Woodbury about the year 1864, though we believe that Mr J W Swan had been working independently in the same direction about the same time. In October 1864 a description of the invention was given in the *Photographic News*. Mr Gaudin claimed the principle of the process, insisting that it was old, and basing his pretensions on the fact that he had printed with translucent ink from intaglio blocks engraved by hand, but it is probable that the result, that the application of the principle might lead to important results. It was just these results which Mr Woodbury obtained, and for which he was entitled to the fullest credit. Woodbury type is a combination of the principle upon which intaglio printing is based with that upon which a carbon-print is obtained. The general features of the procedure will be understood from the foregoing description of the carbon-process. An image is obtained on bichromatized gelatin from a negative of the usual kind by exposing a thick layer of gelatin to light and then washing away all its soluble parts from the back of the exposed print. This is the mould which it is necessary to obtain. At first Woodbury made electrotypes from the mould, from which he could obtain prints mechanically. The intaglio was placed on a specially devised printing press, and the mould filled with gelatin containing colouring matter such as Indian ink. A piece of paper perfectly even in thickness was placed in contact with the mould, and a piece of flat glass under pressure brought down upon this. The excess of pigmented gelatin was squeezed out, and, when slightly set, it adhered to the paper and was brought away from the mould. After drying, a perfect picture was obtained in pigment, the image being reversed as regards right and left, but that difficulty was surmounted by using a reversed negative, and also by a modification of the process subsequently introduced by Mr Woodbury. The gelatin relief was made as before, and then by means of very heavy pressure in a hydraulic press the mould was squeezed into soft metal, from which the prints could be afterwards taken off. This is the same principle as that on which nature printing is conducted, and at first sight it seems strange that material such as gelatin should be able to impress metal. Mr Woodbury found that it made very little if any difference in the sharpness of the image if the relief was reversed and the back of the relief pressed into the mould. This of course made the print correct as regards right and left. He has not, however, been content with his original operations, but has further simplified them, the outcome being what is known as the "stannotype process." In 1880 he read a description of it before the French Photographic Society. The modification consisted in using a mould in gelatin from a positive or glass. The mould, when hardened by chemical means (as was indeed the case with the original Woodbury-type process), was attached to a sheet of flat glass, and then covered by the foil and passed through a rolling press the cylinders of which were covered with thick india-rubber. This forced the tinfoil into every crevice of the mould, yielding a block impervious to moisture and ready to have gelatin impressions taken from it. At first Mr Woodbury took an electrotypes from the relief covered with tinfoil, obtained from a negative, but he abandoned this for a simpler plan. He took a positive on glass in the ordinary manner adopted by photographers, from which he made a mould in gelatin. This he covered with tinfoil and printed direct from it.

Photo-Lithography.

Photo-lithography

Reference has already been made to the effect of light on gelatin impregnated with bichromate of potash, whereby the gelatin becomes insoluble, and also incapable of absorbing water when the action of the light has had full play. It is this last phenomenon which occupies such an important place in photo-lithography. In the spring of 1859 Asser of Amsterdam produced photographs on a paper

basis in printer's ink. Being anxious to produce copies of such prints mechanically, he conceived the idea of transferring the greasy ink impression to stone, and multiplying the impressions by mechanical lithography. Following very closely upon Asser, J W Osborne of Melbourne made a similar application, his process is described by himself in the *Photographic Journal* for April 1860 as follows. "A negative is produced in the usual way, bearing to the original the desired ratio. A positive is printed from this negative upon a sheet of (gelatinized) paper, so prepared that the image can be transferred to stone, it having been previously covered with greasy printer's ink. The impression is developed by washing away the soluble matter with hot water, which leaves the ink on the lines of point of the map or engraving." The process of transferring is accomplished in the ordinary way. Early in 1860 Colonel Sir H James, R.E., F.R.S., brought forward the Southampton method of photo-lithography, which had been carefully worked out by Captain Ashton de Courcy Scott, R.E. We give a detailed description of it as practised at Southampton.

Preparation of the Paper.—The mixture consists of 3 oz of Nelson's "fine art" gelatin and 2 oz of potassium bichromate dissolved in 10 oz of water and added to the 40 oz of water with which the gelatin, after proper soaking, has been previously mixed. Good and grainless bank post-paper (chosen on account of its toughness) of medium thickness is made to float on this solution (after it has been stained) for three minutes, when it is hung up in the dark to dry. It is again floated on the solution and hung up for desiccation by the corners opposite to those which were previously uppermost, and then passed through a copper-plate or lithographic press to obtain a smooth surface. The paper is next placed upon a negative and printed in the ordinary manner, the negative being very dense in those parts which should print white, and perfectly transparent where the black lines have to be impressed. From about two minutes' exposure in sunshine to an hour in dull light is requisite to give sufficient intensity to the prints, which are next covered with greasy printer's ink, made from lithographic printing ink, pitch, varnish, palm oil, and wax. The inking is best done by covering a lithographic stone with a fine layer by means of a roller, and then passing the paper through the press as if pulling a lithographic print,—an operation which may have to be repeated twice to ensure the whole surface being covered, and yet not too thickly. The inked print is placed face uppermost on water of a temperature of about 90° Fahr, and, when the soluble parts of the gelatin have taken up their full quantity of water, the paper is laid on a sloping glass plate, inked surface uppermost, and a gentle stream of warm water poured over it. This removes the soluble gelatin and the greasy ink lying on it, the removal being helped by the application of a very soft sponge. When all the gelatin and ink except that forming the image have been removed, the paper is allowed to dry till ready to transfer to stone. The method admits of several variations in detail, such as coating the gelatin with albumen and removing the soluble albumen by cold water, some of them being excellent, especially where the relief of the developed print is small, as relief is an enemy to the production of fine work on a lithographic stone, since the ink, in passing through the press, squeezes out and produces broad lines which should be otherwise fine.

Another method of producing a transfer, called the *Papyro*—"papyrotypage" process," was published by Abney in 1870, type method, in which the ink is put on to a surface of gelatin by means of a soft roller, and thus has the great advantage that the ink can be removed at pleasure if any part is not satisfactorily inked, without the basis of the print being

destroyed. In this process tough paper is coated with a fine layer of gelatin and subsequently treated with alum or chrome alum, afterwards receiving another coating, as in the Southampton method. The printing too is carried out as in the Southampton method, but not so deeply. After withdrawing the prints from the printing frame they are soaked in cold water, and a roller is passed over them charged with an ink made of 4 parts of best lithographic chalk ink mixed with 1 part of palm oil. A roller coated with velvet is said to be better than the ordinary composition rollers. The ink takes when the work is all clear, the transfer is exposed to light, and is ready to be put down on stone or zinc.

Photo-Engraving and Photo-Reliefs.

This may be divided into two classes, one the production of an engraved plate for printing by the copper-plate press, and the other for the production of *lithés* for printing with type. Niepce's process is still generally employed for the first when line engravings have to be reproduced. A copper plate is covered with asphaltum, a film negative placed in contact with it, and the necessary exposure given. After development with olive oil and turpentine the lines are shown as bare copper. The plate after being waxed at the back is next plunged into an acid bath and etched as are etched plates. When a half-tone negative has to be reproduced on copper Fox Talbot's method, described in his patents of 1852 and 1858, is still the simplest. A print on gelatin is transferred to a copper plate, and the surface etched by means of different strengths of ferric chloride, which renders the gelatin insoluble and impermeable; hence it will be seen that a weak solution of ferric chloride is able to reach the copper through the gelatin more readily than a strong one. In order to be successful it is necessary to give a grain to the plate; this is effected by sprinkling it with powdered resin, which is then washed.

Relief plates for printing with type are usually made on zinc. If an ordinary photo-lithographic transfer be transferred to zinc and then sprinkled with resin, the zinc may be immersed in weak acid and the uncovered parts eaten away. The regularity of the erosion is much increased by previously immersing the plate in a weak solution of copper sulphate. The particles of metallic copper deposited on the zinc form with it and with dilute acid galvanic couples, which rapidly eat away the zinc. The etching bath should be kept in motion. The depth of the erosion is increased by littering the surface again with powdered resin, which adheres to the lines, and then heating the plate. The warmed resin runs down the eroded lines and protects them from under-cutting when again placed in acid. This process is applicable to line-engravings. Niepce's bitumen process is also applicable, but in that case a positive must be applied to the plate to be etched. There exist several methods by which half-tone negatives may be reproduced for working off in the printing-press. They depend principally on breaking up the whole surface by means of lines. Thus, if, between the surface on which the printing is to take place (and which has been coated with some sensitive medium) and the positive, a film on which a network of lines has been photographed be interposed, it is evident that the resulting print will consist of the half-tone subject together with an image of the network of lines. This can be etched in the manner described above. Most of these processes are secret, but it is believed that this is the one most generally practised.

Photographs in Natural Colours.

The first notice on record of coloured light impressing its own colours on a sensitive surface is in the passage

already quoted from the *Farbenlehre* of Goethe, where Photo-Seebek of Jena (1810) describes the impression he obtained on paper impregnated with moist chloride of silver. In 1839 Sir J. Herschel (*Athenæum*, No. 621) gave a somewhat similar description. In 1848 Edmond Bequerel succeeded in reproducing upon a daguerreotype plate not only the colours of the spectrum but also, up to a certain point, the colours of drawings and objects. His method of proceeding was to give the silver plate a thin coating of silver chloride by immersing it in ferric or cupric chlorides. It may also be immersed in chlorine water till it takes a feeble rose tint. Bequerel preferred to chlorinize the plate by immersion in a solution of hydrochloric acid in water, attaching it to the positive pole of a voltaic couple, whilst the other pole he attached to a platinum plate also immersed in the acid solution. After a minute's subjection to the current the plate took successively a grey, a yellow, a violet, and a blue tint, which order was again repeated. When the violet tint appeared for the second time the plate was withdrawn and washed and dried over a spirit-lamp. In this state it produced the spectrum colours, but it was found better to heat the plate till it assumed a rose tint. At a later date Niepce de St Victor chlorinized by means of chloride of lime, and made the surface more sensitive by applying a solution of lead chloride in dextrin. G. W. Simpson also obtained coloured images on silver chloride emulsion in collodion, but they were less vivid and satisfactory than those obtained on daguerreotype plates. Poitevin obtained coloured images on ordinary chloride of silver paper by preparing it in the usual manner and washing it and exposing it to light. It was afterwards treated with a solution of bichromate of potash and cupric sulphate, and dried in darkness. Sheets so prepared gave coloured images from coloured pictures, which he stated could be fixed by sulphuric acid (*Comptes Rendus*, 1868, vol. lx. p. 11). In the *Bulletin de la Société Française* (1874) St Florent describes experiments which he made with the same object. He immerses ordinary or albuminized paper in silver nitrate and afterwards plunges it into a solution of uranium nitrate and zinc chloride acidulated with hydrochloric acid, it is then exposed to light till it takes a violet, blue, or lavender tint. Before exposure the paper is floated on a solution of mercuric nitrate, its surface dried, and exposed to a coloured image.

It is supposed—though it is very doubtful if it be so—that the nature of the chloride used to obtain the chloride of silver has a great effect on the colours impressed, and Niepce in 1837 made some observations on the relationship which seemed to exist between the coloured flames produced by the metal and the colour impressed on a plate prepared with a chloride of such a metal. In 1880 (*Proc. Roy. Soc.*) Abney showed that the production of colour really resulted from the oxidation of the chloride that was coloured by light. Plates immersed in a solution of hydroxyl took the colours of the spectrum much more rapidly than when not immersed, and the size of the molecules seemed to regulate the colour. He further stated that the whole of the spectrum colours might be derived from a mixture of two or at most three sizes of molecules. In 1841, during his researches on light, Robert Hunt published some results of colour-photography by means of fluoride of silver. A paper was washed with nitrate of silver and with sodium fluoride, and afterwards exposed to the spectrum. The action of the spectrum commenced at the centre of the yellow ray and rapidly proceeded upwards, arriving at its maximum in the blue ray. As far as the indigo the action was uniform, whilst in the violet the paper took a brown tint. When it was previously exposed, however, a yellow space was occupied where the yellow

rays had acted, a green band where the green had acted, whilst in the blue and indigo it took an intense blue, and over the violet there was a ruddy brown. In reference to these coloured images on paper it must not be forgotten that pure salts of silver are not being dealt with as a rule. An organic salt of silver is usually mixed with chloride of silver paper, this salt being due to the sizing of the paper, which towards the red end of the spectrum is usually more sensitive than the chloride. If a piece of ordinary chloride of silver paper is exposed to the spectrum till an impression is made, it will usually be found that the blue colour of the darkened chloride is mixed with that due to the coloration of the darkened organic compound of silver in the violet region, whereas in the blue and green this organic compound is alone affected, and is of a different colour from that of the darkened mixed chloride and organic compound. This naturally gives an impression that the different rays yield different tints, whereas this result is simply owing to the different range of sensitiveness of the bodies. In the case of the silver chlorinated plate and of true colloido-chloride, in which no organic salt has been dissolved, we have a true coloration by the spectrum. At present there is no means of permanently fixing the coloured images which have been obtained, the effect of light being to destroy them. If protected from oxygen they last longer than if they have free access to it, as is the case when the surface is exposed to the air. That photography in colours may one day be accomplished is still possible, though the bright tints of nature can never be hoped for, since, as a rule, they are produced by sunshine, whereas on the plate they have to be viewed by diffused light.

Reducing action of light.

Action of Light on Silver Salts.—The action of light on sensitive bodies has occupied the attention of many experimentalists from a very early period of photography. In 1777 Scheele, according to Hunt (*Researches in Light*), made the following experiments:—

"I precipitated a solution of silver by sal-ammoniac, then I edulcorated it and dried the precipitate and exposed it to the beams of the sun for two weeks, after which I stirred the powder, and repeated the same several times. Hereupon I poured some caustic spirit of sal-ammoniac (strong ammonia) on this, in all appearance, black powder, and set it by for digestion. The menstruum dissolved a quantity of *luna cornuta* (horn silver), though some black powder remained undissolved. The powder having been washed was, for the greater part, dissolved by a pure acid of nitre (nitric acid), which, by the operation, acquired volatility. This solution I precipitated again by means of sal-ammoniac into horn silver. Hence it follows that the blackness which the *luna cornuta* acquires from the sun's light, and likewise the solution of silver poured on chalk, is *silver by reduction*. I mixed so much of distilled water, with well-edulcorated horn silver as would just cover this powder. The half of this mixture I poured into a white crystal phial, exposed it to the beams of the sun, and shook it several times each day; the other half I set in a dark place. After having exposed the one mixture during the space of two weeks, I filtered the water standing over the horn silver, grown already black, I let some of this water fall by drops in a solution of silver, which was immediately precipitated into horn silver."

This, as far as we know, is the first intimation of the reducing action of light. From this it is evident that Scheele had found that the silver chloride was decomposed by the action of light liberating some form of chlorine. Others have repeated these experiments and found that chlorine is really liberated from the chloride; but it is necessary that some body should be present which would absorb the chlorine, or, at all events, that the chlorine should be free to escape. A tube of dried silver chloride, sealed up *in vacuo*, will not discolour in the light, but keeps its ordinary white colour. A pretty experiment is to seal up *in vacuo*, at one end of a bent tube, perfectly dry chloride, and at the other a drop of mercury. The mercury vapour vola-

lizes to a certain extent and fills the tube. When exposed to light chlorine is liberated from the chloride, and calomel forms on the sides of the tube. In this case the chloride darkens. Again, dried chloride sealed up in dry hydrogen discolours, owing to the combination of the chlorine with the hydrogen. Portevin and H. W. Vogel first enunciated the law that for the reduction by light of the haloid salts of silver halogen absorbents were necessary, and it was by following out this law that the present rapidity in obtaining camera images has been rendered possible. To put it briefly, then, the action of light is a reducing action, which is aided by or entirely due to the fact that other bodies are present which will absorb the halogens. There is another action which seems to occur almost simultaneously when exposure takes place in the absence of an active halogen absorbent, as is the case when the exposure is given in the air,—that is, an oxidizing action occurs. The molecules of the altered haloid salts take up oxygen and form oxides. An example of this has already been shown in the section on "photographs in natural colours." If a sensitive salt be exposed to light and then treated with an oxidizing substance, such as bichromate of potash, permanganate of potash, hydroxyl, ozone, an image is not developed, but remains unaltered, showing that a change has been effected in the compound. If such an oxidized salt be treated very cautiously with nascent hydrogen the oxygen is withdrawn, and the image is again capable of development.¹

Spectrum Effects on Silver Compounds.—The next in Specquery is as to the effect of the spectrum on the different silver compounds. We have already described Seebeck's effects on (1810) experiments on the chloride of silver with the spectrum whereby he obtained coloured photographs, but pounds Scheele in 1777 allowed a spectrum to fall on the same material, and found that it blackened much more readily in the violet rays than in any other. Senbier's experiments have been already quoted at the beginning of this article. We merely mention these two for their historical interest, and pass on to the study of the action of the spectrum on different compounds by Sir J. Herschel which is to be found in the *Philosophical Transactions* for 1840. He there describes many interesting experiments, which became the foundations of nearly all subsequent researches of the same kind. The effects of the spectrum have been studied by various experimenters since that time, amongst whom we may mention Becquerel, Draper, Portevin, H. W. Vogel, Schumann, and Abney. Fig. 1 (see pp. 836-38), which appeared in the *Proceedings of the Royal Society* for 1882, shows the most recent researches by the last-named experimenter as regards the action of the spectrum on the three principal haloid salts of silver. We may mention that in two instances exception has been taken to these results—(1) by H. W. Vogel, who recognizes a difference of behaviour in the spectrum in chloride and bromide of silver when precipitated in alcoholic and aqueous solutions, and (2) by Schumann to the effect of the spectrum on the double iodide and bromide, and iodide and chloride. The latter experimenter finds that when the two salts are mixed after precipitation the results are correct, but that if the precipitations of the two salts take place together the most refrangible maximum of sensitiveness disappears. The diagram (see fig. 1), however, will give a very approximate approach to the truth. Nos. 33 and 34 show the effect of the spectrum on a peculiar modification of silver bromide made by Abney, in which the silver bromide is seen to be sensitive to the infra-red rays. This modification is, and will be, largely used in investigating this part of the spectrum.

¹ See Abney, "Destruction of the Photographic Image," in *Phil. Mag.*, vol. v., 1878; also *Proc. Roy. Soc.*, vol. xxv., 1878.

Effect of Dyes on Sensitive Films.—In 1874 Dyes and Dr Vogel of Berlin called attention to this subject. He found that when films were stained with certain aniline and other dyes and exposed to the spectrum an increased action on development was shown in those parts of the spectrum which the dye absorbed. The dyes which produced this action he called "optical sensitizers," whilst preservatives which absorbed the halogen liberated by light he called "chemical sensitizers." A dye might, according to him, be an optical and a chemical sensitizer. He further claimed that, if a film were prepared in which the haloid soluble salt was in excess and then dyed, no action took place unless some "chemical sensitizer" were present. The term "optical sensitizer" seems a misnomer, since it is meant to imply that it renders the salts of silver sensitive to those regions of the spectrum to which they were previously insensitive, merely by the addition of the dye. The idea of the action of dyes was at first combated by many, but it was soon recognized that such an action did really exist. Abney showed in 1875 that certain dyes combined with silver and formed true coloured organic salts of silver which were sensitive to light, and Dr Amory went so far as to take a spectrum on a combination of silver with eosine, which was one of the dyes experimented upon by Major Waterhouse, who had closely followed Dr Vogel, and proved that the spectrum acted simply on those parts which were absorbed by the compound. Abney further demonstrated that, in many cases at all events, the dyes were themselves reduced by light, thus acting as nuclei on which the silver could be deposited. He further showed that even when the haloid soluble salt was in excess the same character of spectrum was produced as when the silver nitrate was in excess, though the exposure had to be prolonged. This action he concluded was due to the action of the dye. The subject has been discussed again recently owing to the production of so-called iso-chromatic films, i.e., films which are supposed to be sensitive to all colours, and which are prepared on gelatin or collodion plates by dyeing them with eosine or some similar dye; and the instructions given indicate that, if a coloured picture or landscape be photographed through yellow glass, the "yellows" will be denser in the negative than will the "blues." Experiment shows if a film after preparation be dipped in a solution of "eosine of silver," made by precipitating eosine with silver nitrate, washing the precipitate, and then dissolving in water faintly alkaline, a negative taken in the usual way will give the "yellows" equally as dense as the "blues." The action of the yellow glass is to cut off the blue rays to which the normal salt is most sensitive, and to leave the yellow rays unaltered, these then expend their energy upon the organic salt of silver. The advantage of rendering the yellows of a picture most intense in a negative is that the resulting print will be more nearly true to nature, since these are the most luminous rays. Further experiment ought surely to show how this can be done without the introduction of the tinted glass.

Action of the Spectrum on Chromic Salts.—The salts most usually employed in photography

are the bichromates of the alkalis. The result of spectrum action in connexion with them is confined to its own most refrangible end, commencing in the ultra-violet and reaching as far as in the solar spectrum. The accompanying diagram (fig. 2) shows the relative action of the

FIG 2.—The top letters have reference to the Fraunhofer lines, the bottom letters are the initials of the colours. The relative sensitiveness is shown by the height of the curve above the base-line

various parts of the spectrum on potassium bichromate. If other bichromates are employed, the action will be found to be tolerably well represented by the figures. No. 1 is the effect of a long exposure, No. 2 of a shorter one. It should be noticed that the solution of bichromate of potash absorbs those rays alone which are effective in altering the bichromate. A reference to pp 831, 833 will show that the change is only possible in the presence of organic matter of some kind, such as gelatin or albumen.

Action of the Spectrum on Asphaltum.—This seems to be continued into and below the red; the blue rays, however, are the most effective. The action of light on this body is to render it less soluble in its usual solvents. Compare this statement with that on p. 822.

Action of the Spectrum on Salts of Iron.—Spectrum-action on salts of iron. Many ferric salts have been used from time to time in the production of prints, the most common at the present time being the ferric oxalate, by which the beautiful platinotype prints are produced. We give this as a representation (fig. 3) of the spectra obtained on ferric

FIG 3.—Same description as for fig. 2

salts in general. Here, again, we have an example of the rigorous law that exists as to the correlation between absorption and chemical action. One of the most remarkable compounds of iron is that experimented upon by Sir J. Herschel and later by Lord Rayleigh, viz. ferrocyanide of potassium and ferric chloride. If these two be brushed over paper and the paper be then exposed to a bright solar spectrum, action is exhibited into the infra-red region. This is one of the few instances in which these light-waves of low refrangibility are capable of producing any effect. The colour of this solution is a muddy green, and analysis shows that it cuts off these rays as well as generally absorbs those of higher refrangibility.

Action of Light on Uranium.—The salts of light uranium are affected by light in the presence of organic matter, and they too are only acted upon by those rays which they absorb. Thus nitrate

The following table gives the names of the observers of the action of light on different substances with the date of publication of the several observations. It is nearly identical with one given by Dr Eder in his *Geschichte der Photo-Chemie*

of uranium, which shows, too, absorption-bands in the green blue, is affected more where these occur than in any other portion of the spectrum

It would be going beyond our province to do more than enumerate the other metallic compounds which are amenable to chemical change by the impact of radiation; suffice it to say that some salts of mercury, gold, copper, lead, manganese, molybdenum, platinum, vanadium, are all affected, but in a less degree than those which we have discussed. In the organic world there are very few substances which do not change by the continuous action of light, and it will be found that as a rule they are affected by the blue end of the spectrum rather than by the red end. For a more detailed account we must refer the reader to *The Chemical Effects of the Spectrum* by Dr J. M. Eder (London)

THE CAMERA

Any article descriptive of photography would be incomplete without a brief notice of the development of the camera. The inventor of the camera obscura was Giambattista della Porta (*q v*), who was born at Naples about 1540. Except as a scientific toy, his apparatus was not of any practical use, though it is the parent of the apparatus which has grown up with photography. The principles which govern photographic lenses have been briefly given under **LIGHT** (vol. xiv p. 593 *sq*) and **OPTICS** (vol. xvii p. 802 *sq*), and we need only state here that the finest camera which can be manufactured is useless unless the lens with which it has to be worked gives a flat field and an approximately achromatic image.

Fig. 4.—Daguerre's camera. M, stop of lens; J, lens; A, Daguerre's camera. ground glass plate, on which the image formed by the lens is shown, and for which the sensitive plate is substituted; B, a mirror held at 45° by means of L, on which the operator viewed the image on the ground glass. The focus was obtained by sliding the inner box D towards or from the lens.

(*Photography*, 4th ed., p. 89), by which it will be seen that at first the idea existed of moving the plate away from the camera. The first camera made in England, as far as is known, was that by Mr. Palmer of Newgate Street, London, on the plan of Mr. Fry and for him, in 1839. It was a very primitive apparatus, and was furnished with a lens made in the same year. The ordinary form of camera was simply a box, at one end of which was a lens, and at the other a ground glass for focusing, for which could be substituted a dark slide holding a sensitive plate. The adjustment of the focus was made by a rack and pinion motion attached to the lens. The arrangement, however, subsequently introduced for obtaining a rough approximation to focus was to have a sliding inner box as in Daguerre's camera; and finally to obtain the greatest sharpness the rack and pinion motion attached to the lens was used. It is evident that this form of camera has an advantage over the single box, since it allows more than one lens to be used. Ottewill's folding camera was a great improvement, in that, for outdoor work, it enabled a cumbersome article to be folded up into a compact space. Figs 5 and 6 show it set up for use, and folded. A still more portable form was made by Mr. George Edwards of Carlton Colville (Suffolk) in 1853, and for it he obtained the medal of the Society of Arts. Its portability is shown by the fact that for a 7-inch by 5½-inch plate its weight was only 2 lb 3 oz. Broadly speaking its principle was that of a couple of frames attached by screws to a solid bar, one of

which carried the dark slide and the other the lens. The two were connected together and enclosed in a cloth bag, which in reality

FIG. 5.—Ottewill's Camera, set up for use.

FIG. 6.—Ottewill's Camera, folded.

was the camera. This instrument is still used at the present day. It did not come into general use owing to its complicated arrangement of screws,—for the main point in any camera is that there should be as few loose screws as possible. The next improvement is that known as the bellows form, originally introduced, it is believed, by Captain Fovke, R.E., about 1854. Its introduction may be said to mark a new era in camera construction, and from that time to the present the bellows is to be found in nearly every improved form. After this invention the square instead of the tapering form of bellows was that most generally adopted. It is unnecessary to trace every improvement that has been introduced, but we give two typical

FIG. 7.—Hare's Camera.

ones (figs 7 and 8), which are manufactured by Hare and Meagher respectively. It will be noticed that in both these cameras there is an arrangement by which the focusing

FIG. 8.—Meagher's Camera.

screws can be made to tilt at an angle with the axis of the lens. This is called a swing-back arrangement, and is necessary when photographing architectural subjects to prevent vertical lines converging in the picture. When the ground glass is in a vertical plane, no matter what tilt is given to the camera, vertical lines will always be shown as parallel in the picture. It will also be noticed that in these cameras there is an arrangement for focusing the lens by means of a rack and pinion motion in fig. 7, and by means of a screw in fig. 8. The gradual motion which can thus be given to the focusing screen is a great advantage, since lenses need not be constructed with rack and pinion motion. Many suggestions have been put forward for adapting

FIG. 9.—Marion & Co's Camera.

the camera for a developing chamber, and we believe Archer's could be used for this purpose. Mr. Newton in 1852 introduced a camera in which wet plates after exposure were developed by dipping in troughs of solutions; and we might name many others who sub-

sequently worked at the same idea. It met, however, with no very great success. The introduction of dry plates was a great step for the landscape photographer, as it enabled him to carry a supply of plates in the field, and to develop them at home. To economize space and weight, what are known as "double backs" were invented. A "double back" is a dark slide in which two plates are placed back to back, being separated by an opaque plate. Each side of the slide can be drawn up or out so as to expose each plate. What are known as changing boxes answer the same purpose. They hold from one to two dozen plates, and by means of a special arrangement each plate can be conveyed to or removed from the dark slide without exposure to light. There are other plans also by which a certain number of plates can be carried in the camera itself and exposed in succession. The writer's opinion of such

instruments is that they possess no striking advantage and many disadvantages, unless for very special purposes. Even for a miniature camera for taking instantaneous street views whilst holding the apparatus in the hand the use of double backs is to be preferred. An excellent specimen is a camera made by Mason & Co. of London (see fig. 9). It is entirely of metal, and fitted with a tender and instantaneous shutter,—one which should stand any amount of rough usage. The whole apparatus, including a dozen plates, can easily be carried in the pocket. The dark slides are strongly made of metal.

In the preceding sketch, brief though it is, of the successive improvements in cameras, probably enough has been said to show the very remarkable development that has taken place since the days when a cigar-box and spectacle lens were used to obtain an image on a sensitive plate. (W. DE W. A.)

PHOTOMETRY, CELESTIAL. The earliest records that have come down to us regarding the relative positions of the stars in the heavens have always been accompanied with estimations of their relative brightness. With this brightness was naturally associated the thought of the relative magnitudes of the luminous bodies from whence the light was assumed to proceed. Hence in the grand catalogue of stars published by Ptolemy (c. 150 A.D.), but which had probably been formed three hundred years before his day by Hipparchus, the 1200 stars readily visible to the naked eye at Alexandria were divided into six classes according to their lustre, though instead of that term he uses the word *μέγεθος* or "magnitude"; the brightest he designates as being of the first magnitude, and so downwards till he comes to the *minimum visible*, to which he assigns the sixth. These magnitudes he still further divides each into three. To those stars which, though ranged in any particular order of brightness, nevertheless exceed the average of that order in lustre he attaches the letter μ , the initial letter in *μεῖωσις* (greater), and to those in the same order which exhibit a lustre inferior to that of the average he affixes the letter ϵ , the initial letter of *ἐλάττωσις*. With this sort of subdivision he passes through all the six orders of magnitude. He does not, indeed, tell us the precise process by which these divisions were estimated, but the principle involved is obvious. The eye was here made the natural photometer, and it is certain that even in the instances where modern instrumental appliances are called into requisition the ultimate appeal is made to perception by the eye. Moreover, it is one of the many remarkable instances of the acuteness and precision of the Greek mind that for upwards of 1500 years no real improvement was made in these estimations of lustre by any of Ptolemy's numerous successors in this field of research. Flamsteed was the first astronomer who extended the estimation of magnitude to stars visible only by the telescope, and he improved Ptolemy's notation by writing 4.3 instead of δ, μ —indicating thereby an order of magnitude brighter than the average of a fourth, but inferior to that of a third—and 3.4 for δ, ϵ , and so on. Later astronomers have sometimes adopted a more precise nomenclature by subdividing the several orders decimally, but it does not appear that by any immediate and unaided effect the eye can estimate subdivisions of lustre exceeding the thirds adopted by the Greek philosopher.

It was not till the year 1796 that any real advance was made in stellar photometry. Sir W. Herschel, instead of assigning a particular magnitude to stars, arranged them in small groups of three or four or five, indicating the order in which they differed from each other in lustre at the time of observation. This method was admirably adapted to the discovery of any variations in brightness which might occur in the lapse of time among the members of the group. Sir William observed in this way some 1400 stars, published in catalogues scattered through the *Philosophical Transactions* from 1796 to 1799; but he discontinued the work before its conclusion. It might be urged that such

a work touches on no human interests, but it rightly seemed otherwise to the philosophic mind of the great astronomer. He remarked that the sun is, after all, only one among the stars, and that what befalls them in the way of varying light as time proceeds may also befall the sun. He puts the question, "Who would not wish to know what degree of permanency we ought to ascribe to the lustre of our sun?" Not only the stability of our climates, but the very existence of the whole animal and vegetable creation itself, is involved in the question. Where can we hope to receive information upon the subject but from astronomical observations?¹ These researches of the elder Herschel were in due time followed by those of his son, Sir John, about the year 1836 at the Cape of Good Hope. He both extended and improved the methods adopted by his father at Slough, and by a method of estimated sequences of magnitude he hoped to arrange all the stars visible to the naked eye at the Cape or in England in the order of their relative lustre, and then to reduce his results into the equivalent magnitudes adopted by the universal consent of astronomers. Sir John, however, like his father, left this important labour incomplete. Not only is the work one of great and continuous effort, but the effects of ever-varying meteorological conditions greatly impede it. Moreover, there is an unsatisfactory indefiniteness attending all estimations made by the unaided eye; numerical or quantitative comparisons are out of the question, and hence we find Sir John, in the very midst of establishing his "sequences," adopting also an instrumental method which might lead him to more definite results.

In the year when Sir John Herschel completed his photometric work at the Cape (1838) Dr Argelander commenced, and in 1843 completed, his *Uranometria Nova*, in which the magnitudes of all stars visible to the unaided eye in central Europe are catalogued with a precision and completeness previously unknown. It contains 3256 stars, and although it will probably be superseded by instrumental photometry it must ever remain a monument of intelligent patience. Argelander's labours were confined to stars visible to the naked eye; by the aid of his assistants, Dr Schönfeld and Dr Krüger, a catalogue of magnitudes and celestial coordinates was ultimately published in their well-known *Durchmusterung*, extending to the enormous number of 324,000 stars.

Dr Gould also, in his *Uranometria Argentina*, has done similar work for stars visible only in the southern hemisphere, and with the aid of his colleagues has attained to an exactness and precision in his estimations of stellar lustre certainly not hitherto surpassed. There have been other worthy labourers in the same field, each of whom has rendered efficient service, such as Dr Heis and M. Houzeau; but it is chiefly to the labours of Argelander and Gould that astronomers at present make their appeal.

It is to Sir John Herschel that we are indebted for the first successful attempt at stellar photometry by what may

¹ *Phil. Trans.*, 1796, p. 184

be termed "artificial" means. By the aid of appliances of the simplest kind he deflected the light of the moon (by means of the internal reflexion of a rectangular prism) through a small lens 0.12 inches in diameter and of very short focus, 0.2253 inches, so as to form a sort of artificial star in its focus. By the instrumentality of strings and a wooden pole he could move this artificial star of comparison so as to be in the same line of sight with any actual star whose light he proposed to measure. Other strings enabled him to remove this microscopic lunar image to such a distance from the eye that its light was adjudged to be sensibly the same as that of the star compared. The distance of the short focused lens with the image contiguous to it was measured by a graduated tape, and the inverse squares of these distances afforded relative numerical measures of the brightness of the several stars thus brought into ocular juxtaposition with the equalized light of the tiny lunar image. In this way he proceeded with the observations of a considerable number of stars, and these, by appropriate methods, were reduced so as to afford the means of the comparison of their relative brightness when set side by side with results obtained by means of his "sequences," and with the estimated magnitudes of preceding astronomers. Sir John, however, did not go on to the formation of a complete "uranometria." While he was thus busy at the Cape of Good Hope, Steinhil at Munich had completed for Dr Seidel an instrument nearly the same in principle but more manageable in form. He divided the small object-glass of a telescope into two halves, one of which was movable in the direction of its axis. The images of two stars whose light he desired to compare were formed by the intervention of prismatic reflexion, nearly in the same line of sight, and one of the lenses was then moved until the light of the two stars near the respective foci of the semi-lenses seemed equal to the judgment of the observer's eye. The distance through which it was necessary to bring the movable lens furnished the data for comparing the relative lustre of the two stars in question. A large amount of work was thus achieved by Seidel, which for a considerable time has been, with greater or less reason, regarded as worthy of confidence in regard to precision (*Trans. Mun. Acad.*, vol. 11.). Dr Zollner substituted the deflected and reduced image of a lamp for one of Steinhil's stars, and the intensity of this light, or artificial star, he could by means of double refraction reduce in any measurable proportion he pleased according to the well-known relations of polarized light. In this way he could equalize the light of the artificial lamp-star with that of the real star with which he compared it; and the division of the lens was thus dispensed with, but a new difficulty was introduced in the impossibility of maintaining the constancy of the flame. Dr Zollner also availed himself of the effects of double refraction in altering at will the colour of his artificial star of comparison. This ingenious form of photometer has enjoyed considerable reputation, but no astronomer has yet persevered in producing a complete "uranometria" by its aid. The most recent and probably the most successful device for a stellar photometer on the principle of equalizing lights is that invented by Professor Pickering of Harvard College. He deflects the light of Polaris, or of some other star such as λ Ursæ Minoris, by means of prismatic reflexion, and he contrives to form an image of it contiguous to the image of any other star selected on the meridian. The equalization of the lights is then effected by the intervention of a polarizing apparatus, such as that adopted by Zollner. Thus the artificial and in many respects objectionable lamp-star of Zollner is dispensed with. Professor Pickering, with singular inventive power, has devised many other forms of stellar photometers on virtually the same principle; for a detailed

account of these labours the reader is referred to the *Annals of the Harvard College Observatory* (vol. xi.) Unlike his eminent predecessors, the American astronomer is persevering in the formation of a complete catalogue of star-magnitudes.

It has been already stated that mere estimations of relative brightness by the unaided eye are inadequate to the production of numerical quantitative results. In the instrumental devices explained, whether by means of the alteration of distances or by the known alteration of planes of polarization, no such defect exists. By their means it is possible to obtain a fairly exact numerical expression for the ratio of the intensities of the two lights measured. On applying a photometric measurement it is found that the ratio of the intensities of the lights in passing from one magnitude to the next, even in the conventional magnitudes of Argelander and Gould, is not by any means constant, and even hardly definite. At the suggestion of Mr Pogson it is now generally accepted by astronomers that the adopted and conventional ratio of the intensity of light in passing from one magnitude to another shall be 2.512 , a convenient number because its logarithm is $.4$, which is easily remembered, and still more so because on the whole it agrees better than any other number with the varying light-ratio existing among the hitherto received orders of magnitude obtained by eye-estimation alone.

There remains still another principle on which a stellar photometer may be successfully formed, and which has been recently largely applied to the determination of star-magnitudes at the university observatory, Oxford. It is constructed on the principle that the absorption of light in passing through a uniform medium depends, *ceteris paribus*, upon the thickness. On this principle a thin wedge is constructed of homogeneous and nearly neutral-tinted glass, through which the images of stars formed in the focus of a telescope are viewed. Simple means are contrived for measuring with great exactness the several thicknesses at which the light of these telescopic star-images is extinguished. In this way the light of any star can be readily compared with that of Polaris (or any other selected star) at the moment of observation, and thus a catalogue of star-magnitudes can be formed. This method has been already applied by Professor Pritchard to all the brighter stars north of the equator, the results are published in the forty-seventh volume of the *Memoirs of the Royal Astronomical Society*, and are to be speedily followed by a complete catalogue, extending to all the stars in Argelander's *Uranometria Nova* north of the equator, and to a few others beyond. For the details of the processes adopted the reader must here, as in all other cases, consult the original researches.

Even in a rapid sketch of so extensive a subject some notice must be taken of the application of photometry to the determination of the relative amount of light received on the earth from the sun, the moon, and the planets. The methods by which these ratios have been obtained are as simple as they are ingenious; and for them we are mainly indebted to the labours of Bouguer and Bond. The former philosopher compared the light received from the sun with that from the moon in the following fashion in 1725. A hole one-twelfth of a Paris inch was made in the shutter of a darkened room, close to it was placed a concave lens, and in this way an image of the sun 9 inches in diameter was received on a screen. Bouguer found that this light was equal to that of a candle viewed at 16 inches from his eye. A similar experiment was repeated with the light of the full moon. The image now formed was only two-thirds of an inch in diameter, and he found that the light of this image was comparable with that of the same candle viewed at a distance of 50 feet. From

these data and a very simple calculation it followed that the light of the sun was about 256,289 times that of the moon. Other experiments followed, and the average of all the results was that the light of the sun was about 300,000 times the average light of a full moon, both being viewed in the heavens at the same altitudes. The details will be found in Bouguer's *Traité d'Optique*. Wollaston in 1839 tried a series of experiments in which the ratio 801,072 was obtained, but the omission of certain necessary precautions vitiates the result (*Phil Trans*, 1829). Bond (*Mem Amer. Acad*, 1851, p. 295) adopted a different process. He formed the image of the sun on a silvered globe of some 10 inches diameter, the light of this image was reflected on to a small mercurial thermometer bulb, and then this second image was compared with a Bengal light so moved that the lights appeared to be equal. The same process was adopted with the full moon instead of with the sun. The result was that the sun's light was 470,980 times that of the moon. Seidel long before this date had compared the light of the mean full moon with that of Jupiter in mean opposition, his result is 6430. So also this light of Jupiter was found to be 4864 times that of Venus at her brightest; and Jupiter was found to give 82 times the light of a Lyre. If, then, these numbers could be accepted with confidence, we should have the means of comparing the light received from the sun with that received from any of the stars. Adopting these precarious numbers on the authorities of Bond and Seidel we have the following results—

Sun's light =	470,980	times the full moon
" =	622,600,000	" Venus at her brightest
" =	302,835,000	" Jupiter at mean opposition
" =	5,970,500,000	" Sirius

Lastly, Bouguer, by comparing the light of the full moon viewed at different altitudes with an artificial light, found that the atmosphere absorbs 1/877 of the light incident on it at the zenith of any place. Professor Pritchard, from photometric measures taken at Cairo, found this number to be 1/57. At Oxford it was 209. Thus Bouguer's determination indicates an absorptive capacity in the atmosphere of Brittany just midway between those of Oxford and Cairo. Seidel at Munich expresses "surprise" at finding his own results so nearly accordant with Bouguer's. These numbers, therefore, may be regarded as close approximations to fact.¹ (c. p.)

PHOTOPHONE. See TELEPHONE.

PHRENOLOGY. This name was given by Forster in 1815 to the empirical system of psychology formulated by Gall and developed by his followers, especially by Spurzheim and Combe. At first it was named "cranioscopy," "craniology," "physiognomy," or "zoonomy," but Forster's name was early adopted by Spurzheim, and became that whereby the system is now known. The principles upon which it is based are four. (1) The brain is the organ of the mind, (2) the mental powers of man can be analysed into a definite number of independent faculties; (3) these faculties are innate, and each has its seat in a definite region of the brain, (4) the size of each of these regions is the measure of the power of manifesting the faculty associated with it. While phrenology is thus, on the one hand, a system of mental philosophy, it has a second and more popular aspect as a method whereby the disposition and character of the individual may be ascertained. These two sides of the subject are distinct from each other, for,

¹ Since this article was put in type, Professor Pickering at Harvard College has published his concluded results. Professor Pritchard at Oxford has also completed his photometric measures of some 2000 of the same stars. Taken as a whole, and as comprising the first complete and systematic efforts in a new and difficult line of research, the agreements of the two catalogues may fairly be regarded as very satisfactory.

while it can only serve as a reliable guide for reading character on the assumption of its truth as a philosophic system, yet the possibility of its practical application does not necessarily follow from the establishment of the truth of its theoretic side.

History.—That the phenomena of mind are in some measure connected with the action of the brain has been recognized from a very early age of philosophy. It is true that Aristotle² describes the brain as the coldest and most bloodless of bodily organs, of the nature of water and earth, whose chief purpose is to temper the excessive heat of the heart, as the cooler regions of the firmament condense the vapours rising from the earth. In his view, as in that of most of the earlier writers of other nations of antiquity, the heart is the seat of life; to it, not to the brain, the Hebrew writers refer thoughts and affections, while they considered judgment as seated sometimes in the head, sometimes in the kidneys.³ This was, likewise, the teaching of the ancient Egyptian philosophy, and hence, while many rites were practised and many prayers offered for the preservation of the heart of the deceased, the brains were passed over with very little precaution for their preservation.⁴ The influence of the Aristotelian teaching is traceable in that of some of the earlier classic writings on philosophy, as is that of the Hebrews in our own colloquial language, but we learn from Diogenes Laërtius⁵ that much more accurate physiological views were held by Pythagoras, who believed the mind and the intellect to have their seat in the brain. The theory of Hippocrates was Pythagorean rather than Aristotelian, for, although in one passage in his work *De Cordis* he expresses himself rather doubtfully, yet elsewhere he clearly states that he considers the brain to be the index and messenger of the intellect.⁶ The cerebral seat of sense-perception is also taught by Plato,⁷ who puts into the mouth of Socrates the theory that the brain is the organ affected by the senses, whereby memory and opinion arise, and from whence knowledge springs. The classic poets also notice this dependence of mind on brain; for example, in the *Clouds* (v. 1276) Strepsiades accuses Amynias of not being in his right mind, and, on being asked why, responds, "You seem to me as if you had had a concussion of the brain."

The two founders of anatomical science, Erasistratus and Herophilus, who lived in the days of Ptolemy Soter, taught not only that the brain was the seat of sensation and of intellect, but also that there was therein a certain degree of localization of function. Erasistratus believed that the sensory nerves arose from the brain-membranes, the motor from the cerebral substance. Herophilus was apparently the first who held that the vital forces resided in and circulated from the ventricles of the brain, at least so we gather from Celsus and the other authors who have preserved his views. By the influence of the writings of Galen,⁸ which directly teach that the brain is the seat of

² *De partibus animalium*, n. c. 7 (Paris, 1629, p. 886).

³ In the Chaldean portion of Daniel (ii. 28, iv. 5, vi. 1) visions and thoughts are referred to the head. For other particulars as to early views see Nasse on the psychical relations of the heart in *Zetzel's psychische Aerzte*, i. 1818. A few of the later medical writers express similar views, see Santa Cruz, *Opuscula medica*, Madrid, 1624.

⁴ *Book of the Dead*, ch. xxvi.-xxx.

⁵ viii. 30, ed. Cobet, Paris, 1850, p. 211,—"ἄφρονες δὲ καὶ νοῦν, τὰ ἐν τῷ ἐγκέφαλῳ."

⁶ "De morbo sacro," in *Opp.* ed. Kuhn, i. 612 sq.; also *Epid.*, ii. 824. Among later writers Lucius of Genoa taught the coextension of soul and body, upon which subject he wrote two books (*Padua*, 1616). In this connexion may be noted a curious work by Schlegelius, *Dialogus de animae principatu, Aristotelis et Galeni rationes proferentes quibus ille cordi, hic cerebro, principatum attribuit*, Tübingen, 1642.

⁷ *Phædo*, ch. xlv, Valpy's ed. 1838, p. 128. See also Haller's *Bibl. anat.*, i. 30.

⁸ *De usu partium*, ed. Kuhn, ii. 700,—"τὰ μὲν ὅντα ἀποβέβηκεν."

soul and intellect, the Pythagorean doctrine became universally received among philosophers. According to the Galenic theory of life, the animal spirits arising from the brain are conveyed thence by the arteries through the body. These animal spirits have their origin in the ventricles of the brain, and pass thence to the heart. It is true that in one place (viii 159) he refers their origin to the cerebral substance, but the ventricular theory was that adopted by his followers. This view is held by the Greek physicians,⁸ some of whom even speculated on the relation of the intellect to the shape and size of the head. The Arabians adopted the same hypothesis, so we find Averrhoes⁹ correcting Aristotle's notion of cerebral physiology in favour of Galen's view. Rhazes⁸ also extended this by giving a sketch of a scheme of psychic localization, and Avicenna⁴ added to the regions recognized by previous authors by interpolating one of his own. Such of the early Christian authors as had occasion to refer in their writings to the relation of soul to body naturally adopted the teaching of Galen, and suited it to their theology, thereby conferring on it an importance which rendered correction difficult. Thomas Aquinas⁵ thus expresses his acquiescence in the theory of localization, as also in a sense does Tertullian.⁶

Early in the 13th century Albertus Magnus⁷ gave a detailed description of the distribution of mental and psychical faculties in the head. The anterior region he assigned to judgment, the middle to imagination, and the posterior to memory. A somewhat similar allocation was given by Gordon, professor of medicine in Montpellier (1296),⁸ who assigned common sensation and the reception of impressions to the anterior cornua of the lateral ventricles, *phantasia* to the posterior, this power being twofold (*imaginativa* and *cogitativa*), judgment or *estimativa* to the third ventricle, and memory to the fourth.⁹ Figures of a similar division were given by Petrus Montagnana¹⁰ and Lodovico Dolce,¹¹ still later by Ghiraldi¹² of Bologna and by Theodore Gall of Antwerp.¹³ That the "vital spirits" resided in the ventricles was doubted by many, and refuted by a few of the anatomists of the 17th century. Bauhin in 1621¹⁴ attacked the old view, and Hoffmann of Altorf

showed that, as the ventricles were closed cavities, they could not transmit any material fluid. That these spirits existed at all was doubted by Alexander Benedictus,¹⁵ Plater,¹⁶ and a few others, but they were believed in by the great majority of 17th and even of 18th century medical writers, many of whom conceived that the ventricles were "semper pleni spiritibus animalibus flammulis similibus, quorum beneficis intelligimus, sentimus, et movemur,"¹⁷ and the opponents of this view were strongly assailed by Riolan and others as revolutionary. The grey matter of the surface of the cerebrum was first recognized as the true dynamic element by Malpighi¹⁸ and Willis.¹⁹ The latter regarded the convoluted surface of the cerebrum as the seat of the memory and the will, the convolutions being intended to retain the animal spirits for the various acts of imagination and memory. Imagination he described as seated in the corpus callosum, sense-perception in the corpus striatum, and *impetus et perturbatio* in the basal parts of the cerebrum above the crura. The thalami he regarded as the centres of sight and the cerebellum of involuntary acts. Columbus²⁰ ridiculed the idea that the convoluted surface can have anything to do with intellect, as the ass, a proverbially stupid animal, has a convoluted cerebrum. According to his view, the convolutions are for the purpose of lightening the brain and facilitating its movements. Succeeding anatomists simply varied these localizations according to their respective fancies. Lancisi placed sense-perception in the corpus callosum, Vieussens in the centrum ovale majus. Descartes supposed the soul to be seated in the pineal gland, Lotze in the pons Varolii.²¹ Meyer considered abstract ideas to arise in the cerebellum, and memory to have its seat at the roots of the nerves.²²

Of later writers three deserve special notice as having largely prepared the way for the more modern school of phrenology. Unzer of Halle in his work on physiology extended the pre-existing theories of localization. Metzger,²³ twenty years before the publication of Prochaska's work, had proposed to make a series of observations on the anatomical characters of the brains of persons of marked intellectual peculiarity; but it is not known to the present writer whether he ever carried this into effect. In a more special manner Prochaska of Vienna may be looked upon as the father of phrenology, as in his work on the nervous system, published in Vienna in 1784, are to be found the germs of the later views which were propounded in that city twelve years later.²⁴

The system formulated by Gall is thus a modern expansion of an old empirical philosophy, and its immediate parentage is easily traced, although, according to Gall's

αὐτῶ περιέχεται ψάμπτου." See also v 238, viii 159, xv 360. In his *Definitiones medicæ* (467, xiv 459) he says that the brain has a ψυχικὴ δύναμις, but does not specify in what part the power inheres.

account, it arose with him as the result of independent observations. These, he tells us, he began to make at an early age, by learning to correlate the outward appearances and mental qualities of his schoolfellows.¹ Gall's first published paper was a letter in the *Deutscher Merkur* of December 1798, but his principal expositions were oral, and attracted much popular attention, which largely increased when, in 1802, he was commanded by the Austrian Government, at the instance of the ecclesiastical authorities, to discontinue his public lectures. In 1804 he obtained the co-operation of Spurzheim (1776-1832), a native of Longwich near Treves, who became his pupil in 1800, and proved a powerful ally in promulgating the system. Master and pupil at first taught in harmony, but they found it advisable to separate in 1813, and we find Spurzheim, several years after their parting, declaring that Gall had not introduced any new improvements into his system since their separation (notes to Chenevix, p. 99) "My philosophical views," he also says, "widely differ from those of Gall."

In Paris, where he settled in 1807, Gall made many influential converts to his system. Broussais, Blainville, Cloquet, Andral, Geoffroy St-Hilaire, Vimon, and others warmly attached themselves to it, and countenanced its progress. Gall visited Great Britain, but the diffusion of phrenology there was chiefly due to Spurzheim, who lectured through the country and through America, and, with the aid of his pupil George Combe, soon attracted a large popular following. His most influential disciples were Elliottson, Andrew Combe, Mackenzie, Macnish, Laycock, and Archbishop Whately, and in America Caldwell and Godman. On the opposite side many influential men took up a strongly antagonistic position, prominent among whom were Barclay the anatomist, Roget, Sir Charles Bell, Sir W. Hamilton, Jeffrey, Brougham, T. Brown, and Sir B. Brodie. The nature of the system rendered it eminently fitted to catch public attention, and it rapidly attained to so great a degree of popularity that in 1832 there were twenty-nine phrenological societies in Great Britain, and several journals devoted to phrenology in Britain and America; of these the *Phrenological Journal*, a quarterly edited chiefly by George Combe with aid from others of the Edinburgh confraternity, notably Sir George Mackenzie and Macnish, "the modern Pythagorean," lived from 1823 to 1847, through twenty volumes. The controversy in many places was heated and often personal, and this largely increased the popular interest. In the *Edinburgh Review* the theory was severely criticized by Thomas Brown, and afterwards in a still more trenchant manner by Jeffrey. In *Blackwood* it was ridiculed by Professor Wilson. Being a subject which lent itself easily to burlesque, it was parodied cleverly in a long rhyme by two authors, "The Cranium," 87 pages long, published in 1817, while, on the other hand, verse was pressed into its service in the rhyme "Phrenology in Edinburgh" in 1824.² The best defence of the system was that by Chenevix in the third number of the *Foreign Quarterly*, afterwards reprinted with notes by Spurzheim.

The popularity of phrenology has waned, and few of the phrenological societies now survive; the cultivation of the system is confined to a few enthusiasts such as will be found attached to any cause, and some professional teachers who follow phrenology as a vocation. Like many similar systems, it has a much larger following in America than in Europe. Based, like many other artificial philosophies, on an admixture of assumption and truth,

certain parts will survive and become incorporated into scientific psychology, while the rest will in due course come to be relegated to the limbo of effete heresies.

The Faculties and their Localities.—The system of Gall was constructed by a method of pure empiricism, and his so-called organs were for the most part identified on slender grounds. Having selected the place of a faculty, he examined the heads of his friends and casts of persons with that peculiarity in common, and in them he sought for the distinctive feature of their characteristic trait. Some of his earlier studies were made among low associates, in jails, and in lunatic asylums, and some of the qualities located by him were such as tend to become perverted to crime. These he named after their excessive manifestations, mapping out organs of murder, theft, &c., but as this cast some discredit on the system the names were changed by Spurzheim, who claimed as his the moral and religious considerations associated with it. Gall marked out on his model of the head the places of twenty-six organs as round enclosures with vacant interspaces. Spurzheim and Combe divided the whole scalp into oblong and contemnuous patches (see the accompanying figures). Other methods of division and other names have been suggested by succeeding authors, especially by Cox, Sidney Smith (not Sydney), Toulmin Smith, Carus of Dresden, Don Mariano Cubi y Solar, Powell of Kentucky, Buchanan of Cincinnati, Hittel of New York. Some, like the brothers Fowler, raise the number of organs to forty-three; but the system of Spurzheim and Combe is that which has always been most popular in Britain.

Spurzheim separated the component faculties of the human mind into two great groups and subdivided these as follows.

I. Feelings, divided into—

1. Propensities, internal impulses inviting only to certain actions.
2. Sentiments, impulses which prompt to emotion as well as to action.
 - A. Lower,—those common to man and the lower animals
 - B. Higher,—those proper to man

II. Intellectual faculties.

1. Perceptive faculties
2. Reflective faculties

In the following list the locality and the circumstances of the first recognition of the organ are appended to the names, which are mostly the inventions of Spurzheim. Gall's names are placed in brackets.³

Propensities.

(1) Amativeness (*Instinct de la génération*), median, below the mouth, first discerned by Gall from its host in an hysterical youth, supposed to be confirmed by many observations, and referred to the cerebellum.⁴

(2) Philoprogenitiveness (*Amour de la progéniture*), median, on the squama occipitis, and selected as the organ for the love of children because this part of the skull is usually more prominent in apes and in women, in whom the love of children is supposed to be stronger than in men.

(3) Concentrativeness, below the obelion and over the lambda. This is a region of uncertain function, unnoticed by Gall, but described as Inhabitiveness by Spurzheim, because he found it large in cats and in a clergyman fond of his home. It has since been considered by Combe to be the seat of the power of concentration, whereof he believed Inhabitiveness to be a special case.

(4) Adhesiveness (*Amitié*), over the lateral convoluted area of the lambdoid suture. This region was prominent in a lady introduced to Gall as a model of friendship, and is said by him to be the region where persons who are closely attached put their heads together.

(5) Combativeness (*Instinct de la défense*), above the asterion; it was found by Gall by examining the heads of the most quarrelsome

¹ For a brief sketch of the life of Gall, see GALL, vol. x, p. 87.

² Other burlesque and satirical writings were published at this time, notably *The Phrenologist's Fare* by Wade, 1800; *The Headpiece, or Phrenology opposed to Divine Revelation*, by James the Less, and *A Helmet for the Headpiece, or Phrenology incompatible with Reason*, by Daniel the Seer.

³ For topographical purposes Broca's names are adopted as the most convenient for localities on the head.

⁴ Apollonius Rhodius speaking of the love of Meleas for Jason (*Argonautica*, iii. 780-785) says, "ἄκαυρ δ' ἄν' ὀφθαλμῶν βέει ἐνδοθὶ δ' αἰὲρ τείρ' ὀδῶν ἤμιχθονα βῆς χροῖς, ἀμφὶ ἀραιὰς ἵνας καὶ κεφαλῇ, ἐνδὲ ρελαιῶν βίω θυγῆς."

of his low companions whom he had beforehand stimulated by alcohol. It was verified by comparing this region with the same part of the head of a quail: some young lady

(6) Destructiveness (*Instinct carnassier*), above the ear meatus. This is the widest part of the skulls of carnivorous animals, and was found large in the head of a student so fond of torturing animals that he became a surgeon, also large in the head of an apothecary who became an executioner.

(6a) Alimentiveness, over the temporal muscle and above the ear. Hoppe describes it as being large in a gourmand acquaintance, and he therefore supposes it to be the organ of selecting food.

(7) Societiveness (*Esprit, Finesse*), the posterior part of the squamous suture.

(8) Acquisitiveness (*Sentiment de la propriété*), on the upper edge of the front half of the squamous suture. This part of the head Gall noticed to be prominent in the pickpockets of his acquaintance.

(9) Constructiveness (*Sens de mécanique*), on the stephanion, detected by its prominence on the heads of persons of mechanical genius. It was found large on the head of a milliner of uncommon taste and on a skull reputed to be that of Raphael.

The organ of Vitativeness, or love of life, is supposed by Combe to be seated at the base of the skull. To this locality Herophilus referred most of the intellectual powers.

Lower Sentiments.

(10) Self-esteem (*Oryxalis, Florid*), at and immediately over the obelion; found by Gall in a beggar who excused his poverty on account of his pride. This was confirmed by the observation that proud persons held their heads backwards in the line of the organ.

(11) Love of Approbation (*Vanité*), outside the obelion, the region in which Gall saw a protuberance on the head of a lunatic who fancied herself queen of France.

(12) Cautionness (*Overconception*), on the parietal eminence; placed here because an ecclesiastic of hesitating disposition and a vacillating councillor of state had both large parietal eminences.

Superior Sentiments

(13) Benevolence (*Bonté*), on the middle of the frontal bone in front of the coronal suture, here Gall noticed a rising on the head of the highly-commended servant of a friend, as well as on a benevolent schoolmate who nursed his brothers and sisters when they were ill. To this spot Xenocrates referred the intellectual powers.

(14) Veneration (*Sentiment religieux*), median at the bregma. Gall noted when visiting churches that those who prayed with the greatest fervour were prominent in this region, and it was also prominent in a pious brother.

(15) Conscientiousness, unknown to Gall, recognized by Spurzheim usually from its deficiency, and placed between the last and the parietal eminence.

(16) Firmness (*Fermeté*), median, on the sagittal suture from behind the bregma to the front of the obelion. Lavater first pointed out that persons of determination had lofty heads.

(17) Hope, not regarded as primary by Gall, who believed hope to be akin to desire and a function of every faculty which desires, and left this territory unallocated.

(18) Wonder, said to be large in vision-seers and many psychic researchers. A second similar organ placed between this and the next is called Mysteriousness by Forster, and is said to preside over belief in ghosts and the supernatural.

(19) Ideality (*Poesie*), noted by Gall from its prominence in the busts of poets, said to be the part touched by the hand when composing poetry.

(20) Wit (*Esprit caustique*), the frontal eminence, the organ of the sense of the ludicrous, prominent in Rabelais and Swift.

(21) Imitation (*Faculté d'imiter*), disposition to mimicry, placed between Benevolence and Wonder.

Perceptive Faculties

(22) Individuality, over the frontal sinus in the middle line; the capacity of recognizing external objects and forming ideas therefrom, said to have been large in Michelangelo, and small in the Scots.

(23) Form (*Mémoire des personnes*), capacity of recognizing faces, gives a wide interval between the eyes, found by Gall in a squinting girl with a good memory for faces.

(24) Size, over the trochlea at the orbital edge, described by Spurzheim and Vimont as the capacity of estimating space and distance.

(25) Weight, outside the last on the orbital edge and, like it, over the frontal sinus. The prominence of ridge here is due to large sinus or a projecting bone. Certain old writers, such as Strato Physicus, located the whole intellect in this ridge.

(26) Colour, also on the orbital edge external to the last.

(27) Locality (*Sens de localité*), placed above Individuality on each side, and corresponding to the upper part of the frontal sinus and to the region immediately above it.

(28) Number, on the external angular process of the frontal bone, large in a calculating boy in Vienna.

(29) Order, internal to the last, first noted by Spurzheim in an orderly idiot.

(30) Eventuality (*Mémoire des choses*), the median projection above the glabella, supposed to be the seat of the memory of events.

(31) Time, below the frontal eminence and a little in front of the temporal crest.

(32) Tune (*Sens des rapports des tons*), on the foremost part of the temporal muscle, where Gall noticed a bulge on the head of a musical prodigy of five.

(33) Language (*Sens des mots*), behind the eye. This was the first organ noticed by Gall, as a clever schoolfellow, quick at languages, had prominent eyes. Old authors have noted the connexion between prominent eyeballs and mental development, thus Gazzali and Syrenensis Medicius Cyprius place the intellect and soul in and behind the eyeballs.

Reflective Faculties

(34) Comparison (*Sagacité comparative*), median, at the top of the bare region of the forehead, where a savant friend of Gall's, fond of analogies, had a prominent boss.

(35) Causality (*Esprit métaphysique*), the eminence on each side of Comparison, noticed on the head of Fichte and on a bust of Kant, the seat of the faculty of correlating causes and effects.

The first identification of each organ was made by an induction from very limited data, but the founders and exponents of the system have collected all available instances wherein enlargements of each of these regions coexisted with increased powers of the faculty supposed to reside therein, and in some cases they have discovered coincidences of a surprising nature. When, however, such do not exist, a convenient excuse is found by reference to the indefinite article of temperament, or by a supposed explanation of the faculty in question as simple but produced by the co-operation of other influences. Thus as Sheridan's bump of wit was small, he is said not to have been truly witty, but to have had comparison and memory strongly developed. The girl Labrosse (described in Ferrussac's *Bulletin* for October 1831), who exhibited strong amativeness but had a rudimentary cerebellum, is said to have obliterated it by over-use. Thurtell, a cold-blooded murderer whose organ of benevolence was large, is said to have been generous, as he once gave half a guinea to a friend, &c.

The method whereby the sizes of organs are estimated is arbitrary and the boundaries of the regions indefinite. The attempts of Nicol, Staton, and Wright to devise mechanical and accurate modes of measurement have not been very successful and have not found favour with the professional phrenologist.

Anatomical Aspect of Phrenology—The phrenological controversy served the useful purpose of stimulating research into the anatomy of the brain; but we owe very little of solid progress to the advocates of the system. Gall is the only writer of his creed in whose works original observations of value are to be found. Although the study of the surface of the cerebrum is of the essence of phrenology, yet nowhere in the circle of phrenological literature are the convolutions of the brain accurately described; our knowledge of their order and disposition comes from the morphologist, not from the phrenologist. The first real step towards their systematic description was made by Rolando,¹ who in 1830 described the fissure to which his name is attached, and very little advance was made until the publication in 1856 of Gratiolet's² and Huschke's³ memoirs. These works for the first time placed the description of the surface of the brain, imperfectly attempted by Desmoulins in 1825,⁴ on a satisfactory basis. Most of the anatomical details contained in the works on phrenology relate to controversial matters of secondary importance, and presuppose the truth of the theory, but even in connexion with these they give us no statistical details of any value. It would be important, for instance, to have tabulated a sufficiently large number of measurements of the relative thicknesses of scalp and skull in different regions, of the variations in development of the diploe, of the varying range of the frontal sinus; but of these we find no sufficient nor definite researches in the whole circle of books cited below.

As under ANATOMY (vol. i. p. 874) a careful description of the brain has been given, we need only allude to such anatomical points involved in the examination of phrenology as are not included in that account.

1. Any physiological theory which correlates brain-action and mental phenomena requires a correspondence between brain-size and mental power, and, speaking generally, we find that the brains of those whose capacities are above the average are larger than those of the general run of their fellow-men. The details of brain-weights will be found at pp. 879, 880 of the article cited.

2. Direct measurements of the relative developments of different portions of brains are difficult and troublesome to make, but their importance to phrenologists is so great that it is remarkable that no attempts to obtain any such were made by them. The series given by Wagner of the relative sizes of the cerebral lobes of four brains is almost the only record of importance in this direction, and is appended.

Brain of	Superior Surface of Frontal Lobe	Superior Surface of Parietal Lobe	Superior Surface of Occipital Lobe	Superior Surface of Temporo-Sphenoidal	Relation of Frontal Lobe (Percentage of Whole Organ)	Relation of Parietal Lobe (Percentage of Whole Organ)	Relation of Occipital Lobe (Percentage of Whole Organ)	Relation of Temporo-Sphenoidal Lobe (Percentage of Whole Organ)	Extent of Free Surface	Extent of Surface of Involution	Total Extent of Surface	Weight in Grammes
Fuchs, clinical teacher	148	169	559	67	5	419	208	840	110	7281	8342	1499
Gaue, mathematician	159	170	650	68	4	407	207	874	112	8228	9341	1409
Workman	118	202	350	62	885	214	385	97	4184	6291	1278	
Woman ..	180	165	51	66	8	400	204	870	107	5209	6317	1188

From this it appears that the woman exceeded Gaue in perspective and reflective organs, exceeded Fuchs in sentiment, and fell below the workman in propensities. It must be said, however, that the phrenological divisions do not accurately coincide with the anatomical. Other series constructed along these lines are very

much wanted, and it would furnish important physiological data if the brains of men distinguished for special qualities were examined in this or some comparable way.

3. It is important in relation to phrenology to ascertain the constancy of the convolutions. Many varieties in the details of the surface-patterns have been recorded by Tenchini, Fogg, Giamin, Radinger, and Sernew,⁵ but the general plan is fairly uniform. A still more important question has been recently raised by Langley, viz., how far identical spots on identical convolutions, in different brains consist of nerve-cells with precisely the same connexions. The convoluted arrangement results from growth of brain-surface under constraint, hence as the different tracts of surface undergo proportional overgrowth they fold out different lines. The occurrence of small differences in the rate of overgrowth, testified by the varieties of the resulting pattern, will cause considerable alteration in the place of definite territories of grey cells. Some method for the determination of the limits of these shiftings of place is much required.

4. The comparison of the rate of growth of brain with the development of mental faculties is important not only to the phrenologist but to the psychologist. No observations on this point were made by phrenological writers, and they simply refer to the first and rather crude observations of the earlier anatomists. We have, however, recently learned from the researches of Bischoff, Tuzeez, and Exner⁶ many particulars as to the rate and progress of brain-growth. At birth the brain weighs one-tenth of the weight of the body, and averages about 11 ounces. For the first year brain-growth and consequently expansion of the skull proceed with great rapidity, the growth during the large part of this period averaging one cubic centimetre daily. This enormous increase is chiefly due to the rapid development of medullated nerve-fibres, which are deficient in the fetal brain. During the second and third years growth takes place more slowly, the occipital and parietal lobes increasing more than the frontal or temporo-sphenoidal. During these and the four succeeding years the base elongates commensurately with the increasing depth of the face. In the sixth and seventh years the frontal lobes grow faster than the parietals, and the average brain has attained the weight of 1840 grammes, being to the weight of the body as 1:20. In the period between seven years and puberty growth is slight, but at puberty the whole brain grows actively, especially the frontal lobes. This activity lasts until about eighteen years of age, then diminishes, but the average brain does not reach its maximum size until about thirty, from a little after which period the brain tends to diminish towards senility.⁷ These measurements illustrate the relation between brain-growth and mental development, but are as easily explicable on any psychological theory of brain-action as on the phrenological. The relation supposed by Davaine to subsist between development of the brain and stature is not borne out by statistics.⁸

5. The estimation of the relative development of grey and white matter in the several lobes is important to any theory of cerebral dynamics which allocates functions specifically diverse to each separate part of the brain-surface, but no attempt has been made by the phrenologist to obtain precise results in this direction, nor even to determine the physical constants of the two forms of brain-matter. The recently-introduced method of Bourgon and Danilewsky, based upon the differing specific gravities of grey and white matter, promises to give definite information as to the relative amounts of these forms of brain-matter, but further experiments are needed to perfect the method.⁹

6. The relations, if any, between the alterations which take place in the shape and position of the head and alterations in brain-surface have been speculated on by the phrenologist. Broussais is reported to have said that his organ of causality had enlarged with increasing age, and a list of cases of similar alterations of head-shape is given by Deville (*Phren. Jour.* xiv. 32), most of which are simply changes of the kind described by Professor Cleland (*Phil. Trans.* 1870). There are no exact measurements recorded which indicate the occurrence of topical increases of a normal brain in special directions coincident with the cultivation of definite faculties. All the so-called cases are given vaguely, with no measurements, and the careful measurements of George Combe in such cases as were available to him showed no appreciable alterations in adult heads even at long intervals of time (see also Andrew Combe, *Phren. Jour.* x. 414).

7. The phrenological want of knowledge of the topography of the brain-surface was necessarily correlated with ignorance of the exact relations of the convolutions to the interior of the cranial bones, these have been carefully worked out by Huschke, Heffler, Turner, and Reil. Some latitude, however, must be allowed in topography, as the exact relation of convolution to skull varies with the shape of the skull. Giaminini showed that the fissure of Rolando is perceptibly farther back from the coronal suture in dolichocephalic than in brachycephalic skulls, and it is still farther back in the extreme boat-shaped form of long-headedness. Passet shows that there is a slight topographical difference in the two sexes (*Arch. f. Anthrop.*, 1852, xiv 89), and in the heads of those with unsymmetrically-shaped skulls there is often a want of lateral symmetry of convolution. Artificial deformations likewise alter in the topographical relations of convolutions, and have served not a little to puzzle the phrenologist. Thus, the artificial dolichocephaly of the Caribs having bulged the squama occipitis, they decided that these people must be amiable lovers of children,¹ &c.

8. The existence of structural differences between different areas of cerebral surface is important to any theory of cerebral localization, but no phrenologist has given us any original information on this point. Since the investigation of Baillargue,² it has been shown that some local differentiations of structure do really exist. Thus in the convolutions around the fissure of Rolando the ganglion-cells of the fourth layer are of large size (granule-cells of Betz), and in the convolutions of the temporo-sphenoidal lobe a layer of small angular cells (granule-cells) is interposed between the larger pyramidal and the ganglion-cells, so that, while in the parts of the brain above the fissure of Sylvius the grey cortex is for the most part five-layered, below and behind that fissure it is six-layered. There is no abrupt passage from the one to the other, the only sudden transition of structure of the grey cortex being at the hippocampal sulcus, and granule-cells, although of smaller size, and less like those of the anterior cornu of the spinal cord, are scattered over other parts of the cerebral grey matter.³ In fig. 71, vol. i p. 874, the relations of the convolutions to the internal surface of the skull are represented, and there was no accurate correlation to the phrenological areas can be seen by comparing that figure with the foregoing series.

The teachings of anatomy with regard to phrenology may be summarized thus: (1) the rate of growth of brain is concurrent with the rate of development of mental faculty; (2) there is some degree of structural differentiation as there are varying rates of development of different parts of the cerebral surface, (3) there is no accordance between the regions of Gall and Spurzheim and definite areas of cerebral surface.

Physiological Aspect.—The theory of some of the older metaphysicians, that the mind, in feeling and reflexion, makes use of no material instrument is not now accepted by psychologists. It was advanced by Brougham and Jeffrey as against the theory of phrenology; but the doctrine that the brain is the organ of the mind is now universally received. While it is probable that certain molecular changes in the grey matter are antecedents or concomitants of mental phenomena, the precise nature of these processes, to what extent they take place, or how they vary among themselves have not as yet been determined experimentally; the occurrence of the change can only be demonstrated by some such coarse method as the altered pulsation of the carotid arteries,⁴ the increase of the temperature of the head,⁵ the abstraction, during brain-action, of blood from other organs as shown by the plethysmograph, or the formation of lecithin and other products of metabolism in brain-substance. As yet not a single step has been made towards the understanding of the connexion between the molecular changes in the nerve-cell and the phenomena of thought and feeling. While our

knowledge of the anatomy of the brain, especially of the grey nuclei and of the white bands uniting them, has within the last few years become much more accurate, brain-function has not as yet been so definitely determined, indeed, much of nerve-physiology, especially that part which relates to the division of labour in the nerve-centres, is largely hypothetical and based on anatomical structure. Certain masses of grey nerve-matter situated in the spinal cord and medulla oblongata are so linked by nerve-cords to organs outside the nervous system which are set apart for the discharge of separate functions that they obviously form parts of the mechanism for the fulfilment of such functions. In the cases where these can be subjected to experiment we learn that they are nervous centres presiding over the discharge of such functions; and it has been determined by experiment, or else deduced from anatomical structure, that in those lower parts of the nervous centres which are more directly connected with the segmental elements of the body there is a certain localization of function, hence the centres of pelvic actions, of respiration, cardiac action, and inhibition of vaso-motor influence, deglutition, secretions, &c., can be mapped out in ascending series. As certain of these centres are united by bands of fibres to the larger and higher-lying grey portions of the nervous centres there is an *a priori* presumption in favour of the extension of this principle of localization. This has been premised on metaphysical as well as on anatomical grounds. Bonnet believed each portion of the brain to have a specifically separate function, and Herbert Spencer has said that "no physiologist can long resist the conviction that different parts of the cerebrum subserve different kinds of mental action. Localization of function is the law of all organization whatever; separateness of duty is universally accompanied with separateness of structure, and it would be marvellous were an exception to exist in the cerebral hemispheres. Let it be granted that the cerebral hemispheres are the seats of the higher psychical activities; let it be granted that among these higher psychical activities there are distinctions of kind which, though not definite, are yet practically recognizable, and it cannot be denied, without going in direct opposition to established physiological principles, that these more or less distinct kinds of psychical activity must be carried on in more or less distinct parts of the cerebral hemisphere."

For the results of experiment on the brain, see PHYSIOLOGY, section "Nervous System."

There is a large weight of evidence, which cannot be explained away, in favour of the existence of some form of localization of function. So little is known of the physical changes which underlie psychical phenomena, or indeed of the succession of the psychical processes themselves, that we cannot as yet judge as to the nature of the mechanism of these centres. So much of the psychic work of the individual life consists in the interpretation of sensations and the translation of these into motions that there are strong *a priori* grounds for expecting to find much of the material of the nerve-centres occupied with this kind of work, but in the present conflict of experimental evidence it is safer to suspend judgment. That these local areas are not centres in the sense of being indispensable parts of their respective motor apparatuses is clear, as the function abolished by ablation of a part returns, though tardily, so that whatever superintendence the removed region exercised apparently becomes assumed by another part of the brain.⁶ Experimental physiology and pathology, by suggesting other functions for much of the brain-surface, are thus directly subversive of much of the phrenology of Gall and Spurzheim.

¹ Martius tells us that the Caribs castrate their own children, fatten and eat them, an abuse of the organ of philoprogenitiveness; see also Garcillaso de la Vega, *Hist. des Incas*, i. 12.

Psychological Aspect.—The fundamental hypothesis which underlies phrenology as a system of mental science is that mental phenomena are resolvable into the manifestations of a group of separate faculties. A faculty is defined as "a convenient expression for the particular states into which the mind enters when influenced by particular organs, it is applied to the feelings as well as to the intellect, thus the faculty of benevolence means every mode of benevolence induced by the organ of benevolence" (Combe). In another work the same author says it is "used to denote a particular power of feeling, thinking, perceiving, connected with a particular part of the brain." The assumption is contained in the definition that the exercise of a faculty is the physical outcome of the activity of the organ, and in several of the standard works this is illustrated by analogies between these and other organs, thus the organs of benevolence and of firmness are said to be as distinct as the liver and pancreas. The mind, according to another author, consists of the sum of all the faculties. In this view the unity of consciousness is somewhat difficult to explain, and consequently there is assumed by others a single unifying substratum, and on this the organs are supposed to act, thus thoughts are defined as "relations of the simple substance, mind, to certain portions of the encephalon" (Welsh, *Phren. Journ.*, i. 206). Gall himself believed that there was but a single principle which saw, felt, tasted, heard, touched, thought, and willed (*Fonctions du Cerveau*, i. 245), and the American exponent of phrenology, Caldwell, says "the mind is as single in its power as it is in its substance; it is a quickening and operating principle, essential to all the mental faculties, but does not, by any means, possess them itself" (*Elements*, p. 16). It is not easy to understand the supposed relation of this hypothetical substratum to the separate faculties acting on it. It must be both immaterial and unconnected with the brain, as the whole two thousand million cells supposed to exist in the cerebral hemispheres are all parcelled out among the faculties, and none are left for the unifying *noia*.

Each organ is considered as engaged, either independently in bringing forth its own product, or collectively with others in elaborating compound mental states, and according to their several degrees of development and activity they are considered capable of perceiving, conceiving, recollecting, judging, or imagining each its own subject. This mechanical conception of the division of labour in the production of the phenomena of mind has the charm of simplicity, but is attended with the difficulty that arises in discriminating the operations of the different organs one from the other. Phrenologists are apt to be vague respecting the limits of the several faculties, as about the boundaries of the separate organs. It was pointed out by Jeffrey that the lines of demarcation between benevolence, adhesiveness, and philoprogenitiveness were indeterminate, although the organs are not very close, and the same applies to other organs.

It is unfortunate for the clearness of the definition that, although historically the faculties were the first phenomena noted, independent of and previous to their localization, yet in the definition the faculties are defined in terms of their localities.

The following arguments are adduced in favour of the fundamental separateness of the faculties: (1) analogy,—elsewhere in the animal economy division of labour is the rule; (2) the variety of mental endowment observed among children before they are influenced by education, and the inequalities in the mental endowments of individuals; (3) the phenomena of insanity, especially of monomania; (4) the varying periods at which individual faculties attain their maximum development; (5) the

phenomena of dreams, and the awakening of a limited number of faculties during them; (6) pain being felt in an organ when it is overtaxed.¹

Such faculties are supposed to be primary—(1) as exist in some animals and not in others, (2) as vary in their development in the sexes, (3) as are developed in varying proportions with regard to other faculties, (4) as may act separately from other faculties, (5) as are not necessarily simultaneous with other faculties in action, (6) as are hereditary, and (7) as may be singly diseased.

According to the development of their powers mankind may be divided into six classes (1) those in whom the highest qualities are largely developed and the animal qualities feeble; (2) those with the reversed conditions developed, with large animal and feeble intellectual and moral faculties; (3) those in whom good and evil are in constant war, with active animal and strong intellectual faculties and sentiments; (4) those partial geniuses in whom a few qualities are unusually developed, while the rest are at or below the mediocre standard, (5) those men of moderate endowment in whom some faculties are nearly or quite deficient; (6) those with an unvarying standard of undistinguished mediocrity in all their faculties.

It is perhaps unfortunate that the word "faculty" has been used in this sense of original power by phrenologists. It would have been better to employ, as Mr Lewes suggests, the term "function" for the native activity of an organ, and to leave "faculty" for the expression of an acquired activity. "Faculty is properly limited to active power, and therefore is abusively applied to the mere passive affections of the mind" (Hamilton, *Lectures*, i. 177).

Practical Application.—"Die Schädellehre ist allerdings nicht so sehr Irrthum in der Idee als Charlatanerie in der Ausführung," says one of its most acute critics. Even though no fault could be found with the physiology and psychology of phrenology, it would not necessarily follow that the theory could be utilized as a practical method of reading character, for, although the inner surface of the skull is moulded on the brain, and the outer surface approximates to parallelism thereto, yet the correspondence is sufficiently variable to render conclusions therefrom uncertain. The spongy layer or diploe which separates the two compact tables may vary conspicuously in amount in different parts of the same skull, as in the cases described by Professor Humphry (*Journ. of Anat.*, vol viii p 137). The frontal sinus, that *opprobrium phrenologorum*, is a reality, not unfrequently of large size, and may wholly occupy the regions of five organs. The centres of ossification of the frontal and parietal bones, the muscular crests of these and of the occipital bones also, differ in their prominence in different skulls. Premature synostoses of sutures mould the brain without doing much injury to its parts. Artificial malformations alter the apparent skull-shape considerably and affect the relative development of the brain but little. All these and other cogent reasons of a like kind, whose force can be estimated by those accustomed to deal with the component soft parts of the head, should lead phrenologists to be careful in predicating relative brain-development from skull-shape. Psychology, physiology, and experience alike contribute to discredit

¹ It is interesting in this connexion to note that in a case published by Professor Hamilton in *Brain* (April 1884), where a tumour existed on the occipital lobe, the pain was persistently referred to the forehead. Many similar cases are to be noticed among the records of localized brain-lesions. Bearing on this point also it is worth noting, once for all, that in nothing is the purely hypothetical nature of phrenological description better realized than in the accounts of what these authors call the "natural language of the faculties"—that poets are supposed to touch ideality when composing, musicians to press on tone and time, and painters on form and colour, when in the exercise of their arts! Yet we are gravely taught this in the standard works on the subject.

the system and to show how worthless the so-called diagnoses of character really are. Its application by those who are its votaries is seldom more than amusing, but it is capable of doing positive social harm, as in its proposed application to the discrimination or selection of servants and other subordinate officials. It has even been proposed to use it for the purposes of the guarantee society and for the selection of parliamentary representatives. The sarcastic suggestion which originated with Christopher North of moulding children's heads so as to suppress the evil and foster the good was actually repeated in good faith by a writer on phrenology, but experience of the effects of malformation leads one to be sceptical as to the feasibility of this mode of producing a social Utopia. The application of phrenology to the art of painting and sculpture has been suggested, but a careful examination of some of the best pictures of the best masters, who were close observers of nature, shows that no phrenological principles were accepted by them in their works. An application to ethnology has also been proposed; but, although there are in most cases well-marked racial characters presented by the skull, yet all attempts at correlating national characteristics therewith have been groundless and worthless. For further particulars on allied subjects, see **PHYSIOGNOMY**.

xv.

PHRYGIA was the name of a large country in Asia Minor, inhabited by a race which the Greeks called *Φρύγες*, *Frēmen*.¹ Roughly speaking, Phrygia comprised the

western part of the great central plateau of Anatolia, extending as far east as the river Halys, but its boundaries were vague,² and varied so much at different periods that a sketch of its history must precede any account of the geography. According to unvarying Greek tradition the Phrygians were most closely akin to certain tribes of Macedonia and Thrace, and their near relationship to the Hellenic stock is proved by all that is known of their language and art, and is accepted by almost every modern authority. The country named Phrygia in the better known period of history lies inland, separated from the sea by Paphlagonia, Bithynia, Mysia, and Lydia. Yet we hear of a Phrygian "thalassocracy" at the beginning of the 9th century B.C. The Troad and the district round Mount Sipylus are frequently called Phrygian, as also is the seaport Sinope, and a district on the coast between Sestos and the river Crus was regularly named Little Phrygia. Again, Abel³ has pointed to the wide currency of names like Mygdones, Doliones, and Phryges or Bugei both in Asia Minor and in Europe, and many other examples might be added. The inference has been generally drawn that the Phrygians were a stock widespread in the countries which lie round the *Ægean Sea*. There is, however, no decisive evidence, and no agreement among modern scholars, as to whether this stock came from the East over Armenia, or whether it was European in origin and crossed the Hellespont into Asia Minor.

According to Greek tradition there existed in early time a Phrygian kingdom in the Sangarius valley, ruled by kings among whom the names Gordius and Midas were common. It was known to the ancient Greeks of Ionia and the Troad as something great and half-divine. When the goddess appeared to her favourite Anchises she represented herself as daughter of the king of Phrygia; the Phrygians were said to be the oldest people, and their language the original speech of mankind,⁴ the Phrygian kings were familiar associates of the gods, and the heroes of the land tried their skill against the gods themselves, we hear of the well-walled cities of Phrygia and of the riches of its kings. Tradition is completely corroborated by archaeological evidence. In the mountainous region on the upper waters of the Sangarius, between Kutayah and Afium Kara Hisar, there exist numerous monuments of great antiquity, showing a style of marked individuality, and implying a high degree of artistic skill among the people who produced them. On two of these monuments are engraved the names of "Midas the King" and of the goddess "Kymbile the Mother." Even the title "king" (*basileus*)⁵ appears to have been borrowed by Greek from Phrygian.

It is impossible to fix a date for the beginning of the Phrygian kingdom. It appears to have arisen on the ruins of an older civilization, whose existence is revealed to us only by the few monuments which it has left. These monuments, which are found in Lydia, Phrygia, Cappadocia, and Lycæonia, point to the existence of a homogeneous civilization over those countries; they show a singularly marked style of art, and are frequently inscribed with a peculiar kind of hieroglyphics, engraved *boustrophædon*, which have not as yet been deciphered.⁶ There can be

¹ The difficulty of specifying the limits gave rise to a proverb—*ὡς τὰ Φρύγες*, Strabo.

² Art. "Phrygia," in Paul's *Real-Encycl.*

³ Herod., ii. 2; Pausan., i. 14, 2; Claudian, *In Eutrop.*, ii. 261; Apul., *Met.*, xi. p. 762.

⁴ *Φαρυγες* in the Midas tomb. It is expressly recorded that *φρυγισμός* is a Lydian word. Barlaam resists all attempts to explain it as a purely Greek formation, and the termination assimilates it to certain Phrygian words.

⁵ It is common to name these monuments "Hittite," but this name presupposes the truth of an historical hypothesis, namely, the conquest of Asia Minor by a race whose capital was in Syria, which has not as yet been supported by any convincing arguments.

traced in Asia Minor an ancient road-system, to which belongs the "royal road" from Sardis to the Persian capital, Susa (Herod., v 55). The royal road followed a route so difficult and circuitous that it is quite unintelligible as the direct path from any centre in Persia, Assyria, or Syria to the west of Asia Minor. It can be understood only by reference to an imperial centre far in the north. The old trade-route from Cappadocia to Sinope, which had passed out of use centuries before the time of Strabo (pp 540, 546), fixes this centre with precision. It must be far enough west to explain why trade tended to the distant Sinope,¹ hardly accessible behind lofty and rugged mountains, and not to Amisus by the short and easy route which was used in the Græco-Roman period. This road-system, then, points distinctly to a centre in northern Cappadocia near the Halys. Here must have stood the capital of some great empire connected with its extremities, Sardis or Ephesus on the west, Sinope on the north, the Cilician Gates on the south, by roads so well made as to continue in use for a long time after the centre of power had changed to Assyria, and the old road-system had become circuitous and unsuitable.² The precise spot on which the city stood is marked by the great ruins of Boghaz Keu, probably the ancient Pteria, of which the wide circuit, powerful walls, and wonderful rock-sculptures make the site indisputably the most remarkable in Asia Minor.

The ancient road from Pteria to Sardis crossed the upper Sangarius valley, and its course may be traced by the monuments of this early period.³ Close to its track, on a lofty plateau which overhangs the Phrygian monument inscribed with the name of "Midas the King," is a great city, inferior indeed to Pteria in extent, but surrounded by rock-sculptures quite as remarkable as those of the Cappadocian city. The plateau is between 2 and 3 miles in circumference, and presents on all sides a perpendicular face of rock 50 to 200 feet in height. In part, at least, this natural defence was crowned by a wall built of large squared stones.⁴ This city was evidently the centre of the old Phrygian kingdom of the Sangarius valley, but at least one of the monuments in it seems to belong to the older period of Cappadocian supremacy, and to prove that the city already existed in that earlier time.⁵ The Phrygian kingdom and art therefore took the place of an older civilization. It is as yet impossible to determine the relation in which the Phrygians stood to the ruling race of that older period, whether they came in from the north-west, or whether they were a primitive people taught, and for a time ruled, by foreigners from Cappadocia, but at last expelling their teachers. It is probable that the tradition of battles between the Phrygians and the Amazons on the banks of the Sangarius preserves the memory of a struggle between the two races.⁶

Of the monuments that exist around this city two classes may be confidently referred to the period of Phrygian greatness. That which is inscribed with the name of "Midas the King" is the most remarkable example of one class, in which a large perpendicular surface of rock

is covered with a geometrical pattern of squares, crosses, and meanders, surmounted by a pediment supported in the centre by a pilaster in low relief. In some cases a floral pattern occupies part of the surface, and in one case the two sides of the pediment are filled by two sphinxes of extremely archaic type.⁷ In some of these monuments a doorway is carved in the lower part, the door is usually closed, but in one case, viz., the sphinx monument just alluded to, the valves of the door are thrown wide open and give access to a little chamber, on the back of which is sculptured in relief a rude image of the Mother-goddess Cybele, having on each side of her a lion which rests its forepaws on her shoulder and places its head against hers. Sometimes a grave has been found hidden behind the carved front, in other cases no grave can be detected, but it is probable that they are all sepulchral.⁸ The imitation of wood-work is obvious on several monuments of this kind. The second class is marked by the heraldic type of two animals, usually lions rampant, facing one another, but divided by a pillar or some other device. This type is occasionally found conjoined with the preceding, and various details common to both classes show that there was no great difference in time between them. The heraldic type is used on the monuments which appear to be the older, and the geometrical pattern is often employed on the inscribed monuments, which are obviously later than the unscripted. Monuments of this class are carved on the front of a sepulchral chamber, the entrance to which is a small doorway placed high and inaccessible in the rocks.

Early Phrygian art stands in close relationship with the art of Cappadocia, but has such individuality, such freedom from conventionality, such power of varying and combining types learned from other peoples, as to show that the Phrygians possessed high artistic faculty very similar in character to the Greek. The monuments of the type of the Midas tomb are obviously imitated from patterns employed in cloth and carpets. Such patterns were used in Cappadocia, and the priest in the rock-sculpture at Izniz wears an embroidered robe strikingly similar in style to the pattern on the Midas tomb; but the idea of using the pattern as the Phrygians did seems peculiar to themselves. The heraldic type of the second class is found also in the art of Assyria, and was undoubtedly adopted by the Phrygians from earlier art; but it is used so frequently in Phrygia as to be specially characteristic of that country.⁹ While Phrygian art is distinctly non-Oriental in spirit, its resemblance to archaic Greek art is a fact of the greatest importance. It is not merely that certain types are employed both in Phrygia and in Greece, but most of the favourite types in early Greek art can be traced in Phrygia, employed in similar spirit and for similar purposes. The heraldic type of the two lions is the device over the principal gateway of Mycenæ, and stamps this, the oldest great monument on Greek soil, with a distinctly Phrygian character. Mycenæ was the city of the Pelopides, whom Greek tradition unhesitatingly declares to be Phrygian immigrants. A study of the topography of the Argive plain leads to the conclusion that Mycenæ, Midea, and Tiryns form a group of cities founded by an immigrant people in opposition to Argos, the natural capital of the plain and the stronghold of the native race. Midea

¹ Sinope was made a Greek colony in 761 B.C., but it is said to have existed long before that time.

² When the Persians conquered Lydia they retained, at least for a time, this route, which they found in existence, and the royal messengers went first across the Halys to Pteria, and then by the road across Cappadocia to the Cilician Gates.

³ See a paper on "The Early Historical Relations between Phrygia and Cappadocia," in *Journ. Roy. As. Soc.*, 1888.

⁴ The small fortress Pishmish Kaleh is a miniature of the great city beside it, see Parrot, *Revue Archéol.*, p. 169 and pl. vii.

⁵ A large tumulus exists in this district between Ba Kan and Ak Eneer, from which one large stone, with an inscription in the usual Cappadocian hieroglyphics, has already been dug.

⁶ Abel (*l.c.*) identifies these two races, and makes the city at Boghaz Keu a Phrygian city.

⁷ Published in *Journ. Holl. Stud.*, 1884.

⁸ The monuments of Phrygia fall into two groups, which probably mark the sites of two cities about 16 miles distant from each other. One group lies round the villages of Kumbet, Yagutluk, and Bakshish; the other beside Layen, Ba Kan, Damir, and Ayran.

⁹ The heraldic type continues on gravestones down to the latest period of paganism. Carpets with geometrical patterns of the Midas-tomb style are occasionally found at the present time in the houses of the peasantry of the district.

appears to be the city of Midas,¹ and the name is one more link in the chain that binds Mysæa to Phrygia. This connexion, whatever may have been its character, belongs to the remote period when the Phrygians inhabited the *Ægean* coasts. In the 8th and probably in the 9th century B.C. communication with Phrygia seems to have been maintained especially by the Greeks of Cyme, Phocæa, and Smyrna. About the end of the 8th century Midas king of Phrygia married Damodice, daughter of Agamemnon, the last king of Cyme. Gyges, the first Mermnad king of Lydia (687-653), had a Phrygian mother. The worship of Cybele spread over Phocæa to the west as far as Massilia, rock monuments in the Phrygian style and votive reliefs of an Anatolian type are found near Phocæa. Smyrna was devoted to the Phrygian Meter Sipyliene. It is then natural that the lays of the Homerides refer to Phrygia in the terms above described, and make Priam's wife a Phrygian woman. After the foundation of the Greek colony at Sinope in 751 there can be no doubt that it formed the link of connexion between Greece and Phrygia. Phrygian and Cappadocian traders brought their goods, no doubt on camels, to Sinope, and the Greek sailors, the *δευαῖρα* of Miletus, carried home the works of Oriental and Phrygian artisans. The Greek alphabet was carried back to Phrygia and Pteria, either from Sinope or more probably from Cyme, in the latter part of the 8th century. The immense importance of Sinope in early times is abundantly attested, and we need not doubt that very intimate relations existed at this port between the Ionic colonists and the natives. The effects of this commerce on the development of Greece were very great. It affected Ionia in the first place, and the mainland of Greece indirectly; the art of Ionia at this period is almost unknown, but it was probably most closely allied to that of Phrygia.² A striking fact in this connexion is the frequent use of a very simple kind of Ionic capital on the early Phrygian monuments, making it practically certain that the "proto-Ionic" column came to Greece over Phrygia. It is obvious that the revolution which took place in the relations between Phrygians and Greeks must be due to some great movement of races which disturbed the old paths of communication. Abel is probably correct in placing the invasions of the barbarous European tribes, Bithynians, Thyni, Marandyni, &c., into Asia Minor about the beginning of the 9th century B.C. The Phrygian element on the coast was weakened and in many places annihilated; that in the interior was strengthened; and we may suppose that the kingdom of the Sangarius valley now sprang into greatness. The kingdom of Lydia appears to have become important about the end of the 8th century, and to have completely barred the path between Phrygia and Cyme or Smyrna. Ionian maritime enterprise opened a new way over Sinope.³

The downfall of the Phrygian monarchy can be dated with comparative accuracy. Between 680 and 670 the Cimmerians in their destructive progress over Asia Minor overran Phrygia; the king Midas in despair put an end to his own life; and from henceforth the history of Phrygia is a story of slavery, degradation, and decay, which contrasts strangely with the earlier legends. The catastrophe seems to have deeply impressed the Greek mind, and the memory of it was preserved. The date of the Cimmerian invasion is fixed by the concurrent testimony of the contemporary

poets Archilochus and Callinus, of the late chronologers Eusebius, &c., and of the inscriptions of the Assyrian king Esar-haddon. The Cimmerians were finally expelled from Asia Minor by Alyattes before his war with the Medes under Cyaxares (590-585 B.C.). The Cimmerians, therefore, were ravaging Asia Minor, and presumably held possession of Phrygia, the only country where they achieved complete success, till some time between 610 and 590. Phrygia then fell under the Lydian power, and by the treaty of 585 the Halys was definitely fixed as the boundary between Lydia and Media. The period from 675 to 585 must therefore be considered as one of great disturbance and probably of complete paralysis in Phrygia. After 585 the country was ruled again by its own princes, under subjection to Lydian supremacy. To judge from the monuments, it appears to have recovered some of its old prosperity, but the art of this later period has to a great extent lost the strongly-marked individuality of its earlier bloom. The later sepulchral monuments belong to a class which is widely spread over Asia Minor, from Lycia to Pontus. The graves are made inside a chamber excavated in the rock, and the front of the chamber imitates a house or temple. No attempt is made to conceal the entrance or render it inaccessible. The architectural details are in some cases unmistakably copied without intentional modification from the architecture of Greek temples, others point perhaps to Persian influence, while several—which are perhaps among the early works of this period—show the old freedom and power of employing in new and original ways details partly learned from abroad. This style continued in use under the Persians, under whose rule the Phrygians passed when Cyrus defeated Croesus in 546, and probably lasted till the 3d century B.C. One monument appears to presuppose a development of Greek plastic art later than the time of Alexander.⁴ It would, however, be quite wrong to suppose that the influence of truly Hellenic art on Phrygia began with the conquest of Alexander. Under the later Mermnad kings the Lydian empire was penetrated with Greek influence, and Xanthus, the early Lydian historian, wrote his history in Greek. Under the Persian rule perhaps it was more difficult for Greek manners to spread far east, but we need not think that European influence was absolutely unfelt even in Phrygia. The probability is that Alexander found in all the large cities a party favourable to Greek manners and trade. Very little is to be learned from the ancient writers with regard to the state of Phrygia from 585 to 300. The slave-trade flourished: Phrygian slaves were common in the Greek market, and the Phrygian names Midas and Manes were stock-names for slaves. Herodotus (i. 14) records that a king Midas of Phrygia dedicated his own chair at Delphi; the chair stood in the treasury of Cypselus, and cannot have been deposited there before 660 B.C. It is not improbable that the event belongs to the time of Alyattes or Croesus, when Greek influence was favoured throughout the Lydian empire; and it is easy to understand how the offering of a king Midas should be considered, in the time of Herodotus, as the earliest made by a foreign prince to a Greek god. The Phrygian troops in the army of Xerxes were armed like the Armenians and led by the same commander.

It is to be presumed that the cities of the Sangarius valley gradually lost importance in the Persian period. Formerly the great line of communication across Anatolia traversed the Sangarius valley, but a better and shorter path south of the Salt Desert came into use in this period, from which these cities were far distant. The final catastrophe was the invasion of the Gauls about 270 to 260; and, though the circumstances of this invasion are almost

¹ A city Midea occurs also in Boeotia, a village Midea on the Hellespont, and a city Mideum in the Sangarius valley.

² See Furtwängler, *Goldschmelze von Pteria*, *Zeitschr. f. Numism.*, 1874. The closest analogies of old Phrygian art are to be found in the earliest Greek bronze work in Olympia, Italy, and the northern lands.

³ Hipponax, fr. 36 [49], proves that a trade-route from Phrygia down the Meander to Miletus was used in the 6th century.

⁴ A gongosum, on a tomb engraved in *Jour. Hell. Stud.*, pl. xxv.

unknown, yet we may safely reckon among them the complete devastation of northern Phrygia. At last Attalus I settled the Gauls permanently in eastern Phrygia, and a large part of the country was henceforth known as Galatia. Strabo mentions that the great cities of ancient Phrygia were in his time either deserted or marked by mere villages. The great city over the tomb of Midas has remained uninhabited down to the present day. About 5 miles west of it, near the modern Kumbet, stood Merus, a bishopric in the Byzantine time, but never mentioned under the Roman empire.

Alexander the Great placed Phrygia under the command of Antigonos, who retained it when the empire was broken up. When Antigonos was defeated and slain at the decisive battle of Ipsos, Phrygia came under the sway of Seleucus. As the Pergamene kings grew powerful, and at last confined the Gauls in eastern Phrygia, the western half of the country was incorporated in the kingdom of Pergamum. Under the Roman empire Phrygia had no political existence under a separate government,¹ but formed part of the vast province of Asia. In autumn 85 B.C. the pacification of the province was completed by Sulla, and throughout the imperial time it was common for the Phrygians to date from this era. The imperial rule was highly favourable to the spread of Hellenistic civilization, which under the Greek kings had affected only a few of the great cities, leaving the mass of the country purely Phrygian. A good deal of local self-government was permitted: the cities struck their own bronze coins, inscribed on them the names of their own magistrates,² and probably administered their own laws in matters purely local. The western part of the country was pervaded by Graeco-Roman civilization very much sooner than the central, and in the country districts the Phrygian language³ continued in common use at least as late as the 3d century after Christ.

When the Roman empire was reorganized by Diocletian at the end of the 3d century Phrygia was divided into two provinces, distinguished at first as Prima and Secunda, or Great and Little, for which the names Pacatiana and Salutaris⁴ soon came into general use. Pacatiana comprised the western half, which had long been completely pervaded by Graeco-Roman manners, and Salutaris the eastern, in which the native manners and language were still not extinct. Each province was governed by a "praeses" or *ὑπερὸν* about 412 A.D., but shortly after this date an officer of consular rank was sent to each province (Hierocles, *Synecd.*). About 535 Justinian made some changes in the provincial administration: the governor of Pacatiana was henceforth a "comes," while Salutaris was still ruled by a "consularis." When the provinces of the Eastern empire were reorganized and divided into "themata" the two Phrygias were broken up between the Anatolic, Opsician, and Thracian themes, and the name Phrygia finally disappeared. Almost the whole of the Byzantine Phrygia is now included in the vilayet of Broussa or Khodavendukya, with the exception of a small part of Phrygia and the district about Themisonium (Karayük Bazar) and Ceretapa (Kayadibi), which belong to the vilayet of Koniye, and the district of Laodicea and Hierapolis, which belongs

to Aidin. The principal modern cities are Kutayah (Cotyaeum), Eski Sheher (Dorylaeum), Afium Kara Hissar (near Prynnessus), and Ushak (near Tiajanopolis).

It is impossible to say anything definite about the boundaries of Phrygia before the 5th century. Under the Persians Great Phrygia extended on the east to the Halys and the Salt Desert; Xenophon (*Anab.* 1, 2, 19) includes Icomum on the south-east within the province, whereas Strabo makes Tyrraene the boundary in this direction. The southern frontier is unknown; the language of Livy (xxxviii 15) implies that Metropolis (in the Tephli Ova) belonged to Pisidia, but Strabo (p. 629) includes it in Phrygia Celensis, beside the later city of Apamea (Dimeir), and the entire valley of the Lycus were Phrygian. The Meander above its junction with the Lycus formed for a little way the boundary between Phrygia and Lydia. The great plateau now called the Banaz Ova was entirely or in great part Phrygian. Mount Dindymus (Murad Daghi) marked the frontier of Mysia, and the entire valley of the Tembrugus or Tembris (Porsuk Su) was certainly included in Phrygia. The boundaries of the two Byzantine Phrygias were not always the same. Taking Hierocles as authority, the extent of the two provinces at the beginning of the 6th century will be readily gathered from the accompanying list, in which those towns which coined money under the Roman empire are italicized and the nearest modern village is appended.

I. PACATIANA. — 1. *Laodicea* (Eski Hissar); 2. *Hierapolis* (Pambuk Kalesi); 3. *Mosyna* (Geveze); 4. *Metropolis*, only in *Notitia Episcop.* (Guzlar); 5. *Attuda* (Assai, south-west from Serai Koni); 6. *Tyazepolis* (perhaps between Dava Ova and Karayük Ova); 7. *Colasae* (near Chousa); 8. *Ceretes* *Dioscoreae* (Kayadibi); 9. *Themisonium* (Karayük Bazar); 10. *Troconia* (Yavshih); 11. *Somaus* (Sarı Kavak, in Daz Kiri); 12. *Dionysopolis* (Orta Koni); 13. *Anastasiopolis*, originally a village of the *Myrgalis* (Uçuk Kuyul); 14. *Aitanassus* (Eski Aidan); 15. *Lunda* (Eski Sadi); 16. *Pelae* (Kayayashlar); 17. *Eumeneae* (Isahely); 18. *Sibula* (Homa); 19. *Pepusa* (Yanık Kuren); 20. *Bria* (Bazasan or Sureti); 21. *Sébastae* (Sivas); 22. *Elusa* or *Aludra* (Hadımlar); 23. *Acmone* (Ahat Kuni); 24. *Aha* (Karkas); 25. *Hicaria*; 26. *Chryse* (Dolu); 27. *Artemum* (Karay. Eren, in Sitchely Ova); 28. *Odyneus* (Uçuk Eynk); 29. *Apha* (Abla); 30. *Colyrium* (Kutayalı); 31. *Exani* (Tehavir Hissar); 32. *Tyberopolis* (Altıntaş); 33. *Cada* (Gediz); 34. *Anagya* (Kilis-keni); 35. *Synarus* (Simav); 36. *Flanopolis* *Temenolichyrus* (Kara Tash); 37. *Trojanopolis* *Grumenothys* (Ghaour Eren, near Orta Koni); 38. *Elaeusius* (Suleimanlı); 39. *II. SALUTARIS*. — 1. *Eucarpia* (near Mentesh); 2. *Hierapolis* (Eski Hissar); 3. *Otous* (Tchor Hissar); 4. *Stectorium* (Emir Assai); 5. *Tricua* (Kara Sandıkly); 6. *Boindus* (Aghaz Kaya); 7. *Augustopolis*, formerly *Anabuta* (Sürmeneh); 8. *Sibudunda* (perhaps Yenik Koni); 9. *Lysias* (perhaps Bazas Agatchi); 10. *Synnada* (Tehit Cassaba); 11. *Prynnessus* (Seulun); 12. *Ipsus*, formerly *Jutta* (near Sakly); 13. *Polybotus* (Bolavandun); 14. *Doomum* (Ischeh Kara Hissar); 15. *Metropolis*, including *Comi* (B. Tchorgia) and *Ambasus* (Ambanar); 16. *Merus* (Kumbet); 17. *Nicola* (Sadi Ghar); 18. *Dorylaeum* (Eski Sheher); 19. *Midasium* (Kara Eynk); 20. *Lycraeus* (Kalyk); 21. *Anolera* (in Dombai Ova); 22 and 23. *Amadassus* and *Prynnessus* (unknown). In later times the important fortresses (and bishoprics) of Aconemus was founded on the site of the present Afium Kara Hissar.

Besides these, certain cities beyond the bounds of the Byzantine Phrygia belonged under the Roman empire to the provinces of Asia and are usually considered Phrygian:—(1) in Byzantine Pisidia, *Phalomechus* (Ak Sheher), *Hadrangopolis* (Akir Koni); (2) in Byzantine Galatia, *Amavus* (Assar near Hamza Hadji), *Orcistus* (Alikel or Alekan), *Troconia* or *Trocnada* or *Trocnada* (Kaimaz); (3) in Byzantine Lycia, *Chrysa* (Horzum).

Phrygia contains several well-marked geographical districts: (1) *PARIORIUS*, the narrow, flat, elevated valley stretching north-west to south-east between the Sultan Daghi and the Emir Daghi from Holm (about Tehai) to Tyrraene (Ighin); its waters collect within the valley, in three lakes, which probably supply the great fountains in the *Arxylum*, and through them the *Sanguarius*; (2) *AXYLUM*, the vast treeless plains on the upper *Sanguarius*; there burst forth at various points great perennial springs, the *Sakaria* fountains.

¹ Oecolia, which is known only from coins, probably belongs to this province. Hierocles adds *Theodosia*, probably a name of *Daldia* (Demirli), which is usually included in Lydia. Mionnet gives coins of *Mosyna*, but they are falsely read and belong to the *Mosium* (Demirli).

² Nos. 1-6 were called the Phrygian "Pentapolis."

¹ An imperial officer named *Pocutorius Phrygia* is mentioned in a few inscriptions of the 2d century, but he belongs to a financial, not an administrative division.

² This liberty was not granted to the cities of any other province in Anatolia.

³ A number of inscriptions in a language presumably Phrygian have been discovered in the centre and east of the country; they belong generally to the end of the 2d and to the 3d century.

⁴ The name *Salutaris* is first found in Ptolemy *Synodus* about 385; in the *Notit. Dignit.*, about 412 A.D., the names *Pacatiana* and *Salutaris* are used.

(Strabo, p. 543), Illye Bashu, Bunar Bashu, Geuk Bunar, Umik Bashu, which feed the Sangarius. Great part of the Axylium was assigned to Galatia. (3) The rest of Phrygia is mountainous (except the great plateau, Danar Ova), consisting of hill-country intersected by rivers, each of which flows, through a fertile valley of varying breadth. The northern half is drained by rivers which run to the Black Sea, of these the eastern ones, Porsuk Su (Tombrus or Tembrogus), Seidi Su (Patthenus), Bardakchi Tchui (Xerabates), and Dayat Tchui (Alandus), join the Sangarius, while the western,¹ Taushanly Tchui (Rhyndacus) and Suvayr Tchui (Maeonius), meet and flow into the Propontis. The Hermus drains a small district included in the Dyazmaene Phrygia, but in earlier times assigned to Lydia and Mysia. A Great plateau, southern and western Phrygia is drained by the Meander with its tributaries, Sandykchi (Glaucus), Banaz Tchui, Koplü Su (Hippunius), and Tchuruk Su (Lycaeus), moreover, some upland plains on the south, especially the Dombu Ova (Auloeta), communicate by underground channels with the Meander. Finally, the Karayuk Ova in the extreme south-west drains through the Kazanes, a tributary of the Indus, to the Lycian Sea. Phrygia Furoris and all the river-valleys are exceedingly fertile, and agriculture was the chief occupation of the ancient inhabitants, according to the myth, Gordius was called from the plough to the throne. The high-lying plains and the vast Axylium furnish excellent pasturage, which formerly nourished countless flocks of sheep. The Romans also obtained fine horses from Phrygia. Grapes, which still grow abundantly in various parts, were much cultivated in ancient times. Other fruits are rare, except in a few fertile valleys and the gardens in the country, and the ancient references to Phrygian figs are either erroneous or due to a loose use of the term Phrygia.² Trees are exceedingly scarce in the country, the pine-trees on the western tributaries of the Sangarius and the valonia oaks in parts of the Banaz Ova, and a few other districts, form exceptions. The underground wealth is not known to be great. Iron was worked in the district of Olybia, and the mines of Synnada, or more correctly of Dozani, and of gold used by the Romans. The scenery is generally monotonous, even the mountainous districts rarely show striking features or boldness of character, where the landscape has beauty, it is of a subdued melancholy character. The water-supply is rarely abundant, and agriculture is more or less dependant on an uncertain rainfall. The circumstances of the country are well calculated to impress the inhabitants with a sense of the overwhelming magnitude of nature and the dependence of man on it. Their mythology, so far as we know it, has a melancholy and mystic tone, and their religion partakes of the same character. The two chief deities were Cybele, the Mother, the reproductive and nourishing power of Earth, and Sabazus, the Son, the life of nature, dying and reviving every year. The annual vicissitudes of the life of Sabazus, the Greek Dionysus, were accompanied by the mimic rites of his worshippers, who assumed with his sufferings and rejoiced with his joy. They enacted the story of his birth and life and death, the Earth, the Mother, is fertilized only by an act of violence by her own child, the representative of the god was probably slain each year by a cruel death, just as the god himself died.³ The rites were characterized by a frenzy of devotion, unrestrained enthusiasm, wild orgastic dances, and wanderings in the forests, and were accompanied by the music of the flute, cymbal, and tambourine.⁴ At an early time this worship was affected by Oriental influence, coming over Syria from Babylon. Sabazus was identified with Adonis at Olybia, Cybele with the Syrian goddess, and many of the coarsest rites of the Phrygian worship, the mutilation of the priests, the prostitution at the shrine,⁵ came from the hot countries of the south-east. But one cautious point of Semitic religion never penetrated west of the Halys: the pig was always unclean and abhorred among the Semites, whereas it was the animal regularly used in purification by the Phrygians, Lydians, Lycians, and Greeks.⁶ The Phrygian religion exercised a very strong influence on Greece. In the archaic period the Dionysiac rites and orgies spread from Thrace into Greece, in

spite of opposition which has left many traces in tradition, and the worship of Demeter at Eleusis was modified by Celtic influence, ultimately traceable to Asia Minor. Pindar erected a shrine of the Mother of the gods beside his house, and the Athenians were directed by the Delphic oracle to atone for the execution of a priest of Cybele during the Peloponnesian War by building the Mettemion in these and other cases the Phrygian character was more or less Hellenized, but wave after wave of religious influence from Asia Minor introduced into Greece the unmodified "barbarian" ritual of Phrygia. The rites spread first among the common people and those engaged in foreign trade. The courts pacted satirized them, and Plato and Demosthenes inveighed against them, but they continued to spread, with all their ferocious enthusiasm, then superstition, and then obscene practices, while among the people, whose religious cravings were not satisfied with the pure external rituals of Hellenism. The orgies or mysteries were open to all, freemen or slaves, who had duly performed the preliminary purifications, and secured to the participants salvation and remission of sins. Under MYSTERIES (*q.v.*) a distinction of character has been pointed out: the true Hellenic mysteries, such as the Eleusinian and the Phrygian, but these certainly existed much similarity between the two rituals. In the first continued to exist. Only while the Phrygian and the Egyptian rites retained much real hold on the Graeco-Roman world. Phrygia itself, however, was very early converted to Christianity. Christian inscriptions in the country begin in the 2d and are abundant in the 3d century. There is every appearance that the great mass of the people were Christianized before 300, and Eusebius (*H. E.* vi. 18) is probably correct in his statement that in the time of Constantine there was a Phrygian city in which every living soul was Christian. The great Phrygian saint of the 2d century was named Abercius, the mass of legends and miracles in the late biography of him long brought his very existence into dispute, but a recently-discovered fragment of his gravestone has proved that he was a real person, and makes it probable that the wide-spread legend conversion of the people attributed to him did actually take place. About the same time the character of the old Phrygian religion was not wholly lost when the country became Christian, but is clearly traced in the various heresies that arose in central Anatolia. Especially the wild ecstatic character and the prophecies of the Montanists recall the old type of religion. Montanus (see MONTANISM, vol. xvi. p. 775) was born on the borders of Phrygia and Mysia (doubtless in the Mured Danus), and was vehemently opposed by the Christians.

Of the old Phrygian language very little is known, a few words are preserved in Hesychius and other writers. Plato mentions that the Phrygian words for "dog," "fire," "se," were the same as the Greek, and to these we may add from inscriptions the words for "mother" and "king." A few inscriptions of the ancient period are known, and a somewhat larger number of the Roman period have been found, but not yet published.

Among the ancient published material about Phrygia frequent references have been made in this article to unpublished monuments, and historical views are stated which have only quite recently been published by the writer. Besides, the work already quoted of Abel and Perrot, see Bitter's "Kleinasien," in his *Exil und von Asien*. Leal's *Asia Minor*. Kiepert's appendix to *France, Pays Inconnus*, a *Revue des Etudes Classiques*, Haase, in *Revue des Etudes Classiques*, Hamilton's *Travels in Asia Minor*, Hirschfeld's "Reisenbericht," in the *Zeit. Monist.* (1879), Texier, *Asie Mineure*, Steudtner, *Asien Minor*, besides the special chapters in the geographical treatises of Chaurier, Vivien St. Martin, Fouquet, de la Harpe, in *Revue des Etudes Classiques* (1889), *Revue de Correspondance* (1889-93), and *Journal of Hellenic Studies* (1882 &c.). (W. M. R.)

PHRYNE, a celebrated Greek courtesan, flourished in the time of Alexander the Great (4th century B.C.). She was born at Thespis in Boeotia, but seems to have lived at Athens. Originally so poor as to earn a living by gathering capers, she acquired so much wealth by her extraordinary beauty that she offered to rebuild the walls of Thebes, which had been destroyed by Alexander (335), on condition of inscribing on them, "Destroyed by Alexander, restored by Phryne the courtesan." On the occasion of a festival of Poseidon at Eleusis she laid aside her garments, let down her hair, and stepped into the sea in the sight of the people, thus suggesting to the painter Apelles his great picture of Aphrodite rising from the Sea, for which Phryne sat as model. The sculptor Praxiteles was one of her lovers, and she is said to have been the model of his celebrated Cnidian Aphrodite, which Phryne declared to be the most beautiful statue in the world.¹ There were statues of her by Praxiteles at Delphi and in

¹ This district was according to the Greek view part of Mysia. In Strabo, p. 577, *Δαειφόρος* must be wrong, *Δαειφόρος* is true to fact, and is probably the right reading. Olives cannot grow on the uplands.

² Those parts of Greece which are most closely related to the Phrygian were certainly accompanied originally by human sacrifices.

⁴ The influence which was exerted on Greek music and lyric poetry by the Phrygian music was great, see MARSTAS, OLYMPIUS.

⁵ There is no direct evidence that this was practised in the worship of Cybele, but analogy and indirect arguments make it pretty certain.

⁶ Clean, the Phrygian, when high priest of the Cappadocian goddess at Comana, caused much scandal by using pigs in the sacred precincts (Strabo, p. 574); he only carried out the customs of his country. Pigs were used in all Greek purificatory rites, which were also practised in Lydia (Herod., i. 85). A pig is under the seat of the deified dead on the happy tomb.

¹ So Athenaeus, 590, 591. But according to others (Clement Alexandrinus, *Protrept.* 53, and Arnobius, *Adv. Gentes*, vi. 13) Praxiteles' model for the Cnidian Aphrodite was Chama, and Phry (xxxix 87) says that some declared that Apelles's model was Pausanias.

her native town, the former was golden or plated with gold, the latter was of marble. It is said that at her request Praxiteles promised her the most beautiful of his works, but would not tell her which was it. Having discovered by a stratagem that of his works he prized most a statue of Love (Eros) and one of a Satyr, she asked of him the former and dedicated it in Thespiae. Being accused of impetuosity by El'ias, she was defended by the orator Hyperides, one of her lovers. When it seemed that the verdict was about to be against her, he rent her robe and displayed her lovely bosom, which so moved her judges that they acquitted her. According to others it was Phryne herself who thus displayed her charms. She is said to have made an attempt on the virtue of the philosopher Xenocrates, and to have signally failed.

PHRYNICHUS, the name of a number of distinguished Greeks, of whom the most prominent were the following:

1. PHRYNICHUS, one of the earliest tragic poets of Athens, was the son of Polyphradmon, and a pupil or follower of Thespis, who is commonly regarded as the founder of tragedy. But such were the improvements introduced by Phrynichus that some of the ancients regarded him as its real founder. He flourished, according to Cynillus and Eusebius, in 483 B.C., but he gained a poetical victory (probably his first) as early as 511. His famous play the *Capture of Miletus* was probably composed shortly after the conquest of that city by the Persians (494). It moved the Athenians to tears, they fined the poet 1000 drachms for reminding them of the woes of their friends, and decreed that the play should never be used again. In 476 Phrynichus won another poetical victory, probably with his play the *Phoenissae*, which celebrated the defeat of Xerxes at Salamis (480). The drama derived its name from the chorus of Phœnician women. On this occasion Themistocles acted as choragus, and it is probable that the play was written to revive his waning popularity by reminding the Athenians of his great deeds. The *Persians* of Æschylus (exhibited in 472) was an imitation of the *Phoenissae* of Phrynichus. Phrynichus died in Sicily, perhaps at the court of Hiero, tyrant of Syracuse, who welcomed those other great contemporary poets Æschylus and Pindar. The titles of his plays mentioned by Suidas and others show that he treated mythological as well as contemporary subjects, such as the titles *The Danaides*, *Artaxerxes*, *Alcestis*, *Tantalus*. But in his plays, as in the early tragedies generally, the dramatic element was subordinate to the lyric element as represented by the chorus. Indeed in his earliest dramas there can only have been one actor, for the introduction of two actors was a novelty due to his younger contemporary Æschylus, who first exhibited in 499. Phrynichus was especially famous for the sweetness of his songs, which were sung by old people down to the time of Aristophanes. Connected with the predominance of the chorus in early tragedies was the prominence in them of the dance. There is an epigram ascribed to Phrynichus in which he boasts that the figures of his dances were as various as the waves of the sea. According to Suidas it was Phrynichus who first introduced female characters on the stage (played by men in masks). The few remains of his works are collected by Wagner and Nauck in their editions of the fragments of the Greek tragedians.

2. PHRYNICHUS, a poet of the Old Attic Comedy and a contemporary of Aristophanes, is said by Suidas to have been an Athenian, but according to the scholiast on Aristophanes (*Frogs*, 13) he was satirized as a foreigner. His first comedy was exhibited in 429 B.C. (according to Suidas, as corrected by Clinton and Meineke). He composed ten plays, of which the *Solitary* ("Monotropos") was exhibited in 414 along with the *Birds* of Aristophanes and gained

the third prize, and the *Muses* carried off the second prize in 405, Aristophanes being first with the *Frogs*. This poet (*Frogs*, 13) accuses Phrynichus of employing vulgar tactics to raise a laugh, and he was further charged with plagiarism and defective versification, but such accusations were too commonly bandied between rival poets to merit much attention. He was not included by the Alexandrian critics in their canon of the best poets. The remains of his works, which have been edited with the other fragments of the Attic Comedy by Meineke and Bothe, are too scanty to allow us to judge of their merits.

3. PHRYNICHUS ARABIVS, a grammarian of Bithynia, lived in the reigns of the emperors Marcus Antoninus and Commodus (2d century A.D.). According to Suidas he was the author of the following works: (1) an *Atticist*, or *On Attic Words*, in two books, (2) *Τιβερμένον συναγωγή*, (3) *Σοφιστικὴ παρασκευή*, or *Sophistical Preparation*, in forty-seven or (according to others) seventy-four books. We have an account of the last-mentioned work by Photus, who had read thirty-six books of it. The copy used by Photus contained only thirty-seven books, but he states that the author in a preface addressed to the emperor Commodus, to whom the work was dedicated, promised, if life lasted, to write as many more books. Separate parts of the work were dedicated to various friends, and Phrynichus excused its delays and imperfections on the ground of numerous illnesses. It consisted of a collection of Attic words and phrases, arranged in alphabetical order, and distinguished according to the purposes they were meant to serve, whether oratorical, historical, conversational, jocular, or amatory. The models of Attic style, according to Phrynichus, were Plato, Demosthenes and the other nine Attic orators (*viz.*, Antiphon, Andocides, Lysias, Isocrates, Isæus, Æschines, Dinarchus, Lycurgus, Hyperides), Thucydides, Xenophon, Æschines the Socratic, Critias, Antisthenes, Aristophanes and the other poets of the Old Comedy, together with Æschylus, Sophocles, and Euripides. Of these, again, he assigned the highest place to Plato, Demosthenes, and Æschines the Socratic. The work was learned, but prolix and garrulous. A fragment of it, contained in a Paris MS., was published by Montfaucon, and again by Im. Bekker in the first volume of his *Anecdota Græca* (Berlin, 1814). We possess another work of Phrynichus which is not mentioned by Photus, but is, perhaps, identical with the *Atticist* mentioned by Suidas. This is the *Selection* (*Eclogæ*) of *Attic Words and Phrases*. It is dedicated to Cornelianus, a man of literary tastes, and one of the emperor's secretaries, who had invited the author to undertake the work. It is a collection of current words and forms which deviated from the Old Attic standard. Side by side with these incorrect words and forms are given the true Attic equivalents. The work is thus a "lexicon anti-barbarum," and is interesting as illustrating the changes through which the Greek language had passed between the 4th century B.C. and the 2d century A.D. Phrynichus is especially severe upon Menander, and wonders what people can see in him to admire so much. The style is concise and pointed, and is occasionally relieved by touches of dry humour. The book is divided into two parts, of which the second appears in some editions as a separate work under the title of *Epitome*. Editions of it, with valuable notes, have been published by Chr. Aug. Lobeck (Leipzig, 1820) and W. G. Rutherford (London, 1881). Lobeck devotes his attention chiefly to the later, Rutherford to the earlier usages noticed by Phrynichus.

There was also an Athenian general Phrynichus in the Peloponnesian War, who took a leading part in establishing the oligarchy of the Four Hundred at Athens in 411 B.C. He was assassinated in the same year.

PHTHALIC ACID. This name was given by Laurent to a di-basic acid, $C_8H_4O_4$, which he obtained by the oxidation of naphthalin or its tetra-chloride with nitric acid. Schunck subsequently obtained the same acid by boiling alizain with nitric acid, but failed to recognize its identity with Laurent's.

One part of naphthalin is mixed with two parts of chlorate of potash, and the mixture added cautiously to ten parts of crude manganic acid. The product, $C_8H_4Cl_4$, is washed with water and then with "ligonin" (the more volatile fraction of petroleum). The chloride thus purified is oxidized by boiling it with ten parts of (gradually added) nitric acid of 1.46 specific gravity, evaporated to dryness, and the residue distilled to obtain the anhydride $C_8H_2O_3$, or rationally $C_8H_4CO_2 > O$, long colourless needles fusing at $128^\circ C$, —the boiling point being 276° .

When boiled with water it becomes phthalic acid, 1st formula $C_8H_4\begin{smallmatrix} COOH \\ COOH \end{smallmatrix}$, rhombic crystals, fusing at $184^\circ C$ with transformation into anhydride, very slightly soluble in water (100 parts at 11° dissolve 0.77 parts), more soluble in alcohol (100 of absolute dissolve 10.1 parts at 15°). Phthalic acid, when heated to redness with lime, breaks up into CO_2 and benzol, the lime salt when mixed with one equivalent αOH of lime, and kept at 83° to $350^\circ C$, yields carbonate and benzoate—

Hence phthalic acid should be obtainable by the oxidation of di-derivatives, $C_8H_4(R)_2$, of benzol ($R = OH, C_2H_5$, &c.), and indeed two acids, $C_8H_4(COOH)_2$, can be thus produced, but neither is identical with phthalic.

Terephthalic acid is obtained by the oxidation of ordinary cymol, $pC_6H_4\begin{smallmatrix} CH_3 \\ CH_3 \end{smallmatrix}$, or other similar "para" bodies with bichromate of potash and sulphuric acid. It is a white powder, quite insoluble in water, sublimable without fusion or dehydration.

Isophthalic acid is obtained similarly from "meta" derivatives, $C_6H_3R_3$, of benzol, hair-fine needles fusing above 300° , almost insoluble in water, but pretty easily soluble in alcohol.

Ortho-benzene derivatives of benzol ought to give "ortho," i.e., Laurent's phthalic acid, but this acid itself is oxidized by the bichrome mixture into CO_2 and H_2O .

Phthalones are a most interesting family of coloured derivatives of phthalic anhydride, which were discovered by Baeyer, and soon found their way into the colour industry. As an example we quote *phenol-phthalone*, obtained by the union of the anhydride with phenol, $C_6H_5OH = H + C_6H_4\begin{smallmatrix} CO \\ CO \end{smallmatrix}$ = $H +$ "Phen." The phthalone is

Phthalic

acid

and, as will easily be understood, something widely different from the di-phenyl-phthalic ether. Phthalic anhydride and *resorcin*—one of the three di-hydroxyl derivatives, $C_6H_3(OH)_2$, of benzol—unite into "fluorescin," distinguished by the strong fluorescence of its solutions. Tetra-brom-fluorescin, a beautiful red colour, is used industrially as *eosin* (from Greek *éōs*, the morning-red).

PHTHISIS (*phthisis*) or CONSUMPTION. This term, although applicable to several forms of wasting disease, is commonly used to designate a malady having for its chief manifestations progressive emaciation of the body and loss of strength, occurring in connexion with morbid changes in the lungs and in other organs.

Few diseases possess such sad interest for humanity as consumption, both on account of its widespread prevalence and its destructive effects, particularly among the young, and in every age of medicine the subject has formed a fertile field for inquiry as to its nature, its cause, and its treatment. On all these points medical opinion has undergone numerous changes with the advance of science and the application of more accurate methods of investigation; yet, notwithstanding the many important facts which within recent years have been brought to light, it must be admitted that our knowledge of this disease is still far from complete. As regards the nature or pathology of consumption it is unnecessary in a notice like the present to refer at length to the doctrines which have from time to time been held upon the subject, further than merely to indicate in a general way the views which have been more or less widely accepted in recent times. In the early part of the present century the study of the diseases of the

chest received a great impetus from the labours of Laennec, whose discovery of the stethoscope led to greater minuteness and accuracy in investigation (see AUSCULTATION). This physician held that phthisis depended on the development of tubercles in the lungs, which, undergoing various retrograde changes, led to the breaking down and excavation of these organs,—in short, produced the whole phenomena of consumption; and, further, that this tuberculous formation affected various other parts and organs, and was the result of a morbid constitutional condition or diathesis. This doctrine, which was generally taught during the first half of the century, and even longer, was to some extent superseded by that to which the greatest prominence was given by Niemeyer and others, namely, that the majority of cases of phthisis had their origin in an inflammation of the lung (catarrhal pneumonia), but that tubercle—the existence of which was freely admitted—might occasionally be evolved out of this condition. This view has had wide acceptance, but has been modified in a variety of ways, especially by its extension to inflammation in other parts besides the lungs, the unabsorbed products of which are held to be capable of producing tubercle by infection from within the system. Still more recently there has arisen another doctrine in connexion with the discovery by Koch of the micro-organism or bacillus of tubercle, which can be cultivated and which, when inoculated, appears capable of producing tubercular disease, namely, the doctrine of the infectiveness of phthisis by means of this "microbe" received into the system from without. This view, which is supported by many striking facts and arguments, has been extensively adopted as furnishing in all probability a rational basis of the pathology of tubercular consumption. Yet it has not been universally accepted, being held by many to be insufficient to account for the origin and course of the disease in numerous instances and in certain of its forms. It is impossible to deny an important place in the course of the disease to inflammatory processes. Even in those cases where the lungs are infiltrated with tubercular deposit evidence of inflammation is abundantly present, while, on the other hand, it would seem that in not a few instances the process is inflammatory throughout. That phthisis, therefore, is not the same process in all cases, but that there are distinct varieties of the disease, is made clear by the morbid anatomy of the lungs no less than by other considerations.

Whatever be the form, the common result of the presence of these disease-products is to produce consolidations in the affected portions of the lungs, which, undergoing retrograde changes (caseation), break down and form cavities, the result being the destruction in greater or less amount of lung-substance. These changes most commonly take place at the apex of one lung, but with the advance of the disease they tend to spread throughout its whole extent and to involve the other lung as well. When the disease is confined to a limited area of a lung it may undergo arrest—even although it has advanced so far as to destroy a portion of the pulmonary tissue, and a healing process may set in and the affected part cicatrize. This is, however, exceptional, the far more common course being the progress of the destructive change either by the spread of the inflammatory process or by infection through the lymphatics, &c., from the existing foci of diseased lung-tissue. Various morbid changes affecting the lungs themselves or other organs frequently arise in the course of phthisis, complicating its progress and reducing the chance of recovery. Of these the more common are affections of the pleura, stomach, liver, kidneys, and especially the intestines, which in the later stage of the disease become ulcerated, giving rise to the diarrhoea which is so frequent and fatal a symptom at this period.

The causes influential in producing phthisis are numerous and varied, but they may for general consideration be embraced under two groups, namely, those which are *pre-disposing* and operate through the constitution as a whole, and those which are *exciting* and act immediately upon the organs implicated. These two sets of causes may be more or less distinctly associated in an individual case, but, on the other hand, one may appear to act in both ways—as predisposing and exciting. The following may serve to illustrate some of the conditions of a predisposing kind. A constitutional tendency to scrofula and its manifestations lends itself readily to the production of phthisis. This morbid constitution is characterized among other things by a liability to low chronic forms of inflammation affecting gland-textures, mucous membranes, &c., the products of which show little readiness to undergo absorption, but rather to degenerate. Inflammations of this character affecting the lungs, as is not uncommon, have a special tendency to lead to the breaking down of lung-texture and formation of phthisical cavities. Many high authorities hold that tubercle-formation may be evolved out of scrofulous inflammations of glands, such as those of the neck, by an infective process, like that already referred to. The mention of this constitutional state naturally suggests another powerful predisposing cause, namely, hereditary transmission. The extent to which this influence operates as a cause of consumption has been differently estimated by writers, owing probably to the various aspects in which the matter is capable of being viewed. It is impossible to deny that the children of parents one or both of whom are consumptive are liable to manifest the disease,—that is, they inherit a constitution favouring its development under suitable exciting causes. But a similar constitutional proclivity may be induced by other influences acting through the parents. Should either or both of them be enfeebled by previous disease or by any other weakening cause, they may beget children possessing a strong predisposition to consumption. Marriages of near relatives are held by some to induce a consumptive tendency,—probably, however, owing to the fact that any constitutional taint is likely to be intensified in this way. Phthisis is a disease of early life, the period between fifteen and thirty-five being that in which the great majority of the cases occur, and of these by far the larger proportion will be found to take place between the ages of twenty and thirty. The influence of sex is not marked. Occupations, habits, and conditions of life have a very important bearing on the development of the disease apart altogether from inherited tendency. Thus occupations which necessitate the inhalation of irritating particles, as in the case of stone-masons, needle-grinders, workers in minerals, in cotton, flour, straw, &c., are specially hurtful, chiefly from the mechanical effects upon the delicate pulmonary tissue of the matter inhaled. No less prejudicial are occupations carried on in a heated and close atmosphere, as is often the case with compositors, gold-beaters, sempstresses, &c. Again, habitual exposure to wet and cold or to sudden changes of temperature will act in a similar way in inducing pulmonary irritation which may lead to phthisis. Irregular and intemperate habits are known predisposing causes, and over-work, over-anxiety, want of exercise, insufficient or unwholesome food, bad hygienic surroundings such as overcrowding and defective ventilation, are all powerful agents in sowing the seeds of the disease. Consumption sometimes arises after fevers and other infectious maladies, or in connexion with any long-continued drain upon the system, as in over-lactation. The subject of climate and locality in connexion with the causation of phthisis has received considerable attention, and some interesting facts have been ascertained on this

point. That phthisis is to be met with in all climes, and it would seem fully as frequently in tropical as in temperate regions, is evidence that climate alone exercises but little influence. It is very different, however, with locality, elevation appearing to affect to a considerable extent the liability to this disease. It may be stated as generally true that phthisis is less prevalent the higher we ascend. The investigations of Dr H J Bowditch in New England and of Dr George Buchanan of the Local Government Board in the counties of Surrey, Kent, and Sussex agree in proving that elevated regions with dryness of soil are hostile to the prevalence of consumption, while low-lying and damp districts seem greatly to favour its development, and it has been found that the successful drainage of damp localities has occasionally had a marked effect in reducing their phthisis mortality. In all such observations, however, various modifying circumstances connected with social, personal, and other conditions come into operation to affect the general result. As regards immediate or exciting causes, probably the most potent are inflammatory affections of the respiratory passages produced as the result of exposure. The products of such attacks are liable under predisposing conditions, such as some of those already mentioned, to remain unabsorbed and undergo degenerative changes, issuing in the breaking down and excavation of the pulmonary texture. A necessary consequence of the modern doctrine of the contagious nature and inoculability of tubercle has been to bring to the front a view as to phthisis once widely prevalent and in some countries—*e g*, Italy—never wholly abandoned, namely, its infectiousness. By some supporters of the recent theories of tubercle it is maintained that phthisis is communicated by infection and in no other way, the infecting agent being the bacillus. Others, while holding the view of the specific nature of the disease, deny that it can be communicated by infection like a fever, and cite the experience of consumption hospitals (such as that described by Dr O T Williams with respect to the Brompton Hospital) as to the absence of any evidence of its spreading among the nurses and officials. Others, again, deny both its specific nature and its direct infectious character. There appears, however, to be a growing opinion that phthisis may occasionally be acquired by a previously healthy person from close association with one already suffering from it, and, if this view be well founded, it affords a strong presumption that some infecting agent (such as the tubercle bacillus) is the medium of communication. The whole subject of the infectiousness of this disease is as yet unsettled, but there appears to be sufficient reason for special care on the part of those who of necessity are brought into close contact with patients suffering from it.

Cases of phthisis differ widely as regards their severity and their rate of progress. Sometimes the disease exhibits itself as an acute or galloping consumption, where from the first there is high fever, rapid emaciation, with cough and other chest symptoms, or with the comparative absence of these, and a speedily fatal termination. In such instances there would probably be found extensive tubercularization of the lungs and other organs. In other instances, and these constitute the majority, the progress of the disease is chronic, lasting for months or years, and along with periods of temporary improvement there is a gradual progress to a fatal issue. In other cases, again, the disease is arrested and more or less complete restoration to health takes place.

It is unnecessary to describe the symptoms or course and progress of all the varieties of this malady. It will be sufficient to refer to those of the ordinary form of the disease as generally observed. The onset may be somewhat

sudden, as where it is ushered in by hæmoptysis (spitting of blood), but more commonly it is slow and insidious and may escape notice for a considerable time. The patient is observed to be falling away in flesh and strength. His appetite fails, and dyspeptic symptoms trouble him. But the most marked feature of the condition is the presence of a cough, which is either persistent or recurs at certain times, as in lying down in bed or rising in the morning. The cough is dry or is accompanied with slight clear expectoration, and the breathing is somewhat short. Feverish symptoms are present from an early period, the temperature of the body being elevated, especially in the evening. The patient often complains of flying pains in the chest, shoulders, and back. Such symptoms occurring, especially in one who may possess by inheritance or otherwise an evident tendency to chest disease, should excite suspicion, and should be brought under the notice of the physician. They constitute what is commonly known as the first stage of phthisis and indicate the deposit of tubercle or else inflammatory consolidation in the lung.¹ Not unfrequently the disease is arrested in this stage by judicious treatment, but should it go on the symptoms characterizing the second stage (that of softening and disintegration of lung) soon show themselves. The cough increases and is accompanied with expectoration of purulent matter in which lung-tissue and the bacillus of tubercle can be detected on microscopic examination.² The symptoms present in the first stage become intensified the fever continues and assumes a hectic character, being accompanied with copious night-sweats, while the appetite and digestion become more and more impaired and the loss of strength and emaciation more marked. Even in this stage the disease may undergo abatement, and improvement or recovery take place, though this is rare, and by careful treatment the advance of the symptoms may be in a measure held in check. The final stage (or stage of excavation), in which the lung has become wasted to such an extent that cavities are produced in its substance, is characterized by an aggravation of all the symptoms of the previous stage. In addition, however, there appear others indicating the general break-up of the system. Diarrhoea, exhausting night-perspirations, and total failure of appetite combine with the cough and other pulmonary symptoms to wear out the patient's remaining strength and to reduce his body to a skeleton. Swelling of the feet and ankles and soreness of the mouth (aphthæ) proclaim the approach of the end.³ Death usually takes place from exhaustion, but sometimes the termination is sudden from hæmorrhage, or from rupture of the pleura during a cough and the consequent occurrence of pneumothorax. A remarkable and often painful feature of the disease is the absence in many patients of all sense of the nature and

gravity of the malady from which they suffer, and their singular buoyancy of spirits (the *spes phthisica*), rendering them hopeful of recovery up till even the very end.

This description is but a brief and imperfect outline of the course and progress of an ordinary case of phthisis. It is scarcely necessary to remark that the disease is greatly modified in its course and progress and in the presence or absence of particular symptoms in individuals. Thus in some the chest-symptoms (cough, &c.) are prominent throughout, while in others these are comparatively in abeyance, and diarrhoea or fever and exhausting perspirations or throat-troubles specially conspicuous. Nevertheless, essentially the same pathological conditions are present in each case. Further, as has been already mentioned, there are types of the disease which obviously influence alike its main features and its duration, these have been embraced under two classes, the acute and the chronic. In the former, which includes the acute tuberculous and acute inflammatory or pneumonic phthisis, the progress of the disease is marked by its rapidity and the presence of fever even more than by local chest-symptoms. Such cases run to a fatal termination in from one to three or four months, and are to be regarded as the most severe and least hopeful form. The chronic cases, of which the description above given is an example (and which embrace various chronic changes, *e.g.*, chronic interstitial pneumonia or cirrhosis of the lung), progress with variable rapidity. Their duration has been estimated by different authorities at from two to eight or more years. Much, however, necessarily depends on the effect the disease exercises upon the patient's strength and nutrition, on his circumstances and surroundings, and on the presence or absence of weakening complications. Many cases of this class remain for long unchanged for the worse, perhaps undergoing temporary improvement, while in a few rare instances, where the disease has become well marked or has even attained to an advanced stage, what is virtually a cure takes place.

The treatment of phthisis has received much attention from physicians as well as from empirics, by the latter of whom chiefly many so-called cures for consumption have from time to time been given forth. It need scarcely be stated that no "cure" for this disease exists; but, while this is true, it is no less true that by the adoption of certain principles of treatment under enlightened medical guidance a very great deal may now be done to ward off the disease in those who show a liability to it, and to mitigate and retard, or even arrest, its progress in those who have already become affected by it. The preventive measures include careful attention to hygienic conditions, both personal and surrounding. In the case of children who may inherit a consumptive tendency or show any liability to the disease much care should be taken in bringing them up to promote their general health and strengthen their frames. Plain wholesome food with fatty ingredients, if these can possibly be taken, milk, cream, &c., are to be recommended. Exercise in the open air and moderate exercise of the chest by gymnastics and by reading aloud or singing are all advantageous. An ample supply of fresh air in sleeping apartments, schools, &c., is of great importance, while warm clothing and the use of flannel are essential, especially in a climate subject to vicissitudes. The value of the bath and of attention to the function of the skin is very great. The like general hygienic principles are equally applicable in the case of adults. When the disease has begun to show any evidence of its presence its treatment becomes a matter of first importance, as it is in the early stages that most can be done to arrest or remove it. Special symptoms, such as cough, gastric disturbances, pain, &c., must be dealt with by the physician according to the indi-

¹ The examination of the chest by the usual methods of physical diagnosis reveals in this stage the following as among the chief points. On *inspection* the thorax is observed to be narrow and poorly developed, or it may be quite normal. At its upper region there may be noticed slight flattening under the clavicle of one side, along with imperfect expansion of that part on full inspiration. On *percussion* the note may be little if at all impaired, but frequently there is dullness more or less marked at the apex of the lung. On *auscultation* the breath-sounds are variously altered. Thus they may be scarcely audible, or again harsher than natural, and the expiration may be unduly prolonged. Sometimes the breathing is of an interrupted or jerky character, and is occasionally accompanied with fine crepitations or râles. Pleuritic friction-sounds may be audible over the affected area.

² In this stage the physical signs are more distinctive of the disease. Thus, the flattening of the chest-wall is still more marked, as is also the dullness to percussion, whilst on auscultation the breathing is accompanied with coarse moist sounds or râles, which become more audible on coughing.

³ The physical signs now present are those of a cavity in the lung—viz., in general absolute dullness on percussion—cavernous breathing, gurgling râles, and pectoriloquy.

vidual case; but it is in this stage of the disease that the question of a change of climate in the colder seasons of the year arises among those whose circumstances render such a step practicable. There can be no doubt that as regards Great Britain the removal of patients threatened by or already suffering from consumption to some mild locality, either in the country or abroad, proves in many instances most salutary. The object aimed at is to obtain a more equable climate, where the atmosphere may have a soothing influence on the respiratory organs, and where also open-air exercise may be taken with less risk than at home. Of British health-resorts Bournemouth, Hastings, Torquay, Ventnor, Penzance, &c., in the south of England, are the best known and most frequented, and although the climate is not so certain as in places farther south in Europe they possess the advantage of home residence, and may be resorted to by persons who are unable to undertake a farther journey. The climate of the Riviera (Maritime Alps) is of superior efficacy owing to its mildness and the dry bracing character of its air, and, despite the long journey, is as a rule to be recommended as one of the best for the greater proportion of the cases of phthisis. The same may be said for Algiers and Egypt. Of recent years the air of elevated dry regions, such as Davos in the Alps and the Rocky Mountains in America, has been strongly recommended, and in not a few cases appears to be productive of good in arresting the disease at its outset, and even advantageous in chronic cases where there is no great activity in its progress. Of like value, and in a similar class of cases, are long sea-voyages, such as those to Australia or New Zealand. Nevertheless, there is no doubt that consumptive patients are often sent abroad manifestly to die. It may be stated generally (although doubtless there may be exceptions) that where the disease exhibits a decidedly acute form, even in its earlier stages, any distant change is rather to be discouraged,

while in the advanced stages, where there is great prostration of strength, with colligative symptoms, the removal of a patient is worse than useless, and frequently hastens the end.

Throughout the whole course of the malady the nutrition of the patient forms a main part of the treatment, and tonics which promote the function of the digestive organs are especially helpful. Codliver oil has long been held to be of eminent value, as it appears not merely to possess all the advantages of a food but to exert a retarding effect on the disease. Where it is well borne, not only will the weight of the body be found to increase, but the cough and other symptoms will markedly diminish. The oil is as a rule best administered at first in small quantity. The frequently employed substitutes, such as malt extract, tonic syrups, &c., although not without their uses, are all inferior to codliver oil. The occasional employment of counter-irritation to the chest in the form of iodine or small blisters is of service in allaying cough and relieving local pains. Respirators to cover the mouth and nose, and so constructed as to contain antiseptic media through which the air is breathed, are sometimes found to lessen cough and other symptoms of chest-irritation.

Among the most serviceable drugs in the treatment of the symptoms of phthisis are the preparations of opium. Administered along with such agents as hydrocyanic acid and expectorants, they are eminently useful in soothing severe cough, along with astringents they are equally valuable in controlling diarrhoea, while with quinine, digitalis, &c., they aid in allaying fever and restlessness and in procuring sleep. But besides these many other medicinal agents, too numerous to mention here, are employed with much advantage. Each case will present its own features and symptoms calling for special attention and treatment, and details upon these points must be left to the advice of the medical attendant. (J. O. A.)
